WIRE WHEELS & AXLES

IT is wire wheel tire economy that appeals to the racing driver, a tire economy that means a saving in time and trouble as well as a greater factor of safety. Better service and a consequent decrease in a car's upkeep cost, because of this added tire mileage, is the manufacturer's fundamental reason for wire wheels.

Can you think of any stronger reasons why you should boost wire wheels to your customers---wire wheels as the basis of all real car service at a minimum upkeep expense. It is the strongest argument you can use in this day of motor car standards.

It is right up to you, Mr. Dealer. Don't wait until a rival dealer gets the jump on you. Insist that your allotment of cars come wire wheel equipped.

Any particular information you want we will gladly give you direct.

advanced ideas of wire wheel design. Standard ⓢ of special drawn carbon steel are used. Not only are viewpoint but McCue manufacturing methods and is fast reaching 1,000 wire wheels per day.

Hartford CONE CLUTCHES

Cone clutches for pleasure cars and commercial trucks

Standard Hartford Cone Clutch Unit Complete with Universals.

Sizes for various motor horse-power and load requirements

HARTFORD CONE CLUTCHES vary in size according to the requirements of the cars or trucks on which it is intended they be used.

It has been common to designate clutch sizes in the same way. The relation between a motor and its load is commonly expressed by horse-power. Some of the Hartford Cone Clutch sizes are M500—25 H. P., M600—45 H. P., M700—60 H. P., etc., as the case may be.

Our experience as clutch specialists in the past invariably has proven valuable in selecting the size clutch best adapted to the requirements of the manufacturers with whom we have done business. By co-operating intelligently with their engineers, a great deal of time and expense has been saved. The engineer knows his requirements; we know the capabilities of various Hartford Clutches. Subsequent tests have always borne out such recommendations.

Clutch requirements in the commercial car field differ considerably from pleasure car clutch practice. This is natural. A new set of conditions arises and while they in no way affect the superiority of the cone type clutch, require study to be handled properly, and here again our experience as clutch specialists has been invaluable to truck manufacturers.

Our truck business is growing rapidly—and better still in a satisfactorily, consistent manner.

Lancia

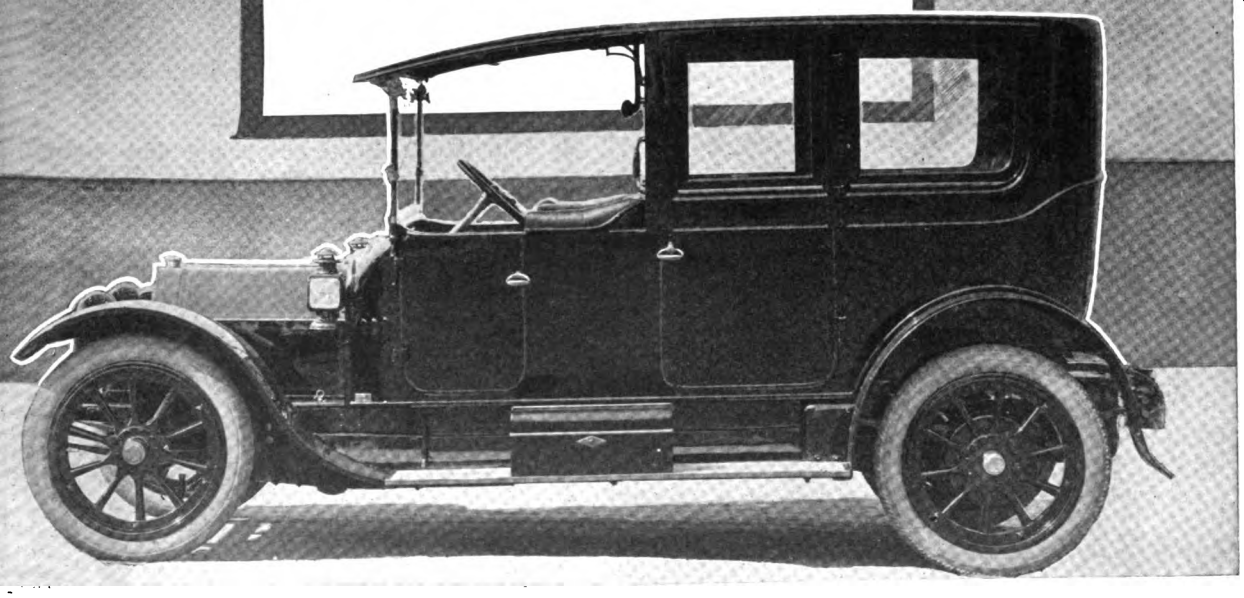
AMERICA'S FAVORITE FOREIGN CAR SOLD AT AMERICAN PRICES

Lancia cars, made in Europe, offer the American buyer every European point of superiority in material, engineering features, workmanship, design and finish—and it is conceded that car building methods which obtain on "the other side" are years in advance of American methods.

And American Dealers can sell Lancia cars at American prices.

You, Mr. Dealer, know that limited quantity production insures the ***personal attention*** of every man engaged in the building. Lancia production is typically European because it ***is*** limited. Here are no American cut and dried operations that produce quantity at the heavy expense of quality.

Lancia dealers use these arguments as the basis for selling arguments.



Car wise buyers who want European automobiles are quick to grasp and act upon them.

There is some choice territory awaiting dealers who are looking for that ***different and better car.*** Are you such a dealer?

Your Customers Want Soot-Proof Spark Plugs

There is a greater and steadier demand for Soot-Proof Plugs than for any other.

They have been on the market longer and motorists have come to rely upon them when others failed to live up to their advertised qualities.

Soot-Proof Plugs are warranted not to short-circuit or leak. They are built with a double chamber and have three times the resistance of the ordinary plug—hence the hottest spark a current is capable of.

Soot-Proof Plugs are self-cleaning and prevent all ignition troubles such as balks, weak spark, carbon, etc., in so far as plugs are concerned.

Why not sell the best known and most reliable spark plug. Going with popular demand is better than bucking against it.

Saved!

Weed Tire Chains enable you to safely make sharp turns and quick stops when a momentary loss of control means loss of life.

The above picture illustrates one of the numerous situations in which you may be placed during bad road weather — when suddenly someone appears directly in your path and in a fraction of a second you must make a sharp turn and apply the brakes. It is then you require a firm unfailing grip on the road which can only be obtained by equipping ***all*** tires with

Weed Anti-Skid Chains

The Only Device that Absolutely Prevents Skidding

The memory of one accident deters future enjoyment in the use of a car. Why run the risk of such accidents and why forfeit the pleasures of motoring ***forever after, when safety can surely be yours by equipping all four tires with WEED CHAINS?***

WEED CHAINS cannot injure tires because "they creep." Easily put on in a jiffy without the use of a jack or other tools. Directions packed with every pair.

Universally Used

WEED CHAINS are generally regarded as the most profitable accessory for the automobile Dealer — Extensively Advertised — Easily Handled — Quick Sellers — No Dead Stock — No Dull Seasons — Liberal Profits — Satisfaction Guaranteed.

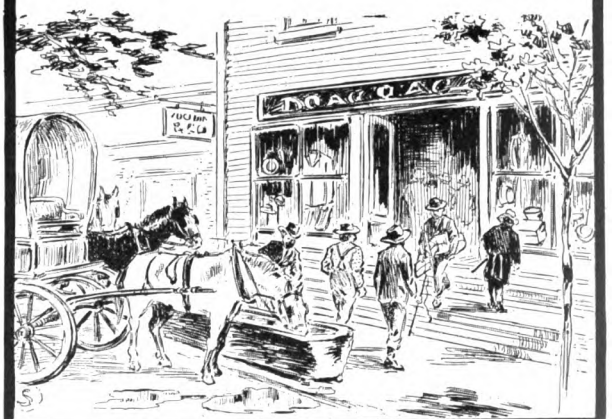
Drawing Trade

The old storekeeper made a shrewd move when he placed a drinking trough in front of his store. It was his way of encouraging the country trade.



The modern automobilist is just as human as the farmer. He dislikes to pump up tires. He will go out of his way to find compressed air. It is the little courtesies which you extend to him that make him your friend and customer.

Progressive dealers readily appreciate the silent sales-making qualities of the Hale Curb Box and hundreds are installing complete outfits, not only for curb use, but for inside service as well. The box may be installed in the sidewalk, near the curb, or in the garage flush with the floor. It makes opportunities for the sale of accessories and fuel, for it puts the obligation on the motorist to reciprocate the courtesy you extend through your Hale Curb Box.

Get the details at once. Send for bulletin 12-W.

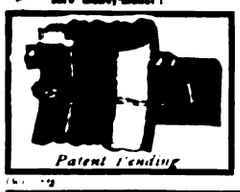
BOSCH MAGNETO COMPANY
224 West 46th Street New York

Let STEAM Do Mending In 20 Minutes!

At last! A handy vulcanizer that DOES vulcanize—that does NOT burn the tire! Shrinks tire up-keep cost to almost nothing!

There, crammed into a few words, are the astonishing advantages offered to motorists by the Positive Steam Tire Vulcanizer. A vastly improved money-saving device that utilizes steam—the only scientific vulcanizing agent, and at instant notice gives you factory service at home.

Positive Steam Tire Vulcanizer

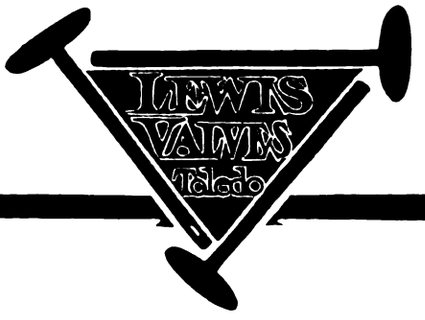


In Single Season Saves Owner Ten Times Cost

All you do is to apply raw gum rubber, clap on the steam vulcanizer, put water in one section, gasoline in the other, and touch a match. In 20 minutes time the job is done. Done so well, mind you, that the union of raw rubber and casing is as solid as the casing itself. Done without risk of ruining your tire by burning it (one of the dangers of the common fire-heated vulcanizers)—AND—done at a SAVING that in one season pays ten times over for the Steam Vulcanizer.

Get More Mileage Out of Junked Tires

That's what you can do. You can mend holes either in tube or casing up to 2½ inches in diameter with one setting. Reset for larger holes. Tires scrapped, can thus be brought to life for hundreds of miles of added service. Price complete $5.00.



DEALERS! Here's a live proposition! Get in touch with us at once if you want to handle a sure money-maker!

Drop a Card Today

You can't afford to pay big prices for those inevitable tire repairs. Here's ready relief! Utilize it. Send card today for complete information.

Bnsiness Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

What is a REAL Tire Protector?

One that does not chafe the tires.

What is the cause of chafing?
Loose fitting protectors, due usually to stretching.

Can stretching be prevented?
No—leather, and even fabric, is bound to stretch.

Can it be overcome?
Yes—by pulling the protectors tight by means of stiff springs which take up the stretch automatically.

Are such protectors made?
Yes—the spring attachment is a patented feature of the oldest and most successful make of protectors—

THE UNIVERSAL CAR

Revised downward—automobile tariffs—by the economical Ford. Many members of Congress own Ford cars—purchased, not so much because of its surprisingly low first cost, as because of its wonderfully low cost of maintenance—and its simplicity.

Here's the test: 300,000 Fords now in service. Runabout $525; Touring Car $600; Town Car $800—f.o.b. Detroit, with all equipment. Get catalogue and all particulars from Ford Motor Company, Detroit.

Simplicity, Strength, Durability

COVERT

Three important points in

Covert Transmissions

You would not think of putting an inferior motor in your car, would you? Superior transmissions are as essential as the best motors.

INTERLOCKS

Double Your Mileage and Stop Tire Trouble

INTERLOCK INNER TIRE

Interlocks are complete inner tires—not inner shoes—placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They insure safety—make new tires give twice the usual mileage, and add 1000 to 5000 miles to old ones. Don't affect resiliency. Make your tires blow-out proof.

Car Owners and Dealers

write for our booklet giving facts about road tests, prices, testimonials, and our 1913 proposition.

NEW SOSS CONCEALED DOOR HINGE NO. 121

This new hinge requires a pillar only ⅝ inches wide. It is detached by removing two screws as indicated in illustration. The trouble avoided and time gained in hanging doors when using Soss Hinges are important factors.

Soss Concealed Hinges can be installed flush with the outside of the pillar, allowing the steel or aluminum panel to be turned over flush on to the face of the hinge, and fastened down securely in the rabbet provided on the edge of the face to receive it, thus allowing more than ordinary clearance.

The non-corrosive case attached to the pillar section of the hinge, prevents water from reaching the wood of the pillar through the hinge.

Description:

Face of hinge on pillar, ⅜ in. x 3⅛ in.
Face of hinge on door, ⅜ in. x 2½ in.
Water-proof case mortises into pillar, ⅜ in. x 1⅝ in. x 1¼ in. deep.
Clearance in opening, 11-16 inches.

No 121

Swinehart Non-Skid Tires

The one type that makes skidding impossible. Both the initial cost and the repair expense of chains and inevitable wear and tear on the fabric of the casing are avoided, representing more than 30% of total tire costs. Swinehart (Keaton) depression type has four times the wearing surface of any other non-skid, and its traction and non-skid properties last until the tire is worn out. Safe and economical.

Is Electricity Cheaper Than Gas Light?

How much does a battery cost? How long are batteries lasting? How much do other repairs and replacements cost?

The average user of Prest-O-Lite pays $10 a year, or less, for light.

If any editor, or any advertiser, claims that electric lights cost less to use than Prest-O-Lite, you can easily prove that he is either ignorant or worse.

If you want the facts, write us.

The Prest-O-Lite Co., 287 Speedway, Indianapolis, Ind.

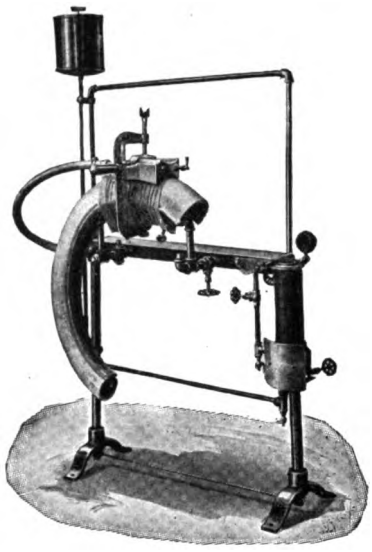
Blow-out repairs that outlast the tire

The only way to make **durable** blow-out repairs **economically** is to reinforce the tire with fabric applied to the inside, fill the hole through the tire with Para gum, then apply heat **both** to the inside and outside. This method avoids cutting away and wasting a lot of expensive tread stock, requires a minimum of fabric and makes a repair that is stronger than the tire. Anyone can use it because the work is all straightforward, requiring no special experience. One set of forms fits all sizes of tires. No extra moulds required.

SHALER Steam Vulcanizer

The Shaler is the only steam vulcanizer that permits using the approved wrapped tread method as it is the only one that applies heat to the inside and outside of a tire simultaneously. It makes perfect blow-out repairs.



To make it complete as a garage equipment it is provided with a tube plate 4 x 30 inches that will mend six tubes as quickly as one.

The boiler, a conical copper coil, heated by a powerful gas or gasoline burner, raises steam so quickly that you can profitably heat the Shaler even if you only have a tube puncture to mend.

The essential Shaler feature of a thermostat to hold the temperature at the vulcanizing degree automatically makes it impossible to overheat a tire. Simply light the burner, and steam is raised to the correct pressure and held there indefinitely.

Price of the complete outfit, including all attachments for tube and casing work, $45.

C. A. SHALER CO., 430 Fourth St., Waupun, Wis.

Vitalized Rubber Diamond (No clinch) Tires

answer your demand for More Mileage

Our chemists have discovered a scientific process of toughening pure rubber.

All types of Diamond Tires are now made of Vitalized Rubber—a flint-like, road-resisting rubber that retains all the young, lusty vigor of the pure gum with no loss of elasticity.

Perfect 3-Point Rim Contact

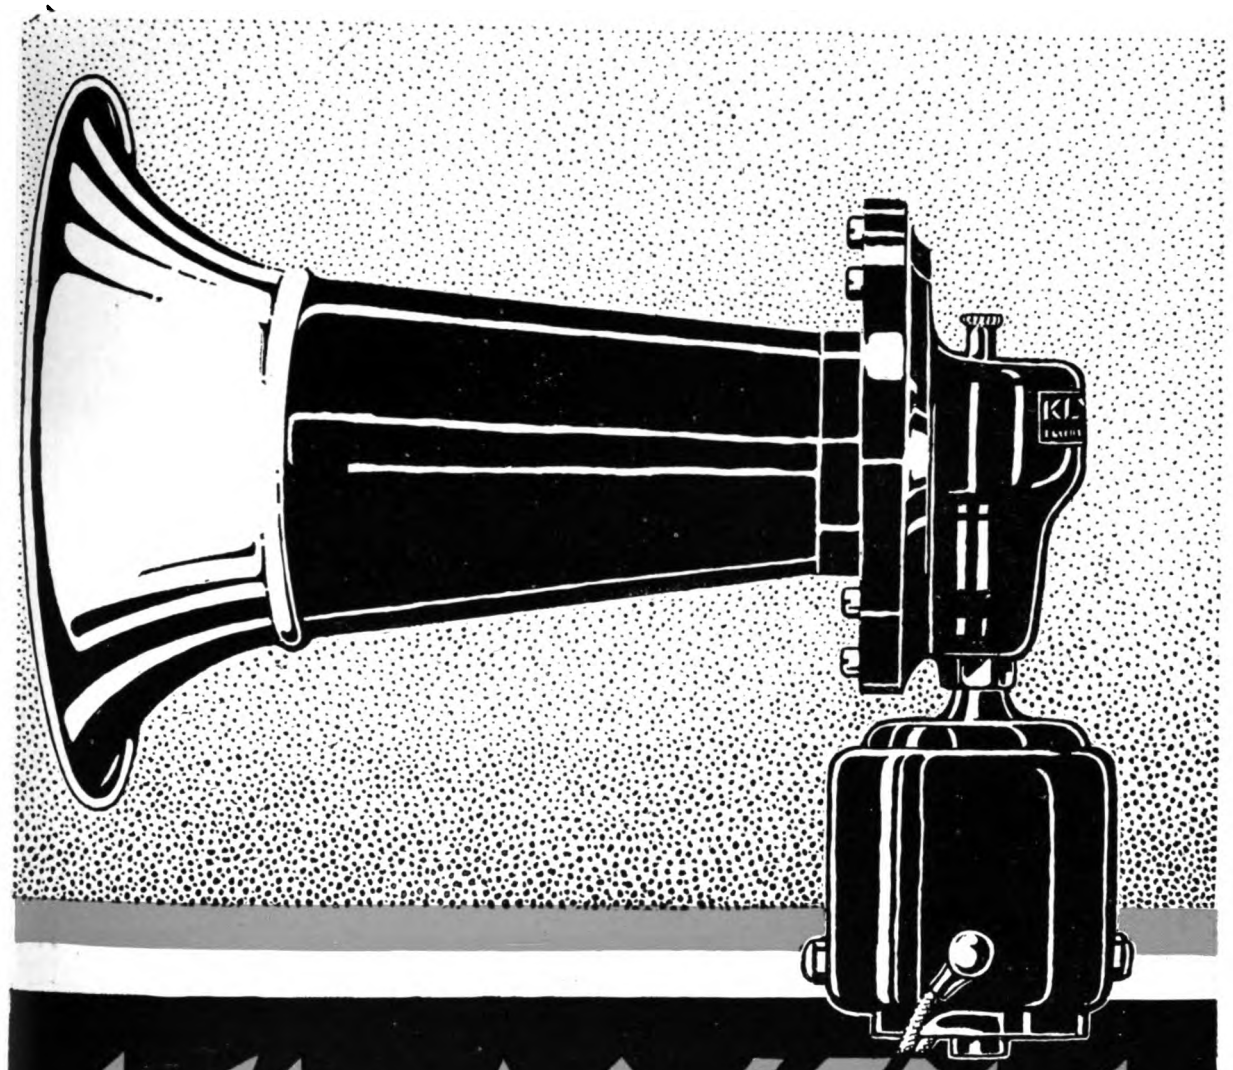
an additional Diamond advantage

Our Engineers have built up and torn down thousands of experimental tires in an effort to produce a perfectly constructed tire that would give you the "More Mileage" tire you have demanded.

In Diamond Tires today each thread of fabric and every ounce of rubber is combined to give the greatest strength and resistance, with no unbalanced strains at unsupported points—*Perfect 3-Point Rim Contact.*

Add to these advantages the No-Pinch Safety Flap for inner tube protection, and, if you wish, the now famous Diamond Safety (Squeegee) Tread and you have absolutely the most satisfying tire money can buy.

Cross Section of Diamond Safety Tread Tire



Be a Diamond Dealer

If you are not a Diamond Dealer—now is the time to get in line. There is a Diamond Branch near you—get in touch today.

MOTOR WORLD

A Trade Paper Giving the World's Motor News

Vol. XXXVI
No. 7

New York, August 7, 1913

Ten cents a copy
Two dollars a year

This new Gray and Davis factory is the largest plant of its kind in the world. Total floor space, 138,400 square feet. Main building is 380 feet long, 60 feet wide and 5 stories high. Window space occupies 70% of the wall area, providing maximum light and ventilation. A railroad spur runs directly to the entrance of the receiving and shipping rooms.

Our New Plant and Its Meaning to You

A Natural Outcome Seventeen years ago when Gray & Davis began building lamps for automobiles, we little anticipated our present huge volume of business.

But just as oil lighting gave way to gas, gas to the Gray & Davis Dynamo, and the starting crank was edged aside by the powerful 6-volt Gray & Davis Starter, we have been "put to it" to keep pace in furnishing facilities to thoroughly care for our rapidly growing business.

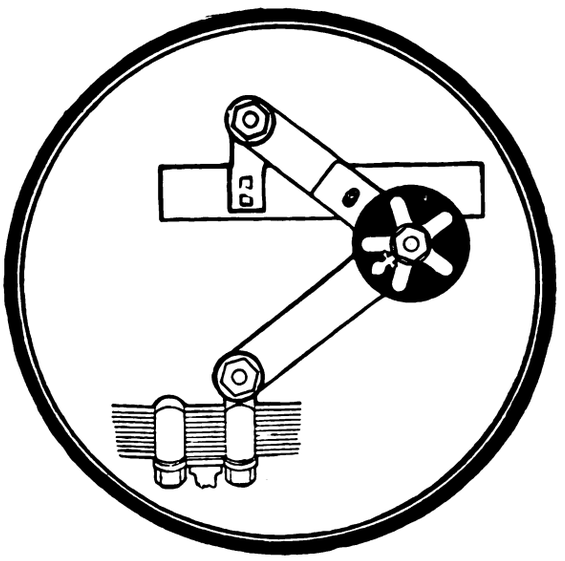
Our need for the finest starting system plant was the natural outcome. And now we have it.

Efficient Manufacture Here, by the most approved methods, we will continue the production of the Gray & Davis Starter and Dynamo. Every device that can increase efficiency, cut time and maintain quality, has been incorporated into our new quarters.

Even in our former quarters we won an enviable record with the 32 automobile manufacturers whom we supply, for unvarying standards in manufacture and quick deliveries. With our present facilities we are fully equipped to beat our own records.

Prompt Deliveries The car manufacturer who builds ten, fifteen or fifty thousand cars and has shipments held up because his Starters are not delivered on time, is losing sales, friends, prestige, reputation.

Buy your Starting-Lighting Systems from the manufacturer having the reputation for delivering in exact accordance with contract specifications, and having the facilities for backing up that reputation. That is the only way to ensure prompt shipment of your automobiles.



GRAY & DAVIS, Inc.
Boston, Mass.

Firestone

"Regulars" Win

IN all the recent Firestone victories, American and International, on speedway or over the mountains, and across the desert—still the winning was achieved by tires from the regular Firestone stock.

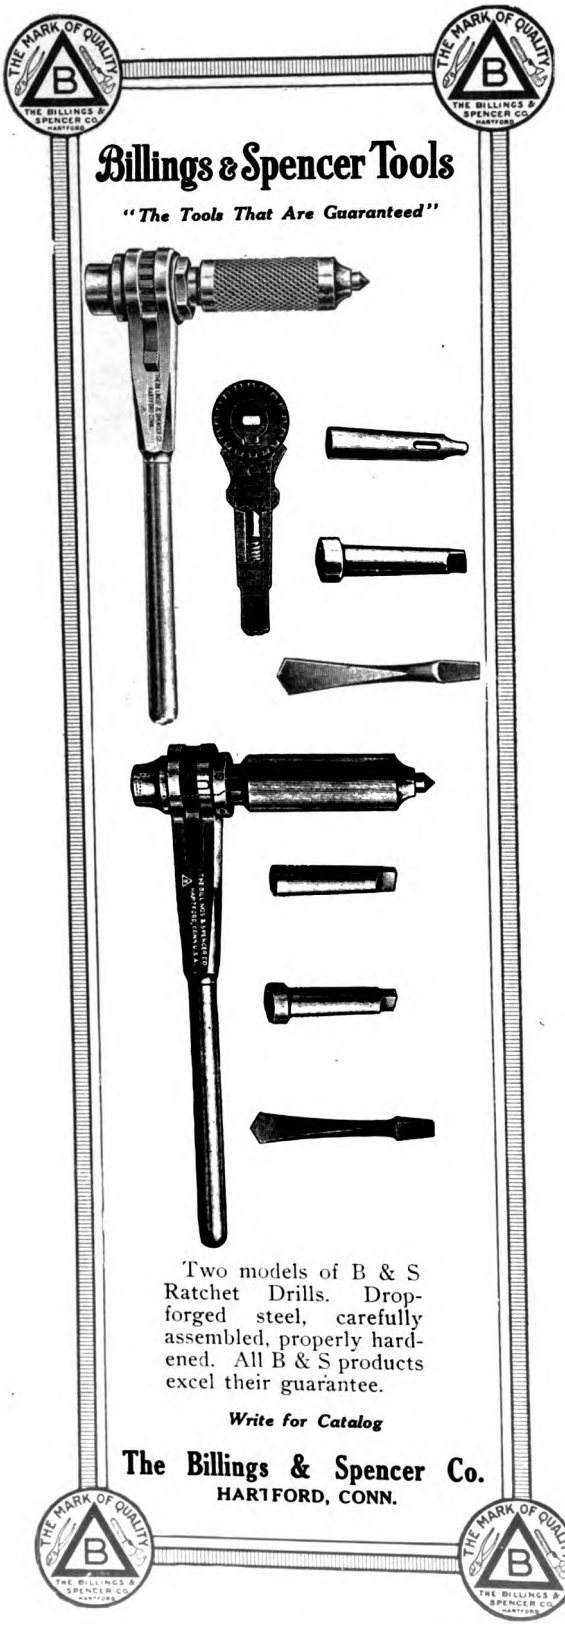
All the motoring world is now familiar with the astounding events which in quick succession further sealed the Firestone claim to supremacy on two continents.

1st and 2nd at the International 500-Mile Sweepstakes, May 30th. Blistering brick arena and heat at 100 degrees. Firestone Stock Tires won.

1st, 2nd, 3rd at Panama-Pacific Road Race, Los Angeles to Sacramento, July 4th, 443 miles over desert wastes and mountain ranges—Firestone "regulars" again ahead, with not one tire change on 1st and 2nd cars during the run.

1st in the three big races at Tacoma—100 mile, 200 and 250 miles with Firestone regular tires again victor.

And we build no racing tires. All this prodigious endurance in every kind of test is yours to command in any Firestone tire.



Firestone pneumatic tires are guaranteed when filled with air at the recommended pressure and attached to rims bearing either one or both of the following inspection stamps. When filled with any substitute for air or attached to any other rims than those specified our guarantee is withdrawn.

We Are After 10%

¶ We figure that if we made all the oil sold as

MONOGRAM OIL

that our annual sales would increase fully ten per cent.

¶ Which means that there is a great deal of oil sold as MONOGRAM that is not the genuine product.

¶ But let this be a fair warning, for we are going to prosecute all cases where other oils are substituted for ours.

¶ Insist — Demand the MONOGRAM Brand.

MOTOR WORLD

Vol. XXXVI New York, U. S. A., Thursday, August 7, 1913 No. 7

NATIONAL ASSOCIATION OF SUPPLYMEN MAY BE FORMED

First Step Taken Toward Meeting During Next New York Automobile Show to Consider Project —Weinstock to Issue Call.

In all human probability, the Automobile Supply Dealers' Association will be the name of the next national organization to become attached to the motor vehicle industry. The first step in that direction was taken yesterday (Wednesday) at Atlantic City, where the Cycle Jobbers' Association of America held their annual session in connection with the convention of the bicycle, motorcycle and accessory trades.

The suggestion of an automobile supply dealers' association was let fall during the Cycle Jobbers' meeting by H. Weinstock, of the Weinstock-Nichols Co., of Los Angeles and San Francisco, who, like many of the other jobbers present, handles both cycle and automobile goods.

The suggestion was well received, and led to the designation of Weinstock as a committee of one to invite all of the legitimate automobile supply jobbers to convene during the next New York show for the purpose of effecting an organization of this kind.

Realizing the elasticity of the term "jobber," strong emphasis was and will be placed on the word "legitimate" in shaping the plans for the proposed association. Its purpose will be not so much to deal with business affairs as to promote acquaintanceship and social intercourse and otherwise to convince each jobber that his competitor is not possessed of horns.

It is believed that the happy results which have followed the convention of the cycle trades in Atlantic City each year can be shared by those identified with the automobile industry. While styled conventions, and marked by at least more or less formal business meetings, the Atlantic City affairs are really trade holidays during which there is a maximum of good-fellowship and good times and a minimum of business.

Receivership for the "Mighty Michigan."

Upon the application of Salsberger & Sons Co., of Chicago, and the First National Bank of Cleveland, a receiver was appointed Wednesday last, 6th inst., for the Michigan Buggy Co., of Kalamazoo, which, it is stated, has been hampered for funds since it branched out from the manufacture of carriages and added automobiles to its business; it made the "Mighty Michigan 40." The Detroit Trust Co., of Detroit, was named receiver, the proceedings being held in the United States District Court in Grand Rapids.

The application for a receiver alleged that the liabilities of the company will total $1,600,000. The company manufactured buggies for thirty years.

Briscoe Returns to European Plant.

Benjamin Briscoe, who, with his brother, Frank, some time ago formed the Briscoe Bros. Co., in Billancourt, France, to produce a light car, returned to France Tuesday last, 5th inst., on the Kronprinzessin Cecile, after a visit to America. While it is stated that he is likely to entrust any manufacture of his car in America to others rather than establish a plant here himself, this trip was devoted largely to other matters, most of them of a personal nature. He will, however, return to this country immediately after the Paris automobile show in the fall. Frank Briscoe remains in Detroit.

Steel Man Promoting a Truck Project.

R. R. Herchelroth, of Johnstown, Pa., who for 12 years was employed by the Carnegie Steel Co. and who is possessed of a number of patents on motor trucks and motor fire apparatus, is organizing a company to manufacture those vehicles. He already has secured an option on a factory site located in the Oakhurst district of Johnstown.

FAILURE OF BANK CAUSE OF RECEIVERSHIP FOR WALPOLE

Chief Source of Funds Fails and Embarrasses Solvent Tire Manufacturer—Petition for Additional Receivers Is Opposed.

In order to relieve a situation brought about by the failure in April last of the Atlantic National Bank, of Providence, which was the chief source of accommodations for the Walpole Tire & Rubber Co., of Walpole, Mass., the latter was placed in the hands of a receiver, Robert C. Fischer, on Saturday last, 2nd inst.

The petition for a receiver was filed by Rensselaer Curtis, according to whom the Walpole assets have a nominal value of $4,126,635 and an actual cash value of $2,500,000, there being no mortgage encumbrance or liens of any kind on the assets. The liabilities amount to $1,355,359, as of June 30th last.

The company is, therefore, perfectly solvent, but the conditions created by the failure of the Atlantic bank could not be overcome save through a receivership. In fact, the receiver was appointed at the request of the receiver of the bank, who claims that upwards of $132,000 is due the Providence institution and that only through the courts can the amount be collected.

Fischer, the Walpole receiver, is treasurer of the company, having been elected in July at the instance of the United States Treasury Department to protect the Atlantic bank's claim, but certain of the creditors have nevertheless asked the court to appoint additional receivers. Their petition will be heard on Saturday next and will be vigorously opposed.

Originally the Walpole business was established in 1892 in Boston, under the name Massachusetts Chemical Co., which later was changed to Walpole Rubber Co. and the business removed to Walpole. In

Digitized by Google

October last, the present corporation, capitalized at $4,500,000, succeeded the Walpole Rubber Co. It also owns the Walpole Shoe Supply Co., of Walpole, and the Consumers Rubber Co., of Bristol, R. I., the latter of which likewise has been petitioned into the hands of a receiver, one of the three receivers being R. L. Curtis, receiver for the Atlantic National Bank, who holds the largest claim, $42,685, for loans and promissory notes.

Several years ago the Walpole Tire & Rubber interests added automobile tires to their production and less than a year ago erected a large factory solely for their manufacture. At the present time, the plant is being operated "full time" and will be continued without interruption by the receiver.

Large orders are in hand, and during the six months ending July 1st last the gross volume of business done amounted to $1,197,194, at which rate it is estimated that the full year will show a net profit of $200,000.

In June last, the Walpole company offered at public sale $350,000 of an authorized issue of $750,000 three-year six per cent. convertible notes. The notes constitute a first lien on the assets of the company and were exchangeable at any time before maturity for 7 per cent. preferred stock of the company, which latter was offered for public subscription in January.

Fosdick and Wentworth "Double up."

Harry Fosdick, who recently resigned the sales management of the Hupp Motor Car Co., of Detroit, and acquired the Hupmobile agency for all of the New England States except Connecticut, has taken Frank F. Wentworth as a partner and opened up at 926-928 Commonwealth avenue, Boston. Fosdick is one of the real veterans of the trade, which means that he has had ripe experience, while Wentworth is no 'prentice hand, having been identified with the Overland, Marion and several other well-known cars in New England for a number of years.

Ford Purchases Assembling Site in Ohio.

Columbus, Ohio, has been added to the cities in which the Ford Motor Co. will establish and operate an assembling plant. The necessary real estate was purchased last week. It comprises a site, 228 x 666 feet, at Olive avenue and Buckingham street.

General Motors Anticipates a Payment.

The General Motors Co. has anticipated, to the extent of $1,000,000 the $2,000,000 payment on account of its sinking fund which is due October 1st. The amount has been paid in cash to the Central Trust Co., of New York, the trustee.

COURT FINES "LEAGUE" BUT INJUNCTION IS TERMINATED

Disobedience of Restraining Order Brings Penalty, but "League" is Again Free to "Do Things"—Bidwell Back from Canada.

For violating the temporary injunction obtained by the Northland Rubber Co., of Buffalo, restraining the International Automobile League and its officers and employes from selling Northland tires and seeking to acquire capital stock in the Northland Rubber Co., Justice Frank C. Laughlin, in the New York Supreme Court, on Saturday last, August 2nd, imposed a fine of $250 on the League and $50 on James J. O'Shea, its sales manager.

Having meted out this punishment, Judge Laughlin, however, refused the Northland Rubber Co.'s plea for a continuance of the injunction, which leaves the International Automobile League, Alfred C. Bidwell, its president, and everyone else connected with it free to "do things" as they had been doing them before the restraining order was issued.

Judge Laughlin refused to continue the order on the broad general ground that the Northland complaint "did not state a sufficient cause for action," but without prejudice to its renewal on proof of violations of the temporary injunction.

In a memorandum filed with his decision, the court states that the contracts, violations of which by the league and Bidwell were asserted by the Northland Rubber Co., had been terminated and are no longer binding on the defendants.

"It may be argued," says Justice Laughlin, "that it should not be held that it was within the power of Bidwell by resigning to terminate the contracts and deprive the plaintiffs of the fruits thereof, and yet, such is the contract of the parties, if it be literally construed; but, it is necessary to decide whether the continuation of the injunction should be denied on that ground alone, for the plaintiff (Northland Rubber Co.) elected on account of alleged violations of the contract by the league to cancel the selling agency of the league, which was a material provision of the contract, and the parties apparently agreed to terminate their contract relations by a settlement contract, which apparently rested on a good consideration."

This decision has no bearing on the claim for damages made by the Northland Rubber Co. against the League and Bidwell for $26,303.33 and other sums, which claims will be determined by civil suit which is pending, nor does the decision in any way affect the Northland $100,000 libel suit against Bidwell, who, incidentally, surrendered himself to the sheriff Tuesday afternoon. He stated that he had just returned from Toronto and claimed that he did not hear of any proceedings against him until he reached Buffalo. He was taken to court and released on $2,500 bail.

Rands Pays More for Warren Plant.

Although the court refused to confirm his purchase of the assets of the bankrupt Warren Motor Car Co., of Detroit, when they were offered for sale by the receiver on June 26th last, W. C. Rands, of the Rands Mfg. Co., again proved the successful bidder when, for the second time, the property was put on the block on Monday last, 4th inst. Rands paid $120,000 for the assets, which include two large buildings and their equipment and the material on hand. On the previous occasion, his bid amounted to $104,000.

The only other bidder of consequence was the Peter Smith Heater Co., which after the first sale interposed the objections which caused the court to set it aside. The Warren accounts and bills receivable were not sold and will be collected by the receiver, the Detroit Trust Co. It is Rands's intention to take immediate possession of his acquirement and immensely enlarge his production of windshields and tops.

Owosso Demands Return of Reliance Bonus

Despite the fact that when the General Motors Co. recently discontinued the Reliance truck factory in Owosso, Mich., it gave assurances that the plant would be used for other purposes, not all of the residents of the little city have taken full stock in the statement. In order to bring the matter to a head, and to secure something in writing, the mayor of the city has, therefore, addressed the General Motors officials demanding the return of the bonus given when the Reliance business was established in Owosso. At that time, it is stated, the Reliance company, which later became a part of the General Motors organization, signed a 15-year contract which has not yet been fulfilled. It is said that the factory furnished by Owosso cost the city about $30,000.

Chevrolet Leaving Detroit for Flint.

The Chevrolet Motor Co. is finally preparing to leave Detroit and take up its abode in Flint, Mich. A portion of its effects already has been removed and it is expected that the company will be in Flint about September 1st. It will occupy buildings vacated by the Imperial Wheel Co., which has transferred its equipment to what is known as the Webster plant on Ridgefield road.

CAR EXPORTS FOR FISCAL YEAR OF 1913 GAIN 27%

Automobiles and Allied Products Total $36,925,349 — Average Value of Cars Advances by $39—Imports Continue to Lose.

During the fiscal year which ended June 31st last the exports of automobiles and kindred products from the United States gained 27 per cent., or $7,832,148, over the corresponding twelve-month, according to a preliminary report of the Federal statisticians; the value of cars, parts, engines and tires shipped abroad during the 1913 fiscal year totaled $36,925,349 as compared with $29,093,201, which was the figure for the 1912 year.

Cars themselves totaled $26,012,934 in 1913 and $21,550,139 in 1912, an increase ot $4,462,795 in value; the number exported in the twelve-month just closed was 25,286 and in the preceding fiscal year 21,757, an advance of 3,529. The average value per car gained by $39, it being $990 in 1912 and $1,029 in 1913. Parts added $5,240,599 to the figures in 1913 and $4,107,155 in 1912, a gain of $1,133,444.

Engines recorded a marked increase in value, more than doubling; in 1913 the value was $778,098, and in 1912 $1,728,596, an increase of $950,498. The number record is 6,891 for 1912 and 11,402 for 1913, advancing by 4,511. Tires advanced $1.285,411, being $2,657,809 in 1912 and $3,943,220 in 1913.

Car imports declined $374,801, or 21 per cent. In 1913 the value of cars imported was $1,759,380 and in 1912 $2,134,181. The record for number was: 1912, 963; 1913, 748; a loss of 215. Parts fell from $304,144 to $263,827, a drop of $40,317. The figures for car and parts imports were: 1912, $2,438,325; 1913, $2,023,207, a loss of $415,118 The average value of cars imported in 1912 was $2,216 and for 1913 $2,352, a gain of $136.

For the month of June alone, as compared with the preceding June, the total value of the products exported gained $329,280; in June, 1912, the value was $2,851,716 and in June, 1913, $3,180,996. Imports of cars and parts for these same comparative months fell from $121,335 to $117,512, a loss of $3,823.

The figures for the separate products exported in the two Junes, with the gains or losses, are: Cars, 1912, 1,941; 1913, 2,154; gain, 213; value, 1912, $2,116,174; 1913, $2,191,152; gain, $74,978. Parts, 1912, $361,835; 1913, $549,616; gain, $187,781. Engines, 1912, 547; 1913, 53; loss, 494; value, 1912, $51,818; 1913, $9,103; loss, $42,715. Tires, 1912, $321,889; 1913, $431,125; gain, $109,236.

Truck Salesman Sues for Defamation.

Despite the fact that George W. Kayton, a salesman, won his suit for commissions against the Universal Motor Truck Co. in the New York City Court recently, as stated in Motor World, he and the company have not yet retired from the courts, for Kayton this week filed another action in the Supreme Court for New York county for $10,000 damages, alleged to have been sustained through derogatory charges made against him by the Universal company.

Kayton's claim for commissions was based partially upon testimony of Howard M. Walton, then connected with the Universal company in New York, and after he had won his suit the Universal company had him summoned to court on a charge of having entered into a conspiracy with Walton in which false testimony was used. The court, however, dismissed the charge, and Kayton now claims that after he left the Universal he secured a position with the Walpole Rubber Tire Co. at a salary of $35 a week and commissions, but that because of the charges made against him he lost this position and since has been unable to secure employment. He also alleges that at the time the charges were made he was well and favorably known in the automobile and accessory trade, but that the cause of his complaint has given him a "black mark" which he is having no little difficulty in erasing.

Fire Destroys Indianapolis Body Plant.

Fire which broke out at midnight on Friday last, 30th ult., totally destroyed the plant of the Showalter Mfg. Co., at 314 Hansom street, Indianapolis. Automobile bodies were the chief product of the company and the inflammable material made quick food for the flames. The Showalter loss, however, is comparatively small—$5,000—the heaviest damage falling on two Indianapolis automobile companies, several of whose chassis were in the Showalter establishment waiting to be equipped with bodies.

Grant Repudiates Cyclecar Designation.

Bothered by persistent reference to its attractive little vehicle as a cyclecar, the Grant Motor Co., of Detroit, is very anxious to have it generally known that the Grant is not in the cyclecar class but is an automobile in the full sense of the word. The Grant people say it was designed long before cyclecars were thought of, and point out that, being of standard gauge and having a gear shift and regular seating capacity, there is no justification for terming it a cyclecar.

REDUCED DUTY ON CARS AND PARTS ADOPTED BY SENATE

Fixes Tax on Cars at 15 to 45 per Cent. —Chassis and Parts at 20—Opposition Proves Unavailing — Ford Dividend Cited.

Efforts of Senators Smith and Townsend, of Michigan, and Senator Brandegee, of Connecticut, proving of no avail, the United States Senate on Tuesday last, 5th inst., adopted the reduced duties on automobiles, chassis and parts as proposed by the Senate finance committee and later slightly amended by the Democratic caucus. The rates as adopted are as follows:

Finished automobiles valued at $1,500 or over, 45 per cent.; valued at less than $1,500 and more than $1,000, 30 per cent.; valued at less than $1,000, 15 per cent.; automobile chassis and finished parts of automobiles, not including tires, 30 per cent.

These rates were adopted only after two hours' discussion, which largely was wasted breath, as an earlier vote on an amendment offered by Senator Brandegee distinctly showed the temper of the Senate majority. The Brandegee amendment, which proposed to insert "or chassis" after the word "automobile," was defeated by a vote of 21 to 46, all of the Democrats and seven Republicans voting against it. The seven Republicans are as follows: Bristow, Crawford, Cummins, Gronna, Jones, Sherman and Sterling.

Senator Smith, of Michigan, drew attention to the fact that employes of every automobile factory in Detroit had joined in a protest against the proposed reduction, but during the course of the debate he and his colleague, Senator Townsend, were forced to admit that one Detroit manufacturer had distributed approximately $10,000,000 in dividends this year and that for several months he had been producing one automobile every minute.

Senator Cummins of Iowa, as his vote on the Brandegee amendment indicated, was not in sympathy with the gentlemen from Michigan. He has pending an amendment wiping out all classifications of automobiles and providing a blanket duty of 25 per cent., which amendment will be called up later, but on Tuesday he strenuously opposed the proposal to reduce the rates on the lower priced cars, declaring that Europe could not compete with this country in the manufacture of such automobiles, which assertion served to bring out the Ford Motor Co.'s recent $10,000,000 distribution.

Senator Cummins also pointed out that the Senate amendment which fixes a duty of

Digitized by Google

45 per cent. on finished automobiles valued at $1,500 or over but which permits the admission of automobile chassis and finished parts of automobiles, not including tires, at 30 per cent., would permit the owner of an automobile purchased abroad to bring it in at the lower duty simply by taking it apart and importing it in parts instead of as a whole.

The rates adopted by the Senate differ materially from those enacted by the House in May last, when the Underwood tariff was passed by a vote of 281 to 139, taxing finished automobiles 45 per cent., chassis 30 and automobile parts 20. The existing duty is 45 per cent. on cars, chassis and parts without distinction.

Detroit McCord not in Automobiles.

Because of the organization in Chicago of the McCord Automobile Co., the McCord Mfg. Co. of Detroit, which manufactures radiators, lubricators, etc., bearing its name, has found it necessary to issue a denial of their connection with the Chicago enterprise, or any other automobile or motor project. The company states that neither its president, A. C. McCord, of Chicago, nor any of its officers or stockholders, is directly or indirectly interested in such enterprises.

Engine Makers Sue Cutting Bankrupt.

Although a petition in bankruptcy was filed against the Cutting Motor Car Co., of Jackson, Mich., as it has not yet been adjudicated a bankrupt the Wisconsin Motor Mfg. Co., of Milwaukee, has brought suit against it for $25,000, representing the balance due on shipments of motors. The hearing in the case, which is the second of the sort which has been brought by the Wisconsin manufacturers, has been set for August 12th, one week previous to the date set for the sale of the Cutting assets.

Williams May Make Rear-End Signals.

George R. Williams, of Detroit, has organized the Williams Auto Stop Signal Co., Ltd. It is designed to market an automatic signal of which he is the inventor. The device comprises a plate on which is inscribed "Stop" attached to the rear of a car which is automatically displayed whenever the clutch is thrown out. Williams figures that the use of his signal will greatly reduce rear-end collisions.

Plant Leased for Anderson Engines.

The Anderson Automatic Engine Co., of Davenport, Iowa, of which C. C. Anderson is president, has purchased what was formerly the Killing molding machine plant in that city. It will be utilized for the manufacture of gasolene engines and motor driven section cars.

DE VOLL PROMOTES SPRING TIRES AND LANDS IN JAIL

Is Accused of Diverting Funds—His "Factory" a Lathe and Drill, Both Mortgaged—Peoria's Rosehued Dream Rudely Disturbed.

C. H. De Voll is one of the comparatively few men who have made real money out of spring tires. Despite the fact, De Voll is unhappy, for late last week he was arrested on a charge of having obtained the money under false pretenses.

He was president of what was called the American Spring Tire Co., a Delaware corporation, which owned patents on a spring tire which, of course, was designed to "put the pneumatic out of business" and make millions for all who invested in it, but as a preliminary thereto it was necessary to obtain "working capital."

De Voll was possessed of the notion that the best way to secure it was to sell state or county rights and dot the country with spring tire factories. At any rate, he sold the rights for 40 counties in Illinois to four Peoria men who are said to have agreed to pay $3,500 for them and who actually made a deposit of $400 to bind the contract. The purchase price included machinery for making the tires, which was to be removed from a so-called factory in Chicago to Peoria.

When, after several demands, De Voll failed to fulfil his part of the agreement, the Peorians, chief of whom was George W. Haas, a tire dealer, started an investigation and, discovering that funds of the company had been diverted, they swore out a warrant for De Voll's arrest.

Meanwhile, they had leased a building in Peoria in which the spring tire plant was to be set up and, the Peoria papers having carried "scare stories" of the "new industry," the price of building lots in the vicinity of the projected fatcory began to soar. When the bubble burst, it was discovered that De Voll's Chicago "factory" consisted chiefly of a drill press and a lathe on which a mortgage had been foreclosed.

De Voll was not in evidence at the "factory," but detectives located him at his home and in due course he was arrested. It is stated that, in addition to the Peoria people, a number of Chicagoans also had invested in De Voll's company. However, the latter may feel about it, it is added that not all of the Peorians have lost faith in the tire.

Landlord and "Building Company" at Odds.

Claiming that the Automobile Building Co., of 1920-32 Broadway, New York City, has defaulted in its rent and in paying the taxes and water bills on the premises it occupies, Robert Goelet filed suit this week in the Supreme Court for New York county for $18,183.23. The complainant states that he leased the premises February 1, 1909, for 20 years to Frank E. Malone, who subsequently turned the lease over to the Automobile Building Co. It is further alleged that he agreed to pay $57,500 rent, the taxes and water bills. The claim is made up as follows: May and June rent, $9,583.34; taxes, $8,371.25; water bill, $228.64.

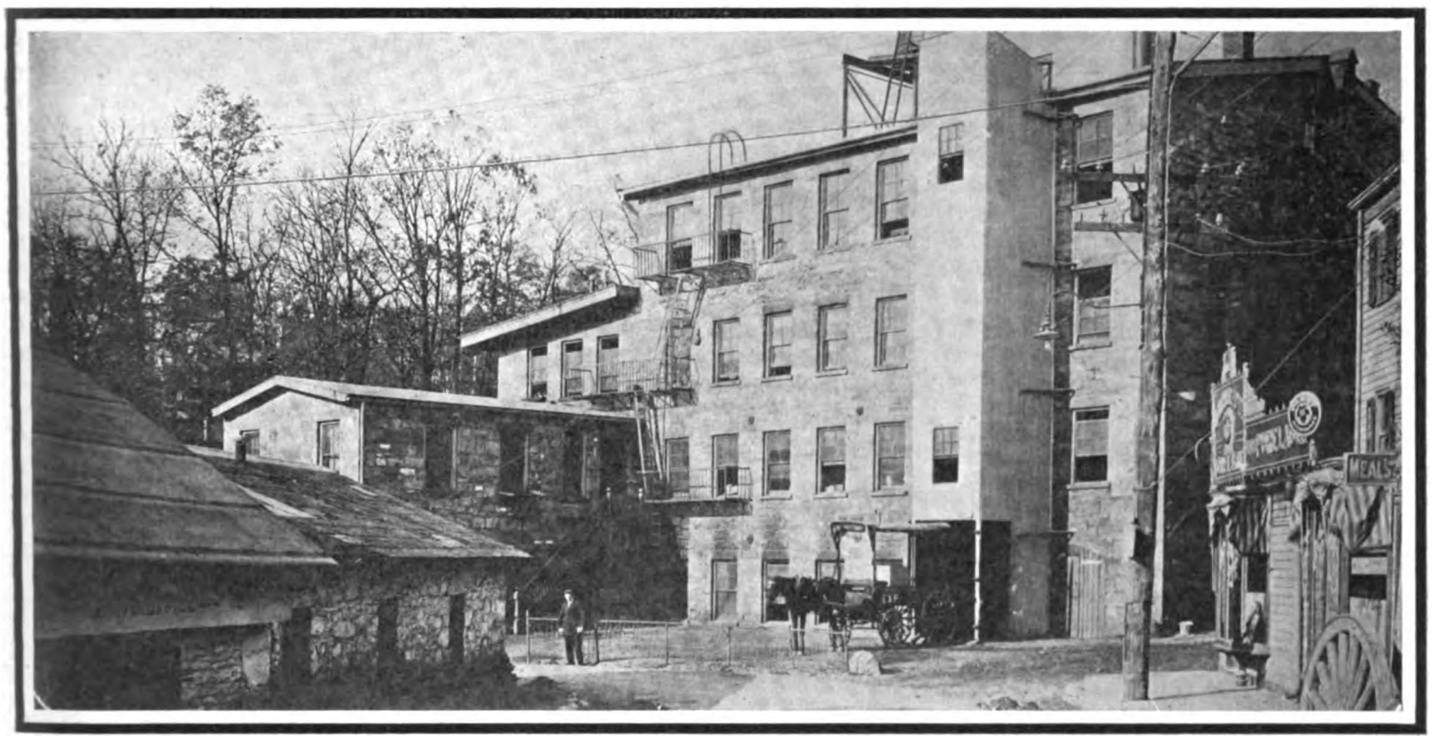
Canadian Gramm Gets Gas-Electric Rights.

W. M. Bennett, for the past two years vice-president and general manager of the International Electro-motive Co., has been elected vice-president of the Gramm Motor Truck Co. of Canada, which is located in Walkerville, Ont. Bennett's entry into Gramm affairs, and the interests which he represents, will give to the Gramm company the exclusive right to use the International company's "Gas-Electric" transmission system in motor trucks in the Dominion. H. W. Acason will remain president of the Gramm Canadian company and F. H. Galusha will continue as secretary-treasurer.

Push up Price of "Gas" in Texas.

Instead of an expected reduction, the Texas citizens who have to do with gasolene were disagreeably surprised on Friday last, 1st inst., when four oil companies located in that State added two cents a gallon to the price of "gas," bringing it to 18 cents. In Texas there are those who maintain that because two of the companies recently were fined $100,000 by the State they are "taking it out on the public." Needless to add, however, no oil producer would would be guilty of anything of the sort!

Motz Transfers its Philadelphia Interests.



The Motz Tire & Rubber Co., of Akron, Ohio, has discontinued its branch in Philadelphia and turned over the agency for its production to the Hall Rubber Co., 1402 Ridge avenue, in that city. The Hall company will have Eastern Pennsylvania and all of Maryland and Delaware as its territory. W. M. Stubbs, former manager of the Motz branch, has followed the Motz tires into the Hall company.

Firestone Man Swinging Around the Circle.

A. G. Partridge, assistant sales manager of the Firestone Tire & Rubber Co., has departed for a swing around the trade circle which will take him first to Winnipeg and Vancouver and then to all the cities on the Pacific Coast, and in the West generally where a Firestone branch or agency is maintained. He will be absent about six weeks.

The Week's Incorporations

FACTORY OF THE WARD LEONARD ELECTRIC CO., IN BRONXVILLE, N. Y., IN WHICH IT HAS DEVELOPED AND IS SPECIALIZING IN AN AUTOMATIC ELECTRIC STARTING AND LIGHTING SYSTEM FOR AUTOMOBILES

Plymouth, Mich.—Automatic Muffler Mfg. Co., under Michigan laws; authorized capital, $15,000.

Roanoke, Va.—Citizens' Auto Transportation Co., under Virginia laws; authorized capital, $40,000.

Paris, Tex.—Lamar County Automobile Club, under Texas laws. Corporators—J. E. Varner, S. B. Gilbert, M. A. Walker and others.

St. Louis, Mo.—Sta-Tite Packing Ring Co., under Missouri laws; authorized capital, $3,000; to manufacture packing rings and automobile accessories.

Spokane, Wash.—Spokane Auto Mfg. Co., under Washington laws; authorized capital, $50,000. Corporators—E. A. Torrance, R. L. Dickerson, P. H. Witschge.

El Paso, Tex.—El Paso Vulcanizing & Auto Supply Co., under Texas laws; authorized capital, $100,000. Corporators—C. W. Mace, William Mace, Charles Fowser.

Milwaukee, Wis.—Chase Motor Truck Service Co., under Wisconsin laws; authorized capital, $25,000. Corporators—Louis C. Pauly, Jr., Ella Pauly, Louis Fernhaber.

Cleveland, Ohio—Arter Auto Body Co., under Ohio laws; authorized capital, $20,000. Corporators—Edward Younger, Frederick S. Rice, J. S. Castle, W. E. Freese, W. J. Redmond.

Harrisburg, Ill.—Parish Ferrell Mfg. Co., under Illinois laws; authorized capital, $50,000; to deal in motor cars and trucks. Corporators—Fred C. Ferrell, Cheaney L. Parish, John J. Parish.

Bridgeport, Conn.—Manufacturers' Sales Agency, under Connecticut laws; authorized capital, $25,000; to deal in motor cars. Corporators—Miles V. Doud, Frederick K. Doud, William L. Scott.

Bridgeport, Conn.—Bridgeport Body Co., under Connecticut laws; authorized capital, $50,000; to manufacture automobile bodies. Corporators—A. W. Ferry, A. W. Sherrod, J. W. Horton, J. H. Hinman.

Chicago, Ill.—Chicago Tire Goods Co., under Illinois laws; authorized capital, $10,000; to deal in motor car supplies and accessories. Corporators — Louis Dulsky, Samuel Dulsky, J. E. C. Blake.

Little Rock, Ark.—Kerosene Carburetter Co., under Arkansas laws; authorized capital, $12,000; to manufacture carburetters for motors. Corporators—Walter G. Addison, W. F. Garnett, W. H. Garnett.

Chicago, Ill.—Michigan Motor Car Co. of Chicago, under Illinois laws; authorized capital, $25,000; to buy and sell motor cars and accessories. Corporators—W. J. Pierce, Edward D. Stuntluff, Maurice E. Stuntluff.

Cleveland, Ohio—Modern Garage Co., under Ohio laws; authorized capital, $10,000; to care for and deal in motor cars. Corporators — Elmer E. Terrell, Albert F. Pliske, Max F. W. Pliske., R. M. Ostrander, V. E. Davis.

New York, N. Y.—Motor Owners' Association, under New York laws; authorized capital, $10,000. Corporators — John C. Travis, 350 West 71st street; Charles L. Clune, Peekskill; Marie M. Novey, 2553 Davidson avenue.

Chicago, Ill.—Turbine Muffler Co., under Illinois laws; authorized capital, $2,000; to manufacture and sell turbine mufflers and other automobile accessories. Corpor-

Digitized by Google

ators—Joseph Libel, George W. Gardner, John J. Karcheiser.

Chicago, Ill.—Electric Auto Sales & Rental Co., under Illinois laws; authorized capital, $12,000; to deal in electric motor cars, motorcycles, etc. Corporators—Nathaniel Rubinkam, Heymann F. Tucker, Grover C. McLaren.

New York, N. Y.—James J. Fero, Inc., under New York laws; authorized capital, $20,000; to deal in tires. Corporators—James J. Fero, 172 Manhattan street; Geo. D. Brown, 108 West 84th street; William S. Foos, Hudson Heights, N. J.

New York, N. Y.—F. D. Homan, Inc., under New York laws; authorized capital, $2,000; to deal in motors, etc. Corporators—Frank D. Homan, 239 West 56th street; Benjamin Jackson, 68 West 107th street; Alphons E. Kannengeiser, 285a 13th street.

New York, N. Y.—Caledonian Oil Co., under New York laws; authorized capital, $10,000; to purchase and deal in lubricating oils, etc. Corporators—J. E. Hernandez and A. B. Brushaver, both of 135 Front street; Harry Hess, Inquisidor 5, Havana, Cuba.

New York, N. Y.—Knight Tire & Rubber Co. of New York, under New York laws; authorized capital, $5,000. Corporators—James C. Nichols, 67 Franklin avenue, New Rochelle; William B. Highes, 879 West End avenue; David L. Fultz, 2112 Beverly Road, Brooklyn.

Fostoria, Ohio—Allen Motor Co., under Ohio laws; authorized capital, $500,000; to manufacture gasolene engines and motor vehicles. Corporators—E. W. Allen, W. O. Allen, J. E. Wright, O. P. Bernhart, E. A. Thomas, George E. Schroth, Grattan H. Baker, R. J. Christie, H. C. De Ran.

New York, N. Y.—Bobra Spark Plug Co., under New York laws; authorized capital, $12,000; to manufacture spark plugs and other automobile parts. Corporators—William Bohleber, 149 Broadway; Chester H. Braselton, 926 Manhattan avenue, Dayton, Ohio; Cyrus L. Bundy, 322 N. 18th street, East Orange, N. J.

Buffalo, N. Y.—Biggam Engineering Co., under New York laws; authorized capital, $200,000; to manufacture transmissions, clutches and other automobile parts, and to operate a general machine shop. Corporators—Harry F. Biggam, 873 Dewey avenue, Rochester; Nathan D. McDowell, Alexander and East avenues, Rochester; and Carlough E. Buck, 247 Rhode Island street.

Increase of Capitalization.

Akron, Ohio—Akron Gear & Engineering Co., from $20,000 to $50,000.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

C. D. Paxton, of Cleveland, well known in the automobile trade, has been appointed sales manager of the Enger Motor Car Co., of Cincinnati. He will, however, maintain an office in Cleveland.

Spencer Murfey, who was formerly with the Republic Rubber Co., has been added to the Grant-Lees Car Co.'s sales staff. He will have charge of Michigan territory, with headquarters in Detroit.

W. B. Jameson, who at one time was prominently identified with the United States Motor Co., has been appointed superintendent of the Maxwell-Newcastle Mfg. Co., in Newcastle, Pa. He succeeds Fred Bajus.

R. F. Judisch, for five years past in charge of the gear department of the American Ball Bearing Co., has joined the Grant-Lees gear organization in that city. Before going to Cleveland, Judisch was for 12 years gear expert of the Brown & Sharpe Co. in Providence, R. I.

G. A. Wells, for 10 years chief engineer of the Adams Express Co., has joined the Autocar Co., of Ardmore, Pa., and will fill a new office, that of instaliation engineer, which has been created for him. Few men, if any, have had more varied or more intimate experience with commercial vehicles of all sorts.

F. W. Heiskell, assistant advertising manager of the International Harvester Co., has been promoted to the management of the advertising department to succeed M. R. D. Owings. The vacancy created by his elevation has been filled by the appointment of A. C. Seyfarth, former head of the I. H. C. production department.

Following the amalgamation of the sales departments of the Marion and American motor companies, and their taking over by the J. I .Handley Co., of Indianapolis, M. D. MacNab, vice-president of the Marion company, has been transferred to Chicago, where he will look after the Handley affairs in the Central States. As MacNab has lived most of his life in Chicago, its surroundings are not strange to him.

Two Tradesmen Meet Tragic Death.

E. Roger Stearns, president of the Los Angeles Automobile Dealers' Association and agent for Kissel cars, and R. D. Barr, manager of the Firestone Tire branch in that city, are dead as the result of an automobile acicdent which occurred on the 29th ult. They occupied a stripped car driven by Stearns and while going at high speed near Encinitas, Cal., the car struck a soft spot and, skidding, collided with a tree. Stearns was so badly crushed that he lived but three hours. The bone of Barr's right leg was crushed and he might have survived had not gangrene set in. He died Thursday night. Both men were well and widely known in the trade on the Pacific Coast, to which Barr removed from New York City about four years ago. He had been married only eight months.

To Produce Gasolene by Refrigeration.

The Olinda Gasolene Co., which recently was organized in the California town of that name, is expectetd to begin operations next week, and because it will utilize the Cutler process it is an object of more than usual interest. The Cutler process is the reverse of that usually employed to obtain gasolene—that is, Cutler utilizes refrigeration and well pressure instead of heat and artificial pressure. It is expected that the Olinda plant will produce 25,000 gallons of gasolene daily at one-half the cost of the old process, and that by the refrigeration method it will conserve the rhigolene, mythese, etc., which hitherto have passed into the air and gone to waste.

Recent Losses by Fire.

Riverton, Iowa—Burt Manrose, garage damaged. Loss not stated.

Suffield, Conn.—James A. Bruce, garage destroyed. Loss not stated.

New Bedford, Mass.—Standard Motor Car Co., Spring street, garage damaged. Loss not stated.

Indianapolis, Ind.—Showalter Mfg. Co., 314 Hanson street, body builders; plant and 11 cars destroyed. Loss, $30,000.

Calgary, Alta.—Dominion Auto Co., store, garage, 15 cars, several dozen motorcycles and all equipment destroyed. Loss, $65,000.

Minor Business Troubles.

Samuel W. Franks, of 626 North St. Francis avenue, Wichita, Kan., has begun suit for a receiver for and an accounting from L. C. Thompson & Co., of that city, makers and distributers of a tire filler; he states that he is entitled to half the proceeds but has received nothing, that $2,000 worth of the product has been sold, and that the members of the company are unable to agree.

Edward A. Bern, a stockholder, has asked for a receiver for the Kindl Car Truck Co., of Chicago; he states that the company ceased to do business in 1906 and wants its affairs wound up.

In the RETAIL WORLD

A. B. Sausser is about to have a garage built in Reading, Pa.

Charles Klop is about to open a garage in Arapahoe, Neb.

S. Murrish and G. Emery are erecting a garage in Magzomanie, Wis.

The Hersh hardware Co., of Allentown, Pa., has "gone into" accessories.

A new garage is to be erected in South Nyack, N. Y., for Alfred Lindsay.

The Undercliff Taxi Co., of Edgewater, N. J., has secured plans for a garage.

A new garage will be opened in Johnston City, Tex., under the style Ross & Green.

Henry O'Connor is about to erect a garage and repair-shop in Watertown, Conn.

Hastings, Neb., is to have a new garage; Milton & Tomlinson is the style of the firm.

R. P. Gailbraith, of Rock Island, Ill., has opened a garage; it is located at 112 19th street.

J. C. Kilgore has opened a garage in Waco, Tex. It is located at 622 Franklin street.

Aaron Egli, of Hopedale, Ill., has become a dealer; he has the Studebaker agency.

The Haynes Auto Sales Co., of San Francisco, has opened a branch in Fresno, in the same State.

James A. Bates has opened a garage in Harvey, Ill. It is located at 188-190 East 155th street.

George Small and Chester Dooley will open a garage and machine-shop in McFarland, Cal.

Frank Kunkel has opened a repair-shop in Effingham, Ill. It is located on West Fayette street.

W. L. Mustard, of Pocahontas, W. Va., will build a new garage; the site is on Raleigh street.

The A. K. Auto Supply Co., of Allentown, Pa., has taken possession of new quarters at 17 South 7th street.

The Oakland Sales Co., of Austin, Tex., has opened new salesrooms; they are located on East 5th street.

A. B. Morrison, of South Bend, Ind., plans to open a garage in Kalamazoo, Mich. He is now seeking a site.

The Central Garage & Machine Works, of Barstow, Cal., has been taken over by L. L. Stanfield, of Los Angeles.

H. T. Brust has completed a garage, 70 x 140 feet, in Elkhart, Ind. He also operates a large farm outside that city.

Martin Zwister, of Milwaukee, Wis., has secured permission to erect a garage on 10th street; it will cost $6,000.

J. H. Kloeber has opened salesrooms in Chicago at 2328 Michigan avenue; he has secured the Henderson agency.

The Overland Auto Co., of Phoenix, Ariz., has erected a new repair-shop; it is located on North Central avenue.

Leonard C. Mackenzie, of Bridgeport, Conn., has admitted Archibald Wolten to his garage and trucking business.

The Cincinnati (Ohio) Auto Co. is erecting a new garage on Court street; the company is a Pope-Hartford dealer.

Dorr & Sons, of Dunellon, Fla., have taken over the business of the Florida Auto Sales Co., in Ocala, in the same State.

A building which is being erected in Peoria, Ill., on Market street will be occupied as a garage by Charles S. Gorman.

Frank W. Johnson, of Eureka, Cal., has entered the trade; he has taken the Hupmobile agency and has located on F street.

The Lincoln Motor Sales Co. has opened a garage and salesrooms in Salem, Idaho, on Ferry street; W. A. Quincy is manager.

Kohn Bros., of Montgomery, Ala., have awarded the contract for a new garage to be erected on Monroe street; it will cost $100,000.

Turner & Hall have taken over the Antioch (Cal.) Garage and Machine Shop; they will increase the equipment and continue the business.

J. Fay, of 169 East 90th street, New York City, has been granted authority to build a garage on West 79th street; the estimated cost is $30,000.

The Burley Garage, located in Lewistown, Pa., on Chestnut street, has been reopened under new management; Roy Long is now the owner.

The Whittesly Garage & Machine Co., of San Benito, Tex., is having a new two-story brick garage built; it will afford 15,000 feet of floor space.

William H. Baxter, of Springfield, Mass., has moved from 163 Dwight street to a new fireproof garage on Oak street; he has the Paige-Detroit agency.

Jones & Lubbe, of San Francisco, have let the contract for a garage which will stand on Taylor street; the specifications fix the cost at $15,000.

Claude Kirkpatrick, of 5183 Poryland place, St. Louis, Mo., has secured permission to build a garage; his application named the cost as $6,000.

The Automobile & Supply Co., of Toronto, Ont., is having a new garage and store erected on University avenue; it will represent an expenditure of $150,000.

The Renault Selling Branch, Inc., of New York City, is about to erect a service station in Long Island City; it will cost $35,000 and will stand on Jackson street.

The William J. Tracey Motor Car Co., of Braddock, Pa., has opened a new garage and salesrooms at 5 Braddock avenue; the company will add a full stock of accessories.

Wilkinson & McClure, of Riverdale, Cal., have leased a garage building in Kingsbury, in the same State; they will operate a repair-shop for cars, motorcycles and bicycles.

George Wright, formerly with Wright, Barrett & Stillwell, of St. Paul, Minn., has branched out for himself. He has taken over the storage business of the Osborne Garage.

Geo. Siegmund and Harry L. Baylies, of Chicago, have formed the Siegmund-Baylies Truck Co. and have located at 2029 South Michigan avenue; they handle the Dart line of commercial cars.

Timothy K. Hayes, of Bloomington, Ill., is erecting a building at 702 North Main street, in which he will enter the trade under the style Cadillac Service Garage; he has the Cadillac agency.

J. H. McNee has sold his interest in the Grand Garage, of Santa Rosa, Cal., to Chas. N. Taylor; Taylor formerly was connected with the business of Don Lee, Cadillac distributer in San Francisco.

Richards & Christy, of Sacramento, Cal., have completed plans for a four-story brick garage to be located on L street, near 7th street; the firm was recently organized to

Digitized by Google

take over the Studebaker automobile business in that city.

Albert C. Lusby, who has been connected with the trade in Los Angeles in various capacities for several years, has opened up as Southern California representative of the Westcott line; his salesrooms are located at 1355 South Flower street.

John W. Calder and James Eells have formed a copartnership in Utica, N. Y., to handle accessories of established reputation; they trade as Calder & Eells. They state that they have disposed of 69 sets of Velvet shock absorbers in Utica since June 1.

O. P. Perkins, former secretary and treasurer of the Whittlesey Garage & Machine Co., of San Benito, Tex., has sold his one-third interest in the company; it was purchased by C. C. Wilt, who had charge of the erection of the new $18,000 building just completed for the company.

The Michigan Motor Co., of Reading, Pa., has opened for business in a new two-story garage and salesrooms, 35 x 115 feet, at 1038-40 Court street. The manager is Geo. K. Seidle, of Bowers, in the same State. The building has an electric elevator, individual lockers for car owners who store their cars in the building, and can accommodate 30 cars.

D. D. Stewart, for several years a dealer in Evansville, Ind., has purchased A. A. Jones & Son's garage, located at 102-6 Upper Third street; A. A. Jones will return to his former home in Elkhart, Ind., and T. J. Jones will return to his former connection with the Goodyear headquarters in Evansville. The business includes the agencies for Pope-Hartford and Auburn cars and Columbia electrics.

E. E. Terrell, Albert F. Pliske and Max F. W. Pliske, of Cleveland, Ohio, have leased the premises at Euclid avenue and East 5th street and will operate under the style Buckeye Garage Co. They have had automobile establishments on Euclid avenue for nine years, having owned the Buckeye and Cooperative garages, the latter of which they sold some time ago. They are incorporating prior to opening in the new location and expect to be ready for business by August 15.

Hugh Quinn and "Mac" Wetmore have formed the Wetmore-Quinn Co. in Detroit and will handle the Paige-Detroit line; they have located at 703 Woodward avenue. Quinn, the president of the company, has been connected with the Abbott-Detroit organization for the last three years, for most of that time having been manager of the factory branch on Jefferson avenue. Wetmore, the secretary and treasurer, has been assistant sales manager of the Lozier Motor Co. for two years.

ISSUES $2,000,000 BONDS AFTER A REINCORPORATION

Prest-O-Lite Takes New Form Under New York's "Non Par Value Law" and Authorizes Bond Issue—Personnel Unchanged.

Having reincorporated under the laws of the State of New York, the Prest-O-Lite Co., of Indianapolis, formerly an Indiana corporation, has authorized the issue of $2,000,000 of bonds bearing interest at 7 per cent. The issue is not because of any stringency in the company's affairs, however, and it is stated that the amount is amply represented by actual and tangible assets.

This statement is in accord with the company's attitude in reincorporating, for it now exists under the New York "Non-Par Value Incorporation Law," which is not especially sought by those who seek to inflate their paper capitalization. The law specifies that the company shall incorporate with so many shares and not so many dollars, and while the old Prest-O-Lite Co., of Indiana, was capitalized at $10,000, the new one has 80,000 shares, the value of which is whatever anyone is willing to pay for them, this figure being fixed largely by the company's earnings.

The 80,000 shares are, however, backed up by a money capital of $800,000, which gives them a theoretical value of $10 each, and all are held by the members of the old company who, also, constitute the new one. Other assets, it is stated, are sufficient to form an ample basis for the $2,000,000 of bonds.

Return of Elgin Trophy Causes Hitch.

If the Chicago Automobile Club doesn't succeed in getting C. E. Schroeder, of New York City, to return the Elgin trophy, which was won last year by Ralph De Palma in a Mercedes car owned by Schroeder, it is likely that the club will endeavor to collect $5,000 from the cup holder and will put up a new trophy to be contested for at the next races, 29th and 30th inst. The holder of the trophy is required to give a bond of $5,000 that he will return the prize to be contested for at the next meet, and while the club holds such a bond from Schroeder, it has obtained no answer to no less than five letters it has written him.

Club to Sue Garage for Stolen Tire.

Because Rev. Frank Sheets, a member of the Aurora (Ill.) Automobile Club, was made the victim of a thief in a garage in Waterman, Ill., the club has voted to retain an attorney and bring suit against the garage owners for the value of a tire and other purloined objects. The clergyman left his car in the garage overnight and the next morning found a tire gone from one wheel and various other things missing. The proprietors refused to make good on the grounds that they had posted a sign saying, "Not Responsible for Articles Lost." Inasmuch as Sheets paid regular storage rates and couldn't have done more to protect himself unless he had chained the tire to the rim, the club is determined to make a test case and also put itself on record as standing for adequate protection for its members.

Trying to Overtake that Lozier Story.

In an effort to overtake a story which originally appeared in print in Detroit, and which was spread fast, George W. Yeoman, general manager of the Continental Motor Mfg. Co., has supplemented a denial by the Lozier Motor Co. to the effect that the former had purchased the Lozier engine plant. What really happened was that the Continental company's Detroit plant was flooded with orders and, requiring some new machinery quickly, a part of the equipment in the Lozier plant was tendered and instantly purchased. The Lozier company will continue the manufacture of its own engines.

Oakland Relinquishes Branch to Bowman.

The Oakland Motor Car Co., of Pontiac, Mich., has discontinued its branch at 1600 Broadway, New York City, and transferred its agency to the Sidney B. Bowman Automobile Co., which also assumed the lease of the Oakland store. Bowman, who hitherto has handled the Marmon car and Vulcan truck, will retain those accounts and concentrate all his sales at the Broadway address, converting his present place on West 49th street into a service station. His deal with the Oakland company carries with it a large slice of good terrirtory in New York and Connecticut.

Manhattan Electrical Buys Western Rival.

The Rock Island Battery Co., of Cincinnati, has been purchased, lock, stock and barrel, by the Manhattan Electrical Supply Co., of New York. The Rock Island brands of dry battery, however, will be continued by the new owners in connection with their Red Seal, Hi-Up, Blue Seal and Mesco dry cells.

Krit's President Goes to Europe.

Lawrence Moore, president of the Krit Motor Car Co., of Detroit, sailed last week to Europe. He will spend most of his time in England, where the Krit car is well intrenched.

NEW YORK, AUGUST 7, 1913

COOPERATION THAT BEARS NO FRUIT.

As regularly as the years roll around, someone discovers that the way for a lot of men to make a lot of money is indirectly to pool their interests and do business under one roof, where one salesroom can be made to serve the purposes of many and minimum stocks be carried and a minimum number of salesmen employed.

The economies which suggest themselves are so great that it is small wonder that they give pause to many of those to whom such schemes are presented; although they are practically of an Utopian character, many merchants are able to convince themselves, or at least partly convince themselves, that cooperation of the sort is one way of putting the "overhead" bugaboo to rout.

That such schemes are more promising than practical, however, is again instanced by the recent fizzling out of an ambitious enterprise of the sort in New York City, to which a score or more of automobile accessory manufacturers loaned their support and some of their money.

In theory, the enterprise sounded well, and, as none of the goods displayed were of a conflicting nature, on the surface it seemed possible that one salesroom and a few salesmen might be made to serve the purposes of several. The venture was an interesting experiment, so far as the automobile trade was concerned, and knowledge of it gave rise to similar projects in other cities, none of which, however, came to a head, so far as known.

The failure of the New York enterprise probably will put a quietus on the others, although it will not prevent annual and semi-annual redreaming of the dream, for, in truth, such schemes are little more than dreams. Likening them to department stores is a far cry. The department store, like all other mercantile establishments, stands on its own bottom and is conducted by one man for one man who has an eye single to his own interests. It is very difficult, if not impossible, to conduct business on any other plan.

Circus performers may be able to ride several horses at the same time, but no business man can do so; each must straddle and direct his own steed safely to reach a given destination, which is to say that a so-called cooperative salesroom must remain a beautiful theory. It must lack singleness of purpose, which means that it lacks individuality and that force which stands for commercial life.

The fizzling of the New York enterprise merely emphasizes that the cooperative salesroom is not the solution of the "overhead" problem.

PHENOMENON THAT REMAINS UNSOLVED.

Does an automobile motor run more smoothly at night than in the daytime? That good old question has again been revived, and despite endless discussions, there never has been given a really satisfactory answer.

Nine out of ten people who have driven cars or ridden motorcycles will declare in the affirmative, and their belief is supported by the opinions of engineers and others who maintain that in some way nightfall brings on its wings more power and smoother running. The occasional testimony of a cold-blooded scientist to the effect that there is no difference, makes little impression on the widespread belief. Therefore it is not likely that the statement of the engineer in charge of a long non-stop laboratory test of a motor, to the effect that though the outer air had free access to the engine, the records showed a difference of only 1 per cent. between night and day running, and that was in favor of daylight, will have much effect.

Various theories have been suggested to explain the phenomenon, if it really exists; but whether the increased moisture content of the atmosphere at night augments expansion of the gas, whether increased barometric pressure has the effect of forcing a greater weight of oxygen into the cylinders of the motor, whether the possible concentration of the oxygen in the atmosphere by cooling after the withdrawal of the sun's heat gives more life to combustion, or whether the truth lies in the combination of these theories or in other causes, is of less immediate and practical importance than the pertinent question as to whether or not the falling of night actually is responsible for increase in power.

If it can be definitely ascertained that there is an appreciable and measurable difference in power between night and day running, it will be well worth while to go scientifically to work to search out the reason and lay bare the governing principles. This being done, there would be available data which might be put to practical use.

LISTEN! RUSHMORE'S HEAP OF SCRAP IRON IS ON FIRE

Or, Rather, it Was on Fire, and it Took Two Hours to Put it Out—Plainfield Manufacturer Learns Steel Chips Will Burn.

"Pig iron under water" has been described as a typically safe insurance risk, and to most persons iron or steel in any shape is equally free from liability to catch fire and burn up. Nevertheless, a recent experience of the Rushmore Dynamo Works in Plainfield, N. J., with a big pile of steel chips which actually caught fire from a blazing rubbish heap near by, shows that finely divided iron or steel may sometimes oxidize faster than it can get rid of its heat, and hence may exhibit all the phenomena of combustion. The story is vouched for by S. W. Rushmore himself.

"Out in our yard we have a big heap of steel chips from the automatic turret and screw machines, which we sell from time to time in lots of several carloads," he says in telling it. "Steel being generally considered a non-combustible, this heap is quite close to the box lumber pile.

"Saturday afternoon last, August 2, the pile stood eight feet high and contained several carloads, when the yard gang piled up alongside of it a lot of old barrels and rubbish and set fire to the latter. Of course, the steel pile got warm. Making my rounds, to see that everything was in shape before going home, I discovered smoke and flame issuing from the supposedly fireproof heap, which at several points at the bottom glowed white hot.

"The heat rapidly increased until it threatened to fire the lumber, so the watchman got out the hose and played a one-inch stream on the pile. The flames went down and I supposed the fire would soon go out, so I went home. Three hours later the night watchman 'phoned me that, in spite of the hose, the fire was getting worse, so I called the fire department, which found a lively little volcano at work. They worked on that pile of chips for just an hour with two powerful streams, and after many detonations of steam and gas, and after the whole yard had been flooded, declared the fire out and went home. At 10 o'clock Sunday morning the day watchman 'phoned me in a hurry that the fire had started again, and, sure enough, I found that darned pile a seething mass, making a weird and threatening hissing sound, but with little smoke and only thin, yellowish flames. The department was again called, and after a couple of hours the pile was cooled down and dug into until apparently dead.

"The chips are put through a centrifugal separator, and the small amount of oil remaining had nothing to do with the fire. It was a plain case of burning iron. The metal was so finely divided, and presented so much surface to the oxygen in proportion to the radiating surface of the pile, that, once started by the heat from the rubbish pile, the combustion proceeded exactly as in a pile of coal, only apparently at a more rapid rate.

"I was surprised to find that the metal had not melted. Where the fire had been hottest the chips were a dark blue. The pile sank about a third in height, and a lot of metal must have been oxidized to create so much heat. Next time I shall almost expect to see the concrete walls blaze up."

Dealers to Show at Michigan State Fair.

Instead of being a neglected quantity, as is the case at so many State fairs and industrial expositions, the dealers of Detroit are again planning to take a leading part in the Michigan State Fair, to be held near that city September 15-20; of course, no exposition near Detroit would be complete without automobiles, and 15 makers and dealers have already contracted for space. They are: Oakland Motor Co.; Cartercar Co.; M. A. Young, Reo and Mitchell; Anderson Electric Car Co., Detroit electric; Detroit-Overland Sales Co.; Siegel-Zeckendorf Co., Cole; Jackson Automobile Co.; Reed Motor Car Co.; Abbott Motor Car Co.; International Harvester Co.; Grinnell Electric Car Co.; Wahl Motor Co.; Schulte & Sons, Patterson; Keeton Motor Car Co.; Regal Motor Sales Co.

While a special building is provided for these exhibitors, such is not the case in numerous other fairs and in Fresno, Cal., the dealers are now agitating for an automobile building, that they may suitably display their wares at a coming county fair.

Ford Anticipates Price-Reduction Date.

Without inkling of its intention having escaped, and in face of official statements that its prices would not be adjusted until October 1st next, the Ford Motor Co. last week reduced the prices of its runabout from $525 to $500, of its touring car from $600 to $550 and of its town car from $800 to $750. The new figures became effective August 1st. Just what induced Henry Ford to take action so far in advance of the fixed date is a matter for speculation, but it is certain that when he decided it was advisable he acted quickly.

Chicago Pneumatic Opens New Branch.

The Chicago Pneumatic Tool Co., manufacturer of the Little Giant truck, has opened a branch in Philadelphia. It is located at 1740 Market street.

KEROSENE MADE TRACTABLE BY PEROXIDE TREATMENT

Smoke, Smell and Carbon Reported to Be Eliminated by Treating Oil With Peroxide of Hydrogen—Process Inexpensive.

However opinions may differ as to the past achievements of George B. Selden, of Rochester, N. Y., in the automobile industry, there hardly can be any question as to the beneficial results that will accrue to all concerned if the experiments now being conducted with a new fuel—or, rather, a fuel treated in a new way—are carried to a successful conclusion. Selden's fuel consists of kerosene treated with peroxide of hydrogen, and the statement is made that the process can be carried out for little more than the bare cost of handling the kerosene. This would seem effectually to settle the price question.

The experiments are the outcome of Selden's observation, made many years ago, that hydrocarbons of the paraffin series, which include kerosene and gasolene, absorb peroxide of hydrogen in considerable quantities, forming a compound of stability, differing somewhat in color, specific gravity and flash-point from kerosene. But most interesting is the statement that when vaporized the oil burns freely and completely in the cylinders, forming no deposit and causing no smoke or smell in the exhaust, and that carburetters of ordinary construction can be used, provided they are capable of a rather wide range of air adjustment, and that heat from the exhaust gases from the motor may be utilized.

One test was made burning peroxidized petroleum distillate in the motor of a 40-horsepower touring car which weighed, with its passengers, 4,600 pounds. A gallon of the fuel carried this car 12.7 miles in 24 minutes without smoke or odor from the exhaust, the machine running on high gear all the time. The muffler was used throughout the test.

Not only is peroxide of hydrogen efficacious in assisting the clean combustion of fuel, but when mixed with lubricating oil it is said to have the virtue of preventing smoke and sooty deposit. Selden states that one of his cars has been run for some 1,500 miles on "peroxidized lubricant" without forming sufficient deposit on the spark plugs to soil a white handkerchief, though it is not stated what fuel was burned. Gasolene and other petroleum products are susceptible of treatment by the peroxide process, as well as kerosene.

When peroxide of hydrogen is decomposed by heat large volumes of oxygen are liberated, the peroxide containing twice as much oxygen as does water. This access of oxygen is responsible for the clean combustion obtained with the compound. Oxygen, which is the principal item in the peroxidizing of fuels, can be produced, it is said, for about $2 per thousand cubic feet, and for this reason the treatment of fuel by the process which Selden has brought into prominence can be carried out at a comparatively trivial expense.

Thirteen Enter for Santa Monica Race.

When entries closed, July 31, for the Santa Monica road race, to be held at Santa Monica, Cal., 9th inst., 13 cars had been listed, but none of them will carry this supposedly unlucky number; it has been dropped from the list. The drivers and cars are: G. Morris, Mercer; W. W. Bramlette, Apperson; Barney Oldfield, Mercer; Teddy Tetzlaff, Fiat; Louis Nikrent, Mercer; McConnor, Speedwell; D. Lewis, Fiat; E. Cooper, Stutz; J. Ophahl, Buick; C. P. Soules, Cadillac; F. Goode, Apperson; T. R. Bramlette, Cadillac; F. Siefert, National.

Carnival Profitable to Perry Dealers.

A carnival and tournament which was recently held in Perry, Ia., brought much business to the Rude Auto Co., one of whose men was kept busy all the week filling gasolene tanks; at the end of the week the company found it had disposed of 1,410 gallons, and other garages, also, recorded big sales. At one time there were 45 cars parked around the Rude garage, which was quite a demonstration, considering that the population of Perry is but 4,360. The dealers apparently were awake to the opportunity and several cars were sold.

Drunken Drivers Now Must go to Jail.

The fact that William Brecka, 26 years old, a truck driver in Newark, N. J., was convicted this week and sent to jail for 30 days for driving his truck while intoxicated was the first most people knew that a law had been passed in New Jersey making it mandatory upon a judge to impose a jail sentence upon a man arrested for driving an automobile or any other vehicle while intoxicated; the law provides penalties of from 30 days to six months and a fine is not optional. Brecka worked for a firm of wholesale butchers.

Hughes Injured When Car Overturns.

While driving a racing car on a country road southwest of Tulsa, Okla., Thursday last, 31st ult., Hughie Hughes, well known as a racing driver, sustained injuries when his car turned over; he was bruised about the body, but not so seriously, it is stated, as to incapacitate him for more than two weeks.

UNION CHAUFFEUR CHARGED WITH USING "STINK BOMB"

Taxicab Owner Says Union Men Bombarded His Car in Front of Chicago Restaurant—Union Officer Held for "Loitering."

If the charges of the American Automobile and Taxicab Owners' Association, of Chicago, are true, the Automobile Drivers' and Chauffeurs' Union, Local No. 327, has taken to throwing bombs as a means of intensifying the strained feelings now existing between the two organizations; the news, however, need alarm no timid person and prevent him taking a trip to Chicago, for thus far no one has been blown up. Someone is likely to be "blown up," however, if P. C. Kohler, secretary and treasurer of the owners' association, finds the man who threw a bomb into his car one night last week, while he was in a restaurant.

The bomb blew up, but the car was not damaged, all of which is accounted for by the fact that the missile was what is known in street parlance as a "stink bomb" and consisted of a thin-shelled, glass affair about as big as a marble and filled with an odoriferous substance, probably hydrogen sulphide, which is as near as the chemists can come to imitating rotten eggs. It might also be added that the imitation is very good and that a car that has been "bombed" now is decidedly unpopular.

Kohler claims the offence was perpetrated by or instigated by the union, and he has caused the arrest on a charge of loitering of Edward Reilly—not Motor World's Reilly—business agent of the union. Reilly is charged with having been loitering near Kohler's car a few minutes prior to the time the "bombardment" occurred.

Gets Bill by Trick and Parcel Post.

Collection agencies are likely to lose considerable business if dealers and garagemen follow the practice of a Kansas man who proceeded to collect several small accounts of long standing as soon as the Parcel Post C. O. D. regulation went into effect, July 1. The accounts were regarded practically as a loss. This merchant wrapped up several neat boxes of waste paper, made the proper C. O. D. arrangements and proceeded to collect the back accounts through the post office. Inasmuch as the recipients of the parcels could not see what was in them until they paid for them they did not realize the trick until too late. Just how business-like this is and how it will affect the merchant's standing in that business community, however, is something else again.

STUDY OF COSTS ESSENTIAL

Unless Expense of Running Business Is Ascertained Profits Cannot Be Assured—Man Who "Guessed Twenty Cents Was Enough."

At a small Canadian town a rear spring hanger on the automobile broke. It could not be repaired. The body of the car rested on the rear axle on one side. The only thing to do was to block it up and drive the 60-odd miles to the factory in Detroit. The little town boasts of only one place where help could be secured. It is a blacksmith shop. The proprietor was a white-haired old patriarch with a full flowing beard. He reluctantly consented to help.

He took a block of wood, measured the space, cut it accurately, drilled two holes in it to take care of two bolts on the axle, slotted it to adjust it to other conditions, and then wired it securely on. It was a good job and it stood up. It took about an hour to fix it up, there was so much measuring and fitting to do. "How much?" asked the automobilist, fully expecting to pay a dollar or more. "Twenty cents will be about right, I guess," replied the blacksmith. "Twenty cents!" exclaimed the automobilist. "Why, that's not enough. Here, keep this half-dollar." It was all he could do to persuade the old man to take it.

Knowledge Necessary to Money-Making.

The old man "guessed it would be about 20 cents." And that is one of the reasons, beyond a doubt, that, at an advanced age, he is still running a country blacksmith shop. And guessing instead of knowing will keep any business man down and absolutely prevent him making money and being hugely successful. There are altogether too many garagemen "guessing." The day of guessing is past; knowing is necessary, if money is to be made. "Breaking even" is not a real answer. You cannot be satisfied with such a tame game. You must forge ahead.

That means one must keep track of things—must get them down in black and white where he can refer to them; must look at the little things as well as the big; must realize that if he makes $400 on the sale of a car he loses, say, 30 cents if he give a man three gallons of gasolene in his car when it contained only one gallon when he brought it in to have his tank mended. Someone must pay for those two extra gallons. He did not charge the customer for them; who pays? And that rear axle was doped with grease; how much was used? Was it four pounds or five? If it was five and you only charged for four, who pays? And that fan belt you put on the other day; you guessed it was about 50 cents for the belt and about a quarter for putting it on. How much time exactly was consumed putting it on? How much did it cost you?

Add Rent, Light and Overhead to Cost.

Was a share of rent and light and heat and selling expense and all the rest that is known as "overhead," added to your cost? Have you got it figured out, or did you just price it 50 cents because the factory listed it at that? It won't "all come out in the wash." To know what a job costs you you must know every item of time and material that went into it. Not "nearly" every item, but exactly every item. It is the only way you can arrive at an accurate cost and add a "profit" that you know is a profit.

Half the complaints about unprofitable business can be traced to inaccurate, inadequate records—and records that are not kept up to date. Guessing is a costly procedure in business. The man who makes money these days knows. He doesn't "figure" that things are worth so much; he knows. If you know what labor costs, what your "overhead" is, what material costs, what selling expense amounts to, what your profit should be, and add it to the rest, you will be sure to make a profit. Unless you do know these things it is a case of waiting for the end of the year to find out. You may be too far gone then. You should know what you are doing on every sale. It is the only way you can be sure you are not like the blacksmith.

THE SHOW CASE AND THE GOODS DISPLAYED THEREIN

The man who discovers for himself that "goods well displayed are goods half sold" has learned a merchandising lesson that is of vital importance. The appeal to the eye is a direct, powerful appeal that captures business when every other form of appeal is silent. There is something about a showcase that arouses the interest of everybody who sees it. Our first thought is "What's inside?" and we proceed to look and find out.

Valueless goods are never put in show cases. The man who cares nothing about the goods he sells will never be bothered with a show case. Fly-specks and dust that depreciate the value of goods will be his portion—but he will not care, because how the goods look is of little interest to him. Brass goods should be kept in show cases where they will not be handled except by the really interested prospect. The same thought applies to nickeled goods of all kinds. And it is worth while remembering that a show case not only protects goods against dirt but also against theft.

If you sell accessories, get a show case and display them. It looks as if you were a merchant . . . and were not ashamed of it. Besides, it pays to display merchandise in show cases because people see the stuff and they want it. The jeweler used to be the largest user of show cases. Now they are used in every line of business—even the clothiers hang their clothes in a show case instead of piling them on a counter. It pays. That is the answer to the showcase. It is a profitable investment. It pays.

"STICKING TO IT" THAT WON

Salesman Who Took Eight Years to "Land" a Customer—Also, the Salesman Who Lost Out Because He Didn't Give a Square Deal.

For eight years a salesman had been calling on a certain New England dealer. The third year he managed to sell him a small bill of goods amounting to exactly $16. Five more years elapsed. He had never been able to get another order.

The dealer was one of those honest, faithful souls who believes in sticking to a line as long as he gets square treatment from the manufacturer or jobber who sells it. He grew to like the salesman, but it seemed impossible for the two to do business. There was no advantage of price or terms to be offered.

Called On the Dealer On Every Trip.

The article was a staple one and the dealer was honestly satisfied with the product he had been getting. The case seemed hopeless. But each time he "made" that town the salesman called on the dealer. He was making a friend of him, if he could not make a customer of him.

Eight years is a long time to call on a man and get but one $16 order. One day when the salesman called he found the dealer busy talking to a man. He seemed to be neither a salesman nor a customer; so the salesman thought he would not wait but would just say "Good day" and proceed about his business. "Wait a minute; I've got to go out, but I will be back in a jiffy," exclaimed the dealer.

At Last the Order Was Secured.

The salesman thought he detected a note of encouragement that he had never heard before in the dealer's voice. He waited. When the dealer came back he said, "Mr. Myer, do you honestly believe the goods you are selling are any better than the line I have been handling?" "Well, they are at least as good; as to whether they are better or not, I am going to leave that to you. Just a minute, and I will let my samples talk and you can make your own comparisons."

He placed his samples on the dealer's desk and then, skipping all ordinary details, proceeded to emphasize one feature where, to use the salesman's language, he had "all the rest skinned a mile."

It took a trifle less than half an hour to write up a $1,600 order for immediate shipment and receive the voluntary promise of another one, just as good, for six months later.

Dealer Explains Why He "Switched."

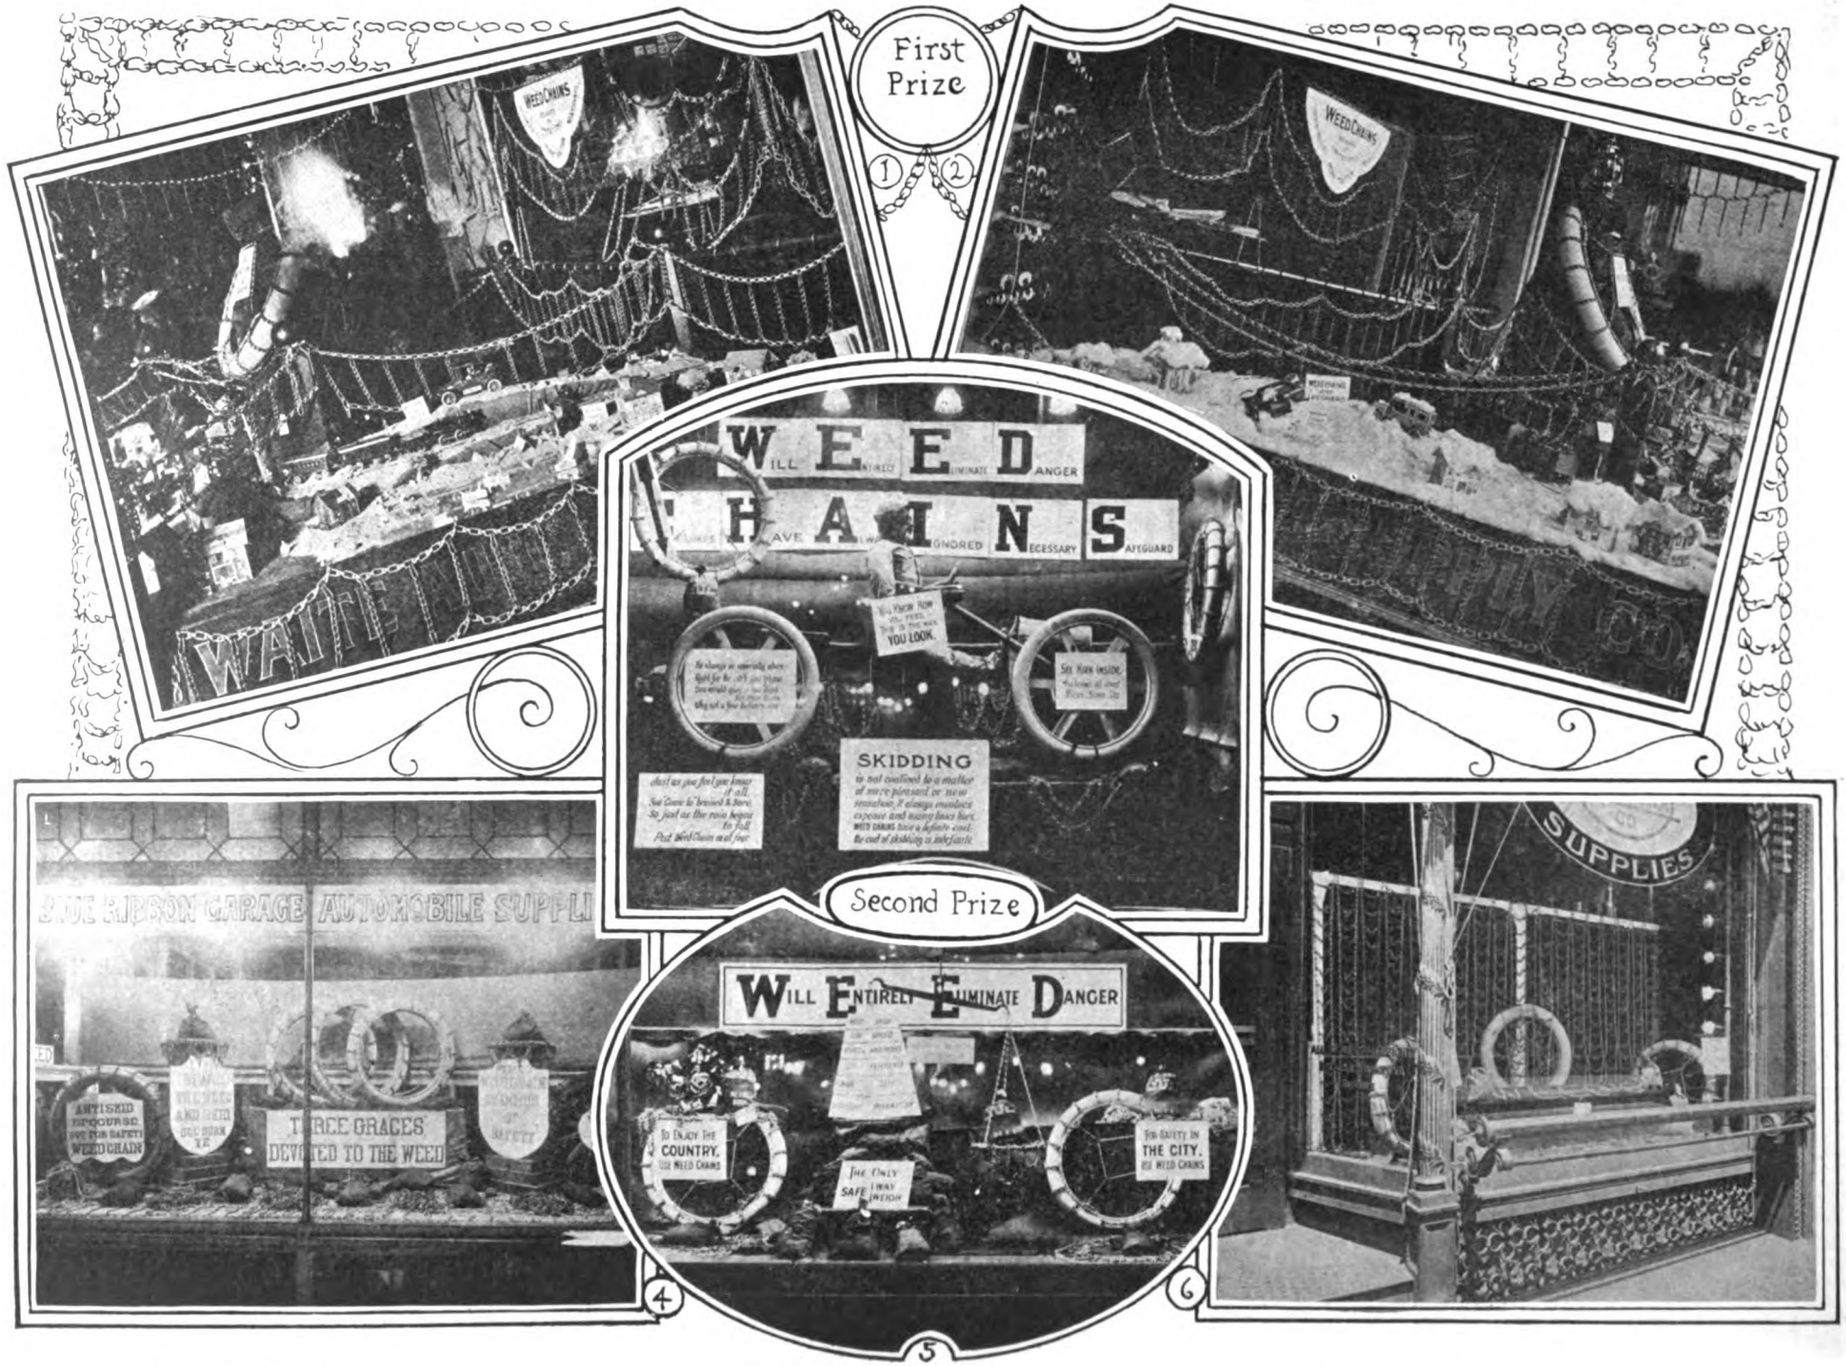
"I suppose you wonder why you should suddenly get this order to-day when heretofore you haven't had even a look-in," remarked the dealer. Myer admitted he was naturally curious, so the dealer continued: "I told you I would stay by the Blank Co. so long as they gave me a square deal; and I did. Just a month ago, when their new man, Mr. Brazer, was here, he asked me some questions that made me suspect he was going to try to sell his goods direct to the city. I asked him point blank if such was the case, telling him at the same time that my order, just given him, included practically everything the city would need in his line.

Brazer told me he was just asking for information for their records. That he lied was demonstrated two weeks later. I don't know what made me go down to the freight depot that morning, but I did go, and you can imagine my amazement, when with the teamster I went to check up the packages, to find, right beside our stuff a box from Blank's addressed to the city purchasing agent. I knew at once that Blank had sold the city direct. So I left our shipment there "Refused" and wrote Blank's that it was subject to their order and told them why. I had no further confidence in that firm and immediately thought of you, and have been holding this order for you ever since."

This story emphasizes two facts that every successful salesman, no matter what his line, will endorse: First, it is absolutely necessary to give every customer a square deal every time. Second, sticktoitiveness is bound to win.

MAKING THE MOST OF THE NEWLY-ARRIVED NEW MODEL

What are you doing to rivet attention on the new model that has just arrived? Does everybody know it has come? It is possible that the splendid new stuff can get into your store and everybody not know about it? When you are brimful of enthusiasm over the various refinements and improvements, before you have grown so accustomed to them that you cease to consider them interesting, that is time to point them out to everybody. People recall where they saw a certain feature first. They like the prestige that early knowledge gives them and they will say as your competitor praises up his car, "Oh, yes; that is the same feature they have in the new ——— car."



And what they say to your competitor they will say to their friends who may chance to praise a certain car they have seen. And every time they repeat it they come nearer to selling themselves. "Make hay while the sun shines" surely applies to the opportunity that beckons to the dealer with the new cars on his floor.

Watch the Indicator and Beat Rival.

Keep your eye on the indicator. Take a look the first thing in the morning, last thing at noon—after lunch and before you go home at night. The days are strenuous and you have got to know you cannot let the other fellow beat you to it.

RESULTS ACCOMPLISHED BY SUPPLY AND ACCESSORY DEALERS IN WINDOW TRIMMING CONTEST PROMOTED BY WEED

1 AND 2, WAITE AUTO SUPPLY'S MINIATURE VILLAGE. 3, BANISTER & POLLARD'S "LOPSY" DRIVER AND SKIDDING CAR. 4, THE BLUE RIBBON GARAGE CLEVER AT MOTTOES. 5, WEED CHAINS OVERBALANCE ALL OTHER SAFEGUARDS WITH DAYTON & WALKER. 6, SIMPLICITY CHARACTERIZED POST & LESTER'S DISPLAY

Digitized by Google

DISPLAYS OF WEED CHAINS THAT WON DEALERS PRIZES

Ingenuity in Window Trimming Characterizes Contest Results—Waite, of Providence, Reproduces Village in Miniature.

Not only are a number of accessory dealers richer because of the attention they drew to their stores by effective window displays, but a dozen of them have received checks from the Weed Chain Tire Grip Co. as prizes given in a window trimming contest promoted by that anti-skidding organization last month, the awards for which were made last week. The prizes, as stated in Motor World last week, were: 1st, $100; 2nd, $50; next 10, $10.

First prize was won by the Waite Auto Supply Co., of 17 Dorrance street, Providence, R. I. The Waite display involved considerable ingenuity and effort and won on its excellence, and the lesson it taught the public through the presentation of a miniature village with numerous accidents and prevented accidents because of the lack of and use of Weed chains. The Waite window is at the point of a triangle and has three street frontages of about equal length, the two side views being shown in an accompanying illustration.

A chain-equipped tire reposed on a pile of chains in bags in the center of the background and chains were strewn about as trimmings. The picture at the left shows several houses of a railroad; above the railroad and running down to a grade crossing is a highway from which a car, not Weed-equipped, has skidded off into the path of an approaching train. Another miniature automobile, chain-equipped, remains in safety on the road.

The other side of the window represents a snow scene in which a car has met disaster because it did not use chains, while a big limousine is making easy progress through the snow with its anti-skid equipment. The little houses add realism, and the Waite display won the attention its excellence merited.

While the second prize winner, the window of the Banister & Pollard Co., of 206-8 Market street, Newark, N. J., does not show up so well in the photograph, it incorporated much of its effectiveness in movement, which does not photograph. The automobile, which forms the principal piece, and in which is a "lopsy" sort of driver, had each wheel muonted on a roller skate and the skates rested on a glass plane.. A cleverly constructed mechanism caused this plane to move sideways and the car skidded in a "terrifying" manner. The driver swayed from side to side, while a placard said, "You know how you feel; this is how you look."

Some member of the firm must be possessed of a poetic instinct, for a sign on the rear wheel of this marvelous car read, "It's always so especially when, Right for the curb you plow; You'd give a hundred for them then, Why not a few dollars now?" Another poem was, "Just as you feel you know it all, You come to bruised and sore; So just as the rain begins to fall, Put Weed chains on all four." The front wheel invited the public to "See Kirk inside; he knows all about prices, sizes, etc."

Three of the equally good ones in the list of $10 winners were the displays of the Blue Ribbon Garage, 283 Fairfield avenue, Bridgeport, Conn., the Dayton & Walker Hardware Co., Paterson, N. J., and Post & Lester, 223 Columbus avenue, Boston, Mass.

The Blue Ribbon centerpiece was three chained tires labeled, "Three Graces, Devoted to the Weed," and was surrounded by a neat arrangement of chains and placards. The Dayton & Walker display contained a clever motto and a balance which moved slowly up and down; one side carried a bag of chains and other a pyramid of blocks bearing such words as, "Slow speed, wise guy, never-skid, and ordinary precaution," but the chain always overbalanced the bigger load. Grass, flowers, etc., on a tire at one side called attention to "Safety in the country," while at the other side was emphasized "Safety in the city." The balance was labeled, "The only safe way (Weigh)."

The Post & Lester window was a simple but effective draping of chains at the back and a clever scheme of trimming with the word "Weed" arranged with cross-chains on a glass shelf.

Club Offers to Build Subway Garage.

Since the South Park Commissioners, of Chicago, reported unfavorably on the proposed subway garage in Grant Park on the grounds that the project would cost too much, the Chicago Automobile Club now has offered to build a garage itself; the entire plan included ten sections, each costing $125,000 and housing 225 cars, and the club offers to construct one section if the commissioners will permit. The club proposes to pay for the garage out of its earnings and then turn it over to the city gratis. It is estimated that the total expenditure would represent $500 for each car space and that the annual earnings per space would be $23.63 after the deduction of interest on a sinking fund to wipe out the indebtedness in 20 years. The garage was proposed to relieve the parking congestion in Michigan avenue.

QUALITIES OF SALESMAN AS VIEWED BY MAN WHO SELLS

Salesman One Who Can Put Thought into Immediate Aggressive Action —"Not What You Say but How You Say it," Says Another.

What is a salesman? What are the qualities which are possessed by the leaders in the profession? What is responsible for the failure of one man and the success of another? These are questions which have been asked ever since salesmanship began to be recognized as a field in which there is unlimited scope for the man of ability, and while the study of methods of salesmen who are successful is productive of valuable information, this takes time; next best probably is inducing the salesman to tell those things of which knowledge is desired.

Garnering these gems of selling knowledge and the producing of greater efficiency in the sales force as a whole is the object of the many sales conventions that are held every year by manufacturers, and some of the expressions of salesmanship that were evolved at a recent gathering of National Cash Register workers are incorporated in that company's weekly organization newspaper. As to what constitutes a salesman, A. C. MacMahon said he didn't think Noah Webster, who wrote a dictionary, was a good one.

"What is a salesman? Noah Webster defines a salesman as a man who sells things. I do not believe that Noah Webster was a good salesman," he said. "I believe a salesman is a man who has the power of thought and can put that thought into immediate aggressive action.

"Salesmanship is a science, because science is simply classified knowledge. What have we got to do when we go to see any man? We must get his attention. We must do something else. We must get his interest. Then we must get his desire, and, fouth, we must get his resolve. After you have secured his atention, you create an interest in his mind. That interest must be put into desire and that desire must be crystalized into resolve before he will possess your article.

"Know your goods. That is the most important.

"It is not what you say, it is how you say it.

"I believe enthusiasm properly defined is not the noise you make. It is something in salesmanship that is within you. You feel it and you want to impart it to the other fellow, because to sell him he must feel the same as you. because that is selling.

Digitized by Google

He says no, and you say yes. He must think the same way you do, however, before you can sell him.

"One of the most essential things is to get your heart in your business, and when you have gone over all these things, you have what? Success. Success is secured through work, work is secured through knowledge and knowledge through enthusiasm, and that in all spells success.

"A man has two roads to go in any business, I don't care what it is, but they read differently. One reads success. The other one reads failure. If you went to a hospital to-night, they'd take your temperature when you go in and they would take your pulse. They would put a chart over your bed, which reads 'success' and 'failure,' and remember this, that no man on earth ever took this road straight across. You have got to go one way or the other.

"We are a part of all we have met—we get ideas from each other. My idea is to get all the good we can out of every individual, and then collectively, and then sort these ideas over and then you have science which is classified knowledge."

"There are some things in selling that are really important and that I think some of us overlook occasionally," said W. A. Outten. "We have always been taught that health, industry, knowledge, ability and honesty go to make up the successful sales agent. I believe that the important thing that we overlook and that many men do not seem to grasp—and before you go in to see a man just think of it—is the word 'Confidence.' When selling goods we should sell ourselves first.

"When you speak to the prospect you must speak with confidence, because you know you have the very best proposition in the world and you can prove it to him."

"In selling, I believe that to a great extent the success of the sale depends on the approach," was W. J. Macauley's opinion. "Now, in the approach I believe that a man to be a success in this business must make himself a student of human nature. He must understand men, and, of course, we only get that by mixing with them and studying them. You can judge a man by the way he talks, the way he holds his head, the look in his eye and the way he holds himself. You must meet him on his own ground."

Indiana Law for Protection of Dealers.

Indiana now has a law which aims to protect the dealer and garageman in that it gives him a lien on any car for which the car owner has purchased supplies or upon which he has had repairs made and has not paid for them; as a result, buyers of used cars are looking up the standing of automobiles which they intend purchasing.

MISSTATEMENT OF FACTS ON TRUCKS AND HARM IT DOES

Wilful or Thoughtless Tales of Salesmen Discredit Industry, Says Timken—"Figures" that Cause Return to Horses.

John Jones & Co. have decided to buy a motor truck. It is up to some one connected with the firm to get the facts about the different makes that the company cares to consider, says the Timken Magazine.

One big, important thing this man should keep in mind is the unfortunate tendency of some salesmen to overrate the trucks they sell. In an effort to convince the buyer that he is really getting more for his money in the way of load capacity, these men often make statements that are physical impossibilities for the truck to back up.

Beware of the salesman who says something like this: "This one-ton truck of ours, Mr. Blank, is really an exceptional buy. While it is rated and sold at the price of a one-ton truck, I can refer you to a number of concerns that are using it to carry 1½-ton loads.

"The truck that you examined a few moments ago is rated at two tons, which is positively ridiculous. Two months ago I sold one of those two-ton trucks to Blank & Co. and I know positively they have been hauling three-ton loads every day since it went into service."

Pure bunk, you say; we grant you that, but the sad part of it is that so many suckers are born every day. An argument of this kind, like a gold mine, gets nine out of ten men who don't realize they are being buncoed until it's too late to holler for help.

Analyze the thing if you will. How many truck manufacturers do you know who could afford to build a two-ton truck, rate it as a one and sell it in competition with the other fellow's one-ton truck?

On the other hand, the builder who is foolish enough to rate a two-ton truck at five tons is courting certain disaster. True, the truck might carry five tons for a short time, but when it breaks down, how much would you give for the manufacturer's reputation?

Nothing is more harmful to the motor truck industry than this wilful misstatement of facts. It reflects not only on the manufacturer but on the industry as a whole.

We are just old-fashioned enough to believe that the one fundamental, basic principle for success in every business is to sell your customer what best answers his requirements. Either sell him the truck he should have or don't sell him any at all.

Sales made on that basis will mean repeat orders because your product will live up to your claims and the user will be satisfied. The other method leads to sure dissatisfaction and throws future orders into the hands of competitors.

Our one regret and this protest on the part of the Timken companies is due to the fact that in hundreds of cases the unwary buyer becomes convinced that motor trucks are unreliable. He, therefore, returns to the horse and wagon and fewer trucks are sold, consequently less axles and bearings are needed and, though innocent ourselves, we share the loss of what might have been.

Waterloo Horses Are Cars' Waterloo.

Maybe it is because horses in Waterloo, Iowa, are more mischievous or less well fed than horses in other parts of the country, or maybe the make of cars in use in that town is of a more edible variety, but in any event the motorists of Waterloo are registering a vigorous complaint with the municipal authorities because they object to having delivery wagon steeds lunch off the backs of the cars; the car owners say that they pay a tax where the horse-drawn wagon pays none, and that it is manifestly unfair to permit a spare-ribbed animal to stop behind a car and sample the top or the upholstery. Some of the horses seem to prefer tops and upholstery, while others have evinced pleasure in seeing how much paint they can scratch off the back of the tonneau while their drivers are in the stores or residences.

Builds Whole Car in the Show Window.

Believing that the public is inquisitive, if not interested, as to things purely mechanical and that an exposition of the oftentimes mysterious "insides" of a car can be used effectively as a means of attracting attention, the Standard Motor Co., of Baltimore, Maryland distributer of Cadillac cars, recently drew crowds to its store by building a car in the show window. The car was assembled from parts carried in stock and the process was watched with interest by the public. Not only did the "stunt" excite interest and enlighten the spectators as to what building a car means, but it was an efficient demonstration that the company carries a parts stock that is complete.

London Experiments with "Owl" 'Buses.

"Owl" street cars are common in all live cities, but London now has "owl" omnibuses of the motor-driven type; these recently were put into service between the Liverpool street station and the Crown Hotel, Cricklewood, and if the experiment is successful the service will be extended to other districts.

KEROSENE CARBURETTER WITH INTERNAL FLAME

Radical Method of Handling Heavy Fuel—Cold Motor Started on Kerosene—Vapor Burns Without Smoke, Smell or Sooty Deposit—Remarkably Smooth Action Obtained and Double the Mileage of Gasolene.

It is generally conceded by those who have spent time and acquired experience in the kerosene carburation field that the application of heat at some period of the travel of the fuel from the tank to the motor is a sine qua non. It also seems to be a very hard fact, however, that the application of heat must be carried out with extreme delicacy, for if there is insufficient heat the process of vaporization is but slightly furthered, while if there is too much heat a chemical action known as "cracking" takes place, the kerosene splits up into its components and the result is poor combustion, an odoriferous exhaust and an abundant deposit in the combustion chambers and other parts with which the vapor comes into contact. A vapor formed with the aid of an insufficient amount of heating is easily condensed and deposited on the walls of the combustion chamber. In all cases it is necessary to heat up the motor by starting on gasolene, except where extra heat is supplied by external means, such as a blow-torch, an electric heating or some other device.

Flame Changes Character of Vapor.

To those who are familiar with the more conventional lines of endeavor that are followed in many attempts to solve the kerosene carburation problem the idea of applying heat by starting a fire, so to speak, in the middle of the mixing chamber of the carburetter itself, doubtless appears revolutionary, if nothing worse; fire in or about a carburetter is a thing commonly and assiduously guarded against. Yet it is by this very proceeding that Alex. T. Porter, president of the Oil Utilities Co., of 171 Broadway, New York, has succeeded in producing a kerosene vapor that differs widely from vapors formed by more familiar processes. It is literally true that, while the carburetter is in operation, there is a small but active flame constantly burning in the mixing chamber and visible through a small window provided for the purpose, and without this flame the device fails utterly of its purpose. Before describing the construction of the apparatus it will be of interest to describe some of the results of its peculiar action.

While the carburetter in actual service is operated in the usual way by atmospheric pressure or, in the popular parlance, by the suction of the motor, the carburetter employed on the bench to show the principle of operation is worked by compressed air, the office of which is to atomize the kerosene as the initial step in the process. The atomized kerosene, which is the ordinary commercial oil, issues in a spray that rapidly condenses on the finger and drips off—

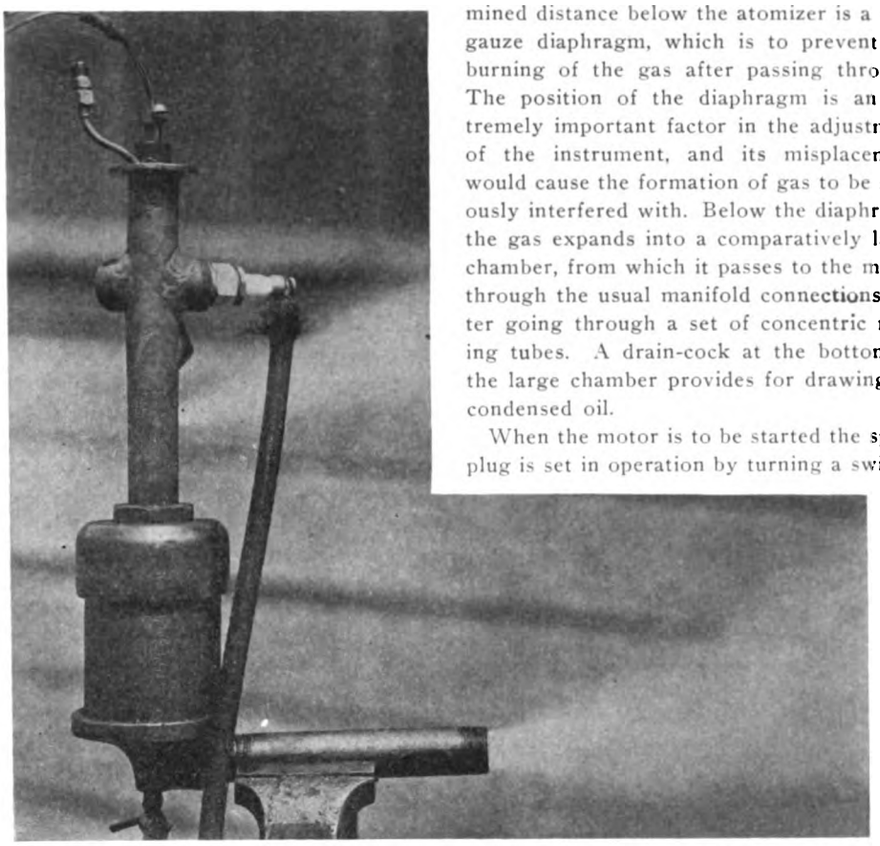
PORTER KEROSENE CARBURETTER

that is, without the application of the internal flame. The instant the flame is started, however, the characteristics of the vapor are entirely changed. Without the slightest appreciable delay the spray becomes a thick, white vapor, strongly resembling heavy steam in appearance, and the most interesting thing about it is that it is decidedly difficult to condense. It floats about in the air like smoke, and disappears in the same gradual way.

Experiments With Bottled Mixture.

The pure vapor, close to the discharge pipe, cannot be ignited with a naked flame. Further out, however, where there is an admixture of air, it can be ignited with a match, when it burns with a reddish flame which soon extinguishes itself. It is notable, however, that the flame gives off no smoke whatever, produces no deposit and has no perceptible odor. The same proceeding in the case of the raw spray of kerosene results in the usual smoke, smell and shower of small particles of black carbon in the air.

The vapor is easily caught in a wide-mouthed bottle held over the discharge pipe of the carburetter, and despite the coldness of the glass walls, remained visible in the bottle for 14 minutes by the watch. Porter states that the temperature of the bottle seems to have little, if any, effect in hastening the condensation of the vapor, and that experiments conducted in the coldest winter weather, with the thermometer far below freezing, indicate the stability of the product of the device; in fact, he states that a bottle brought in from the frosty air, filled with vapor and immediately set out in the cold retains the white fog just as long as if the temperatures were at summer figures.



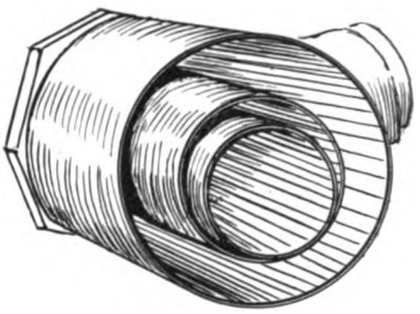
Starting Cold on Kerosene.

If a bottle of the white vapor is opened for a moment and a little air admitted, a match applied to the mouth will ignite the mixture, which will burn very rapidly and with a slight puff of flame. There is absolutely no sign of smoke, however, or of deposit of any sort. A well-polished bottle of one quart capacity—a common milk bottle, in fact—in which vapor was burned perhaps a dozen times showed no sign whatever of deposit or smoke, though as a matter of course the mixture was a haphazard one and combustion was obviously slow, as such combustion goes.

The conclusions naturally drawn from these demonstrations are that by Porter's method it is possible to produce a kerosene vapor that is sufficiently stable to withstand condensation considerably longer than is necessary to get it into the cylinders of a cold engine and ignite it; in other words, that with the Porter carburetter—if such a device may be called a carburetter—it is possible to start an absolutely cold motor on kerosene alone. Further, it would appear that under normal conditions combustion should take place without smoke or odor and without leaving deposits in the cylinders. And it may be said that the actual operation of a carburetter on a car bears out these conclusions. The motor starts, when dead cold, on the kerosene vapor at least as easily as on gasolene

Digitized by Google

There is this difference between gasolene and kerosene, however. Judging from the running of the motor, the kerosene burns more slowly than gasolene, there being apparently more gradual expansion and less

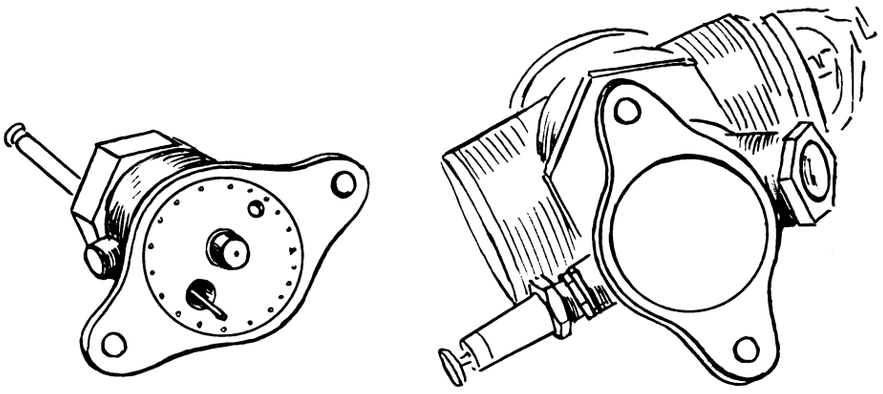


EXPERIMENTAL VAPORIZER IN ACTIVE OPERATION

of the explosion effect. The correctness of this would seem to be borne out, in a measure at least, by the fact that the motor will throttle down to a lower speed than with gasolene and will "hang on" when climbing a grade on high gear in a way that is rather surprising. There is a softness of action in the motor that is quite perceptible. Porter states that while the speed of combustion is quite sufficient for all ordinary purposes, when a motor is raced to an excessive speed the power falls off sooner than with gasolene.

As to the construction of the carburetter, it is decidedly simple, but the simplicity is the result of a long series of experiments which ran through complications almost without end and entailed a vast amount of labor in eliminating that which was useless or unessential. The accompanying illustrations show the internal arrangement of the device. The kerosene enters at the top, together with a small amount of air, the arrangement being exactly similar to that of the common atomizer. Below the atomizer, which is in a separate head fitted to the body of the carburetter, are the main air inlet, which is fitted with a spring-actuated auxiliary air valve of the usual type; the spark plug, which is maintained in operation as long as the carburetter is working and ignites a small portion of the sprayed fuel; and a little mica window through which the flame can be seen. At a carefully determined distance below the atomizer is a wire gauze diaphragm, which is to prevent the burning of the gas after passing through. The position of the diaphragm is an extremely important factor in the adjustment of the instrument, and its misplacement would cause the formation of gas to be seriously interfered with. Below the diaphragm the gas expands into a comparatively large chamber, from which it passes to the motor through the usual manifold connections, after going through a set of concentric mixing tubes. A drain-cock at the bottom of the large chamber provides for drawing off condensed oil.

When the motor is to be started the spark plug is set in operation by turning a switch; a separate coil and set of dry cells are used. The motor is then cranked. Suction draws down and atomizes the oil, the spray being ignited the instant it comes in contact with the spark at the plug points, which are located directly under the atomizer. The volume of atomized oil and the speed of travel are such that only a very small quantity are consumed by the flame—approximately two per cent., as nearly as Porter has been able to figure it. At the gauze diaphragm the flame is totally extinguished and the gas passes on to the motor.



It is noticeable that the gas is not a hot gas. Coming from the outlet of the bench

CONCENTRIC COOLING TUBES

demonstrating device, its warmth is scarcely perceptible to the hand; the intake manifold of the motor running on kerosene is warm only to an extent that is attributable to the travel of heat from the cylinders. With reference to the plug and its constant sparking, it is stated that the carburetter often will work for long periods without the extinguishment of the flame, but that its going out for any reason is followed by the failure of the carburetter to work and the stoppage of the motor. The elimination of the constant sparking is the object of work now in progress; in any case, however, it is not a matter of great moment.

Perhaps the most striking characteristic of the vapor produced by the Porter apparatus is that it seems impossible to make it smoke or form a carbon deposit. In view of the familiar and aggravating tendency of kerosene to produce an intense and offensive smoke when ignited and to deposit carbon thickly when all the conditions gov-

ATOMIZING HEAD AND MIXING CHAMBER SEPARATED

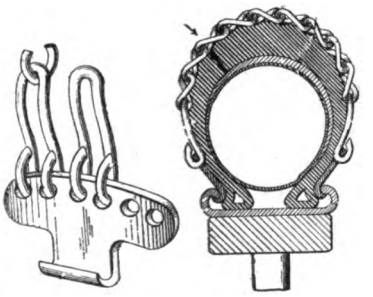
erning its vaporization by more ordinary methods are not exactly right, it is nothing short of amazing to see Porter's kerosene vapor burn in any condition in which it can be ignited, without smoke, smell or deposit. Of course, the vapor itself has an odor—which, however, is quite different from that

Digitized by Google

raw kerosene—but the products of combustion appear to have none. In one of e motors employed for test work the nition system was in bad condition and e motor missed fire considerably. When is happened the white vapor came through e tail-pipe perfectly clean and without any lf-burned smell—in fact, the smell of lu-icating oil was plainly perceptible in the haust. When all cylinders were firing roperly the exhaust was absolutely clean nd would not soil a white handkerchief.

Porter does not attempt to explain why here should be no liberation of carbon, eing satisfied, at least for the present, with etting results, but, of course, attributes ne peculiarities of the vapor to the slight artial combustion in the carburetter, which pparently acts in some way to prevent the ormation of carbon upon combustion outide of the carburetter. Porter has found hat there never is trouble from deposits n the sylinders or on the spark plugs exept where the flame in the carburetter has een momentarily extinguished and raw erosene vapor has been drawn in.

Despite the somewhat startling expedient of using a flame in the device, there is no danger from its presence. The vapor at the point of combustion is too rich to burn rapidly, burning beyond the screen is impossible and a back-fire from the motor would have a tendency to extinguish the flame momentarily. Apparently there is no danger from the flame.



Most of the road test work with the Porter carburetter has been done with a large and heavy six-cylinder car, the manufacture of which has been discontinued, which is notoriously voracious in the matter of fuel consumption. The motor is rated at 60 horsepower. Running on gasolene, the best average that could be made was 5 miles to the gallon of fuel. On kerosene with the Porter carburetter the average rose to 10.5 miles per gallon, and the motor showed an appreciable increase in power, especially on hills. Under favorable conditions a speed of close to 60 miles was attained on kerosene, while the best that could be done on gasolene was less than 50 miles an hour.

Porter is frank to say that there still is room for improvement in the device. He aims to eliminate the spark, except at starting, and he expects to reduce it somewhat in size, though as it is it is no larger than a gasolene carburetter of equal capacity. There are details that require more careful attention in the way of adjustment than Porter likes, for it is his aim to make the carburetter very much less easily deranged than a gasolene carburetter. The means of doing these things have been found, however, and it now is merely a question of putting them into the most convenient and compact form.

REPAIRING BLOW-OUTS BY USE OF PATCH AND CHAIN

Los Angeles Invention which Will be Manufactured by Weed Company—Patch Stops Hole in Tire and Chain Holds Patch in Place.

When a man has a blow-out on the road he is in trouble, even if his trouble is nothing more than putting on a spare tire and tube, but if he has no spare tire or tube, then he is in real trouble, especially if he is out in the country or some distance from a garage where he can have his tire repaired or get a new one. Having this situation in mind, possibly having had it forcibly called to his attention, Timothy C. Dobbins, of Los Angeles, has invented a device calculated to afford an efficient tem-

DOBBINS'S CHAIN BLOW-OUT REPAIR

porary repair, and the device is now in process of being placed on the market by the Weed Chain Tire Grip Co. of New York.

The Weed company steered Dobbins through an interference proceedings in the United States patent office and will produce the device under a royalty arrangement. It is simple in its construction and one way in which Dobbins and the Weed company came to be acquainted may be through the fact that he employs a cross-chain arrangement of somewhat the same nature as the regular Weed cross-chain used for anti-skidding purposes.

The device consists of a couple of brackets which hook under the clincher rims at the sides and are connected by several cross-chains, lying close together and extending over the tire. When a blow-out occurs the procedure is to remove wholly or partially the tire and tube and place a large, stiff blow-out patch over the hole in the shoe on the inside; this is strong enough to withstand considerable pressure, but is not safe for any extended travel. The tube is placed in position with the hole in the tube covered by the patch, and tire and tube are replaced as before the accident occurred.

The brackets are then hooked under the edges of the rims, in such position that the mesh of chains comes across the hole in the shoe and acts as a reinforcement for the patch. When the tire is inflated the patch may tend to spring outward, but it cannot go far before its progress is halted by the mesh of chains and the air pressure is sufficient to make a sufficiently tight fit to permit the car to be driven several miles. It is not beyond the realm of reason to suppose that much more than "several miles" could be driven on occasion before the repair would fail of its purpose.

Forgot the Make of His Machine.

This is said to be a veracious yarn. Whether it is or not, it ought to be. A salesman for an automobile house got into casual conversation with a flashy young fellow in a smoking car, and in time the talk drifted around, more or less naturally, to automobiles. And when the Flashy Fellow confessed to owning a car the salesman pricked up his ears and asked what make it was.

"Gee! Now, let's see—darned if I can think of the name!" sputtered the chap. "I'd know it in a minute if I heard it, but it's gone clean out of my head."

Mr. Salesman smelt a rat and decided to go after it.

"Well," he said, "there's the Remington, Royal, Underwood, Blickensderfer, L. C. Smith——"

"That's it! That's it! It's an L. C. Smith!" interrupted the victim, eagerly. "Great machine, ain't it?"

"Yes," replied the salesman, slowly. "It's a fine machine. I don't know very much about such things, but I've heard that it is one of the best typewriters built," and he disappeared down the narrow passageway and never even glanced back at the stunned youth.

Putting Metal-to-Metal Joints Together.

In handling parts that are put together with metal-to-metal joints, or even with thin gaskets, the greatest care should be taken not to bruise the edges. It is rather surprising how easy it is to raise a small lump on a cast iron part, for instance, which will be sufficient to prevent a tight joint and will be the cause of more or less leakage until it is discovered and dressed down with a smooth file. Aluminum parts such as crankcases, gearcases and the like are of course even more easily marred, and should be handled with great care.

Why Clutches Require Gentle Treatment.

Despite much verbal and printed advice, and despite the existence of common sense in people who drive cars, an enormous amount of trouble is caused by the improper

Digitized by Google

use of the clutch. It is thought by many to be less trouble to let the clutch in with a slam and brace up against the inevitable jerk that follows than to take a little care and effect a gradual engagement. The personal discomfort caused by the wrenching jar caused by this method of starting of the car is the smallest part of the evil that results. Every part of the driving mechanism is subjected to abnormal stresses, and if there is any tendency of any part to let go or to give trouble, rough work with the clutch will bring on that trouble long before it is normally due. Of course, sudden engagement of the clutch on an up grade is much worse than on the level, but it is bad enough anywhere.

The Salesman and the Gear Shift.

Electric gear shifts had been very prominent in public and private trade, and the man who walked into a certain salesroom supposed every salesman, at least, knew something about them.

"Got the new electric gearshift on this car?" he asked, pointing to a chassis on the salesroom floor.

"Sure! Want to see it work?" And the "salesman" walked over and threw in the electric starter.

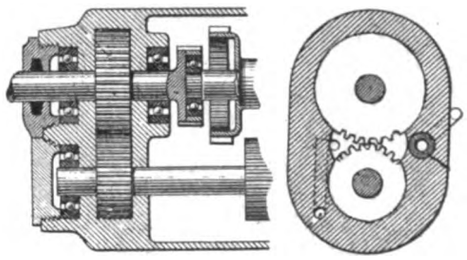
When informed that that didn't seem to be what the visitor was seeking, the "salesman" confessed himself "stumped."

One Cause of Obstructed Pipes.

One of the possible, if rare, causes of gasolene line-pipe obstruction may arise from the fact that when fittings are screwed together very tightly small bits of metal often are stripped off the threads and in time work their way to the place where they can do the most harm. While it is difficult to guard wholly against this sort of thing, it is usually sufficient to round off the end of a threaded part that is being screwed into a fitting, so that there will be no opportunity for the thread to break.

Why Mufflers May Sometimes Whistle.

The rapid manufacturing methods that now are common are responsible for the fact that the holes drilled in mufflers sometimes are rough and ragged, with the result that the escaping gases set up a whistling noise that is anything but agreeable. Smoothing off the rough edges will usually eliminate the unwelcome sound.



Hand Cranks that Need Lubrication.

Small thing though it is, it is surprising to notice the number of starting cranks that are squeaky either in their bearings or in their handles. Squeaks mean friction, and in the case of the handle it may mean friction against someone's skin—if that someone doesn't spill a little oil.

HERE'S A CLUTCH BRAKE HIDDEN IN THE GEARCASE

Clever Device on French Car Prevents Spinning of Clutch — Secondary Gear Shaft Driven by Oil Pump Gears.

Everyone who has driven a car knows that after a machine has run for a short time and the bearings have been well "run in" the clutch, and with it the clutch shaft and primary shaft of the gearset, will spin at quite a lively rate after the clutch has been disengaged and the gears placed in neutral preparatory to changing to a lower gear, and it is necessary either to wait until the parts have slowed down or else produce a racket that causes pedestrians to turn around and "rubber"—that is, if no clutch brake is fitted. The clutch brake is merely

HYDRAULIC CLUTCH BRAKE

a diminutive brake acting automatically to slow down the clutch under such circumstances, the usual device being some sort of a frictional arrangement.

A very clever little clutch brake, which differs widely from the more conventional type, is built into the gearcase of the Rochet-Schneider car and takes the form of a gear pump, as the accompanying illustration clearly shows. In this gearset the secondary shaft is permanently geared to the clutch shaft and therefore turns whenever the clutch shaft turns. The pinion and the gear are mounted upon the secondary shaft and the clutch shaft, respectively, and are enclosed in a close-fitting casing so arranged with intake and outlet chambers and ports that they act just as does an ordinary gear pump. The oil which is circulated, however, merely flows round and round in a closed circuit, the inlet passage, and its port being in communication with the opposite outlet passage and its port. The passages and ports are of such size that the oil normally flows freely, offering practically no resistance. In the outlet, however, is a valve which is connected through a lever with the clutch pedal.

When the clutch pedal is depressed to withdraw the clutch the valve is partly closed, so that considerable resistance is opposed to the flow of the liquid, and this resistance of course quickly absorbs the energy in the spinning clutch and shafts and slows them down. It is clear that any desired degree of resistance or braking effect can be obtained by the adjustment of the connection between the clutch pedal and the brake-pump; if a quick action is wanted the valve is set to close all but a very small opening, while a more gradual retardation can be had by adjusting for a less restricted valve opening. While the wear and the conseqent increase of leakage in such a device is slight, it can readily be compensated for by the same adjusting means, a more restricted valve opening making up for loss of pressure through leaks caused by wear.

Lorimer's Daughter Sues Elgin Promoters.

Sixteen prominent men, stockholders in the Elgin Road Race Association, are named as defendants in a suit for $50,000 filed in Elgin, Ill., by Mrs. Graham, daughter of former Senator William Lorimer, asking that amount for damages alleged to have been sustained when a portion of the grandstand collapsed at the 1910 race; the suit would have been outlawed had it not been filed before September 1. The reason for the delay is said to be an effort to secure settlement through the Pacific Surety Co., which carried all risks of the race and which is reported to have offered her $1,200 in settlement.

A similar action has been filed in Cook county against the Chicago Motor Club. The 16 men sued are: Fred W. Jencks, H. D. Hemmens, Theodore Schmitz, Wallace Willson, Philip Freiler, M. M. Cloudman, M. S. Aldridge, George Glos, Charles G. Heywood, F. M. Lasher, E. J. O'Beirne, W. J. Gilbert, A. M. Retan, D. B. Hoornbeek, Charles Kerber and W. H. Goetting.

Leverage of Long and Short Screwdrivers.

It is doubtful if the truth ever will overtake the ancient superstition that a greater leverage can be obtained with a long screwdriver than a short one. The pursuing truth is that the length has nothing to do with the turning leverage, but that a long screwdriver almost invariably has a handle of greater diameter than a short one, which, of course, accounts for the greater leverage. Put a large handle on a short screwdriver and a small handle on a long one, and the state of affairs would be reversed. If it was true that a long screwdriver gave more torque than a short one it would be in order to apply the principle by making the propeller shaft of a car as long as possible, and by this means bring about an "unearned" increase in the power of the drive!

—Digitized by Google

FALLACY OF TRYING TO IMITATE PERSONALITY

Reilly's Salesman Expresses His Belief in Each Man Retaining the Personal Assets With Which He Was Endowed—"Polish Off the Rough Edges and Don't Be a Monkey," Says Reilly.

Two little girls in blue blouses and white skirts tripped down the street, and they passed a girlish "How do you do, Mr. Reilly?" as they went by that dealer's salesroom, which Reilly was just entering, having come from a successful rolling of the

TWO LITTLE MAIDS PASSED A GIRLISH "HOW DO YOU DO? MR. REILLY"

little square bones in the cigar store nearby. This meant that, instead of Reilly paying double for his cigars, Mike the Cigar Man footed the bill, wherefore Reilly had a license to be unusually genial.

Reilly Calls Little Girl a "Monkey."

"Hello, girls! Long ways from home, aren't you?" he answered, and as they smilingly admitted that perhaps they were the dealer passed on into his salesroom, where his salesman was looking over a new car, fresh from the factory.

"Who are your lady friends?" queried the salesman.

"Oh, they live up my way."

"Cute kids, aren't they?"

"They sure are—especially the bigger one. But that other one—she's a regular little monkey."

"That's not a nice way to talk about a lady," remonstrated the salesman. "What do you mean—a little monkey?"

"You couldn't notice it very well by seeing them once, but you couldn't help noticing it if you saw much of them. The little one is always with the other one, and she mimics her in every way she can. It is only the girl way of doing things, I suppose, but sometimes it makes me weary to see her imitate the big one. Girls have always been that way, and I suppose they always will be; but they make me think of monkeys every time."

"Well," challenged the salesman, "why pick on the girls; they're all good friends of mine. How about the men? Didn't you ever see a man monkey?"

Salesman Says There Are Men "Monkeys."

"I suppose there are a few," admitted Reilly, as he swung the right rear door of the car open and shut to see if it fitted properly.

"A few!" exclaimed the salesman. "A few is good; the trade's full of them. 'trade monkeys,' and you find them in every trade, especially in the selling end."

"Then they're 'monkey salesmen,' or 'salesmen monkeys,'" suggested Reilly.

"Whatever they are makes little difference, but what does make the difference is that they don't realize the damage they are doing themselves by copy-catting after somebody in the hope that by being like him they will be as good and as efficient as he is."

"Well, isn't one thing that is just like another thing just as good as the other?" asked Reilly.

Copying Man Cannot Be Complete Work.

"Yes," agreed the salesman, "provided it's a complete copy; but the men who start out to copy other men can go only so far; they can copy mannerisms, and ways of speech, and style of dress, but when they come to imitate the real inside man—that which is responsible for the man's success—they fall short. They have copied a few exterior points, and that is all."

"How do you happen to know all this?" asked Reilly, as the two moved into the office.

"Did you ever happen to have heard it said that experience is one of the greatest and best teachers?" asked the salesman.

"I once heard a rumor to that effect."

"Well, that's where I learned it; I once thought imitating a successful man would assure me success," replied the salesman.

"And it didn't," added Reilly.

The Salesman's Attempt at Imitation.

"Quite right. It didn't," asserted the salesman. "I had an idea when I was new in the business than as good a way as any of making good was to do as the older men in the business did, so I picked out a model and started to copy him. In the doing I was squelching my own personality at a rapid rate and I didn't know it. And I wasn't getting on as fast as I had hoped I would, either."

"What did you copy?"

"Well, for one thing, this man's name was Griffin and he had a crisp and assertive way of speaking, and I thought that inasmuch as he was making good I could do the same thing, or help myself some, by getting so I could talk as he did. I naturally do

Digitized by Google

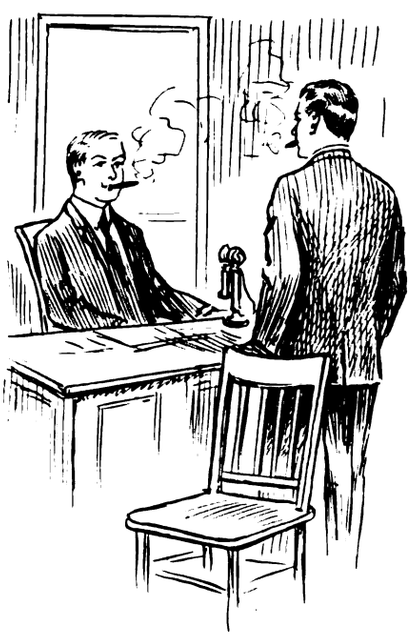
not talk that way, but I made myself do it and it didn't seem to fit. Finally, one day the boss, who had given me my job, wanted to know what had become of the tone and manner of speaking that I brought with me when I came there to work. He said he had liked it because it did not have the terseness that characterized some men and still rang true and was convincing. I asked him if I had changed in that respect, and he said he believed I had.

The "Griffin" Suit That "Made Noise."

"I didn't extend any particular explanation, but I proceeded at once to discard the Griffin voice and get back to my own. I actually got along better, too, for it was myself and my old voice that nature had given me working together as it had been intended they should. Also, Griffin used to wear checked suits and tan shoes and was somewhat flashy in his dress, and I thought I ought to do the same thing, too. I got a suit that was as near like his as I could get without having it the same thing, but I never felt natural in it.

"I always liked something more subdued, a blue or a black, or something like that, and the first time I put on that Griffin suit I felt as if people could hear it a block. Maybe they couldn't—but I could. After I thought things over and cogitated on what the Old Man had said, I wondered if I wouldn't do just as well if I trimmed the rough edges off my own personality and used it instead of trying to discard it and acquire one like Griffin's. One of the first things I canned was that Griffin suit, and when I got back into clothes that I liked I actually felt better and did better work in the bargain.

Each Personality a Harmonious Whole.



"Griffin was a trifle nervous and impetuous, and I tried to copy that, but without success. I never was so constituted, and it made a monkey of me right away; I felt foolish and I guess I acted foolish. The trouble with it all was that it didn't fit. I was made one way and Griffin another, and each of us was destined to get along fairly well the way we were made, and when I tried to fit some of those Griffin characteristics in with mine it was a poor combination."

"It's the same way with those two little girls," said Reilly. "The littler one would be just as cute as the other one and in her own way, but the cuteness she tries to copy is a flat failure."

"It's a case of subordinating personality," asserted the salesman. "No two people are exactly alike, although there are close comparisons now and then, and every man, I believe, can do the best work with his own personality. Griffin's crisp talk, impetousness and flashy clothes all went to make up a harmonious combination and no one noticed that there was anything wrong with any part of the whole; people who knew Griffin would have noticed it had he changed in any respect, and when anyone mentioned Griffin they immediately saw a picture of him as he was.

How Men Resemble Architecture.

"It's like architecture. One type or style is made up of harmonizing things, and it is the same with men. You put a Greek voice on a Louis the Can man and it doesn't fit. Neither does a Turkish pagoda suit hitch with an early Gothic walk."

"THEY HAVE COPIED EXTERIORS, AND THAT'S ALL," SAID THE SALESMAN

"Some architecture there!" commented Reilly.

"That's all right, I mean well anyway," added the salesman. "I may have got things a little mixed, but I don't believe you know the difference. If I started out to talk to a prospect and go at him hammer and tongs, as some salesmen can do, it would make a fool of me. I can't do it and I ought not to do it; I was cut out to do things in a different way and I can do my best in that way.

Many Things Worthy of Imitation.

"I don't mean that there is nothing worth copying, for there are many things about a man that are well worth imitating. If another dealer finds that you are holding a big trade through your service proposition, it certainly is up to him to imitate you; and not only should he imitate you, but if he is any kind of a dealer he should go you one better. If I find that another salesman is selling a certain style of car by catering to the women of the prospects' families it is a good move for me to do the same thing—only go him one better. Copying efficiency-making qualities is all right and is very helpful.

"Copying methods is legitimate and a worthy course of procedure, but copying mere exterior mannerisms of individuals is useless and all wrong. The whole business world of to-day has been brought to its present efficiency through copying and improving upon the business methods of others; this form of imitation makes progress, for the man who is copied and improved upon is obliged to go his competitor one better."

Smooth Off One's Rough Edges.

"Yes," supplemented Reilly, "and in the same way a man can enter into competition with himself. He can make his personality valuable to himself by smoothing off the rough edges and by improving upon it but without spoiling it. A man doesn't have to wait until he finds someone to imitate before he can do little things, such as deciding that he would look just as well if he kept his clothes pressed and didn't let his face look like a wilderness through lack of a shave.

"Any man with intelligence and self-respect should be able to do those things without any assistance and he ought to be capable of reasoning out without much difficulty that it doesn't look very gingery for him to lop around and lean on something every time he gets a chance. He need only give a little thought to himself and he will speedily discover various little things that might be remedied—that is, provided he can take an impartial look at himself.

Reilly Cites a Need of Improvement.

"Young Bergoman, down the 'row,' sits in his salesroom office with his feet on the desk and never takes them down until a prospect or a customer gets nearly to him. That's a part of the personality, I suppose; he's not the punchy, gingery type that some men are, and I wouldn't wonder but that he has a streak of laziness in him, but there isn't anything about him that prevents him acting like a gentleman and a business man. He wouldn't be subordinating his personality if he kept his feet off the desk and went out on the floor to meet his customers; he would merely be rounding off the rough edges."

"But supposing a man isn't able to polish off his rough edges unassisted; what's he going to do?" asked the salesman.

"Did you notice this polish?" asked Reilly, as he smoothed down his dome, where No. 9 and No. 13 had become crossed in a very annoying manner.

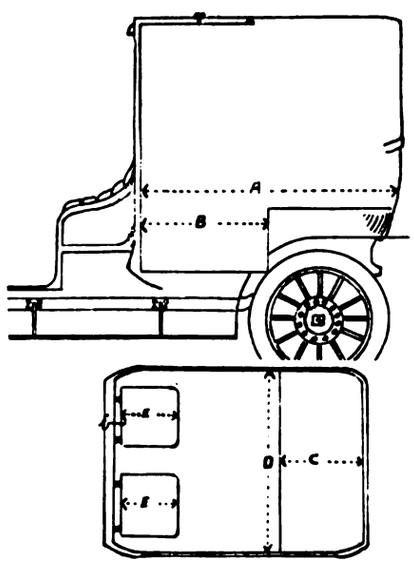
NEW YORK REORGANIZES ITS TAXICAB BUSINESS

Regulations Under New Ordinance Specify Certain Features of Construction and Make Plain Defects That Will Bar Cabs From Service—Raise Standards of Cabs and Drivers and Lower Rates.

New York City has revised its entire code of regulations governing the use and operation of taxicabs and all other vehicles which ply for public hire.

Rates have been lowered, protection has been furnished the public against exhorbitant charges, strict supervision has been established over the whole hack business, and the new ordinance, which went into effect August 1, not only sweeps away the hack stand privilege through which hundreds of thousands of dollars of a polite "graft" was paid to hotels, clubs and others by the taxicab companies, but it has more direct reference to both the construction and maintenance of cabs than is generally supposed.



During the past week the Mayor's Bureau of Licenses has been very busy straightening out the kinks in the situation, licensing chauffeurs anew, examining vehicles and taximeters, educating the cabmen in the new regulations and establishing the cab stands.

Standard of Taxicabs to Be Raised.

The primary object of the examination of vehicles is to raise the standard and ensure a neat, clean, comfortable and safe means of transportation for the public, and for this purpose the examiners have had printed a codification of the defects and faults which will cause a taxicab to be ordered out of service until it has been altered to conform to the official specifications. Some of these are defects of upkeep; others are due to factory construction, and not a few of the taxicab men have been surprised to learn that so many things could be the matter with a cab. It is not unlikely that some taxicab manufacturers, too, will be obliged to make alterations in their blue-prints.

It may be possible that there are cab makers who, in constructing their brakes and steering connections do not arrange to lock or pin the nuts which secure these parts, but the regulations provide that such must be the case. Also, exhaust pipes must extend beyond the rear end of the cab body and doors must be of a type which can be unlocked from the inside.

Another little constructional wrinkle which will be required after February 1, 1914, the date when new licenses must be taken out each year, is a little sliding shutter in the glass behind the drivers' head through which passengers may communicate with the chauffeur. Also, after the expiration of the present licenses no taxicab which seats four passengers inside shall have outside more than the single seat for the driver, this seat to be designed for one person only. And when a taximeter is affixed at the factory it must be placed on

HOW NEW YORK DEFINES TAXICAB SPECIFICATIONS

the side of the cab opposite the driver's seat.

There are, however, more important specifications to be regarded in building taxicabs. The city has specified certain body measurements which, unless they are observed, compel the cab to be listed as a "little taxicab," in which case it can carry and charge for but two passengers. They apply to the inside of the tonneau or rear seat compartment, are in the nature of a minimum measurement and are as follows: Front to back (A), 45 inches; front to riser of rear seat (B), 26 inches; depth of rear seat (C), 19 inches; width at front of rear seat (D), 41 inches; depth of auxiliary seat (E), 12 inches.

Must Provide for Carrying Baggage.

Provision must be made for a reasonable amount of baggage and some sort of a receptacle must be provided for the carrying of a rate card. Sightseeing cars must have the backs of the seats enclosed so that the occupant of a seat is not in danger of having his pockets picked by a "dip" in the seat behind him.

The regulations as to defects and faults upon which a cab may be rejected are:

Defective Axles—1. Bent axles (front or rear), dead axles (front or rear), or steering knuckles so worn or bent as to cause the front wheels to show a tread of more than three inches wider than the standard design of the vehicles. 2. Front wheels showing more than one inch out of line. 3 Rear axle shaft-drive wheels that run more than 1½ inches out of the true at any point.

Defective Steering Gear—1. Lost motion of more than one-quarter steering wheel turn with road wheels rigidly fastened. 2 Post insecurely fastened to chassis. 3. Loose ball joints on rods and arms.

How Broken Frames Bust Be Repaired.

Defective Frame—1. Broken side frames which have not been repaired with outside or inside steel plate of a cross section equal to or greater than that of the frame at the point of fracture, or which have not been welded, or which have not been trussed with steel rod of at least one-half inch diameter. 2. Sagged and bent frames. 3. Distorted side frames showing a sag or bend at any point of more than one-quarter inch per linear foot.

Defective Springs—1. Broken springs having more than one leaf in six broken at center point of axle. 2 Broken springs having any one of the top three leaves broken. 3. Springs so flattened as to give less than four-inch drop to frame with no load in vehicle. 4. Springs not tightly bolted to axles.

Defective Flooring—1. Any flooring not notched, fitted, screwed, bolted, buttoned or fastened in such a way as to preclude possibility of jarring loose. 2. Flooring with holes, not necessitated by construction, of more than nine inches area. 3. Floor boards less than three-quarters of an inch thick and supported at points further than 30 inches apart.

Defective Guards and Steps—1. Loose or missing mud guards, running boards or chain guards. 2. Mud guards that prevent full opening of doors or allow clothing to touch wheels or mechanism of car when

Digitized by Google

entering. 3 Chain guards that do not completely protect passengers' clothing on entering or leaving vehicle.

Defective Gas Line — 1. Gasolene pipes not soldered or screwed in place at every point. 2. Gasolene pipes and systems that leak at any point.

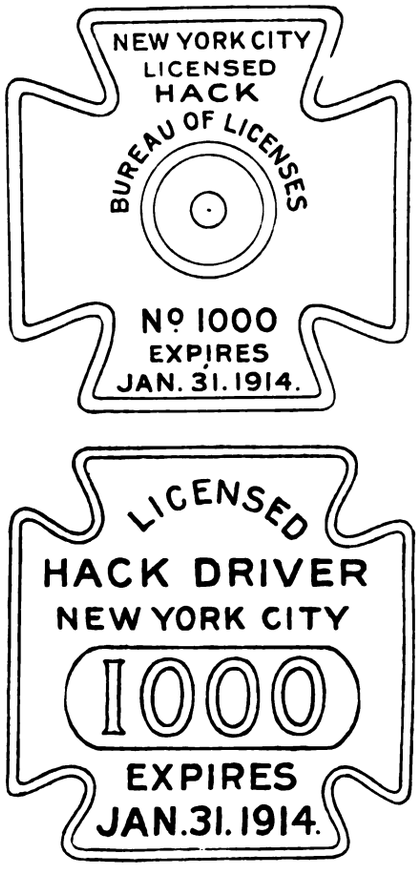
Defective Brakes — 1. Braking systems that do not have at least one set of brakes which will lock the wheels of the vehicle against the inertia of the car at any possible speed on dry, smooth pavement. 2. The maintenance of the brakes in perfect order of a motor hack is of the utmost importance, and this will at all times be insisted upon; and they will at all times be subject to inspection. 3. All brakes and steering connections secured with bolts must have such bolts fitted with nuts, the same to be locked or pinned. 4. These parts shall be subject to inspection at any and all times.

Specifications That Cover Engines.

Defective Power Plants—1. Engines that cannot be run without smoking. 2. Cars not equipped with muffler or silencer. 3. Exhaust pipes shall extend beyond rear end of cab body.

Defective Doors—1. Doors that will not shut securely so as to remain closed unless unlatched by hand. 2. Doors that cannot be unlatched from the interior of the vehicle. 3. All vehicles must be properly upholstered, painted and varnished.

Defective Tops and Glazing —1. Tops shall be of good quality and weather-proof material. 2. Bows shall be in good condition. 3. Joints between tops and main body on landaulet cars shall be tight and waterproof.



Glass.—1. Glass in both windows and doors must be clear and free from air bubbles, cracks or fractures. 2. Glass shall be set in frames of approved quality and shall be so arranged and fitted as to be noiseless. 3. No glass will be accepted that is so arranged as to obscure the view of the passenger. 4. Windows shall be so arranged as to be easily adjusted by passengers for ventilation. 5. On and after February 1st, 1914, no license will be issued for any motor propelled hack, unless provided with a small sliding shutter in the glass behind the driver's head.

Horse Cabs, Too, Have a Standard.

Horse-Drawn Vehicles — 1. All horse-drawn vehicles shall conform to the same standard as that required of motor vehicles, and a license will not be issued to any horse-drawn vehicle when horse, or horses, or harness does not come up to such reasonable standard of fitness as may be prescribed by the Chief of the Bureau of Licenses, or his duly appointed representatives. 2. Any hack drawn by one horse shall be a licensed cab.

Sightseeing Cars—1. The back of seats on sightseeing cars must be closed to prevent, as far as possible, the pockets of the passengers being picked. 2. The rates of fare under which such sightseeing cars operate must be permanently displayed.

Motor Hacks—Touring cars must seat at least four persons in the tonneau. Front

NEW YORK'S APPROVED CAB LABEL AND BADGE FOR ACCEPTED DRIVER

or drop seats must be adjusted so as to be easily raised and lowered by passengers. Provision must be made for a reasonable amount of baggage.

The regulations also provide that oil cans, waste, etc., shall not be carried on the footboard and that no advertisements or notices shall appear on the outside of the car except such as pertain to the owner. A robe must be provided between November 1 and April 1 of each year. No driver shall refuse to carry any reasonable amount of baggage, and when cabs are lined up at a stand the drivers of the first two in line shall be with the cabs and ready for a fare. Also, no driver, unless previously engaged, shall refuse to carry an applicant, although a prospective passenger may choose any car in the line.

When a car leaves the head of the line the rest must move up one position, and no cab may solicit passengers in front of any theater or other building by driving back and forth unless he drives two blocks past each time. Hotel men and others may, however, request the city to establish a stand for a certain kind of cabs in front of their place of business, "gas," horse or electric, but granting it is optional with the city.

Signs Tell How Many Cabs to a Stand.

The cab stands are designated by signs placed on the sidewalks at various places, specifying how many and what kinds of cabs may stand there. A sample reads, "Public Cab Stand, for 3 taxicabs on 110th street and 1 taxicab on Lenox avenue," and another, "1 taxicab and 1 horse cab on Broadway, 8 taxicabs on 49th street." The signs thus far employed are a metal sheet on an iron rod standard, but when the matter of wiping out the "graft" stands has been adjudicated, if favorably to the city, a more ornamental type will be employed.

In the case of horse cabs and others on which taximeters are not affixed, a mile shall be 20 blocks north and south in the numbered streets, as from 120th to 140th, and seven blocks east and west on numbered and lettered avenues, as from 1st to 7th avenue. Each driver will carry receipt blanks and must give a receipt when asked, thus affording a remedy in case of intentional or unintentional overcharging.

The terms applied to various vehicles plying for public hire have been determined as follows: Hack, any vehicle; cab, a two-passenger hack; coach, for four or more passengers; sightseeing car, a vehicle to carry seven or more for sightseeing purposes; taxicab, a coach driven by mechanical power and having a taximeter; "little taxicab," a mechanically propelled cab with a taximeter.

Undesirable Drivers Being Eliminated.

Stringent regulations are eliminating the undesirable class of chauffeurs, and the new group will be well informed as to the city if the examination they are being given is any criterion. A license will not be granted to an applicant unless he can read and write the English language, and is clean in dress and person; unless he is a citizen of the United States or has declared his intention to become a citizen; if he is under 21 years of age; if he is not strong enough to deal with the baggage of passengers; if he is deemed unfit from any infirmity of body or mind; if he unable to produce testimonials of good conduct from his last employer; if he is unable to produce at the office of the Bureau of Licenses two reputable citizens who will give sworn testimony as to his good conduct, as to how long they have known him, etc.; if he is addicted to the use of intoxicating liquors;

Digitized by Google

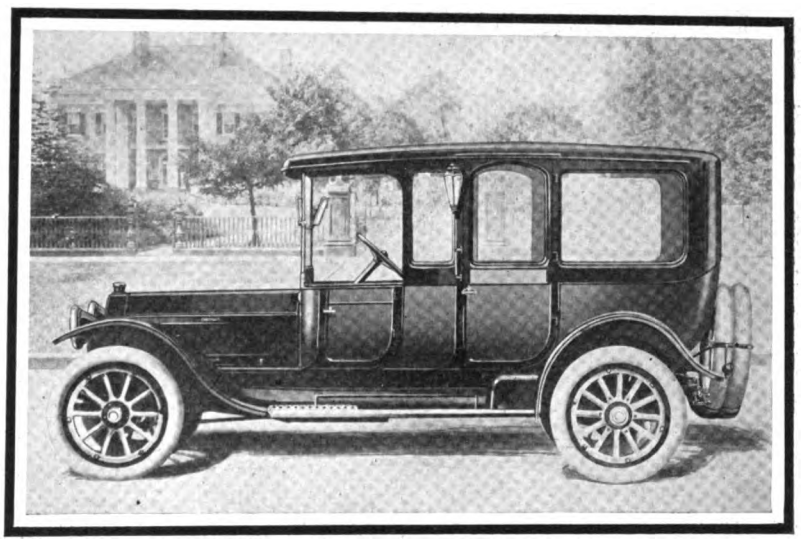
he is unable to answer satisfactorily questions as to his knowledge of the provisions the ordinance governing public hacks, the lice traffic regulations, the location of the veral railroad stations, steamboat piers, spitals, places of amusement, public ildings, etc.; if he is unable to produce o recent photographs of himself.

Cabs which are licensed have sealed upon ie right side of the dash over the hood a etal license tag and each driver, too, is iven a tag. The cab license number and ie new rates are contained on a card hich is fastened inside the cab where it an be seen by the passengers. If the taxieter has not been adjusted to conform to ie new rates the passenger is instructed ow to find the correct charge. The card ays:

"This taximeter is adjusted to register - cents for the first — mile or any part hereof, and 10 cents for each additional — nile. This is higher than the legal rate. o find correct fare, calculate mileage by he fare on this meter and pay according to he legal rates printed below. The number f this taxicab is ——.

"Legal rates: Single tariff for one or two passengers—30 cents for the first half mile or any fraction thereof; 10 cents for each additional quarter mile; 10 cents for each our minutes of waiting time; 20 cents extra or each trunk. No charge for hand baggage.

"Double tariff for three or more passengers—40 cents for the first half mile or any fraction thereof; 10 cents for each additional one-sixth mile; 10 cents for each four minutes of waiting time; 20 cents for each trunk. No charge for hand bagagge."



Simplifying Inches and Millimeters.

One of the results of the use of the metric system of measurements has been to confuse those who are not familiar with the divisions as compared with the inch standard, and to such the direct-reading millimeters-inches conversion scales that have been brought out by the Ward Leonard Electric Co., of Bronxville, N.Y., should be most convenient. The scales are six inches long, of flexible celluloid. On one side is the scale of inches, in the usual way, and against it the millimeter scale, so that any measurement within the capacity of the scale can be followed and read directly in millimeters. On the other side the millimeter scale adjoins the edge with the scale in inches back of it. Thus a measurement can be taken either in inches or millimeters and the conversion made instantly and directly. The fact that the device is designed for advertising purposes detracts not one whit either from the cleverness of its conception or its genuine utility as a means of making conversions.

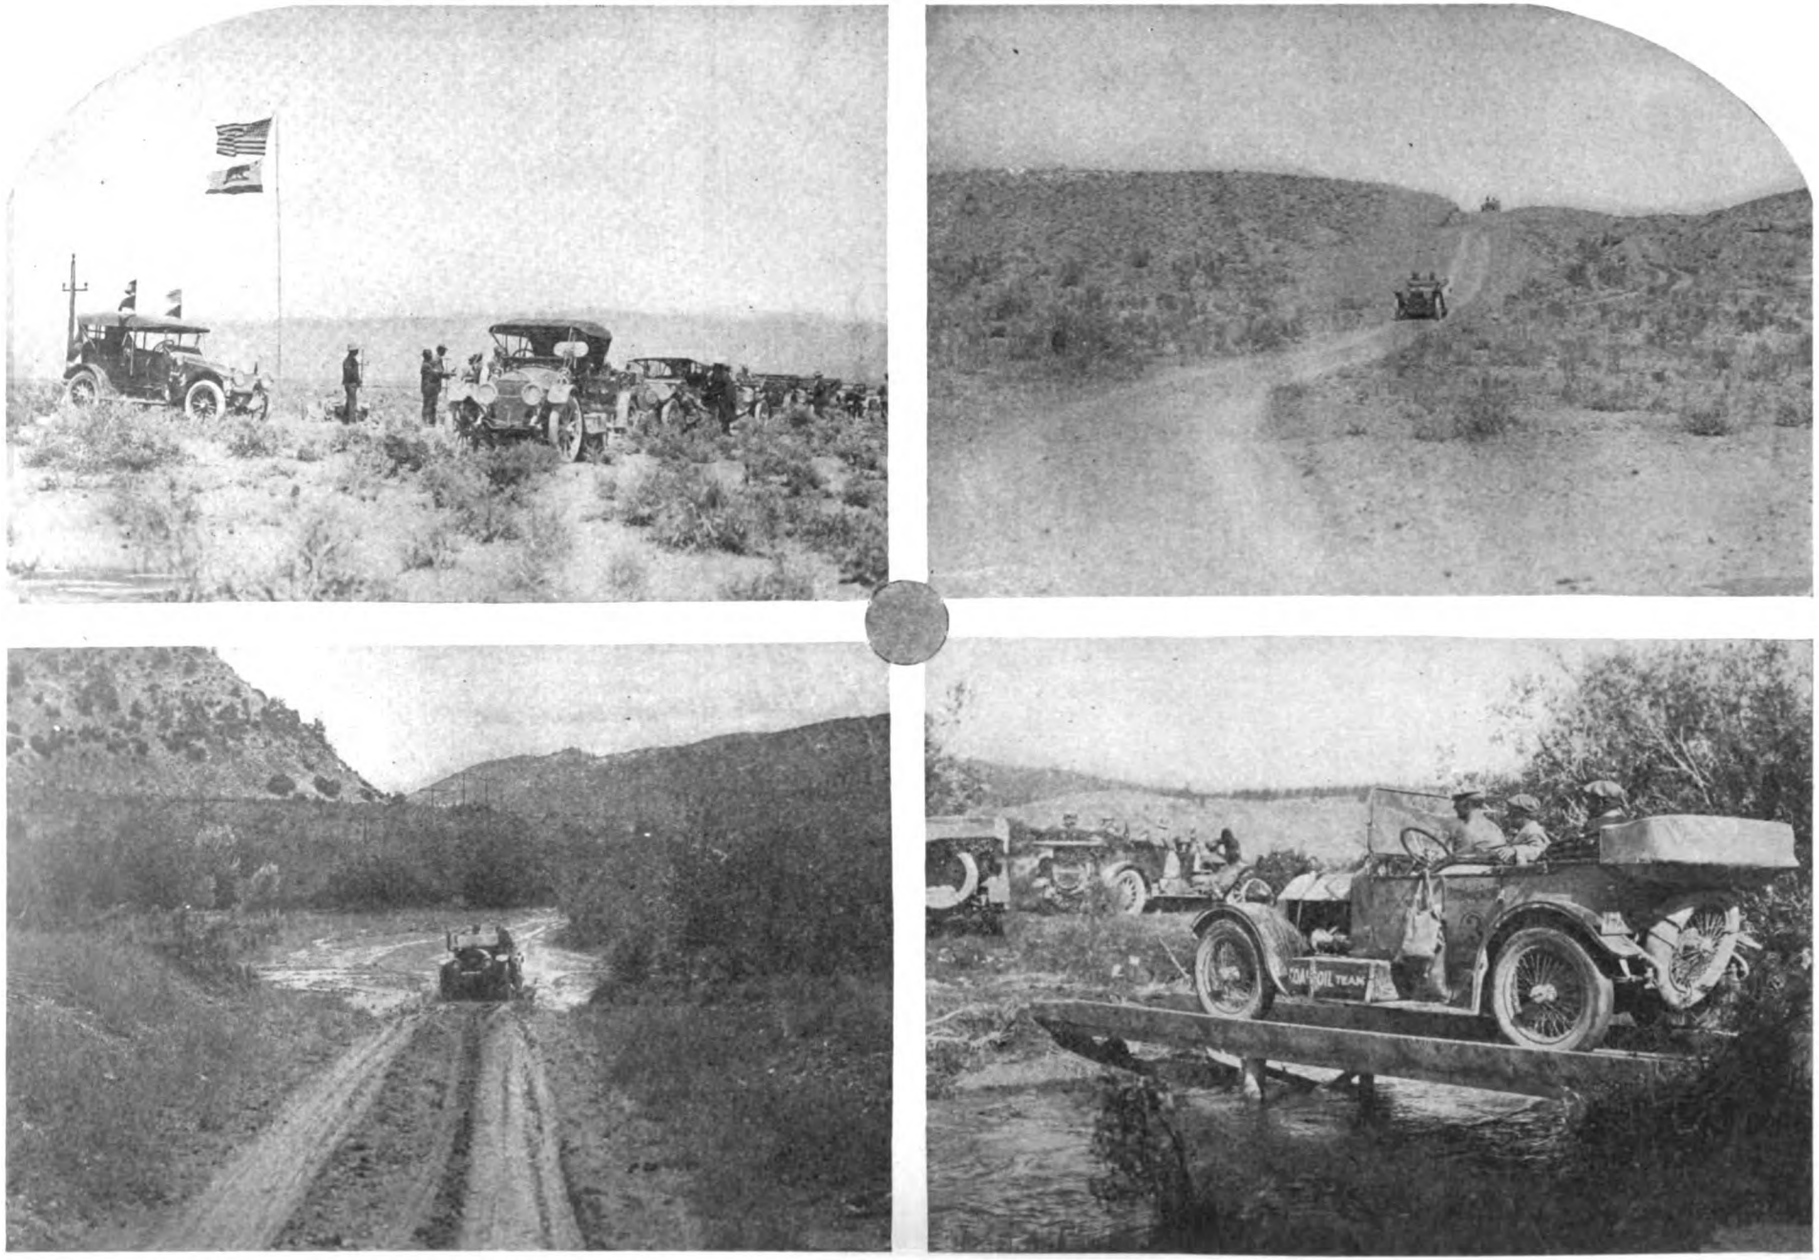
ENCLOSED CAR COMFORTS EXEMPLIFIED IN PEERLESS

Maximum Area of Glass and Minimum of Framework Give Unrestricted View—Interior Details Last Word in Refinement.

It is a difficult matter to make even a guess at what may be done by automobile manufacturers in the future to increase the luxuriousness of enclosed cars, so thoroughly are the possibilities of making improvements being investigated; but it is by no means hard to perceive a concrete improvement when it is built into a car, and for this reason the limousines, berlines and other enclosed bodies the Peerless Motor Car Co. is mounting on its three six-cylinder chassis of the latest series—38, 48 and 60 horsepower, respectively—are not a little conspicuous.

PEERLESS LIMOUSINE THAT IS PRACTICALLY GLASS-WALLED

The most striking feature, as the accompanying illustration makes plain, is the wide area of plate glass employed—in fact, there is so much glass that the view in all directions is practically unobstructed; the rear wall is provided with a window that is as liberal in its dimensions as those in the sides, and thus the chauffeur is enabled to look back and see clearly the road behind him without "taking observations" with the aid of a mirror. A considerable area of clear glass has been gained by eliminating framing and employing heavy plates of glass sliding in grooves. Side and partition windows are raised and lowered by means of straps, while the windows in the doors are moved by a patented handle device which, when turned, moves the glass and holds it in any position by means of automatic clutches.



The doors are so designed that they open practically flat against the body, which, however, they cannot touch. The full opening of the door is available. Electric steplights are automatically switched on by the opening of doors, illuminating the steps for entering or leaving passengers. The interior lights are of the pullman car type—that is, when not in use each lamp is concealed by a silver plate which, when a button is pressed, swings around and brings the lamp into position, at the same time switching on the current. Pressing another button causes the lamp to disappear and go out. The lamps are neatly and unobtrusively built into the corners.

The auxiliary seats, of a new type, controlled by the Peerless people, fold, when not in use, into the partition wall and are entirely out of the way. The backs of these seats are adjustable for height, so that either tall or short passengers can be made comfortable. The regular seats are improved in detail to such an extent that they are said to be even more easy than the seats of the older Peerless cars—which is highly complimentary to the new seats. Communication with the driver is through an electric telephone embodying the microphone principle, which reproduces spoken instructions more clearly than they can be transmitted by means of the usual speaking tube.

According to despatches from Pittsburgh, the American Petroleum Society has been organized in that city for the purpose of "studying the science of petroleum technology." One of the principal objects of the society, it is added, "will be to lower the cost of gasolene."

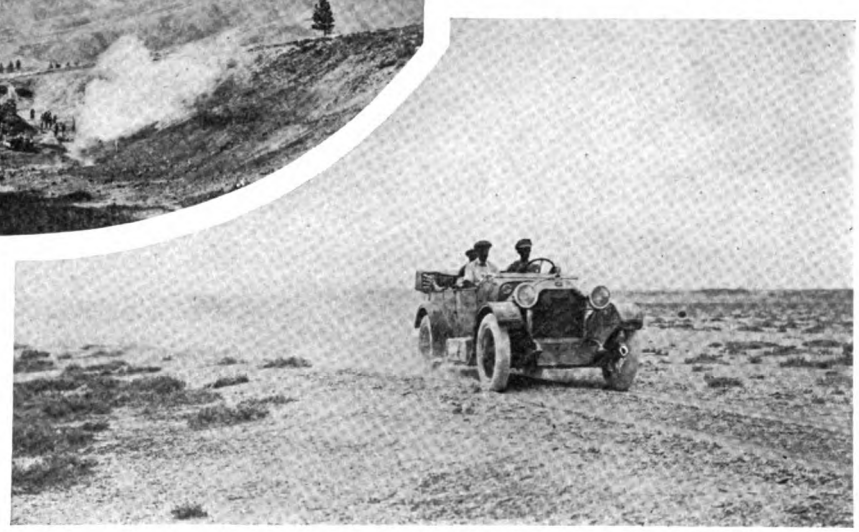
INDIANA "BOOSTERS" REACH END OF WESTWARD JOURNEY

Day Late in Los Angeles, but All Finish in Good Shape — Californians Extend Enthusiastic Welcome to Hoosiers.

It's all over but the shouting, and even the official shouting is over, but to keep an Indiana "booster" from shouting on any and all occasions is a yet unaccomplished task; but the tour of the "Indiana made" tourists from their State to the Pacific Coast has officially terminated, the party having rolled into its destination, Los Angeles, last Sunday, 3rd inst.

WHERE MOUNTAINS RISE IN GRANDEUR

All the way they "boosted" Indiana, and all the way they talked for the Lincoln highway, that great thoroughfare which they helped to blaze and which is in fair prospect of being a real automobile road some day. Former Mayor Bookwalter of Indianapolis made speeches without number and Carl G. Fischer of Prest-O-Lite and Speedway fame made even a few more than that, and everybody talked Indiana until some of the natives who are not familiar with their geographies picture the Middle West as a big section labeled "Indiana" with a few no-account patches of land around the edges.



San Francisco gave the tourists a royal welcome and, in fact, all the California towns did the same; of course, some of them have not so many people as has San Francisco, but they made noise in proportion. The trip through California, from the time the Nevada line was passed, was the bright spot in the tour, for the roads were better; but even with better roads the tourists were disappointed in what California had to offer in the way of highways and those Golden Staters who had been so wildly enthusiastic about California "boulevards" were voted into the Ananias Club without a dissenting vote.

The party arrived in San Francisco Monday, July 28, as stated in Motor World last week, and spent several days rambling around the Golden Gate and taking in the sights of the metropolis of the Pacific Coast. But even if they did have a good time, they couldn't stay forever, so they pulled up stakes and set out for Los Angeles, the last lap of the run, Thursday morning, and the cars made easy time down through the Santa Clara valley to Del Monte. Summertime is flower time in California, and many of the party were treated to sights they had never seen before. Although it was but 150 miles, the tourists took from 8 o'clock in the morning until 5 o'clock in the afternoon to make the trip. And everywhere was the enthusiastic California greeting.

Thursday night, 31st, was spent at Del Monte, and the next morning the cars were rolled away toward old Monterey, a few miles distant, where historic scenes abound. Turning southward again, the Indianans passed through the Salinas valley and over the Santa Margarita mountains, traversing innumerable small towns en route. Just before noon the old San Miguel mission was passed and the midday stop was made at the Hot Springs hotel, a noted resort.

At times the route from San Francisco south lay along the beach, and on one occasion the tourists found the tide encroaching upon the highway they had picked out, but just to demonstrate that folks from Indiana are somebody, they drove with their wheels in the wash of the sea. Someone said they stopped the tide, but that sounds like an Indiana story. After 150 miles of this pleasant travel, the cars arrived in San Luis Obispo at 4 o'clock in the afternoon, and the night of the 1st inst. was spent in this little old community.

Kodaks were set clicking the next morning on the southward journey when the cars went up the steep grade of San Marcos pass, which, while no slight ascent, was negotiated without difficulty because of the excellent highway; only 119 miles were made that day, and the travelers rested when they reached Santa Barbara at the end of a roadway which led beneath luxurious magnolias, some of them 90 feet high.

DESOLATION—AND THERE WERE MILES AND MILES OF IT

On the morning of the 3rd inst., last Sunday, the final stretch of the trip was begun. The tourists seemed to feel the approach of a demonstration, and long before they arrived in that city they were aware that they would get a welcome; it really started when Los Angeles dealers representing each of the makes of Indiana cars met the party at Santa Barbara to make the 105-mile run to the final goal, and outside Los Angeles there were cars and more cars. Someone said there were 1,000. Maybe there were; no one had time to count them. A run down to Long Beach to the ocean was planned to complete the trip.

ELECTRICITY AND ACETYLENE FINANCIALLY CONSIDERED

Ward Leonard Engineer Takes up Cudgels for Electricity—Gives Figures for Generator, Battery and Motor Operation.

To the Editor of Motor World:

I was very much surprised to see on page 29 of your issue of July 24th, an article headed "Counting the Cost of Lighting by Electricity."

The first part of this article is evidently supposed to be written by some one in the employ of the Motor World Publishing Co. and has the authority of that company. The balance quotes from an article written by an employe of a concern whose interest is in discounting the great advantages gained by electric lighting of motor cars.

Of course, no one ever thought he could produce power by means of a dynamo without putting power into it, but I cannot understand just why your part of the article should assume that the power produced by the average dynamo is 35 amperes and 7 volts, with 50 per cent. efficiency, when the average dynamo actually gives from 8 to 10 amperes at 7½ volts.

An actual test on a stock dynamo of one of the large concerns with a constant current output of 10 amperes into a battery, shows that at all normal engine speeds the power necessary to drive the dynamo averages about .21 horsepower.

Your figures show a power necessary to drive the dynamo of over three times that which these tests show.

Now, in regard to some of the statements made by Mr. Combs. Mr. Combs says: "The result of these tests shows that from 5 per cent. to 12 per cent. of the fuel fed into the engine of an electrically lighted car is consumed by the electrical apparatus."

Let us analyze Mr. Combs's figures. If a car were driven some 6,000 miles in the course of a year at an average of 16.5 miles per gallon, as in case two, the gasolene cost (at 18 cents per gallon) will be $65.52 for the year. Now, if 7.8 per cent. of the amount of gasolene used is used by the electric dynamo, as per Mr. Combs's figures, this will mean a total gasolene cost for light of $5.11, which is undoubtedly decidedly less than the cost of lighting a car by means of gas and oil during that period.

Another statement that is rather interesting is: "The discharge rate for two average headlights and one tail light is between 9 and 11 amperes."

Motor World shows deplorable lack of knowledge in publishing such a statement.

The average headlight has a 16 candlepower bulb and takes less than 3 amperes. The average rear light has a 2 candlepower bulb and takes less than ½ ampere.

The average pair of 16 candlepower headlights and 2 candlepower tail light will take about 6 amperes, and even if the customer uses 21 candlepower headlights (the largest used in ordinary practice), he would not get anywhere near the 9 amperes discharge rate mentioned.

Mr. Combs further states: "The dynamo must generate close to 14 amperes if the battery is to be charged at all, for the owner who does most of his driving by night and little by day."

This statement is just as incorrect as the former ones, and a charging rate of 10 amperes is ample for any owner who has 21 candlepower headlights and 2 candlepower or 4 candlepower rear light, and drives all the time at night.

The statement that "Some of the cars of the Indiana-Pacific Tour have had to burn their lights a few hours each day in the day time to keep from overcharging the battery" is incorrect, and if any drivers did it they did it through ignorance.

Another statement is: "Storage batteries used for both starting and lighting are having an average life of less than one year. Batteries used for lighting alone are having an average life of considerably less than two years."

My experience in the electric lighting and starting field has been rather extensive and dates back to the beginning of this development. Practically all batteries that have been on cars with lighting systems under my observation in the last three or four years are still in use without giving any trouble whatsoever. Batteries in use for over a year are universally giving perfect satisfaction, with no signs of when their useful life will cease.

I note the statement in regard to instruction books I take pleasure in enclosing herewith pages 18 and 19 of a circular which gives you all the instructions which one of the largest companies finds necessary for the care of the system.

I am interested in the statement: "It must be remembered that when a motor car maker adds 200 pounds of electrical equipment," etc., because this is another exaggeration similar in its type to those already mentioned.

One system such as is used by cars having an engine the size of some of those mentioned in Mr. Combs in his article will weigh a total of about 130 pounds or less, including the weight of the wires, cables, switches, dynamo, motor, battery, gears, etc. Subtract from this the weight of the usual storage ignition battery, which weighs between 30 and 40 pounds, and the weight of the type B Prest-O-Lite tank, which weighs some 25 pounds, plus the weight of the heavier lamps necessary if gas and oil are used, and you will find that the motor car maker is adding to the weight of his car very little indeed.

I trust you will give this letter the same prominence that you have given the statements by Mr. Combs.

LEONARD KEBLER.
President Ward Leonard Elec. Co.

[The first part of the article referred to in the foregoing letter was intended solely to explain the method of calculating the power absorbed by a dynamo. The figures were assumed arbitrarily for the purpose of illustration only and were not stated to represent the output of the average dynamo and were not intended to do so.—Ed.]

INDIANA "BOOSTERS" REACH END OF WESTWARD JOURNEY

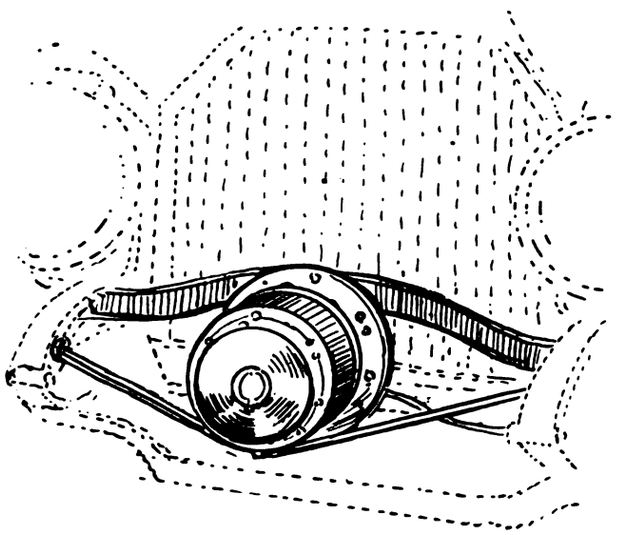
(Continued from page 31.)

The Los Angeles reception was truly enthusiastic, but was clouded by the fact that the local dealers' association used the occasion to boost a suburban real estate addition which had just been opened.

The list of cars was made up of two Americans, two Marions, one Premier, two Hendersons, two Haynes, one Pathfinder, one McFarlan, two Appersons, one Empire, one Pilot, one Marmon, one Premier truck and one Brown truck—18 in all.

The cars claim a clean score; the Brown truck, which had been overloaded with baggage and supplies and which became stranded in the Rockies, cut across from Big Pine after entering California, and, omitting San Francisco from its schedule, caught up with the party near Los Angeles, so that every car that started was on hand at the finish. That is, with the exception of A. L. Westgard's Premier, which he drove north to Portland, Ore.

As to schedule, the cars were a day late, due to a bit of over-scheduling in the rough Nevada country. They started from Indianapolis July 1 and, while they should have reached Los Angeles August 2, they arrived the following day, taking 34 days.



As to distance, several registered 3,740 miles, but Ray Harroun did so much demonstrating with the kerosene carburetter on his Henderson that he traveled 4,015. This he made on 258 gallons of kerosene, costing $31.68, and 6 gallons of oil, costing $2.40, wherefore he figures his cost per mile at ¾ cent and his average fuel consumption at 15½ miles to the gallon. A car of about the same size and weight as the Henderson but using gasolene averaged 14 miles to the gallon and its fuel and 38 gallons of oil cost $110—about three times what Harroun spent.

MOTOR STARTING ENERGY COILED UP IN SPRINGS

Construction and Operation of Four Types of Mechanical Starters That Rely on Spring Tension—Ease of Installation, Light Weight and Simplicity That Mark Them—Rewinding by Motor Power and Momentum.

In the field of the true mechanical engine starter, which differs in several respects from the pneumatic apparatus which has been illustrated and described in the last two issues of Motor World, it is doubtful if there is anything simpler—barring pedal and lever operated devices, of course, which form a separate division of engine starters—than the spring-operated mechanism which is completely enclosed and self-contained and may be attached almost by any one of average intelligence; it is a single unit.

EVER READY SPRING STARTER INSTALLED

VOLKMAR CRANKING DEVICE IN SERVICE

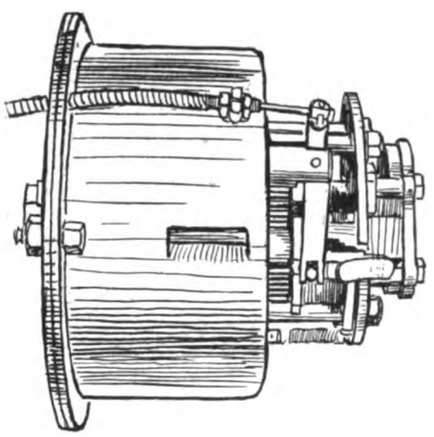
In its particular sphere, this type of starter has a number of features that recommend it and that should go far toward increasing its popularity. In the first place it is very light; probably it is lighter than any other form of starter with the exception of the various forms of manually or pedal-operated apparatus. In the second place, it is exceptionally simple to attach and it can be applied to any make of car regardless of model or age or power; it is fully automatic, never requires attention once it has been properly installed and it performs its work with the minimum of exertion on the part of the operator.

Obviously, the statement to the effect that such devices never require attention after they have been installed, requires slight modification, for no piece of machinery, regardless of class, will operate indefinitely and prove efficient if it is let too severely alone. Where metal moves against metal, lubrication always is needed if friction is to be (practically) eliminated and wear reduced to the point where it is negligible. Hence, any of these devices will require a couple of squirts of oil now and then, though in applying it care should be taken to follow the instructions of the manufacturer; generally, each manufacturer supplies with his apparatus an instruction book telling what to do and what not to do, and if these instructions are followed implicitly it may be expected, without fear of disappointment, that the apparatus will prove quite satisfactory — provided it is not abused.

Winding Up the Big Springs.

But to get back to the starters themselves: Spring operated devices are of two kinds, and almost without exception both kinds employ long steel springs coiled concentrically with the engine crankshaft. In one kind, the spring is rewound after it has performed its function of starting the motor, by the motor itself; in the other kind, the spring is rewound not by the motor but by the car, or rather the momentum of the car, and this distinction forms an important difference between the two types. In the former type, the engine must be started by the spring before the spring can be rewound for the next start—unless a hand winding crank is used, of course—whereas in the second type the spring can be rewound without using a hand crank, simply by rolling the car along the road, or by permitting it to coast down a slight declivity.

Among starters of the first kind, the Ever Ready, which is produced by the American Ever Ready Co., of New York City, probably is as well known as any for its installation on a great number of cars, and its successful use for a number of years has made it a fairly familiar sight on the highways and byways. In appearance, it looks for all the world like an inverted headlamp; and it is just about the proper size to complete the illusion. For the average four-cylinder motor of say, 4⅜ inches bore or less, the polished brass casing measures just 8½ inches in diameter and 10 inches in length from back to front; for larger motors the casing is one inch longer and for smaller ones it is 1½ inches shorter, the diameter remaining the same in any case. The neat appearance of the starter as it looks applied to a car is shown by the accompanying phantom sketch.



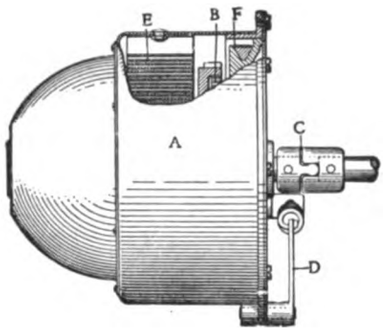
The entire mechanism of the device is contained within the brass housing; there is nothing outside this case except the pedal which releases the coiled up energy that starts the motor. In the partly sectional drawing of the starter that is reproduced herewith, the various parts are quite clearly shown. The principle element, of course, is the spring, or rather the springs, for there are two of them; they are designated

Digitized by Google

E and they are powerful enough, by the way, to give the motor anywhere from six to eight complete revolutions at a rate of about 300 revolutions a minute. Hence the starter may be expected to provoke responsive kicks from a motor even if the start is made on magneto ignition.

Spring Releasing Mechanisms.

When these two powerful springs are released by depression of the pedal provided for the purpose, they kick the crankshaft around because their tension is greater than the compression of the motor; this is the theory upon which all spring starters operate. Then when the engine has started and the pedal is released, the springs automatically are rewound for the next start. To make this operation easy, the rewinding is done through a train of gears, designated B in the accompanying sketch. When the springs are fully rewound, which requires just 26 revolutions of the motor and therefore is done in a few seconds, the winding mechanism automatically is released and the brake band F clamps down tight, holding the springs for the next start.



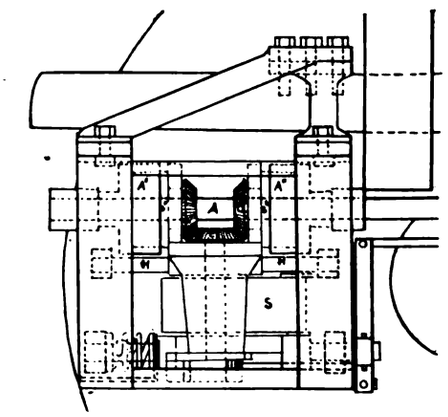
VOLKMAR SPRING STARTER

What to Do When Motor Balks.

If the engine should fail to start under the persuasion of the springs, which is unlikely because of the speed at which the crankshaft is rotated, the springs can be quite easily rewound by hand with a small crank that is provided for the purpose. Similarly, if the starter is damaged by collision, or by anything else, the motor can be cranked by hand, and this feature is further desirable because it permits the crankshaft to be rotated slowly by hand for grinding in valves, for instance, or for timing them. In the picture, the release lever is designated D; A is the external casing and C is the universal coupling between the starter and the engine.

The Volkmar, which is produced by the Volkmar Auto Starter Co., of New York City, is another somewhat like the Ever Ready; it spins the srankshaft around just as it would be spun by hand, which is the way automobile motors are supposed to be started. Like the Ever Ready, the Volkmar relies upon the energy represented by two coiled up springs contained in a brass casing that is mounted in front of the radiator and attached to the forward extension of the crankshaft nominally occupied by the hand crank. These springs are two inches wide and no less than 12 feet long and when they uncoil their power is sufficient to crank the engine from six to twelve revolutions, depending upon the size of the motor and its condition. A small dash pedal serves to release the springs, and once their work is finished they are rewound automatically for the next start.

EVER READY DETAILS



How Internal Details Differ.

The internal economy of the Volkmar starter, however, is quite a little bit different from that of the Ever Ready, as the accompanying drawing shows. Instead of being held by a brake band clutch, the springs are held in readiness by a positive dog clutch which performs two functions. This clutch is keyed to the starter shaft in such a way that it is free to move along the shaft under the control of the spring releasing pedal. When the starter is at rest with the springs wound, the center shaft and the clutch rotate freely with every movement of the engine. As soon, however, as the spring tripping pedal is depressed, the sliding clutch moves back and gears on its back face engage gears on the face of the spring arbor, thus making the spring, arbor and clutch to all intents and purposes a solid piece. The same movement of the clutch releases the springs, thus cranking the engine.

After the engine has started and the operator's foot is removed from the pedal, which returns to its normal position under the action of a small spring, the sliding clutch is moved along its shaft, disengaging the gear in mesh with the spring arbor and engaging gears on its other end with the rewinding pinion. The two starting springs then are rewound through a train of gears by the engine, and when they are rewound to the proper tension a simple Geneva gear automatically disengages the engine from the rewinding pinion. The engine then continues to run and no parts of the starter except the central shaft remains in motion. For motors up to 30 horsepower, the Volkmar starter weighs complete 35 pounds, and for larger motors—up to 60 horsepower—the weight is 45 pounds.

Bigger and Heavier Construction.

The Tudor starter, which is produced by John W. Tudor, of Boston, Mass., is entirely different from either of the two devices already described, although it belongs in the same general class with them; which is to say, the coiled spring is rewound after it has started the motor by the motor itself. The general layout of the mechanism, which is rather larger and heavier than either of the other two, is shown by the accompanying sectional views; the device complete weighs about 75 pounds and it is powerful enough to crank a heavy motor three revolutions at high speed without rewinding the spring.

TUDOR BEVEL GEAR DRIVE

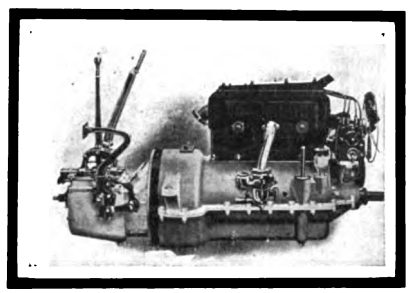
Starting Drive Through Bevel Gears.

The spring in the Tudor starter is not mounted concentrically with the engine crankshaft, as it is in every other spring starter; instead, it is carried on a short shaft at right angles to the crankshaft extension, to which it is geared as shown. On the crankshaft extension there are two bevel gears facing each other and the shaft that carries the spring is geared to both of them. These two gear wheels, however, are free to rotate on the crankshaft extension shaft under normal conditions. When the engine is to be cranked, the controlling pedal is depressed and this operation serves to clutch one of the crankshaft extension gears to the shaft and at the same time to release the spring which cranks the motor through the gearing. When the pedal is released, the first gear automatically declutches from the shaft and the other is

Digitized by Google

utched, thus turning the shaft carrying ie spring in the opposite direction and re-inding the spring for the next start; the pring is held in its coiled position by an rdinary ratchet and pawl mechanism which s not shown in the picture. With this de-ice, as with the others, a hand crank for se in emergencies is supplied and can be ttached in the good old-fashioned way vhen necessary.

The Warner Gear Company's starter, which is made under Gardner patents by he Warner Gear Co., of Muncie, Ind., is he only spring engine starting device on he market in which the spring is rewound by the momentum of the car; hence it is still different from any of the others and rightfully belongs in the second class of starters of the kind.

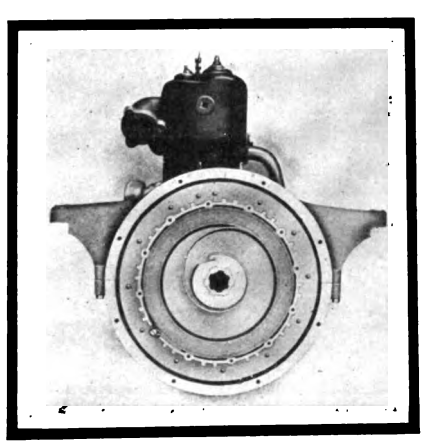


Winding Up by Momentum.

Two views of the Warner mechanical starter are shown herewith, and both of them have been reproduced from actual photographs; in the first of them there is shown a complete unit power plant to which the starter has been attached. In the picture, the black spacing ring shows the space actually taken up by the starter and also makes plain just where it is applied. The second picture shows an end view of the same engine after the gearset and clutch have been removed, showing the heavy spring coiled and ready for action as it is applied within the unit housing.

In its simplest aspect the Warner starter is nothing more or less than a connecting link between the engine and the gearset. To make the apparatus clear, it may be likened to a propeller shaft brake drum that contains a heavy coiled spring acting as the connection between the drum and the propeller shaft; when a brake band is clamped around the drum, the drum remains stationary and the spring winds up around the propeller shaft, and when it is fully wound the band will slip on the drum. If the motor is stopped the band will hold the drum and the spring until released, when the spring will unwind and in doing so will crank the motor.

In actual practice, the Warner starter consists of a special steel spring of tremendous strength, 42 feet in length and three inches wide. This spring is securely coiled within a large drum which forms the inside driving spider of the large face multiple disk clutch. One end is hooked securely around the main drive member, as shown in the accompanying picture—this hook, by the way, is an important feature, for it prevents the spring unwinding more than half its length—and the other end is attached to the outer edge of the drum.



The operation of releasing the spring is controlled by the regular clutch pedal, which is mounted so that it can be moved to engage either one of two small levers; its movement, however, is controlled by the gear shift lever and it is impossible to release the starting spring unless the gears are in neutral. A slight depression of the clutch pedal, after it has been moved to

WARNER STARTER APPLIED

engage one of the small sub-levers, releases the spring and starts the motor. The spring is calculated to "spin" the average four-cylinder motor 16 times at a rate of speed equal to from 900 to 1,000 revolutions a minute. Further depression of the clutch pedal, after the car has been started and has gathered speed, applies the service brake, which is virtually the casing to which the outer end of the spring is attached, and in this way the spring is rewound, not by the engine but by the momentum of the car transmitted through the propeller shaft.

Obviously, if the operator should neglect to apply the service brake after the motor

WARNER INTERNAL ECONOMY

had been started, the first time he applied it to bring the car to a halt, the spring would be wound automatically and ready for the next start. Due to the tremendous power represented by the momentum of the car, the rewinding operation is exceptionally quick; it is pointed out by the manufacturers that it requires less time to rewind the spring than it does to unwind it in starting the motor. The actual weight of the starter complete is but 40 pounds.

As obvious as it must be to those who are thoroughly familiar with motors and motor cars, it evidently is not so obvious to others, that the operation of any engine starter, regardless of how it operates—the system on which is operates—is quite as much dependent upon the condition of the motor as it is upon the starter; otherwise they would not put themselves in the class with the novice who attempted to start his motor with the gasolene turned off and then wondered why he got no results! It should be plain that if any kind of a starter is to be expected to start the motor then the motor must be capable of being started. In other words, the throttle must be opened the proper amount and the spark advanced the correct degree and the ignition current switched on. Unless all these things are done it certainly will be necessary to wield the hand crank, if not to start the motor, then to wind up the spring.

In this respect the electric starter or the pneumatic starter has a little the advantage of the spring device, for if the motor does not start promptly with the former the trouble can be remedied and the crankshaft given another whirl merely by pressing a button. But just as the operator learns that he must set spark and throttle and ignition to start by hand or by electricity, so will he learn to set them to start with a spring—even if he has to learn by experience and that experience means one or two muscular encounters with the starting crank.

Proper Method of Cleaning Upholstery.

The well-known cleansing properties of gasolene make the temptation to employ it for cleaning the leather of the upholstering a strong one; but gasolene has the unfortunate effect of dissolving the enamel on the leather, so that the finish is removed along with the dirt. According to one who knows, nothing is better than white castile soap and warm water as the best cleansing agents for leather of the kind used for automobile seats, and the washing and drying should be followed by a rubbing with a soft cloth sprinkled with a few drops of olive oil, the last vestige of which should be removed with a dry, soft sloth.

Owing to a misunderstanding of terms, the description in last week's Motor World of the latest series of Stearns-Knight cars made it appear that the spark and throttle levers have been placed under the steering wheel, whereas it is the switch, carburetter, lighting and horn controls that are in the neat casing on the column under the wheel. The gearset of the four-cylinder model, which formerly was mounted on the rear axle, now is mounted with the motor, forming a unit power plant.

1,047,538. Spring Tire for Automobiles or Other Vehicles Gottleib A. Krautter and William M. Krautter, Marion, Ohio. Filed July 21, 1911. Serial No. 639,863. (Tire formed of spring-supported sections.) 3 claims.

1,047,548. Casolene Gage for Automobiles. Chas. E. Miller, Reading, Pa., assignor of one-third to Jos. M. Keenan and one-third to Edward H. Filbert, Reading, Pa. Filed July 20, 1912. Serial No. 710,538. (Glass gauge resembling water gauge of a boiler.) 4 claims.

1,047,573. Apparatus for Electrical Ignition Systems. Max Schafer and Robert Wagner, Stuttgart, Germany, assignors to The Firm of Robert Bosch, Stuttgart, Germany. Filed April 9, 1912. Serial No. 689,579. (Terminal arrangement for high-tension distributer.) 5 claims.

1,047,594. Expansible Core for Repairing Tires. Elno H. Trump, Akron, Ohio, assignor of one-half to John K. Williams, Akron, Ohio. Filed Sept. 18, 1911. Serial No. 649,929. (Repair core expanded by forcing wedging members into filling of small balls or the like.) 5 claims.

1,047,595. Speed-Regulating Carburetter. John F. Twigg, San Francisco, Cal. Filed Nov. 8, 1909. (Fuel valve controlled by speed of ingoing gas.) 18 claims.

1,047,611. Gradometer. Frank A. Bradley, Washington, Mo. Filed Feb. 7, 1912. Serial No. 675,978. (Quadrant with indicator actuated by pendulum.)

1,047,620. Pneumatic Wheel. James M. Dennis and Russell R. Dennis, Cambridge City, Ind., assignors, by direct and mesne assignments, to International Pneumatic Wheel Co., a corporation of Indiana. Filed Nov. 23, 1911. Serial No. 661,877. (Wheel with plunger-and-cylinder spoke arrangement, and compressed air chamber in hub.) 6 claims.

1,047,621. Pneumatic Wheel. James M. Dennis and Russell R. Dennis, Cambridge City, Ind. Filed Jan. 15, 1912. Serial No. 671,265. (Wheel with plunger-and-cylinder spoke arrangement, and compressed air chamber in hub.) 4 claims.

1,047,642. Vehicle Wheel. Adolph Jaeger, Jackson, Mo. Filed Oct. 28, 1910. Serial No. 589,522. (Wheel with plungers cushioned against air-bag in hub.) 5 claims.

1,047,650. Frame for Automobiles. George Hill Jones, Aldan, Pa. Filed April 25, 1910. Serial No. 557,311. (Frame with integrally formed radiator frame.) 5 claims.

1,047,660. Casing for Vehicle Springs. Louis F. Kuhn, Cananea, Mexico. Filed April 17, 1912. Serial No. 691,328. (Housing to enclose spring joints.) 4 claims.

1,047,705. Resliient Wheel. Harry L. Rice, Chilhowee, Mo. Filed Oct. 23, 1911. Serial No. 656,246. (Wheel with curved spring spokes.) 3 claims.

1,047,741. Spring Wheel. Frederic W. Brown, New Orleans, La., assignor of one-fourth to Anthony Ten Eyck Brown, Atlanta, Ga., and three-twentieths to Lydia M. Brown, New Orleans, La. Filed Feb. 8, 1921. Serial No. 676,267. (Wheel with two sets of small semi-elliptic springs, linked together, between inner and outer rims.) 10 claims.

1,047,803. Inner Tube for Automobile Wheels. Daniel W. Harris, Platte City, Mo. Filed April 3, 1912. Serial No. 688,252. (Spiral inner tube of spring metal.) 1 claim.

1,047,817. Windshield. Frank Knight, New Haven, Conn. Filed Dec. 12, 1911. Serial No. 665,230. (Windshield adjustable for both height and inclination.) 3 claims.

1,047,839. Revolving Cylinder Internal Combustion Engine. Charles Benjamin Redrup, Canton, Cardiff, England. Filed June 15, 1911. Serial No. 633,337. (Revolving cylinder engine with staggered cylinders.) 8 claims.

1,047,860. Internal Combustion Engine. Willard Irving Twombly, New York, N. Y., assignor to Twombly Motors Co., New York, N. Y., a corporation of New York. Filed Aug. 15, 1910. Serial No. 577,178. (Valve system in which exhaust valve stem works through intake valve and stem.) 8 claims.

1,047,886. Driving Mechanism for Automobiles. Carl M. Clark, Philadelphia, Pa., assignor to Simon Friedberger, Philadelphia, Pa. Filed May 4, 1912. Serial No. 695,132. (Electric motor with direct shaft drive to rear axle.) 4 claims.

1,047,888. Resilient Vehicle Wheel. Joseph Gaynor, New York, N. Y., assignor to Standard Resilient Wheel Co., Inc., New York, N. Y., a corporatio n. Filed Aug. 10, 1912. Serial No. 714.340. (Wheel with helical springs and jointed spokes.) 7 claims.

1,047,963. Timing Device for Ignition Systems. Charles T. Mason, Sumter, S. C. Filed Oct. 4, 1911. Serial No. 652,706. (Adjustable gear drive and mounting for magneto.) 7 claims.

1,048,020. Rotary Valve for Internal Combustion Engines. Harvey Oliver Witwer, New Hamburg, Ontario, Canada. Filed April 29, 1911. Serial No. 624,019. (Hollow plug valve with pressure counterbalance.) 3 claims.

1,048,021. Distributer for Automobile Engine-Starters. Charles A. Wulf, Indianapolis, Ind. Filed Dec. 16, 1911. Serial No. 666,224. (Distributer for ignition starters.) 2 claims.

1,048,054. Resilient Wheel-Rim. John Edman, Minneapolis, Minn., assignor to Alfred M. Hoyland, Minneapolis, Minn. Filed Nov. 2, 1908. Serial No. 460,634. (Tire with inner tube between rim flanges of wheel, and outer tread.) 1 claim.

1,048,055. Spring Wheel. Estle Archie Finzer, Hicksville, Ohio. Filed Nov. 1, 1911. Serial No. 657,916. (Wheel with pneumatic cylinder cushions.) 4 claims.

1,048,095. Explosive Engine. Ralph Ragan, Atlanta, Ga. Filed July 24, 1911. Serial No. 640,267. (Double-acting motor with separate pumping cylinders.) 4 claims.

1,048,106. Automobile-Top Slide. Alice E. Smith, Elyria, Ohio. Filed Sept. 9, 1910. Serial No. 581,226. (Slide-rails for front bow supports of top.) 2 claims.

1,048,162. Starting Ignition for Internal Combustion Engines. Gottleib Honold, Stuttgart, Germany, and Max Rall, Paris, France, assignors to The Firm of Robert Bosch, Stuttgart, Germany. Filed Oct. 20, 1910. Serial No. 588,137. (Sparking system for ignition starters.) 8 claims.

1,048,208. Device for Repairing Pneumatic Tires. Gustaf H. Raflovich, Boston, Mass. Filed Feb. 29, 1912. Serial No. 680,603. (Expanding core for tire repair work.) 2 claims.

1,048,211. Automobile-Lock. Herman J. Richner and Edward H. Richner, Cleveland, Ohio. Filed Feb. 19, 1912. Serial No. 678,705. (Locking device acting on flywheel.) 9 claims.

1,048,213. Front Driving and Steering Mechanism for Motor Vehicles. Merrick W. Sappington and Edward S. Hornbeck, Winchester, Ill. Filed Dce. 14, 1911. Serial No. 665,707. (Driving and steering hub with ball-and-socket joint.) 1 claim.

1,048,235. Friction Speed-Gear for Automobiles. Walter E. Trufant, Whitman, Mass. Filed Feb. 23, 1906. Serial No. 302,330. (Friction transmission with automatic pressure regulation.) 4 claims.

1,048,237. Pressure-Gauge. Charles R. Twitchell, Los Angeles, Cal., assignor, by mesne assignments, to A. Schrader's Sons, Inc., New York, N. Y., a corporation of New York. Filed April 26, 1911. Serial No. 623,452. (Tire pressure gauge of automatic "pencil" type.) 3 claims.

1,048,257. Transmission-Gearing. Roland T. Wright, Meltonville, Iowa. Filed Dec. 15, 1911. Serial No. 665,904. (Individual clutch change-speed system.) 2 claims.

1,048,258. Igniting Attachment for Lamps. John H. Young, Pelham, N. Y. Filed Sept. 4, 1912. Serial No. 718,451. (Gas lamp igniter with mechanical sparker.) 4 claims.

1,048,299. Pneumatic Clutch. James T. Dickson, Los Angeles, Cal. Filed July 18, 1911. Serial No. 639,196. (Clutch in which two disks are pressed apart by air pressure.) 4 claims.

1,048,308. Rotary Gas Engine. George E. Hanley, Oakland, Cal. Filed March 3, 1911. Serial No. 611,994. (Rotating cylinder engine.) 2 claims.

1,048,311. Exhaust Motor. Carl F. High, Madison, Wis. Filed June 26, 1912. Serial No. 706,029. (Exhaust-operated turbine on crankshaft.) 5 claims.

1,048,336. Vehicle-Spring. George E. Neuberth, Newark, N. J. Filed Oct. 10, 1910. Serial No. 586,236. (Auxiliary spring of the leaf type.) 2 claims.

1,048,362. Starting Internal-Combustion Engines. Fredereick Richard Simms, Willesden Lane, England, assignor to Simms Magneto Co., Inc., New York, N. Y. Filed Dec. 10, 1910. Serial No. 596,638. (Ignition starter.) 7 claims.

1,048,371. Pneumatic Cushion-Spring for Wheeled Vehicles. Joseph William Sutton, Brisbane, Queensland, Australia, assignor to Mary Sutton, Brisbane, Australia. Filed Aug. 26, 1911. Serial No. 646,208. (Pneumatic cushion within metal casing.) 2 claims.

1,048,376. Anti-Skidding Device. Rudolph John Thiesen and Campbell Thomas King, Jr., Atlanta, Ga. Filed Dec. 23, 1911. Serial No. 667,516. (Nonskid bars swinging laterally on hinges.) 2 claims.

1,048,406. Friction Driving Mechanism for Motor Vehicles. James M. Gilstrap, Delano, Cal. Filed Aug. 2, 1912. Serial No. 712,893. (Friction drive mechanism with shifting shaft.) 3 claims.

1,048,423. Puncture-Proof Tire. William McKay, New York, N. Y., assignor of one-twentieth to Irwin G. Burton, New York, N. Y. Filed May 16, 1911, Serial No. 627,475. Renewed May 24, 1912. Serial No. 699,538. (Pneumatic tire with separators between inner tube and shoe.) 5 claims.

1,048,464. Gearing for Traction-Engines. John T. Metcalfe and Garfield Metcalfe, Quincy, Pa. Filed Oct. 6, 1911. Serial No. 653,280. (Gearing for driving either wheel independently of the other.) 8 claims.

1,048,466. Horn. William Sparks, Jackson, Mich. Filed May 9, 1912. Serial No. 696,216. (Motor-driven diaphragm horn.) 3 claims.

1,048,467. Windshield. George L. Wilson, New York, N. Y., assignor to Martin L. Williams, South Bend, Ind. Filed Feb. 29, 1908. Serial No. 418,493 (Folding windshield with locking device.

1,048,482. Internal-Combustion Engine. William O. Barnes, Philadelphia, Pa. Filed Jan. 11, 1907. Serial No. 351,849. (High-compression motor with means for regulating compression.) 15 claims.

1,048,485. Crankpin Connection. Edward C. Bennett, Wormleysburg, and Charles J. Hilliard, Harrisburg, Pa. Filed April 29, 1911. Serial No. 624,225. (Connection for opposed motor rods to a single crank.) 1 claim.

1,048,503. Speedometer-Recorder. Arthur W. Dennis, Jacksonville, Fla. Filed April 1, 1912. Serial No. 687,749. (Automatic printing device for recording speedometer.) 8 claims.

1,048,510. Spring Suspension for Vehicles. Wm. E. Eastman, Boston, Mass. Filed June 8, 1912. Serial No. 702,420. (Spring system with spiral springs and connecting levers and links.) 4 claims.

1,048,518. Priming Device for Carburetters. Julius L. Fritz, Philadelphia, Pa. Filed Feb. 15, 1912. Serial No. 677,812. (Automatic primer operated by low suction.) 16 claims.

1,048,530. Automobile Radiator-Lamp. Don W. Harlow, Cleveland, Ohio. Filed Feb. 5, 1912. Serial No. 675,509. (Lamp holders built into radiator casing.) 6 claims.

1,048,557. Conveyance and Signaling Appliance Therefor. Ray H. Manson, Elyria, Ohio, assignor to The Dean Electric Co., Elyria, Ohio, a corporation of Ohio. Original application filed April 24, 1911, Serial No. 622,858. Divided and this application filed Sept. 18, 1911. Serial No. 649,964. (Electric horn button and wire connections.) 2 claims.

1,048,610. Internal Combustion Engine. William Wallace, Milton, Mass. Filed Dec. 9, 1911. Serial No. 664,816. (Overhead valve gear for V-motors and means for cutting out cylinders on either side.) 7 claims.

1,048,620. Carburetter. Eugene B. Williams, Stockton, Cal. Filed May 8, 1912. Serial No. 695,854. (Bi-fuel carburetter with single mixing chamber and two float chambers.) 3 claims.

World's Stock Champion. Fastest Stock Mile

National

World's Fastest 500 Miles in Competition

One question in a million brains

All over this country there are men asking the same question *you* are asking yourself. In the stone front city salesroom; in the small town garage; in the offices and factories, serious-minded, thinking men are asking; "What is to be the future of the motor car business?"

Stronger and stronger glares the spot light of truth on the situation. More and more the public sees and realizes the truth. The answer to the question is found today in the public confidence. The dealer who can not see what the public sees; the dealer who fails to hear what the public says, will get a sad answer in the future. The same applies to the manufacturer. Opinions may differ in details, but the fact remains that the manufacturer who has proven his honesty, sincerity, and his here-to-stayness is the one who is being elevated to the highest level of public confidence today.

The methods of manufacturers and their selling policies decide their measure of true worth—or lack of it.

The dealer deals himself a poor deal, if he deals with any builder but the one who is here-to-stay.

The future of the motor car business is *good*.

Good for what?

Good for the good builder and good dealer.

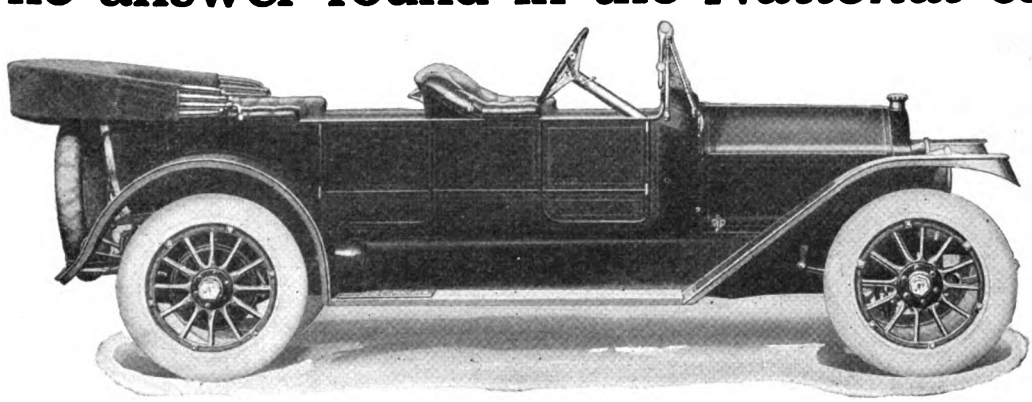
You simply can't be a good dealer for a bad builder. Your hard work and cleverness can not outweigh the faults of the builder. Why spend your money and your labor to try and make good for a bad builder?

More cars than ever before will be bought this coming season. The educated public will buy them. You can't fool them. You only fool yourself in trying to do that.

The public wants its money's worth; it wants to buy where it has confidence in the car builder, the car's reputation and the prestige and rating of the manufacturer.

A car can rise no higher than its source, its factory.

A dealer can rise no higher than his car.



Catalog specifications, the paint on the hood, and salesman's speeches are futile if the car is lacking or the builders are not absolutely responsible and firm.

It is inevitable that the reputable builder with square methods of dealing with customers and who produces the greatest value in his cars, is the one who will have the confidence of the public. The *National* wins business and customers for you.

We repeat: For a car of quality, power in abundance, speed in emergencies, dependability, reliable and always efficient service, perfect control, convenience and comfort, there is no better car built than the *National*.

This is a matter of record, in tests and actual demonstrations of all kinds. This is guaranteed by a thirteen-year-old company with unimpeachable rating and good will. The *National* company is stable; it is here to stay because it is right in its methods of giving the public the one service that counts—*quality*.

The answer found in the *National* car

Five models, $2750 to $3400

American Made For American Trade

New Departure

Ball Bearings Throughout, and Why

By the use of New Departure ball bearings throughout the entire chassis, the manufacturer of this car has reduced power losses, repairing and operating costs to a minimum.

New Departure ball bearings eliminate friction. Friction is expensive, wears away the parts, hastens depreciation, and makes frequent repair necessary.

By eliminating friction New Departure ball bearings waste so little of the motor energy that maximum driving power is transmitted to the rear wheels. By eliminating friction there is practically no wearing away of the parts. The life of the entire car is longer and repairs are fewer.

All of these advantages are secured without sacrificing bearing efficiency. New Departure ball bearings will carry the load under all conditions of service equally as well as any bearing made.

Have you seen our interesting brochure on "Friction Elimination"? If not, drop us a card today and it will be forwarded to you by return mail.

The New Departure Mfg. Co., Bristol, Conn.

A Continued Story— No. 1

Look for No. 2 Next Week

Well, you've got to hand it to me for being the wise guy this time

Before making my choice of a buzz cart, I looked up the dope on the new-fangled Starters and there's nothing to it.

It's the good old reliable hand crank for mine—always on the job, ready for business. What if it is oily and muddy and I do have to get out in the mud and slush, a gink that runs a machine don't care for good togs anyway.

Sure, she starts hard sometimes, but exercise is good for me, cooped up in the office all day, and I want a Starter I can depend on.

That agent looked like a good fellow and showed he knew his business when he stood up for the hand crank. It has delivered the goods for years and it's only a question of time when the chaps with the new ideas will be glad to come back to it again.

Elyria-Dean
TRADE MARK

Rexo qualities have made it the most universal standard equipment electric horn. Designed primarily for large car manufacturers its popular price and good note have drawn public approval.

The **Rexo** gives a single tone warning and is instantly responsive to a pressure of its control button. Like all Elyria-Dean Warning Signals, the **Rexo** leaps into action, producing its warning signal simultaneously with the driver's needs.

So well made are Elyria-Dean Warning Signals that no oiling is required and the only adjustment (required perhaps once a year to take up wear) can be made in a few moments with a screw-driver.

Rexo Horns retail for $8 and are guaranteed as to workmanship, materials and breakage the same as the Tuto Horns.

Get the Elyria-Dean dealer's proposition. Our line will cover every warning signal need of your customers.

Elyria-Dean
TRADE MARK

TUTO
HORN
PRICE $15.00

Formerly Tuto Horns sold regularly for $25. Improved facilities and the economy of quantity production made it possible for us to offer the best of Elyria-Dean warning signals—the Two-Tone TUTO for $15. This price includes all attachments and controls ready for a complete installation. Each Tuto carries our unlimited guarantee against defective materials, workmanship and operation.

A slight pressure on the control button gives a low but adequate warning, sufficient for ordinary conditions. A firm pressure on the control button instantly produces a loud, imperative demand for the right of way.

Mr. Dealer!!

Do you realize that in buying a car, a customer rarely asks about the **wheels?** That while his safety depends so largely upon these four corners of his car—the parts of all parts that must not fail—yet he accepts them without question?

Do you realize that it is up to you, Mr. Dealer, to see that this confidence is not misplaced, this feeling of security not unwarranted?

Protect your customer by recommending a wheel that is absolutely reliable, a wheel that you know will stand up in any emergency.

Facts &Figures

Of Interest to Everyone Connected With the Automobile Industry

To give an idea of the magnitude of our business, and that we really supply about 75% of the automobile trade in our line, we hereby give the following

SWORN AFFIDAVIT

Helen L. Hicks, of Borough of Brooklyn, City and State of New York, being duly sworn, deposes and says that she has been employed by the Automobile Supply Mfg. Co., a domestic corporation, for over three years last past in the capacity of billing clerk and general office work, and that she is familiar with the shipping slips, shipping books and bill books.

Deponent further states that on July 3rd last she examined said books and same show that the Automobile Supply Mfg. Co. shipped

In Feb., 1913—26,267 Bulb and Electric Horns of different sizes and types.
In Mar., 1913—36,167 Bulb and Electric Horns of different sizes and types.
In April, 1913—34,722 Bulb and Electric Horns of different sizes and types.
In May, 1913—41,215 Bulb and Electric Horns of different sizes and types.
In June, 1913—35,668 Bulb and Electric Horns of different sizes and types.

Sworn to before me this 14th day of July, 1913.

(Signed) HELEN L. HICKS.

(Signed) ISAAC BROWN,
Notary Public, Kings Co.

(The original of the above affidavit is on file in the office of this publication.)

The above statement of facts is sworn to. There is no bluff—no exaggeration—no misleading statements. It proves conclusively our claim, that we are the largest manufacturers in our line in the world.

Our sales average over 40,000 horns per month.
Newtone Horns sell on their merit, efficiency and price.

But even with such a production, we have not been able to supply the jobbers with the amount they require. It has been necessary to enlarge our plant; additional floors have been added—more machinery installed and an increased force of skilled mechanics.

Beside that, we have contracted with Kendrick & Davis Company, of Lebanon, for 2,000 motors per week for six months, so that we may catch up with our orders. This, together with our own production, will enable us to take good care of the manufacturers and jobbers as well as foreign orders.

Th World's Record for Fuel Economy Again Goes to the FRANKLIN

The Franklin has always been known as the most economical car to operate—economical in gasoline consumption, economical in tires and economical in repair expense. This fact, which has been established by countless performances in the past, was confirmed in striking manner a few weeks ago.

On June 20th, 1913, Mr. S. G. Averell, of New York, a private owner, drove his special Franklin 83.5 miles on one gallon af gasoline over a course including city and country roads on Long Island. Mr. Averell was accompanied by Mr. Herbert Chase, laboratory engineer of the Automobile Club of America, who acted as official observer. See the official report of the Automobile Club of America.

The previous economy record was held by a Franklin which traveled 46.1 miles on one gallon in July, 1909. Even this was not the first Franklin Economy Record. In May, 1906, a Franklin won the Economy Test of the Automobile Club of America against a large field, with a record of 87 miles on two gallons of gasoline.

Franklin fuel economy is a long established fact. Franklin tire economy is almost as well known. In 1912 Franklin owners reported an average of 10,746 miles service per set of tires, with an average of 3,663 miles without puncture. Ninety-eight per cent. of Franklin owners do not carry extra tires. Experience has taught them that it is unnecessary.

There is a reason for this unusual economy of fuel and tires. It is due to Franklin construction. By reducing the "unsprung" weight (i. e., the weight below the springs) to an absolute minimum, by distributing the necessary weight properly, by proportioning each part of the car in correct relation to every other part, we have produced a light, evenly balanced car which runs with very little propulsive effect and very little strain on the tires.

The following figures will show you why the Franklin is so easy on tires and why it burns so little fuel per mile. These figures will mean nothing to you unless you compare them with the actual weight of your own car. Weigh your car with its full road equipment.

Weights and Tire Sizes of the Franklin:

	Pounds.	Tires.
Six "38" touring or phaeton	3,328	4½-5
Six "38" 7-passenger touring	3,480	5
Little Six "30" touring	2,993	4½
Four "25" touring	2,520	4

These weights include full equipment, gasoline and oil. Compare these weights and tire sizes with other cars. Franklins 700 to 1,200 pounds lighter, are equipped with tires as large or larger.

The Franklin direct-cooled engine is largely responsible for Franklin fuel economy. Gasoline consumption is cut squarely in two because direct cooling permits the motor to operate at the temperature of maximum efficiency for gasoline vapor. Fuel is saved from two ends, the smaller amount consumed per unit of horsepower and the smaller amount necessary to produce power to drive the lighter car.

The Motor Cannot Stall

The Entz electric starting system used on Franklin cars makes it impossible for the engine to stall. One switch controls both the starter and magneto. Throw on the switch and the starter goes to work. If by accident you cut off the gas the starter picks up the motor, and, as you give it gas again, away it goes.

The Best Car for Dealers

From the dealer's standpoint the Franklin is the most distinctive high-grade car on the market. It eliminates competition. It enjoys a clean unbroken record of success for more than eleven years. Franklin dealers are making money and have always made money.

We will be glad to mail on request a copy of O. K. Parker's interesting story, "A Strenuous Trip Into the Grand Canyon of Arizona." Mr. Parker is chief engineer of the Automobile Club of Southern California.

Franklin Cars Are Made As Follows:

Franklin Six "38" 5-passenger touring	$3600	Franklin Little Six "30" touring-car or 2-passenger phaeton	2900
Franklin Six "38" 4-passenger phaeton	3600	Franklin Four "25" touring	2000
Franklin Six "38" 7-passenger touring	3850		

Write for our catalogue—a book full of real automobile facts.

BAILEY
ELECTRIC SYSTEM

The Coming Light

With the arrival of the perfect electric generator, electric lighting for motor cars is unquestionably displacing all other forms.

Electric Generators have heretofore been subject to criticism on account of their inefficiency and unreliability.

The Bailey Electric Generator, a wonderful dynamo only 5½ in. high, 5½ in. wide and 7½ in. long, weighing 17 pounds, designed by Benjamin F. Bailey, the famous Electrical Engineer, furnishes the first logical solution of the electric lighting problem.

In its construction, all unsatisfactory and trappy devices, such as reverse current relays, magnetic switches, vibrating contacts, delicate rheostats, slipping clutches, corroding platinum points and other trouble making appliances have been entirely eliminated.

Furthermore, there are no moving parts involved in the Bailey System of Regulation.

A patented mercury switch, the very simplicity of which has foiled other inventors, makes the construction of this generator so simple and compact, that in spite of the fact that its output running from 10 to 15 amperes is almost double that of other generators, the entire mechanism is little larger than a man's hand.

Another thing—due to its peculiar construction, when the big headlights are thrown on, it automatically supplies the additional current required for their lighting.

You are always assured of brilliant lights on all your lamps, and a sufficient reserve in the battery to take care of emergencies.

Prices of Complete Outfit

Model L 1, suitable for car lighting systems requiring 60 candlepower or less, $75.00.

This price includes generator, wiring, harness, 60-ampere hour storage battery and all controlling switches ready for installation. Price f.o.b. Grand Rapids.

Model L 2, suitable for car lighting systems requiring 60 to 100 candlepower, $125.00.

This price includes generator, wiring, harness, 80-ampere hour storage battery and all controlling switches ready for installation. Price f.o.b. Grand Rapids.

The above outfits can be attached to any existing type of car having an exposed rotating shaft on the power plant.

Send for our Booklet, "Electric Lighting Explained," which shows in detail how the generator is made and what it will do. Also describes the Bailey Combination Ignition, Starting and Lighting Unit.

The Service that Pleases—Plus Absolute Frankness

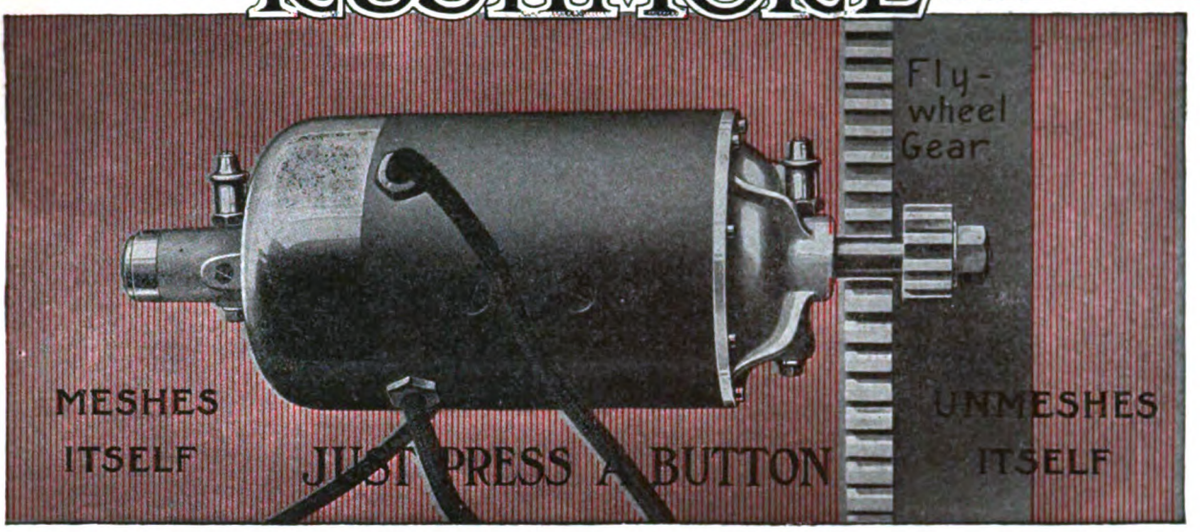
We are frank with our customers. We tell them exactly what we can do—and we don't jolly ourselves. If anything, we underestimate. We regard that as good business.

"Do just a little bit better than the customer expects and he will be pleased." That's an axiom of all good retail businesses. It applies with equal force to a proposition like ours.

For we don't make anything. We simply do the machine work.

Other concerns with like equipment can do the work—perhaps equally well. At least there is nothing to prevent their buying just as fine equipment, just as skilled labor.

But, we never crowd our shop—we believe that to have the preference and keep it we must give better SERVICE—do better work, make better deliveries.



And that is the basis on which we solicit your 1914 contract for machining crankshafts. Experience, "Know how" and splendid equipment are the "rocks of our faith."

Notice—we make deliveries according to schedule—no excuses, no failures. Don't wait too long. To be sure of having MICHIGAN SERVICE on your 1914 crankshafts get in touch with us now.

MICHIGAN CRANK SHAFT CO.
LANSING, MICH.

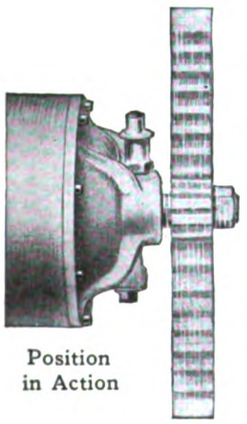
RUSHMORE



EFFICIENCY

Efficiency in a motor is the ratio of energy delivered to energy received—of output to input.

There is no such thing as an engine-starting motor of "100 per cent. efficiency," nor will there be till we have perpetual motion.

The actual efficiency of an engine starter is readily tested by measuring the brake power delivered, and the voltage and amperage of the current received.

Most engine starters have an efficiency of 60 to 65 per cent. at the motor pinion. If intermediate gears are used, the power delivered at the flywheel is further reduced some 15 or 20 per cent., making a net efficiency of about 45 to 55 per cent.

Position in Action

This is for geared starters, most of which operate on a 6-volt battery, taking 100 to 125 amperes for an engine of fair size. A flywheel starter which takes the same number of amperes at *double the voltage* is likely to be only one-half as efficient as the geared starter.

The most efficient starter possible is the single-reduction motor acting directly on the flywheel, because it operates at favorable speed without needless gearing.

Owing to certain refinements of design and the absence of intermediate gears, the Rushmore Starter has an efficiency of 75 per cent. at the flywheel rim. It costs less for battery than any other electric starter made. For equal current, it turns the engine from ¼ to ½ faster than any other starter.

Dealers,

What About the Call for a Better Tube?

The universal demand among motorists is for a better tube. No one knows that better than you do, Mr. Dealer.

You're the man next to the user. If any one kicks, you get the **kick.** But that's not the worst of it. Motorists are game buyers, and if they buy a tube from you that gives poor service—goes to pieces—they say nothing to you about it, but go elsewhere next time and buy another make. And they advertise the bad deal among their friends.

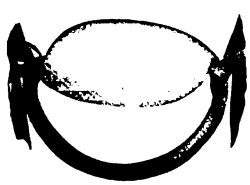
Think what a lot of business you lose—in tubes and in other lines—through the sale of poor tubes.

Mr. Dealer, investigate the **quality of the tube** you are selling. Name or reputation count for little these days. Motorists want **quality tubes,** regardless of who makes them.

What about the call for a better tube? Are you going to continue selling shoddy tubes, or are you going to give your customers the QUALITY TUBE they are calling for?

5-X-Test Answers the Call

The Mansfield Tire & Rubber Company heard the CALL FOR A BETTER TUBE a year ago. We saw the great opportunity awaiting the maker who would give the TUBE QUALITY motorists wanted. We arose to the opportunity, and now we present the 5-X-TEST TUBE—quality supreme.



In our determination to give QUALITY we simply forgot about our profit—we only added a fair, living profit.

Dealers who have tested 5-X-Test, and are selling it, are high in their praise of the quality.

We want to send you a sample section of the 5-X-Test Tube. We want you to test it out—compare it with the tube you are now selling. Then we'll let you be the judge. THE QUALITY WILL SELL YOU 5-X-TEST TUBES. Fill out and mail the coupon.

Made of Fine Grizzly Crepe—Red and Grey

In making 5-X-Test Tubes we use very fine rubber, to insure finest quality. This fine grizzly crepe is prepared by a special formula which gives it greatest strength, toughness and life. 5-X-Test is made in both red and grey.

Exacting Building

Mansfield 5-X-Test Tubes are built under the most exacting methods. The raw gum is first inspected by experts. If the slightest imperfection is found the stock is thrown out.

The splicing is done with the most hair-splitting precision. After the tube is cured, it is subjected to a very rigid inspection. The ends are then spliced by a scientific process. Then the tube is again inspected by a scrupulous tube expert. The slightest imperfection disqualifies a 5-X-Test Tube. Only tubes proved-by-test to be absolutely perfect ever reach the user.

The Test of Strength

Note this picture. It is from an actual photograph of a Mansfield regular stock tube, inflated to more than five times its normal size.

That is the **Test of Strength** of **Mansfield 5-X-Test Tubes.** When Mansfield tubes will stand that test, they will surely stand **any test** in the tire, in hard use.

100 Per Cent. Efficient

The Mansfield 5-X-Test Tube is 100% efficient. It gives users the service expected from a tube—for we build that service into every 5-X-Test Tube that leaves our factory.

Sell It With Confidence

You can sell this tube with all confidence—and the quality will back you up. This tube will bring repeat orders for you, but it won't come back.

Stock this tube and it will be a big asset to you for future business.

5-X-Test quality will give the satisfaction that builds business in other lines.

Fill Out the Coupon

Cut out the coupon, fill in your name and address, mail it to us, and we'll send you a sample section of the 5-X-Test Tube, and give you our proposition. It's a money maker for the dealer. It gives the dealer bigger profit.

Fill out the coupon now and mail it.

The Mansfield Tire & Rubber Co.,
Mansfield, Ohio.

We have read your Dealers' announcement in Motor World, and you may send us a sample section of your 5-X-Test Tube.

Also send us your special proposition on one-third gross assorted sizes, half grey and half red.

The Cable-Structur Tire

Dealers, ponder these two questions: Are you selling a tire that builds business? Are you making enough profit on tires?

Those are vital questions to every dealer, and worthy of your deepest consideration.

If you are selling a tire of questionable quality, your business—and your success—is at stake. Poor quality tires never made money for any dealer. But poor tires have ruined hundreds of men like you. Poor tires are sure to knock you—sure to drive away business.

And then think who's making the profit on the tires you sell—you or the manufacturer?

In the Cable-Structur Tire we offer you a real business-builder—a tire that will increase your business. The quality we build into Cable-Structur guarantees satisfaction to users. One Cable-Structur tire in use will sell dozens of others for you.

And then — Cable-Structur means a bigger profit for you. Write for our special proposition and let us prove it.

40,000 Tested

Motorists have already tested out more than 40,000 Mansfield Tires. Now the demand calls for our utmost capacity. That extensive test has proved Cable-Structur mileage to be between 7,000 and 12,000 miles.

Knowing that, is there anything to doubt about this tire?

Saves Rim-Ruin

The Cable-Structur base does away with the clinched base, and makes rim hooks unnecessary. Without the use of rim hooks, no rim-ruin is possible. 24 endless steel wires, 12 in either side, form the base. These cables give a tensil strength of 16,800 pounds. So nothing can force the tire off the rim, over the flanges.

Hand Building

Cable-Structur Tires are hand built by tire experts. These men never hurry. We pay them by the hour at highest wages. So there's no desire to rush or slight the work.

Those are some reasons why you should sell Cable-Structur tires. Write for our new catalog. It tells all

Some good territory is still open. Write for our special Cable-Structur proposition.

SPARTON

THE ELECTRIC SIGNAL DE LUXE

THE "SPARTON" WILL OUTSELL ANY OTHER MAKE OR TYPE OF ELECTRIC WARNING SIGNAL ON LOOKS, WARNING NOTE DELIVERED, CURRENT CONSUMPTION, GUARANTEE OR PRICE.

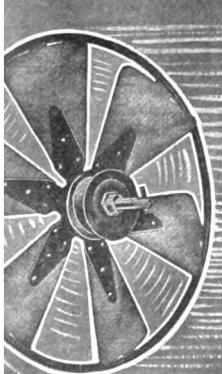
Dealers everywhere are adding handsome profits to their accessory business, for the "SPARTON" is the ONE logical warning signal that meets the owner's requirements.

It's RIGHT through and through and the price is no greater than you are expected to secure for Buzzer signals.

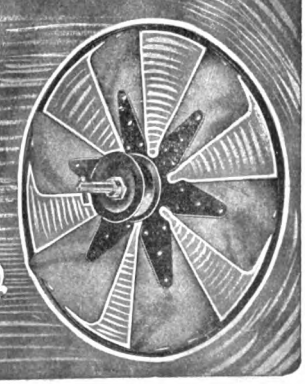
There is a "SPARTON" for every car, either dash or underhood model. Any standard finish. All the "SPARTONS" you want when you want them. One price to all Dealers, NO discrimination, NO exclusive selling arrangement.

PRICES $10.00 to $15.00

THE FAN BUSINESS WE DO PROVES OUR FANS ARE THE BEST.



Standardized parts not only increase manufacturing efficiency, but later duplication in case of accident is possible on short notice.



Automobile Engineers in the designing of new cars universally indorse our ONE PIECE BLADE RADIATOR FANS. The QUALITY is known, and the cooling results are accepted as maximum.

In solving the cooling problems of most of the better car and Motor Manufacturers we oftentimes find it necessary to meet certain conditions heretofore unknown in other factories. In so far as is possible we build enough STANDARD sizes to meet any cooling requirement. The chances are nine in ten that we can meet yours without making a special job.

Our catalogue is pure gold to the Engineer, who would be interested in knowing what we know about Automobile Fans.

Our experience of years is tabulated in concise form. It is really a text book on cooling. It's FREE to you.

"BOWER SAVES POWER"

How Bower Saves Power!

The Bower Bearing has a cylindrical roller with a flanged head at one end. The flange takes care of end thrust, the roller of radial load. This simple division of labor gives two extraordinary advantages to Bower Bearings: (1) it reduces friction to a minimum and (2) it obviates the need of any adjustment. Moreover, the raceways and the rollers being at all times parallel, the rollers are self-aligning. Thus a maximum diameter of rollers can be used; their speed of rotation is comparatively low; wear is minimized, and long life is assured to the bearing.

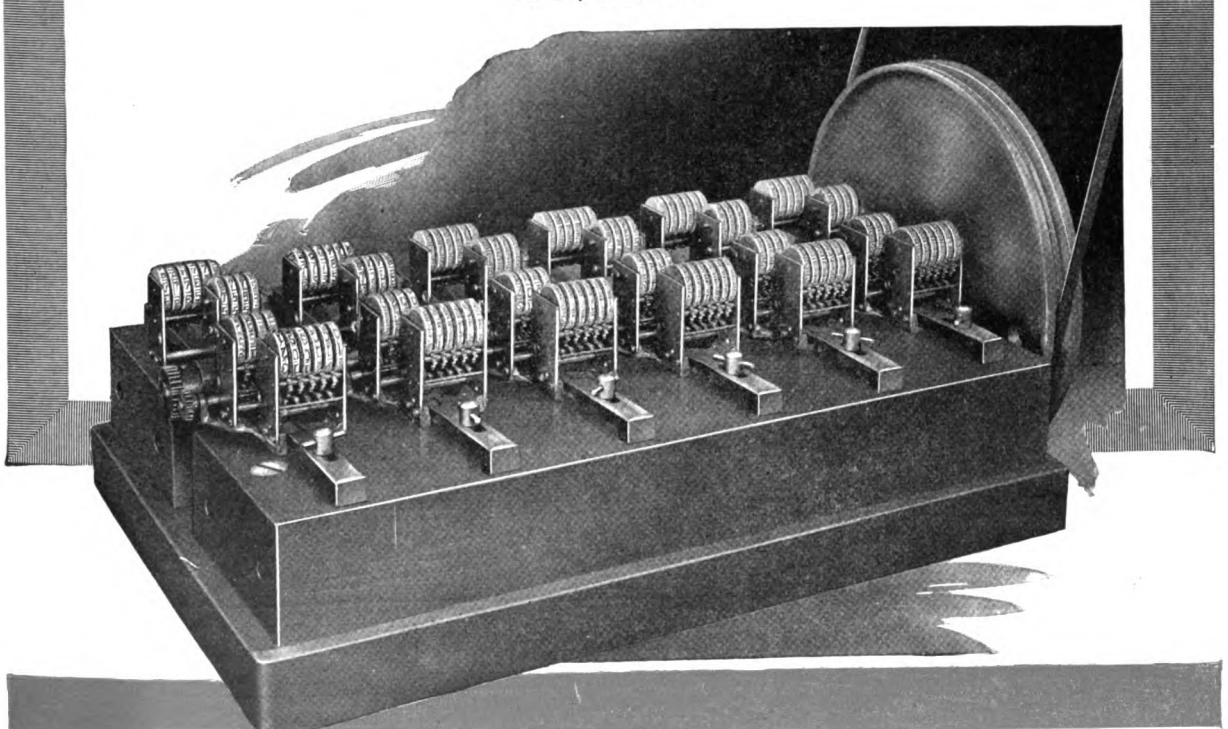
WARNER

QUALITY AUTO-METER

1,000 Miles a Minute



THE odometer of every Warner Auto-Meter made is tested, on the machine shown below, at 1,000 miles per minute—***one thousand times as fast*** as it is ever likely to be called on to run, and ***five hundred and fifty-eight times as fast*** as any automobile has ever been driven. It must show absolute accuracy in hours of running at this speed, or it is thrown in the scrap heap. The world's fastest motor car record is 106 miles, 382 yards, in one hour, recently made at Brooklands, England. The Warner odometer is tested at a speed ***five hundred and fifty-eight times as great.***

In ordinary motoring a speedometer is very rarely required to record a speed as high as 60 miles per hour—because at this speed the pleasure of motoring is lost. A speedometer which registers correctly at a mile-a-minute speed can, therefore, be relied on as accurate. We prove the Warner absolutely accurate at a speed ***one thousand times as great.***

No other speedometer made is given the severe tests and careful inspections to which the Warner Auto-Meter is subjected.

If you knew more about the fine interior construction of the Warner you would better understand why the vast majority of high-priced cars are Warner-equipped.

The Warner Auto-Meter Factory
Beloit, Wisconsin

Velie

You Take No Risk With This Car!

After five years of constantly increasing success, Velie now ranks with twelve leading cars in the world. Big increase in production for 1914. More cars—bigger line—greater facilities.

The Velie has made good. There is a lot in this fact for every automobile dealer to consider. Sold for five years with practically no advertising, it has shown a steady, healthy growth each year. With your own knowledge of selling conditions, think what this means.

Sales for 1913 doubled sales for 1912, and every Velie owner is satisfied. Advance inquiries for 1914 models are greater than ever before.

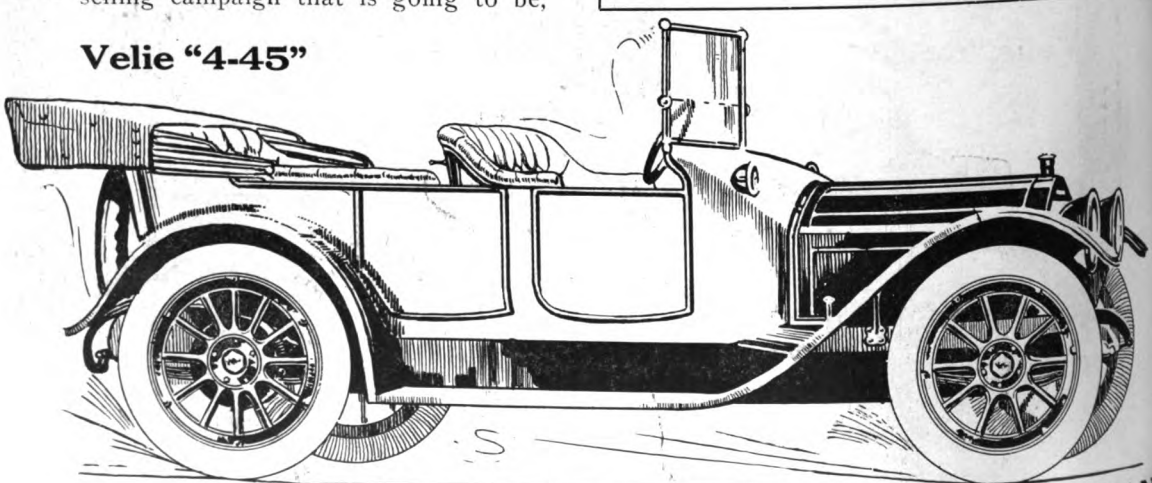
Will Take Advantage of This

Now we are ready to take full advantage of the big tendency in favor of the Velie. We are greatly enlarging our facilities for building cars. Already well up among the leading twelve manufacturers in the country, we will double our output for 1914.

All Dealers Can Share in This

We have widespread representation now, but we can give more dealers the advantages of handling the Velie line. We are opening a big advertising and selling campaign that is going to be, first of all, for Velie dealers. Most of it will be co-operative advertising, done for the dealer in his own territory, where every bit of interest it creates is centered on his garage.

It is the dealer who acts first in unoccupied territory who is going to get the benefit of this big co-operative campaign.



The dealer who handles the Velie car is in business to stay.

The Velie is not an untried car. It is used by thousands of satisfied owners

Send for Our Prop

Let us put you in touch with what the Velie Dealership means—not only in the car itself, but in the money-making co-operation which we extend to every Velie dealer. Velie

Velie "4-45"

75,000 Continental Motors

CONTINENTAL MOTORS ★ Powerful the Nation ★ AMERICA'S STANDARD

OVER 3,000,000 H.P. TO HELP YOUR SALES

"The Almighty fights on the side of the heavy battalions," said Napoleon.

Every salesman knows how true that is—how he must build up his "selling talk" point by point, how he must heap reason on reason, and how back of his spoken word must stand the reputation of the article and the great force of its advertising.

And the battle as a rule goes to the side of the heaviest battalions.

Every Motor Vehicle Built Around a Continental Motor Has the Biggest Factor in the Industry Backing It.

Has 75,000 Continental Motors giving world-wide satisfaction, delivering 3,000,000 h.p. in daily use—every motor in a high-grade, long-lived motor vehicle.

Offer any one of these 75,000 Continental converts a car with any other motor and your sale is 100% harder.

Offer him a motor vehicle with a Continental motor and your sale is half made.

Confidence is the backbone of business, and CONTINENTAL CONFIDENCE has been won because it has been earned.

And back of every Continental-powered car is Continental advertising—the national campaign of which the first broadside is just being fired. Added to the manufacturer's advertising of the car is our advertising of the motor—the costliest and most vital factor in that car.

On the side of the heavy battalions—is that where you are lining up for the campaign of 1914?

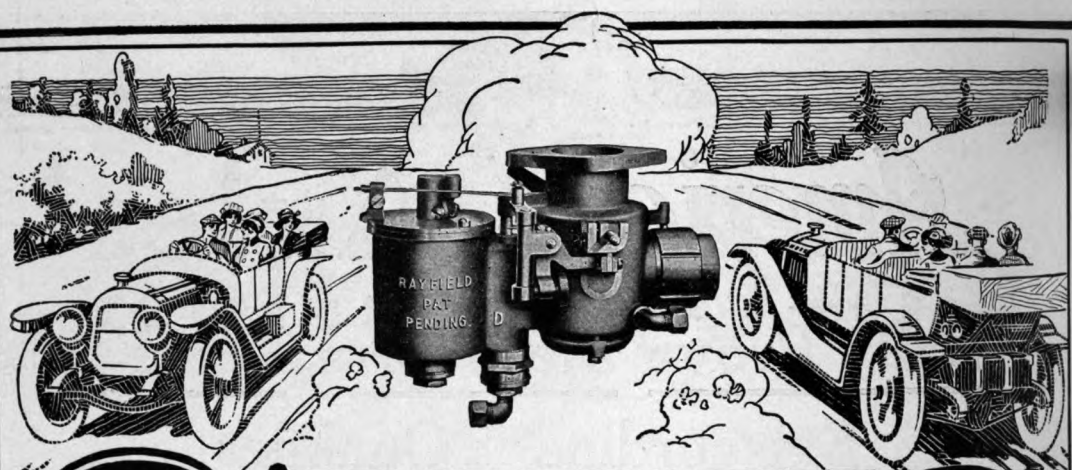
"American" Axles

Daily Prove the Worm Drive's Extraordinary Qualities

FULL FLOATING "American" Axles with the Lanchester-Daimler worm Drive have been regular products of this company for nearly two years. They have successfully met every test required for gasoline and electric pleasure cars of the highest grade.



The Lanchester-Daimler Worm Drive has simply duplicated in America its splendid record abroad. It is the very best form of a type of gear whose merits are beyond question.

When we secured the sole American rights as axle manufacturers of this drive, motor car builders acknowledged that its perfect production by us for both gasoline and electric pleasure cars was a foregone conclusion.

They knew that we would bring to its construction the same quality of engineering skill that has given the first place to our Bevel Drive Axle, and which is responsible for the fact that today 80% of the high grade electric pleasure cars in this country use either that or the Lanchester-Daimler Worm Drive in an "American" Axle.

RAYFIELD
CARBURETOR

Rayfield Carburetor Has Always Been Right

The correct principles of carburetion were embodied in the first Rayfield.

Hence it has not been necessary to make important alterations in the design or operation of this carburetor.

To our determination to be right in the beginning, the Rayfield owes its reputation of today, and the advance it has made over carburetors that were in the field long before it appeared.

And because the Rayfield was correct in design, construction and operation, it develops the greatest economy, the greatest flexibility, the greatest power and the greatest speed of which a motor of given size is capable.

Rayfield records on the track are the most conspicuous, perhaps; but the Rayfield records of satisfied users—men who will always be Rayfield users, no matter what car they drive—are the ones for you to consider.

Because, it is in every day, year round use that the Rayfield has shown unexcelled capacity for economy, for operating in wide ranges of temperature and altitude without change of adjustment.

These are the features you ought to know about, whether you are a manufacturer, dealer or car owner.

There are thousands whose experience has convinced them that the Rayfield is far and away the best carburetor for them to fit to their cars, to sell and to use.

Your first step toward the Rayfield Army would be investigation, and we only ask you to investigate.

Co-Operation

of the manufacturer and dealer is necessary to make the greatest success.

A factory is handicapped by a poor dealer.

A dealer is handicapped by a factory whose product does not stand up, is too high priced, or is not up to date.

The dealer can no longer force upon the public *any* car regardless of reputation, price or looks.

Enough cars are being built to supply the demand and the public is buying the cars in which it has confidence, which it knows are not out of date, and the price of which represents good value.

Was not the dealer seriously handicapped in the season of 1913, if he was trying to sell a high-priced four-cylinder car, *or* if he did not have a six-cylinder which had behind it years of service to prove it was right, *or* if he was trying to sell right-side drive or a car with tool boxes, etc., on the running board? He might just as well have tried to sell a car without fore doors.

Remember, the advanced manufacturers are not really leading the public in ideas.

The manufacturers with advanced ideas are those who have seen the trend of the public demand early.

There were less than half a dozen manufacturers who discovered before the 1911 season, that the public wanted fore doors.

The dealers who did not have cars with fore doors will remember their troubles.

The dealer who did not have a left-side drive in 1913 not only was handicaped but was forced to talk against *what he will be compelled to recommend in 1914.*

How many manufacturers saw the six-cylinder demand six years ago and developed a Six? Not many.

And yet there are more than five times as many manufacturers offering six-cylinders today than there were a year ago.

This means that more than 80 per cent of the Sixes offered today are first-year Sixes—*unproven.*

PREMIER had fore doors in 1911.

PREMIER has been building Sixes seven seasons.

PREMIER had left-side drive in the summer of 1912.

PREMIER had clean running boards, no projecting hinges, etc., in the summer of 1912.

PREMIER a year ago had features which the latest announcements are claiming as new.

There is an advantage in the dealer having what the people want, when they want it, and *not being a year late.*

What the Premier factory has done, the advanced ideas the Premier product represents, and the results of the sales, show the co-operation of the Premier factory and Premier dealers.

Premier sales in the season of 1913 more than doubled those of the previous year.

The increase in		Chicago was	93 per cent
"	"	" Boston was	94 per cent
"	"	" Indianapolis was	67 per cent
"	"	" New York was	55 per cent
"	"	" St. Louis was	87 per cent
"	"	" Los Angeles was	49 per cent
"	"	" Pittsburgh was	19 per cent

On July 1st there was not six Premier dealers in the United States who had as many as two new Premier cars in stock or in the freight yards.

Eighty-five per cent of the dealers who were selling Premier cars four years ago are selling Premier cars today. Some of them were small dealers then, but you know how Premier dealers have grown.

We have an interesting proposition for the live dealer.

Premier will maintain its lead in 1914 and again prove a profitable line for the live dealer.

Are you interested in knowing how these dealers doubled their business?

We can tell you, and will gladly do so.

Selling Service Means What? Selling Satisfaction

With an automobile, does the carrying of a big stock of parts, having an emergency trouble car available all the time, and a man at the telephone constantly, *necessarily* mean Selling Service?

Could a railroad claim to sell service which has poor engines and rolling stock, and whose trains do not keep going, although this railroad might at all times have an emergency train to send to the help of the stranded passengers?

Taking you to your destination without delay or interruption is dependable service.

Can an automobile manufacturer or dealer sell the kind of service the people are looking for?

Not unless it is built in the car.

The dealer may assure his patron of prompt assistance and quick relief but this does not make the car he is selling any more reliable or satisfactory.

The public, the user, knows the cars which give service and are dependable.

What are the weaknesses of your car? Should they be there? Does the factory know they are there? Do they realize that in order to really sell service, that service must be built in the car?

Numerous Premier owners have toured Europe in their cars. When we have been asked what, if any, parts should be taken along, we inquired if experience has shown any parts as unreliable. As a result they left without extra parts. And we have never had a Premier driver stranded in Europe.

Is it reasonable to suppose that ten private owners would have left their chauffeurs at home and undertaken a trip across the continent in 1911, in their Premier cars, if the experience they had had with their Premiers had shown them unreliable or had failed to prove them absolutely dependable?

Records show that in one of the largest cities in America, one of the largest Premier distributing points, Premier has a record of not having lost a Premier owner in three seasons.

Would this be possible if satisfaction was not built in the Premier and if these customers were not getting satisfaction out of their Premiers?

Remember, every car sold represents to the dealer either an asset or a liability.

Every customer is a knocker or a booster. If he is getting service out of his car he is a booster. If he is not, he will tell his troubles.

Investigate Premier's record, analyze Premier construction, and compare it point for point with any car of American or European manufacture, and you will find the answer.

Are you interested in knowing how Premier dealers doubled their business?

We can tell you, and will gladly do so.

Small Duplicate Parts

made on screw machines are the vital links in the motor car. They connect all the other larger and heavier parts and unify them into the finished vehicle. Ultimately they bear the brunt of all the stress and strains.

Why not insure the working life and efficiency of your product with Namco screw machine products – the links that hold up under pressure?

The accuracy and finish of Namco parts are safeguarded through every process. The automatic precision of the machines is supplemented by a thorough inspection system, which assures you of parts that are ready to use and easy to assemble just as they come to you.

We can give you excellent delivery service right now, and will quote you dates and prices promptly on receipt of your models or blueprints. Send them direct to our "Quotation Dept."

You can always get immediate delivery of A.L.A.M. screws and nuts, castellated and plain; and on U.S.S. and V standard nuts, Cap and Set screws, and Hexagon Brass Nuts.

HAYNES

America's First Car

Scores Another Big First

Ever since Elwood Haynes created America's first gasoline car and drove it down the streets of Kokomo two decades ago the Haynes has been a pioneer, a pace-maker in developing the automobile and adding new improvements. At the top of the next page is a long list showing that the Haynes has been first to use a majority of the important improvements. And now the Haynes again comes to the front, as the

First of the old-line cars to adopt the

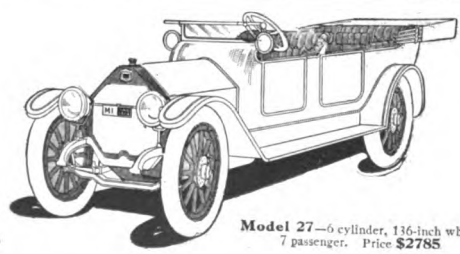
Vulcan Electric Gear Shift

as standard equipment on all models

The new Haynes models, are first for up-to-date equipment. They have absolutely everything that makes a car easy to start, control and ride in. The Haynes reputation is of the best. Haynes reliability and economy are common talk with the trade.

They have complete electric equipment; electric starter, electric lights, electric gear shift.

The cowl-board conveniences include switch for electric lights, oil sight feed, ignition, automatic cut-out for lights, dash light, auxiliary air-pressure pump, air gauge and speedometer.



Regular equipment includes mechanically operated time pump. The gasoline supply is automatic pressure-feed. The gasoline capacity is larger than the average.

The design is new. The lines are longer and more sweeping. It's a grand car through and through.

Read the specifications, see what great cars we have for you in the new models and remember that same sturdy reliability is put into these cars as has been built into the Haynes for twenty years.

Specifications of The New Haynes

Motor—Bore 4 1-4 in., Stroke 5 1-2 in. L-head Haynes. Cylinders cast in pairs.
Cooling—Centrifugal pump and pressed steel fan.
Wheel Base—Model 26, 130. Model 27, 136. Model 28, 118.
Ignition—American Simms Magneto.
Lubrication—Splash and gravity feed.
Control—Left hand. Vulcan Electric Gear Shift.
Transmission—Selective Type, three speeds forward, one reverse.
Steering Column—Worm and worm gear type.
Clutch—Haynes contracting steel band.
Rear Axle—Full Floating Timken on Models 26 and 27; McCue, Model 28, Gourney Bearings.
Front Axle— I-Beam. O. H. steel heat treated.
Wheels—Artillery type. Funk demountable rims.
Tires—Models 26 and 27, 36 x 4 1-2 Model 28, 34 x 4.
Springs—Front Semi-elliptic 39 1-8 x 2, rear 48 x 2
Brakes—15 1-4 external and 15 internal Models 26 and 27. 12 and 16 internal on Model 28.
Finish—Indiana dark blue body. Pacific Tour gray, optional.
Gasoline Feed—Pressure. Automatic feed.
Upholstery—Buffed leather—deep cushions.
Starting and Lighting—Leece-Neville electrical system.
Dash Equipment—Electric lights, sight oil feed, automatic cut-out for generator, dash light, auxiliary air pressure pump, air gauge and speedometer. Models 26 and 27 have rim wind clock and shock absorbers.
Other Standard Equipment—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind-shield, Vulcan electric gear shift, two large electric headlights, electric side lights, electric tail light, full dash equipment, electric starter, generator, 80 ampere hour storage battery, speedometer, horn, coat and foot rails, tire irons, full tool equipment, one extra demountable rim and Collins curtains.

Model 27—6 cylinder, 136-inch wheelbase, 7 passenger. Price **$2785**

Other Haynes Firsts

The first gasoline driven American-made car.
The first two-cylinder opposed motor car.
The first user of aluminum in crank case.
The first to use nickel steel in axles.
The first side door car.
The first to use throttling carburetor.
The first to use make and break spark.
The first to use the jump spark.
The first to use electric ignition.
The first to use a magneto.
The first to use double independent system of ignition, through two sets of spark plugs.

First Come—First Served

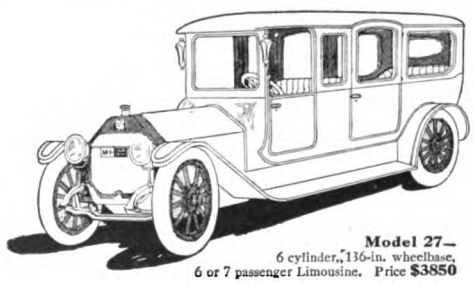
will be the rule in allotting cars to the few new dealers which the increased Haynes output permits us to serve.

Contract now for your share of

Haynes Cars With the Electric Gear Shift

You know what happened when the electric self-starter was introduced a couple of seasons ago. You recall how prospects flocked to see the cars with the new feature. You remember how the electric starter idea took and you also know what a hit the introduction of electric lights made. It's easy to forcast the hit that the electric gear shift will make. It is a greater improvement than either electric starter or lighting.

Possessing qualities for which they are famous—backed by 20 years of reputation—possessing everything else in modern equipment, the new Haynes models with Vulcan Electric Gear Shift give you the greatest selling proposition in the field.



Regular Haynes dealers, of course, have the first claim on our output, but our capacity has been increased and there will be cars enough for a few new dealers. If you want to grasp this unequaled opportunity, better telegraph, write us special delivery or better still, hop on a train and come to Kokomo.

Haynes Automobile Company 1 Main St., Kokomo, Indiana

Brake construction of the Lewis single-bearing full-floating type rear axle

LOOK over this brake construction carefully and you will catch the enthusiasm that comes from viewing a piece of workmanship exceptionally well executed. Good brakes—reliable, powerful in action, sure always—are vital.

You will observe that the bands are full floating, toggle operated and powerful; both internal and external, 16 inch diameter by 2¼ inch face. They are lined with solid web asbestos facing specially impregnated with a compound that makes the fabric impervious to oil, mud and water.

LEWIS QUALITY

Gland nuts are used on outer end of shaft tube, providing a means of retaining the grease in the axle and doing away entirely with any opportunity for grease to get into the brake construction. Every refinement and point of excellence that should be in the very best axle manufactured will be found in this "Lewis Quality" rear axle.

1914 Maxwell Announcement

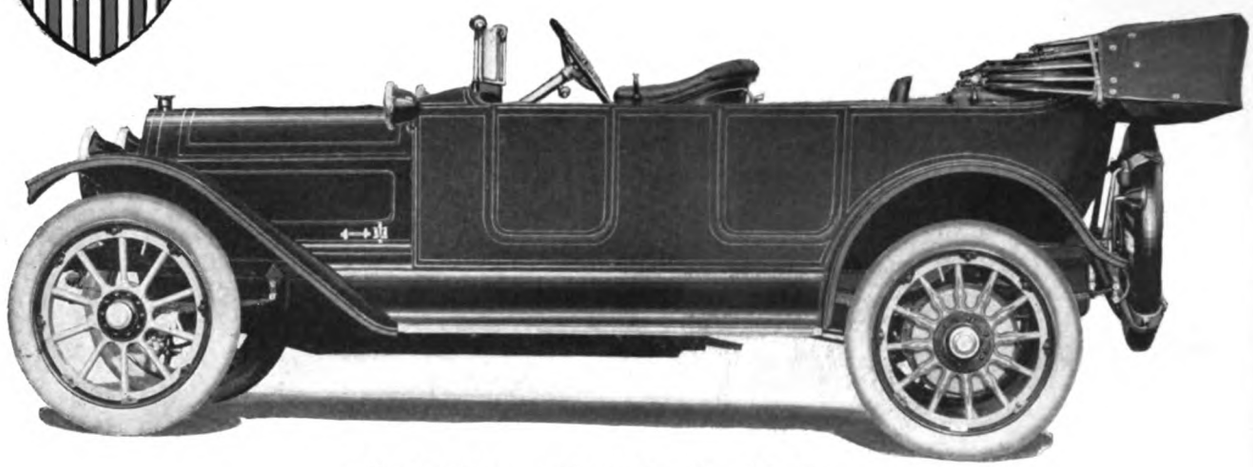
This Ad Is To Dealers Direct

DOUBTLESS you have read our 1914 announcement which appeared in all the big daily newspapers east of the Rockies last Sunday, and will appear in all the large newspapers west of there next Sunday.

Just in passing, might mention that this is only the first of a series of big advertising campaigns. This one cost approximately $30,000, and is just an indication of how we are going to sell the product for our dealers.

That is one of the reasons why 4,000 dealers are going to handle this line—and they will be 4,000 of the best dealers in the United States. The other reason is that the dealer who investigates will find that here is a line he cannot duplicate anywhere else.

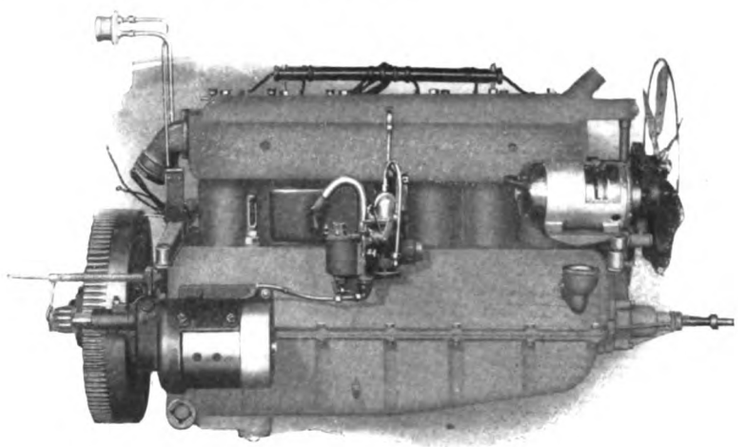
You have had experience doubtless with handling lines of cars with various models by the same maker in different priced classes. You know what ordinarily happens. One or two of the models are ready sellers—but there is always one that drags. Always one that the sales manager tells you you must take if you are to get the others.



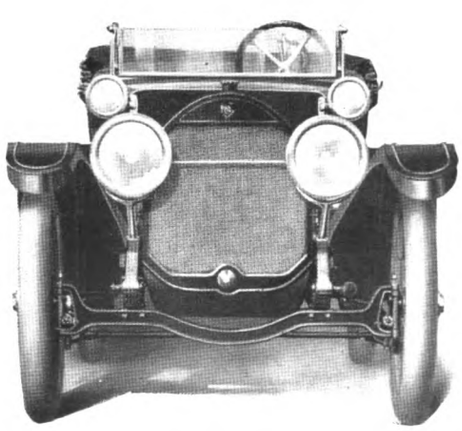
That is what we have in mind when we say that the Maxwell line for 1914 cannot be equalled anywhere else.

Take, for example, the highest priced car in the line—Maxwell "50-6." Ordinarily you would expect the big fellow to be the one that would drag if any did.

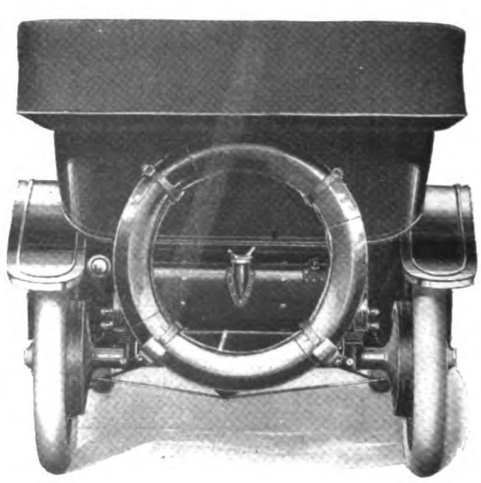
We refer you to last season's experience—the season which closed August 1st, and call your attention to the fact that we were the only makers of sixes in this class who had not a car left in his factory on that date.



Price last season was $2,350. Without the slightest change—because we did not know how or where to make it better—except to give the buyer his choice of right or left-hand steer—we have made the price of the 1914 model $1,975. This, with Gray & Davis electric starter, full equipment, even to electric cigar lighter in tonneau and finished in every detail so that it puts it up to the maker of a $4,000



Digitized by Google



1914 Maxwell "50-6"—$1975

The sweetest running thing on wheels. Six-cylinder motor, bloc-cast, 50 h. p. 130" wheel base; electric starter and lights; Bruce Ott body; 5-7 passengers; disappearing seats; 36" x 4½" tires all 'round. Luxuriously finished, long, easy riding springs and full equipment, including ventilating windshield, top and Jiffy curtains—even an electric cigar lighter. Left or right side drive optional.

Digitized by Google

car to prove where he gives the difference in quality.

The six is a flexible proposition from a manufacturing standpoint. That is to say, we can increase or retard the production of a car of this type, so as to make 2,000 or 3,000 or 4,000 or 5,000 or 6,000 of them, according as the demand develops.

With the model "25", for example, this would be impossible. It is a quantity production proposition, and if we are going to make 30,000 of them—as is our plan—we must equip for that many and we must make that many in order to make them at the price. You can understand this even if you are not a manufacturer.

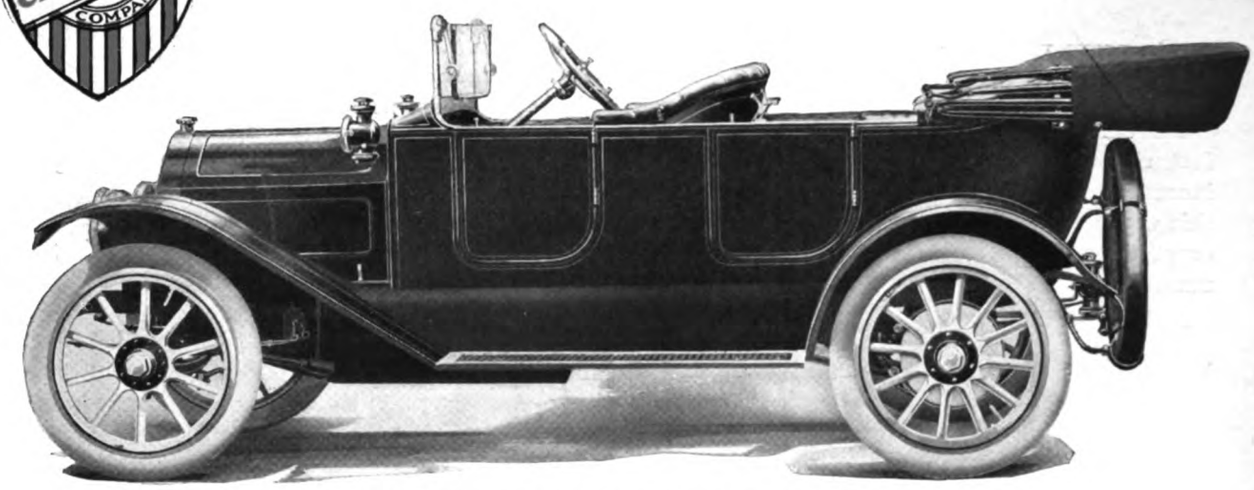
As I have said, the six is a flexible proposition. We enjoyed a splendid demand for the 1913 model at $2,350. We intended to make the price $2,400 for 1914—in fact, we said as much in our ads recently. But you have doubtless noticed there is a red-hot contest on for supremacy in this class of car—it is a rather easy class for smaller manufacturers and assemblers to get into. You have noticed some cut-throat methods of late. It did not touch us because we were sold out.

But looking the situation over, Mr. Flanders said, "We can doubtless sell all the sixes we make at $2,4co. But I do not propose that our sales force shall be engaged in forcing any one model. Every car in the line must sell on its own merits and meet its own competition entirely independent of any other car in the line.

"Now, inasmuch as some folks have started something, I am going to give them a car that is known as the sweetest six on wheels, and at a price they cannot surpass and stay in business. We will just make it $1,975, and we will make it just as good as we can—and see how far the others can follow the pace."

So you see the big car—the big seven-passenger fellow—which will naturally command a lesser demand, and which you would expect to be the tardy one—will probably prove to be the leader of the line.

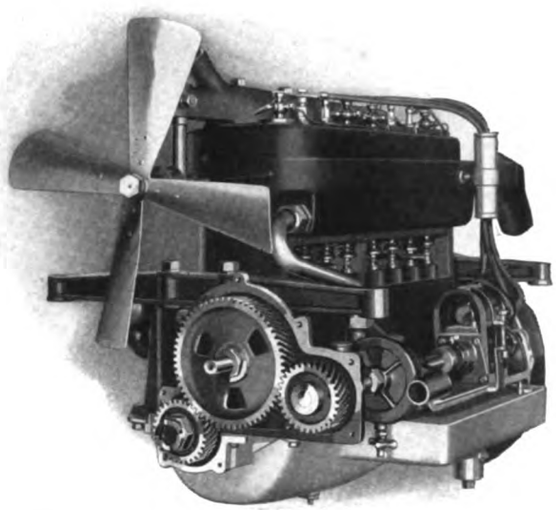
One thing is certain—you as a dealer can appreciate that the **big beautiful six will give class to the entire Maxwell line. The owner of a Maxwell, no matter of which model, will be proud to say he owns a Maxwell.**



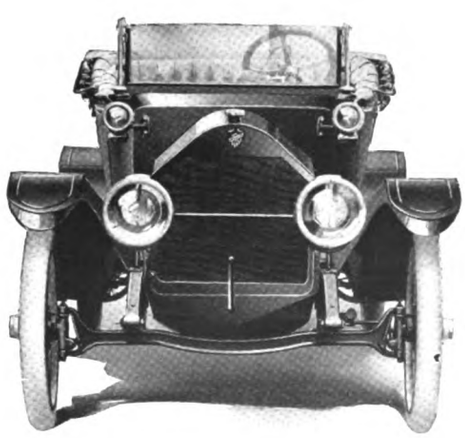
We are not dealing with verbiage nor using superlatives unnecessarily, because we are talking to practical men—to dealers who are accustomed to handing out enthusiasm themselves and who naturally discount everything they hear. But we want to say to you that we believe there is no other six-cylinder motor in any car at any price, that is as well balanced or as sweet running, as this six. With the full floating rear axle which we recently put under this car it is a perfect product—or as nearly perfect as engineering skill and manufacturing care can make it.

By the way, you, as the man who has to stand between the factory and the ultimate user, will appreciate this—if you did not know it before: When we found that the axle under the "50-6" was too light to hold the motor—driving pinion not strong enough, and not enough room in the housing to put in a larger one—we replaced without request, and entirely at our own expense, every rear axle under every "50-6" car that was out.

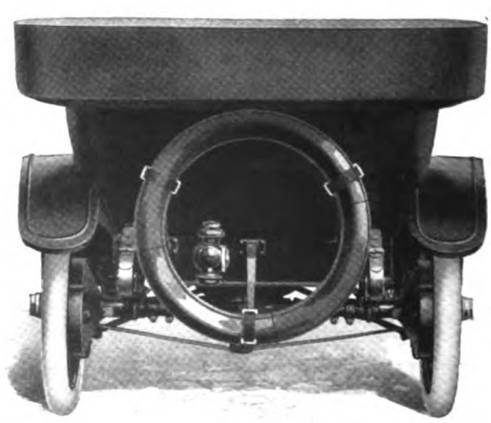
That is a mighty important point for a dealer to consider. It shows what our policy is going to be in the matter of standing back of our product—no matter which one. What we did for the "50-6" we would do for the "35" or "25" if it became necessary.



In short, the 4,000 dealers who will handle the Maxwell line for 1914 will know first: That every car in the line will be the leader in its class—will dominate its class because it will be a better car for the same or less money than a buyer can find elsewhere, let him shop until he is black in the face. Second: They will know that the policy back of the $37,000,000.00 concern that makes this product is based on the assumption that if we are to stay in business and become the biggest in the business, we must back up our product to the dealer who passes it on to the buyer.



Digitized by Google



1914 Maxwell "35-4"—$1085—$1225

Powerful, silent, sweet running; bloc-cast 4-cylinder motor; 111" wheel base; 33" x 4" tires all 'round. Left hand drive, center control. Electric starter and lights, at $1225. Three-quarter elliptic springs. Bruce Ott body, ventilating windshield and full equipment, including Jiffy curtains.

Digitized by Google

While we will be second largest in the world this year, that does not satisfy us at all. We have got to be first.

Next consider the Model "35". The same wonderful bloc-cast, 4-cylinder motor that was in the Everitt "36"—frankness compels us to admit that there was not much else good in that particular car. But that was not our fault. We did not make it. We acquired that proposition primarily to get two of the greatest motors we have ever known—the "50-6" and the "35-4" motors.

You cannot develop an automobile motor in a day—nor in a year—nor in two years. We have bought that knowledge with hundreds of thousands of dollars and years of experience. So we took these two wonderful motors and we built a car that was as good all the way through as the motors themselves—the Maxwell "35-4" 1914 model which will sell at $1,085 without and $1,225 with, electric self-starter and lights, cannot be equalled anywhere else at the price.

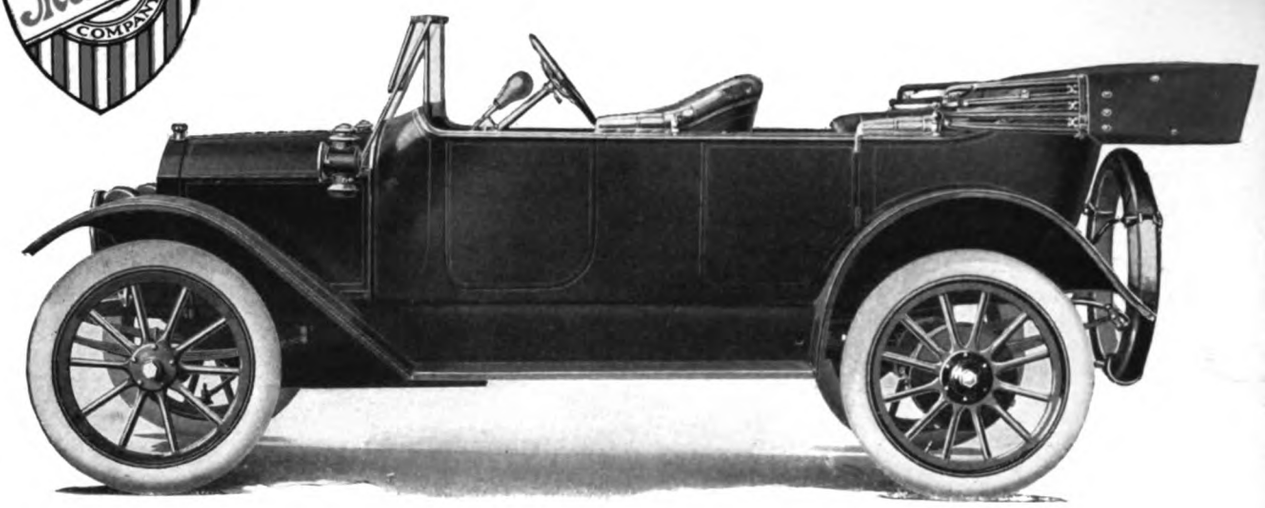
Oh, yes, we know all about it: There are other cars of similar rating, horsepower, wheelbase and all that sort of thing, but we don't need to tell you as a practical dealer, where the difference is. You will lift the hood and find it for yourself. If you don't find it all there, you will take a look inside the transmission case. You will find it in the beautiful body designed by Bruce Ott. Made and trimmed as they do not make and trim bodies in the ordinary $1,200 class. We do not need to tell you the tremendous difference in cost of making a bloc-cast motor such as this, and one with single or twin-cast cylinders.

We do not need to tell you. You know.

To let you into a little secret, our engineers started some months ago to re-design this motor so as to take $150 out of the making and bring it down in price so as to compete with other cars that, looked at superficially, might be considered competitors—cars that being made cheaper, can afford to be sold cheaper. There was a riot when our dealers heard of this. Our Sales Manager joined in with them and soon became the ringleader. All protested against the slightest change in this splendid motor. And Mr. Flanders agreed.

Every man who has handled this car or sold it knows that such a motor is vastly more expensive to make—but it's worth it because when it is once made it is made for keeps. There is almost no limit to the life of a well-designed, well-proportioned bloc-cast motor. Being machined as a unit, everything has to be in line—and crank-case and cylinders being cast in a unit everything has to stay in line. So you see we have another dominating car in our "35" model.

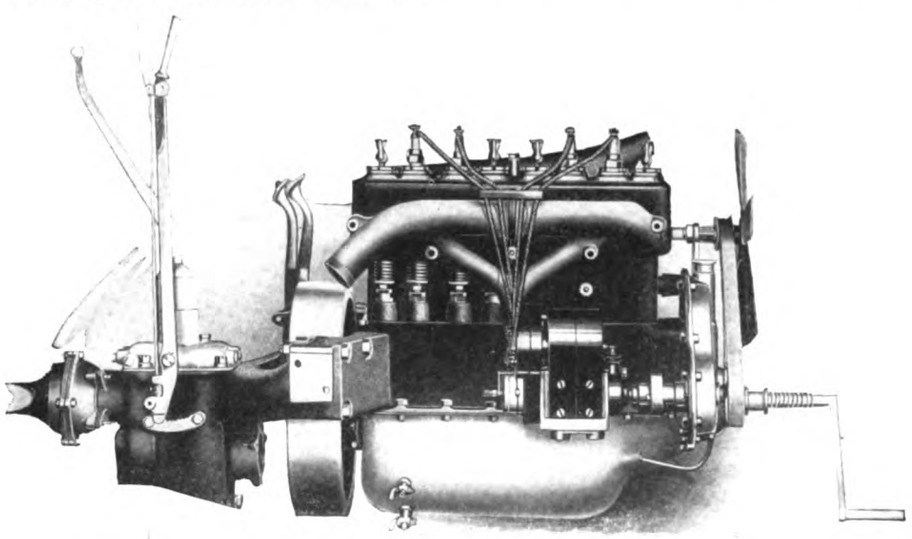
We won't have to ask you to take a few cars of this model in order to get the other—the customer who wants a car in the $1,200 class will, after looking them all over, insist on this one—and you will simply supply his demand.



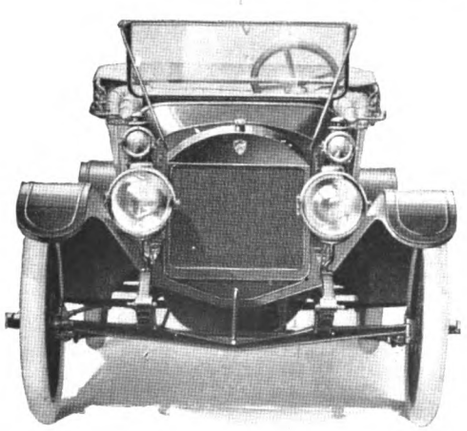
And now the wonderful Maxwell "25"—the car you have all been looking for, hoping for, and wondering why some big manufacturer did not make.

Much as you know about this business, you probably did not know that the first requisite was manufacturing facilities and millions of dollars capital. On top of that, it involves the greatest engineering feat known to the industry.

Why, it's child's play to design a $5,000 automobile. If you doubt it just look back over the past and recall the hundreds of $5,000 cars you have known. They came and went, mostly because the demand for such a car was too little—and you have doubtless noticed it is getting less and less every day.



Cars like the Maxwell "50-6" at $1,975 put a crimp in that kind of proposition. The maker of a $5,000 car is on the defensive today. It's up to him to prove he has a better car. Most of them have given up trying to prove it—and built a smaller car. But they still try to get a high price for a former reputation. There's going to be some real fireworks along that line during the next few months—just watch the Maxwell "50-6."



Digitized by Google

1914 Maxwell "25-4"—$750

The year's sensation. Four-cylinder, bloc cast; 25 h. p. motor; magneto; weight 1600 pounds; 103" wheel base; 30" x 3½" tires all 'round; 3 speed selective transmission; full five-passenger body designed by Bruce Ott; complete equipment, including tire holders, ventilating windshield; top, Jiffy curtains.

Digitized by Google

But we were talking about the "25". Funny how we will get discussing one of these models and slop over on to one of the others. You see we are very enthusiastic about the whole line—each one is King in its own Principality.

We were saying it was child's play to design a $5,000 car—do you know that there is only one maker in the world who has ever been able to make a good cheap car?

No, we're not advertising the other fellow—we are just telling the truth.

We did not start out to make that kind of a car. You have told us—thousands of dealers have told us—that there were hundreds of thousands of people who were willing to pay a little more for a car that was a lot better.

A real automobile, in which the people in the tonneau did not have to rest their chin on their knees.

One that a six-foot man could drive himself without having to make a chauffeur of his four-foot-eight son.

It's funny, but seems as if more big men buy more low-priced cars than any other price, so we figured that the seats had to be standard size, to fit the buyer.

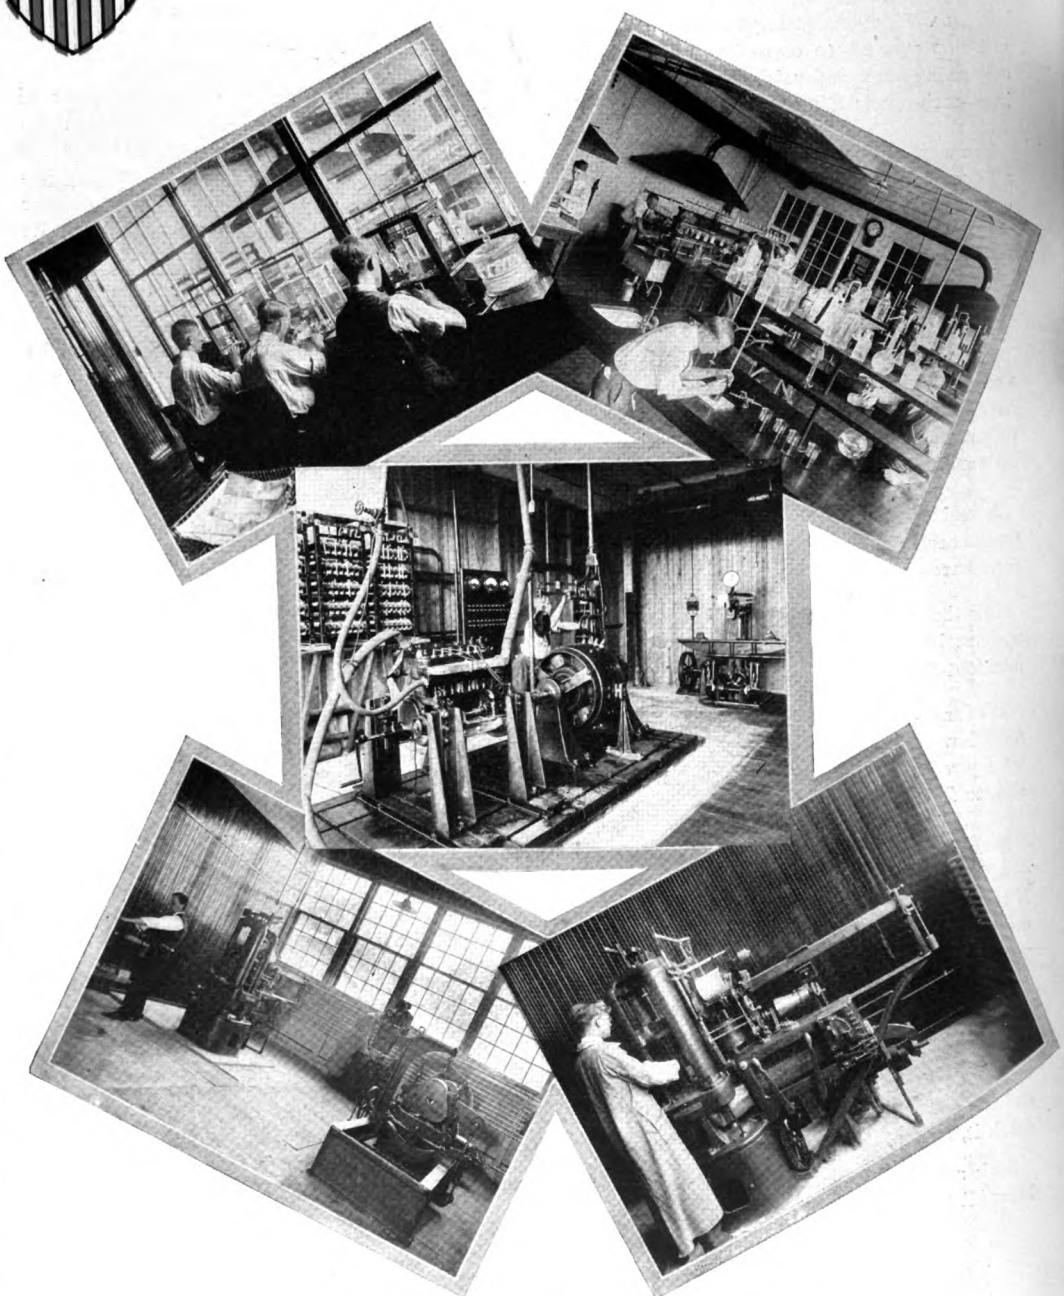
On top of that it had to have power plus—because you know a car like this is criticized more rigidly than a $5,000 car. To the buyer of a $5,000 car the deal is an incident in the day's work. To the man who buys a car like the Maxwell "25" at $750, it is a mighty important matter. He not only must consider first cost, but to a still greater extent, must he consider maintenance cost afterward. "Design for that quality as the first consideration," said President Flanders to our engineers.

Such a car must be light, and it must be strong. It must withstand anything it runs up against.

Consequently it must be made of the best materials the science of metallurgy knows how to put into it.

And finally, it has to have style and finish—because you know we are building this car for a class of buyer who, like the average American, detests a uniform and refuses to wear one even if it does cost less than regular clothes.

That's the kind of car we have made in the Maxwell "25"—and we won't have to insist on your taking a carload of these in order to get a six or a "35." You will want this car on its own merits, too.



Now, just a word more: We cannot hope to supply the full demand for any of these models—with the possible exception of the "50-6", which, as we stated above, is a flexible proposition. If the demand runs above 6,000 of these, however, we cannot supply them. We are laying out our plants for 500 cars a day of the model "25"—but it will be 18 months before we reach that point.

During the next twelve months we will, however, make 30,000 of the Model "25"; 12,000 of the Model "35" and 2,000, or as many more as you want up to 6,000 of the "50-6". That makes us second largest in the world—but that doesn't satisfy us. We've got to be first. There is only one way to do that—make better cars at the same or lower prices—and—stand back of the product and the dealer. That's the only way we know and, again, we refer you to our policy, not as we speak it, but as we proved it in our acts in regard to the Maxwell "50-6".

Such a policy once known gives every dealer confidence and enthusiasm. Well, that is the Maxwell Company's policy.

$1500 Stewart Delivery Trucks $1500

NEW PRICES

Effective August 1st the Chassis Price of Stewart Delivery Trucks will be reduced from $1650 to $1500

Increased output and reduction of manufacturing osts make possible this reduction in price of Stewart elivery cars. A year's successful manufacturing has hown us where we could cut down "overhead" and ıcrease our production without added expense. The avings thus made we are passing on to our customers.

The reduced price, however, means no reduction in he quality of the Stewart cars, either in material or orkmanship. We will continue the same high-grade onstruction—as evidenced by our use of such standrd parts as these:

Continental Motor, 30 H. P., 3 3-4 in, bore x 5 1-4 in. stroke
Timken Axles, front and rear
Brown and Lipe selective transmission
Multiple disc clutch
Bosch magneto
Gemmer steering gears

A number of improvements have been added, such s foot accelerator, dash adjustment for the carburetor, nd other refinements making for convenience and conomy.

Proved by a Year's Use

No radical changes have been made in the Stewart ucks, because a year's hard use in 60 cities in 42 different lines of trade has shown that radical changes are unnecessary. Stewart trucks have proven this. They have made good—both for customers and for dealers.

The Wise Dealer's Foresight is The Poor Dealer's Hindsight

The success of Stewart trucks in the hands of our dealers has already proved the wisdom of those dealers who took on the line at the beginning. Every Stewart sold is a moving salesman, helping to bring in more orders. There is still good territory open, however. There is still **opportunity** for prudent dealers to take on this **profitable line.** Selling Stewart cars is an all-the-year-'round business. No seasons; no trading; no heavy expense for entertainment and joy rides—just a plain business proposition to present to sensible business men.

The reduction in price widens the **already large market** for Stewart trucks. Now is the time to look into this money-making proposition. Write or wire for details.

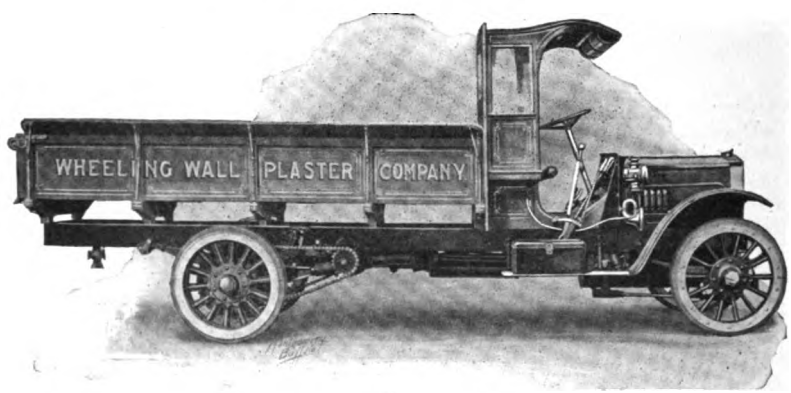
THE ATTERBURY LINE

Why is the Atterbury Line of Trucks—all sizes from the 1,500 pound delivery car to the heavy duty 5 ton truck—the best line for truck dealers to handle?

Atterbury Trucks are built as they are, not because factory experimenting has so dictated, but because we have watched and studied the performance of hundreds of Atterbury Trucks in actual use in the ten years' time they have been on the market.

Sometimes a year's use of a truck will show where it could be bettered. Some other detail of construction may not develop the need of being changed for three or four years. It is safe to say, however, that ten years time will bring out the worth or fallacy of every last detail of truck construction.



Certain parts must be changed and more radical improvements made in them than in others. One of the first and most important things to adjust is the relation of motor sizes to loads. Our experience has proved that the adjustment of motor sizes to loads is by far more practical than the practice of using the same size motors for varying loads, and compensate for greater loads by increasing engine speed. The former method leaves a margin for increased efficiency as may be required by grades, road conditions or overloads. This margin of efficiency adds to a motor's life without increasing its fuel consumption. The latter way does not.

Radius rods are, perhaps, next in importance. Atterbury radius rod construction provides for two way shocks and are acknowledged to be most practical.

Many other details of "hitch-up" have been improved consistently, thus adding to the efficiency of Atterbury Standards.

These are some ideas the prospective dealer should take into consideration before deciding upon an agency.

You—Mr. Dealer—will have to show your customer and back up what you show him. With the Atterbury Line you can show him how efficiency is obtained and can point to specific and practical reasons why such construction means the efficiency he wants.

TIMKEN

The way of long ago

The magnetic way of today

In the Grip of the Magnetic Chuck

YEARS ago it was Timken practice to put the heat-treated, hardened steel cup for the Timken Bearing in a chuck that held it firmly at only three points. Then grind a round tapered hole in the center.

But pressure at three points did distort the cup a little bit. When that pressure was released the cup would spring back and the hole would no longer be ***exactly*** round.

Then a chuck made of heavy springs was used. Springs of equal force pressed over the whole outside surface of the cup. A great advance over three point suspension in a chuck.

Nearly all the cups now came through round. Nearly all! But Timken shop men have mighty little use for that word *nearly*.

Trouble was that some of the cups were very slightly out of round when they came from the hardening room. The chuck springs were forced out a little farther at the high points, not quite so far at the low points.

So the springs pressed a trifle harder on some parts of the cup than on others. After release the hole would be very very nearly, but not quite, round.

And this is how *nearly* was eliminated:—

We stopped grasping the cup by its outside surface. Just ground the back flat and put it up against a strong flat magnet.

That magnet now is the chuck that holds the cup firmly while it whirls and the swift revolving emery wheel grinds the round tapered hole.

There is no rim pressure on the cup. So the round hole stays round when it's taken off the magnetic chuck.

This is just one of a hundred stories that tell how the efforts of a great organization are bent day by day toward perfection of the Timken Bearing. The bearing whose unique principles of design made it 'the one bearing against the field' for motor-car use long before present day accuracy was attained.

THE TIMKEN ROLLER BEARING CO.

Canton, Ohio, U. S. A.

Every Timken Bearing, large or small, is of just one Timken Quality, through and through

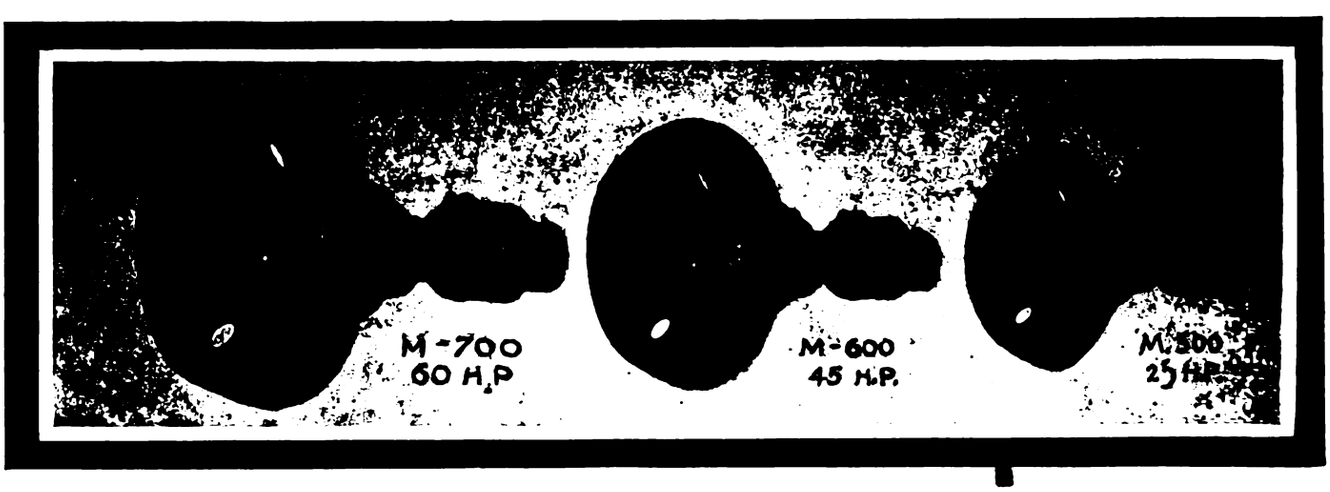
Hartford CONE CLUTCHES

A CAR with a standard motor, transmission and rear axle may sometimes handle and perform somewhat better than another with the same main elements.

We are are accustomed to speak of the first car as having a better hitch-up. A car's clutch is one of the most important elements in the parts which constitute a car's hitch-up. In these days of standardized cars it behooves manufacturers to look to the hitch-up elements for therein may lie the turning point of a car's success.



Hartford Cone Clutches will improve the hitch-up of any car. They have done so for many American made cars, some high priced, many medium and several of the low priced variety. There is only one quality of Hartford Cone Clutch, however—the best; the best as to material ,workmanship and design.

The fact that the several low and medium priced cars using Hartford Cone Clutches have equally as good clutches as the high priced cars is no reflection on the high priced cars. It is, rather, an insurance to the high grade car owners that they have the best clutch that can be built.

Manufacturers of medium and low priced cars, knowing well the importance of an efficient hitch-up have invariably sought the best among types and adaptations of clutches.

Their search has generally ended with the adoption of Hartford Cone Clutches. We said "generally"; we mean always, because we have never lost a customer and are constantly adding to our list.

He who buys a car that has under its hood a

BUDA MOTOR

knows that he will never meet a car (even a $5,000 one) with a BETTER motor.

("There aint no such animile")

The day of the annual revolution in motor design, *the day of experiment*, is past, and everybody knows it. Most modern motors are "good" and the cry of today is for refinement of design and manufacture, "*get-at-ability*," *strength* and *quality of parts*—in a word, for a motor that is "right" and (above all) STAYS "right."

Common sense tells you that to get these qualities at a moderate price *absolutely requires* first, long experience in motor building *as a specialty*, and next, a very large and efficient *organization*, with the *resources* and the *equipment* to back it up.

The Buda Company, one of the pioneers of the business, and *the first in America to make motors on the "cast-in-block"* plan, has ALL these things, and that is why the saying is TRUE that the Buda Motor IS

"The Part That Sells the Car"

The popularity of some of the low-priced cars is based on the lasting security of the bolted-up parts.

Absence of rattle and noise makes a powerful appeal to the ears of the buyer—and a record for "standing up" is the best re-sale argument.

It is our experience that manufacturers of very large volume have, as a rule, paid closer and keener attention to bolted-up security. Perhaps this is one of the reasons for their success.

Now that it is positively known that looseness and squeaks can be overcome by the use of spring lock washers of pre-determined efficiency, manufacturers of automobiles are generally becoming more insistent on the three essential points of a successful nutlock washer—

PROPER SECTION
PROPER ANALYSIS
PROPER HEAT TREATMENT

"AS SURE AS THE WHIRL OF THE WORLD"

THE BIRTH OF A BETTER LIGHT

Built with magneto dimensions - designed to be connected direct to magneto or pump shaft - operates at 6 volts - begins to generate at 200 revolutions per minute - attains maximum output at car speed of 17½ miles per hour.

AUTO-LITE ELECTRIC STARTING and LIGHTING SYSTEM

The AUTO-LITE Electric Generator - a simple, positive, convenient source of current for motor car electric lighting.

THE Auto-Lite Electric Generator—a simple, positive, convenient source of current for motor car electric lighting.

Built with magneto dimensions—designed to be connected direct to the magneto or pump shaft—operates at 6 volts—begins to generate at 200 revolutions per minute—attains its maximum output at car speed or 17½ miles per hour.

Your 1914 car should carry the Auto-Lite system as standard equipment—no matter what price you pay.

Due to its already wide-spread adoption, car manufacturers can equip with the Auto-Lite if you so specify.

For the manufacturer who desires lighting, starting and ignition in one system or separate units, we are able to provide the best recognized equipment now in use.

Where Have Your Profits Gone?

By C. P. HENDERSON

FOR years—almost since the inception of the automobile industry—I've hunted the secret of your profit-*loss*. It's not because you don't sell enough cars. It isn't because of the profit per car. It isn't because your establishment is too expensive. But it is because at the very height of the heavy buying season you don't get *cars of the year ahead.*

Your prospects hold off for 1914—those who do buy, buy discount cars—the precious selling weather slips by—winter is on before your 1914 deliveries commence. And then people are *not* buying.

That's where your profits go!

HENDERSON

You Should be Selling 1914 Cars Today

Today you should be offering your market 1914 cars. For the leaders next year will supply carburetors that will burn kerosene or gasoline—thus cutting the year's fuel cost down 75 per cent.

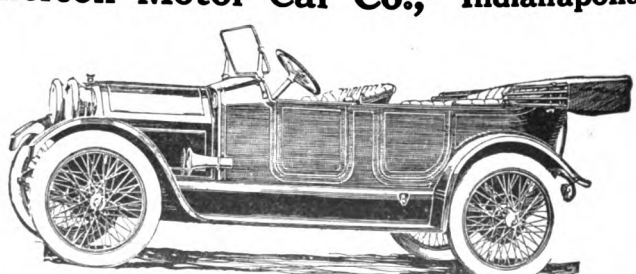
Also wire wheels, cowl dash, cowl gasoline tank, left drive, the new center seat control, dust-proof en bloc motors with oversize cooling and, of course, electric, self-cranking and lighting systems.

But you cannot offer them under any other name than Henderson until the precious selling weather has disappeared *with your profits.*

Popular Models for Every Class of Trade

For we are a year ahead with our car. We anticipated the demand—we came out early with 1914 models. Since May 20th we have been shipping—our dealers get their maximum profits.

And the models, too, are the ideal to sell. There is the Light Four, at $1585—ideal country and city business; the De Luxe Four, for city business and some country trade; the Six for large city trade; the coupe for the large city business.



Is not this a wonderfully balanced line? And remember, we supply it at the time *when buying is heaviest!* When biggest profits are possible.

Dealers tell us, because we know their conditions, that we are destined to be leaders in the moderate-priced class.

If what we have said interests you and you are the type of man we like, wire us about territory—or come to the factory if you can. May we hear from you quickly?

The New Henderson Six, Touring and Roadster Models, $2285.

Henderson Motor Car Co., Indianapolis, Ind.

New Henderson De Luxe, $1785

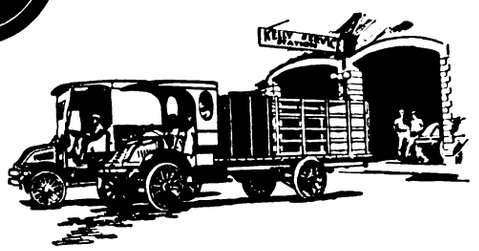
Jeffery-Dewitt SPARK PLUGS in the Making

Scene II. Affixing the lettering, preparatory to a second baking of the porcelain. Few people realize the intricate processes and ceaseless care necessary to make the world's leading Spark Plug—the *J-D*. Yet every plug must pass through 52 operations and three departments. The process pictured above also gives opportunity to reject all porcelains that have developed a defect during the first firing—nothing but a perfect porcelain can find its way into a *J-D* product.

At 75 cents, the PETTICOAT plug possesses the famous unbreakable Jeffery-Dewitt porcelain, the accurate metal parts, and the patented packing joint. The electrode is of special alloy. For good, hard, efficient service, this plug is especially recommended. It can also be had in conical type; and both conical and petticoat types may be had with platinum points, at $1.25.



JD

INTERLOCKS

Stop Your Tire Trouble

Don't fail to write today for Interlock Booklet which tells all about Interlock Inner Tires, and gives many new tire pointers of the greatest value to every automobile owner.

The Interlock is an **extra inside tire** which is placed between the outer casing and the inner tube for the purpose of so strengthening the tire that it will be proof against blow-outs, rim cuts and punctures and therefore last twice as long.

When you know what Interlocks will do, you will want them. They give you practically **two tires on each wheel** with no change in the looks of the tire. With this combined strength you can run your car an entire season without delays, annoyance or tire trouble, and save about half your tire expense.

In writing for catalog, please give name of your local dealer, and if he cannot supply you with Interlocks, we will send you the name of a nearby dealer who can.

To Dealers: A good proof of the efficiency of Interlocks is that they are regularly stocked in all sizes by the largest jobbers who only handle quality goods, such as Beckley-Ralston Co., Chicago; Bi-Motor Equipment Co., and Iver Johnson, Boston; Fry & McGill Co., Denver; Motor & Machinist Co., Kansas City; Chanslor & Lyons, Los Angeles; Western Auto Specialty Co., Iowa City; Ia.; Gibson Automobile Co., Indianapolis and all leading automobile supply houses.

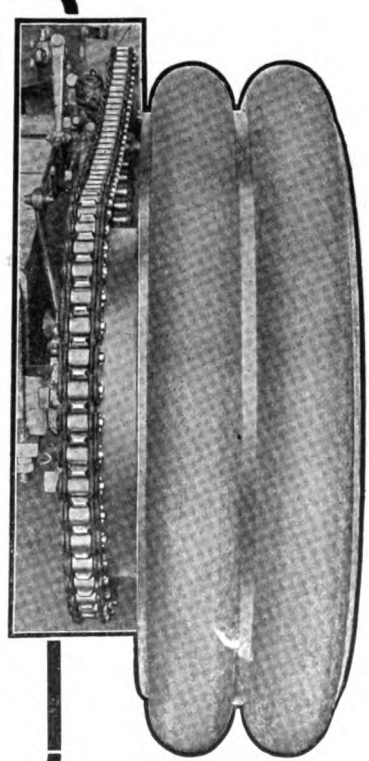
"WHITNEY" Chains

WE call your attention here to "Whitney" Cotter Detachable Chains as the most practical chains ever offered for motor vehicles. They have made a record for themselves which no other Detachable Type has approached.



This Cotter Pin feature is so practical and necessary that it calls for little detailed explanation. The illustrations tell their own story, proving that this form of construction is logical and necessary for chain equipped motor vehicles. This Cotter Detachable Chain can be taken apart at any link and lengthened, shortened or repaired without the use of any special tool, as the Cotter Pin can be removed with pliers, screw driver or any sharp pointed instrument. The use of "Whitney" Cotter Detachable Chains assures the builder, owner and driver of commercial vehicles uninterrupted service on account of the ease of repair.

"Whitney" Chains are made from steel best adapted for the purpose, carefully hardened and calculated to resist the most wear, while in the matters of machining and assembling the utmost care is exercised and thorough inspections and tests characterize each process of manufacture. Their future service, however, depends upon the accuracy of sprockets, care, lubrication, alignment and adjustment, for the best chain in existence cannot withstand the evil influence of improper conditions and give best results.

Write for our illustrated catalog which shows top and side views of each size of all Roller chains manufactured by us.

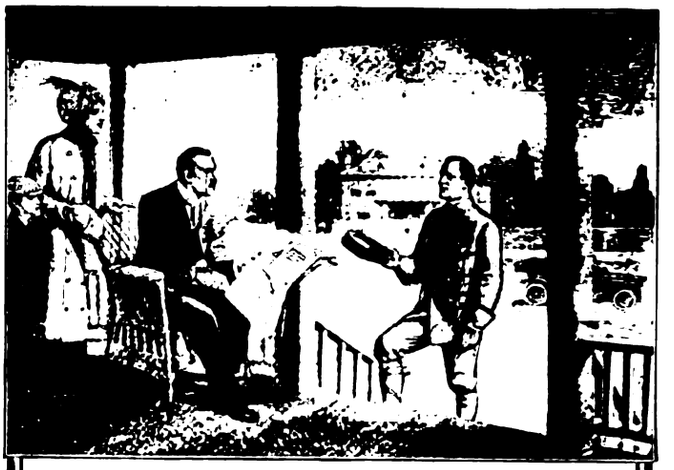
The A. L. A. M. Formula for determining Horse Power rating gives only a scant idea of the efficiency of Ergon Standard Motors.

Model	Bore	Stroke
C	3¾	4½
CX	4	4½
D	4⅜	6



Brake tests show to a remarkable degree the benefit of the Ergon tendency toward a long stroke motor.

For heavy duty truck practice no better motor than the Ergon Model D has ever been produced. In Model D motor the replacement of gears by Renold Silent Chain for magneto, pump and timing drive is a decided improvement, giving less wear on parts and in eliminating all vibration.

Ergon Motors can be had either as independent or unit power plants. Write us for blue prints, specifications and records of dynamometer tests. Their flexibility makes Ergon Motors applicable for a wide range of truck power plant requirements.

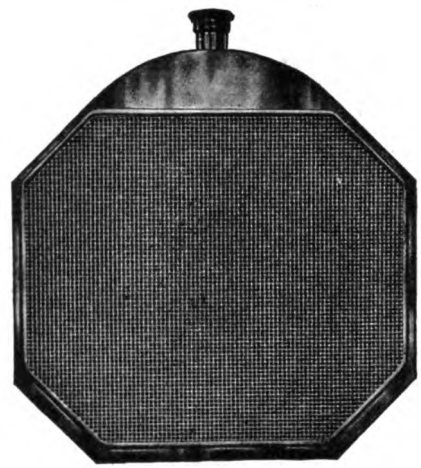
KLINE KAR



"FORTY" $1985

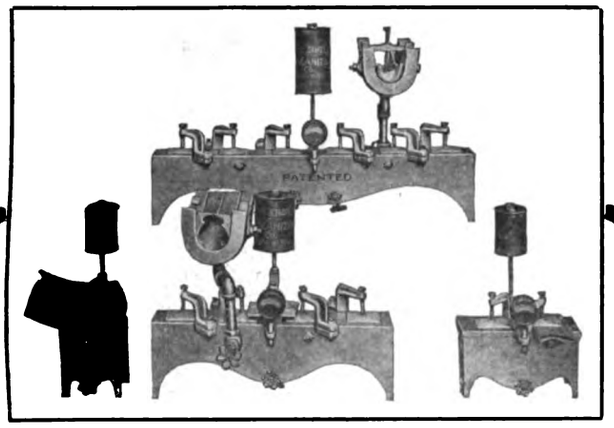
The best four-cylinder forty horsepower car on the market with separate electric starting and lighting, and separate ignition systems. The economical four speed forward transmission is another big asset.

Address Dept. W for Catalog

KLINE MOTOR CAR CORPORATION
Richmond, Va. **York, Pa.**

Main Office and Factory, Richmond, Va.

Our departments of engineering and design co-operate with the men who build the car—combining their weight of experience in radiator making with the particular requirements of the designer of the automobile.



We will not, however, endanger the reputation we have made by making radical changes from established design. In standing by this resolve, we have, on rare occasions been obliged to lose business—something to be regretted, but none the less necessary.

Mayo Radiators are built to hold the engine at an even temperature—not too hot to endanger its usefulness, nor too cool to lose its efficiency. "Tolerance" in change of design is therefore liberal—but it has its limits.

If you, as the man who has sold the car, find yourself in "hot water" so to speak, with a leaky, inefficient radiator and a "superheated" customer, then be sure this car was not equipped with a Mayo Radiator. Dealers who sell cars Mayo equipped know that the radiators will stand up under any unfavorable condition short of a blow with a hammer or a bad collision.

75% of all tire trouble is due to under inflation

THERE is no method yet discovered of ascertaining the pressure in the inside of a tire, except by the use of a pressure gauge. A casing containing 40 pounds of air looks and feels exactly like a casing containing 80 pounds. If your tires require 80 pounds and you only give them 40, they're on the quick road to the scrap-heap.

Send For This Free Booklet

For the owner, or for the man who finishes autos and carriages, this little booklet entitled "The Care of the Car" will be found full of practical suggestions.

It tells the owner how to keep his car in the best of condition and what to specify when having the car done over.

It demonstrates to the finisher why permanent results pay best and why no jobs need "go wrong."

It contains a number of popular color samples and a novel plan for showing how they will look when put on a car.

You should have this booklet. There's a copy waiting for you. Send coupon for it **today.**

For Your Transmissions

The very best lubricant you can buy is the cheapest in the long run because it saves wear and repairs.

Dixon's Graphite Grease No. 677

Is the best lubricant for enclosed transmission gears because it penetrates to every wearing surface, leaving a **permanent** graphite coating that reduces noise, saves wear, makes cool running, conserves power. And it is highly economical, too. Write for "Lubricating the Motor," No. 23—the autoist's authority on lubrication.

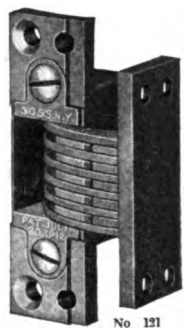
NEW SOSS CONCEALED DOOR HINGE NO. 121



This new hinge requires a pillar only ⅞ inches wide. It is detached by removing two screws as indicated in illustration. The trouble avoided and time gained in hanging doors when using Soss Hinges are important factors.

Soss Concealed Hinges can be installed flush with the outside of the pillar, allowing the steel or aluminum panel to be turned over flush on to the face of the hinge, and fastened down securely in the rabbet provided on the edge of the face to receive it, thus allowing more than ordinary clearance.

The non-corrosive case attached to the pillar section of the hinge, prevents water from reaching the wood of the pillar through the hinge.

Description:

Face of hinge on pillar, ⅞ in. x 2¼ in.
Face of hinge on door, ¾ in. x 2½ in.
Water-proof case mortises into pillar, ⅞ in. x 1⅝ in. x 1¼ in. deep.
Clearance in opening, 11-16 inches.

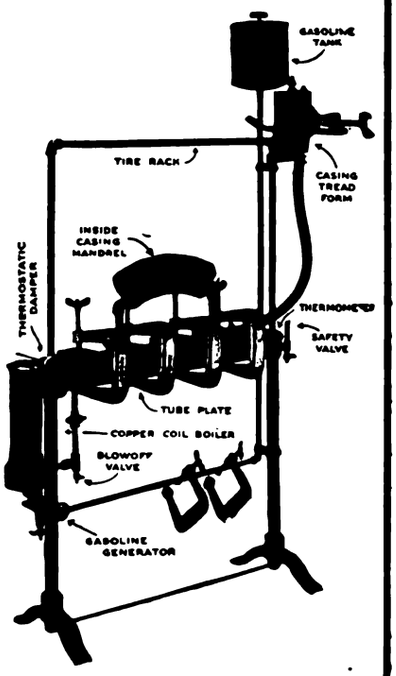
The Motorist's Self Vulcanizer

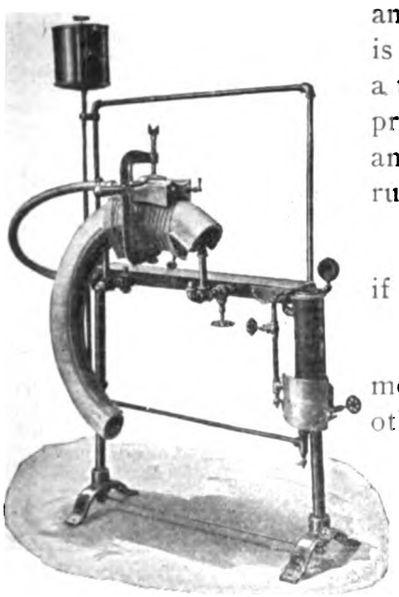


NATIONAL RUBBER COMPANY, 4413 Papin St., St. Louis, Mo.

Digitized by Google

Complete Steam Vulcanizing Plant—$45

Get that extra 80 per cent. that you have been paying to some fellow who has had foresight enough to install a vulcanizer. If he can afford to maintain a plant and **split the profits,** how in Sam Hill can you afford not to do your own vulcanizing?



A school boy can turn out enough work with the Shaler Steam Garage Vulcanizer to pay for it in a week or two. Not a get-rich-quick proposition, but a practical, simple vulcanizer that will handle your work and let you in on the most profitable part of the automobile business.

The Ideal Garage Outfit

Will do every kind of vulcanizing that you want to handle, tube punctures—or large casing blow-outs. Steam is raised in twenty minutes in a copper coil boiler, so the machine can be profitably heated even if only a single tube repair is to be made. Gasoline or gas used for fuel. A gallon of gasoline will run the whole outfit all day long.

It's a SHALER Vulcanizer

and has the exclusive Shaler feature of a temperature control that is automatic. No watching or regulating. Start the burner and a thermostat automatically adjusts the flame and keeps the steam pressure exactly right for vulcanizing. As a check on this mechanism a safety valve relieves the pressure should it accidentally run above the vulcanizing point.

Tube plate can be heated independently of the casing forms if desired. Handles six tubes as quickly as one.

Casings are repaired by the approved Shaler wrapped tread method, which makes stronger repairs at less expense than any other way, and requires no extra moulds for different sized tires.

Write Today for Full Description

Ask for NPR circular. It tells in detail how this vulcanizer will make money for you.

THE moderate-priced car should be Klaxonized.

Disregard the high-standard of Klaxon *quality* and the permanent satisfaction guaranteed to Klaxon users—and consider the question solely on the basis of the advertising value resulting.

The Klaxon, Klaxonet and Klaxet are recognized by buyers everywhere as the *standard* signals—the very best. Car buyers know that they are included as regular equipment of every high-priced car made. They look for them on the car they buy. Finding them creates confidence in the other parts of the car—in the car itself.

They are accepted without question as the best warning signal equipment possible for a maker to provide. No explanation is necessary—no apology—no argument. The agent is not compelled—as is otherwise frequently the case—to substitute a Klaxon at his own expense for the cheap, unknown signal, in order to make the sale.

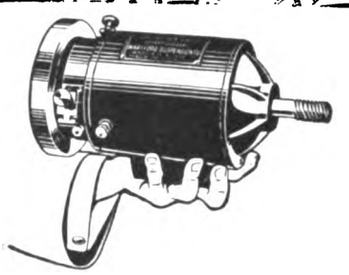
Any Manufacturer Can Test The Hartford Starter Without Redesigning His Car

With most electric starters the car manufacturer is beset with the difficulty of altering his car's design to try them out.



This difficulty has been entirely overcome in the Hartford Electric Starter which can be successfully applied to any car in use without a single structural change. The wonderful compactness of the Hartford Starting and Lighting System makes this practicable.

While our buyers are clamoring for lighter weight cars, they are also demanding electric starter equipment. In the case of many manufacturers this has meant an increase in their car's tonnage, which has produced an under-tired car.

Consequently the demand of manufacturers, designers and engineers is for a starter that is of proven efficiency, yet of extreme light weight.

It remained for Mr. E. V. Hartford, the inventor and designer of the

Hartford Electric Starter

to couple the greatest power with the least weight and offer to manufacturers an electric starting and lighting system which is light, powerful, silent and trouble proof.

No manufacturer is asked to take these claims for granted.

We should be glad to extend you the service of our special installing department which will assign an engineer to attach and demonstrate this system on your car or you can put it on yourself. Catalog on request.

Send for interesting booklet giving history of Self-Starters

Fedders Radiators

NEVER in the history of the automobile industry has a car manufacturer built his own radiators successfully. Radiator building is a specialty in itself. Radiator design, however, is a joint problem for the automobile engineer and the radiator maker. The engineers' problems of engine cooling detail concern circulation methods, weight, shape, style, etc., while the radiator maker's experience can best determine materials and methods of construction. Co-operation between the two is the safest and sanest way to get at the best cooling system for certain cars which require something outside of radiator standards.

For years Fedders Radiators have been used on the highest grade cars and probably for years to come many cars will find Fedders Radiators all that they can ask for in a radiator, but to anticipate a tendency on the part of many engineers, we are always ready to co-operate with them, and to that end have gotten our manufacturing facilities in shape to take care of all kinds of special requirements. Why not avail yourself of our experience?

Vol. XXXVI New York, U. S. A., Thursday, August 14, 1913 No. 8

TRUCKS TO HAVE NO PLACE AT NEXT AUTOMOBILE SHOWS

Pleasure Cars Only to be Shown in Palace and Coliseum — January Dates for Both Exhibitions— More Space in Palace.

There will be no trucks or commercial vehicles of any sort at either of the forthcoming National shows in New York and Chicago. Although several months since it was decided to eliminate "truck week," as the second week of the shows had come to be termed, there were those who believed that commercial vehicles would be permitted to mingle with the pleasure cars. This belief, however, is put to rout by the official statement issued this week that both the New York and Chicago exhibitions will be devoted wholly to the display of pleasure cars.

The dates for the two shows also were made public. The New York exhibit, which will be staged wholly in Grand Central Palace, will open January 3rd and close January 10th. The one in Chicago will occupy the Coliseum and First Regiment Armory, as formerly, and will open January 24th and terminate on the 31st. It will be the first time that both of them are under the management of the same organization, the merging of the N. A. A. M. and the Automobile Board of Trade into the Automobile Chamber of Commerce rendering this possible. There also will be but one double-admission day at both shows, instead of two days as heretofore, which is to say that the 50-cent fee will prevail except on the single $1 day.

In Grand Central Palace four floors will be utilized, affording 50,000 square feet more floor space than was used at both the Palace and Garden last January, a fact that will surprise most of those not intimately familiar with both buildings.

Automobiles will occupy the first and second floors of the Palace, and all of the wall spaces of the other floors. The space about the wall on the second floor and other sections on the same floor which may be needed for the purpose will be devoted to a special section for the exhibition of electric cars. On the third floor, the spaces not occupied by car exhibits, will be given to the products of the Motor and Accessory Manufacturers, Inc., who also will have 15,000 feet of the fourth floor. The M. A. M. will make the allotment of spaces to its members as has been the custom in the past. It is expected, also, that the Motorcycle Manufacturers' Association will show their products on the fourth floor. Space can be had also on this floor for accessory makers and jobbers who are not members of any organization.

For the Chicago show the gallery of the Coliseum will be extended at the sides and each end of the building will be lengthened by 24 feet, this arrangement adding 5,000 more feet of space for the exhibits. The aisles will extend around the inside of the balcony instead of the outside, as heretofore, so that the exhibition space will be given greater depth. There will be also a slight rearrangement of the main floor. Three-fourths of the center of the main floor of the armory will be devoted to the exhibition of electrics.

S. A. Miles, general manager of the Automobile Chamber of Commerce, is busily engaged on the plans for both exhibitions and expects that application blanks and diagrams will be issued on or about September 1st.

Indianans to Market Marathon Output.

To market the entire output of the Marathon Motor Works, of Nashville, Tenn., the Herff-Brooks Corporation has been organized in Indianapolis, with a capital of $100,000. Its officers are Jacob Herff, president; Herbert Herff, vice-president; George Herff, treasurer; H. H. Brooks, secretary. The Herffs previously constituted the State Auto Co., which handled the Marathon car in that city, while Brooks was sales manager of the Marathon works.

MICHIGAN FAILURE REVEALS WONDERFUL FINANCE SYSTEM

Receiver Discovers Weird Method of Handling Dealers' Notes—"Bills Payable" not Included in Statements to Banks.

It is believed by some of those who are delving into its affairs that the Michigan Buggy Co., of Kalamazoo, owner of the Michigan Motor Car Co., which went into the hands of a receiver last week, as reported by Motor World, can be saved. They admit, however, that saving it will not be a simple matter, as the receiver's probe has uncovered what at best may be described as a much mixed state of affairs.

The mix-up is of such a character that it is not possible to arrive at anything suggestive of an authentic statement of assets and liabilities. Meanwhile, however, the receiver, the Detroit Trust Co., has placed W. F. McGuire, former production head of the Maxwell Motor Co., in charge of the Michigan plant, and as it contains material sufficient to build about 500 cars, McGuire will perform that task as quickly as possible.

Victor F. Palmer, secretary and manager of the company, has been sick abed for several weeks and at last reports was still confined to his home, but there are those who blame him for the trouble and who do not mince words in doing so. The actual owners of the property, Frank B. Lay and his son, F. B. Jr., have the confidence of most of the community, and it is said that they are more to be pitied than censured.

The methods of financing the needs of the Michigan company are said to have been if not distinctly original then not common to a very large portion of the automobile trade. When it was desired to borrow money from the banks, for instance, the necessary statements of financial condition were rendered but, strange to say, few, if any, of them ever carried the item "Bills

Digitized by Google

Payable." In fact, it is stated that such bills, most of them for material, were not entered on the books at all, but were simply carried in files. As a result, the statements rendered the banks were always of a pleasing nature.

Dealers' paper also was negotiated on an extensive scale. "Bills Receivable," which are listed as an asset, amount to $1,288,000, or which $860,000 is represented by dealers' notes, one dealer alone having given paper in the sum of $300,000. This sort of security was not only invited but freely made use of.

If a dealer purchased, say, 100 cars he at once gave the Michigan Motor Car Co. notes for $100,000, dated at periods to correspond with shipping dates, which notes were then negotiated by the Michigan company. In case a dealer did not take the cars ordered, when the notes fell due the Michigan company sent him a check to protect the notes and in turn obtained a new set of notes. As the dealers who gave them are responsible for the notes, whether or not they have received the cars, the Michigan failure may cause embarrassment in more than one retail establishment.

Because of these methods of doing business, the receiver will not be able to get to the very bottom of things for some little time. In an effort to do so, it has addressed a letter to all creditors asking for complete statements, and when they are received and checked up it is probable than considerable light will be shed and that still more illumination will be turned on by the receiver's representative, who is calling on every Michigan branch and dealer for the purpose of checking up both cars and accounts.

Stewart Takes up Accessories in Chicago.

F. W. Stewart, who for several years was connected with the Buick branch in Chicago, has gone into the accessory business in that city on his own account. He is trading as the Stewart Auto Accessories Co., at 1509 Michigan avenue, L. L. Kennedy being the local manager. Stewart has the State agency for Velvet shock absorbers, Dann oil cushion spring inserts and several other accessories, and will still further add to his accounts.

Studebaker Buys Parts Plant in Pontiac.

The Studebaker Corporation has purchased that portion of the bankrupt Flanders Mfg. Co.'s plant in Pontiac which, before it was merged by Flanders, was known as the Vulcan Gear Works. It will be employed exclusively in the production of replacement parts for Studebaker cars. It will become known as Plant No. 15 and will be in charge of W. W. Austin as superintendent.

STRIFE REGARDING WALPOLE RECEIVERSHIP GROWS TENSE

Court Has Yet to Decide Whether There Shall Be One Receiver or More—Creditors to Meet to Attempt Agreement.

Whether there shall be more than one receiver for the Walpole Tire & Rubber Co., of Walpole, Mass., which failed August 2nd, has divided the creditors into two warring camps. Those who want but one receiver and those who want more than one each have organized themselves into what is styled Creditors' Protective Committees and are now engaged in strenuous strife.

One of these committees, which favors but one receiver, is composed of R. L. Curtis, receiver of the Atlantic National Bank, whose failure brought down the Walpole company; Charles F. Wilson, representing the Charles F. Wilson Crude Rubber Co., and W. G. H. Randolph, representing the Endurance Tire & Rubber Co., who represent claims approximating $440,000.

The opposing Protective Committee, which is seeking the appointment of a co-receiver, is composed of Thomas R. Eaton, Edward H. K. Revere and Arthur Wainwright. Still another committee of creditors, composed of C. N. Draper, Edward L. Belding and John C. Meyer, also has circularized the creditors in favor of the appointment of an additional receiver.

Meanwhile, Robert C. Fisher, treasurer of the company, who was appointed receiver at the time of the failure, is still in sole charge and is operating the plant to the best of his ability, but whether or no he will remain "alone and by himself" probably will be decided on Saturday next, 16th inst.

The application of the committee of creditors who believe that more than one receiver is desirable was heard in the Federal court in Boston on Saturday last, but in response to the urging of the Curtis-Wilson-Randolph Creditors' Protective Committee, the court withheld decision for one week, or until a meeting of all the creditors could be heard and their opinion obtained. This meeting will be held in the Hotel Astor in New York this afternoon (Thursday) at 2 o'clock. Its sentiment will be conveyed to the court and undoubtedly will largely influence any decision which may be rendered.

Goodyear Official Sails to South America

J. C. MacFadyean, vice-president and general manager of the Goodyear Tire & Rubber Co. of South America, sailed Saturday last on the Imperator to Brazil, via Europe. He had just come from the Goodyear parent factory in Akron and is going south to assist in the establishment of the Goodyear factory which will be built in Rio de Janeiro. It will be a three-story reinforced concrete structure, costing more than $1,000,000, and is expected to be in full operation in less than a year. It will produce not only tires, but other rubber goods, the immediate market for tires alone being placed at a valuation of $30,000,000 annually. Instead of taking American workmen to Brazil, the Goodyear people for several months have been training six Brazilians at their Akron factory, and these men will serve as foremen and heads of departments of the South American plant.

Report Regarding Alco Again Denied.

Reports are again circulating that the American Locomotive Co. is preparing to discontinue or otherwise dispose of its Alco automobile interests. They are coupled with rumors that W. H. Marshall, president of the Locomotive company, and Leigh Best, vice-president in charge of the Alco department, will retire from office. Similar reports were rampant only a few months ago, but apparently were stilled when Best was assigned to the automobile department.

When President Marshall was asked by a Motor World representative concerning has rumored resignation, he stated that he had heard nothing about it, but that the report of his retirement was revived regularly each year. In his turn, Vice-President Best declared that if he was to resign, or if the Also automobile department was to be discontinued, he knew nothing about it.

Reiss's Hupmobile Deal Causes Changes.

Having taken the metropolitan agency for the Hupmobile, Charles E. Reiss, president of the American-Marion Sales Co., of New York, has relinquished that office to J. A. Handley, of Indianapolis, president of the manufacturing companies of those names. Reiss, however, retains his interest and will remain secretary and a director. The management of the American-Marion Sales Co. will devolve on Winfield S. Jewell, its vice-president. It will keep its present headquarters at 1896 Broadway, New York. Reiss removing to 1690 Broadway, where the Hupmobile will be handled under the firm name Charles E. Reiss & Co.

Hudson Declares Big Stock Dividend.

Having transacted business to the extent of $10,500,000 during the fiscal year ending July 1st, an increase of $3,500,000, the Hudson Motor Car Co., of Detroit, last week cut a fat "melon" in the form of a 100 per cent. stock dividend. More than $250,000 also was carried to the surplus account, the annual report of the company showing no bonded indebtedness of any sort.

OVERLAND TO HAVE BUT ONE CHASSIS AND LOWERS PRICE

Discontinues Larger Model and Will Concentrate on Improved $950 Car —Greatly Increased Production in View.

Henceforth there will be but one Overland car, or, more correctly speaking, but one Overland chassis. While it has been considerably refined, and the equipment considerably added to, it will be substantially the 30-horsepower model which this year has sold for $985. Its horsepower, however, has been increased to 35 and its price reduced to $950.

It will be frunished with either roadster or five-passenger touring body at this price, and while its regular equipment will include electric lights, if an electric starter is desired Gray & Davis equipment will be supplied at an extra cost of $125. The same chassis will be utilized for an open delivery wagon at $900, or a closed delivery at $950, but in each case if the Gray & Davis starter is desired $125 will be added to the price of the car.

The fact that the Willys-Overland Co. purposed discontinuing their 45-horsepower $1,475 model and concentrating on the smaller car was not generally known, and for that reason the news will excite no little surprise. The move, however, is in line with the well-thought-out Willys policy of increasing production. Concentration on one model, it is estimated, will permit an increase of about 10,000 cars, bringing the Willys-Overland production for the 1914 year to 50,000.

In general appearance the $950 car follows the lines of its predecessor, but is slightly larger in every way.

The increase in the dimensions of the motor raises the piston displacement from 226.2 cubic inches to 240.5 cubic inches, the old bore and stroke and the new being 4 x 4½ inches and 4⅛ x 4½ inches, respectively. According to the A. L. A. M. formula, the horsepower rating with the old dimensions was 25.6, but with the ⅛-inch increase in bore and rating now is 27.2 horsepower. Except for the increase in dimensions, the motor remains the same, the four cylinders being of the L-head type and cast separately. A Splitdorf magneto has been substituted for the Remy instrument used in the past.

Along with the increase in the size of the motor, the wheelbase of the car has been increased from 110 to 114 inches, and instead of 32 x 3½-inch tires, all wheels now are shod with 33 x 4 tires. At the same time the body has been made roomier and the cushions deeper, and the comfort of passengers has been further looked after by increasing the width of the doors and so concealing the hinges and latches that they cannot be seen, let alone touched. Otherwise, except for great improvement in the finish, which now is in Brewster green instead of the darker color that has been used in the past and the addition of a deeper skuttle over the dash, there is very little that is new. As heretofore, power is transmitted through a large diameter cone clutch, to which there has been added a brake to facilitate gear shifting, and a three-speed selectively controlled gearset with the hand levers placed in the center of the footboard; the steering column remains at the right side.

To the list of equipment, which last year for the first time was included in the purchase price, there has been added electric lights, operated from a large storage battery, and an electric horn; the remainder of the list is as follows: Top with side curtains and boot; windshield built into place; Stewart speedometer, and the usual complement of tools, tire repair outfit, spare parts and so forth.

Buick Branch Transferred to Dealer.

The Buick Motor Co. has discontinued its branch in Cleveland, Ohio, having turned over its representation to the Ohio Buick Co., which was incorporated two weeks since for the purpose. G. C. Peckham, who for years has handled the Buick in Dayton, is president of the new Cleveland company, H. M. Adams is vice-president and H. E. Gilbert treasurer. D. A. Burke, former manager of the branch, will become attached to the Buick factory sales organization.

Dates Set for Second Flanders Sale.

Options obtained by Harris Bros. & Co. at the time they purchased the machinery and stock having been annulled by the court, the real estate and buildings comprising the plant of the bankrupt Flanders Mfg. Co. will be offered for public sale September 8th and 9th next. The property in Pontiac will be sold on the first day and that in Chelsea on the 9th, the sale, of course, being conducted by the receiver of the Detroit Press Co.

Chandler Elects Three New Directors.

To fill vacancies, W. R. Hopkins, president of the Belt & Terminal Realty Co.; J. W. Deutsch, Cleveland; William P. Herbert, Philadelphia; Albert Jarecki, president of the Jarecki Mfg. Co., have been elected directors of the Chandler Motor Car Co., of Cleveland. The officers of the Chandler company, however, remain unchanged.

ANDERSON BUYS ALL RIGHTS TO HANLON WINDOW PATENT

Gets Control in America and Abroad for Double-Pane Device—Will Incorporate Construction in 1914 Models of Electrics.

Following several months of negotiations, the Anderson Electric Car Co., of Detroit, has purchased the entire American and foreign rights under the William B. Hanlon patent for electric car windows and is incorporating this new feature, with others, in the models it is bringing out for the 1914 season; the device differs materially from the ordinary type of car window, and the inventor's claims are that the driver of a car so equipped will at all times have an unimpaired vision of the road ahead of the vehicle.

The patent, No. 993,061, was granted May 23, 1911, to William B. Hanlon, of Pittsburgh, Pa., and is best described as being a double front window, the front half of which swings outward from the bottom like a windshield. The device consists of one window which fits into more or less ordinary window fittings and which can be dropped into a pocket, much as ordinary enclosed car windows are dropped. The other window, which is located in front of this window, is hinged at the top and is so arranged that it can be swung outward from the bottom.

When the swinging window is closed an air chamber exists between the two panes, just as in the double window of a house, and it is claimed by the inventor that this will entirely prevent frosting in cold weather. In case of a storm of rain or snow, the adjustable section may be swung out as in the rain-vision type of windshield which has been used on gasolene touring cars. With this adjustment of the device the occupant of the car is protected from the cold wind and his vision is not obscured. The device, also, is equally applicable to the front of an electric railroad car.

Bremer-Wilson Going to Benton Harbor.

Having acquired substantial support in Benton Harbor, Mich., the Bremer-Wilson Mfg. Co. has been reorganized, with a capital of $150,000, under the laws of that State, and is preparing to leave Chicago. In Benton Harbor it will have two buildings, one 60 x 100 and the other 25 x 60 feet, where the manufacture of Triplex gas savers, engine starters and other devices will be carried on. Fred C. Bremer is president and general manager of the new company and I. N. Wilson secretary and treasurer.

83 COUNTRIES PURCHASERS OF AMERICAN AUTOMOBILES

Government's Twelvemonth Summary Reveals Complete Destinations of Exported Cars—Five Continents and Oceania Buyers.

While the total of automobiles exported from the United States in the fiscal year ending June 30 was 25,286 cars valued at $26,012,934, as stated previously in Motor World, later information which has been compiled by the Federal statisticians reveals interesting information as to the volume of cars purchased by 83 different countries of the world, both large and small. The statistics do not make a comparison with previous years, but merely give the figures for the one twelvemonth.

Of the total of $1,737,141 of commercial vehicles, it is not surprising that foreign North America should lead with 60 per cent. and Europe 12 per cent., but makers of trucks and delivery wagons will be interested to know that of all South America, Argentina, Venezuela and Brazil are the main purchasers. European Russia bought 13 trucks, and in Asia the majority went to Japan. The Philippines lead in the Oceanic group with 43 and are followed by Australia and Tasmania with 17.

Austria-Hungary with 135, Spain with 186 and Sweden with 256 are comparatively heavy buyers of pleasure cars in Europe, although not separately listed in the government's monthly export compilation; the West Indies, in North America, also are active purchasers of pleasure cars, and, in South America the ranking order is Argentina, 1,062; Brazil, 987; Uruguay, 209; and Colombia, 110. The regular government report says little of Asia, but in pleasure cars the purchases there are not inconsiderable, the leaders being British India, 439; Straits Settlements, 387; Japan, 312; and the Dutch East Indies, 278. Australia and Tasmania took 2,083 and New Zealand 958, in the Oceanic group, and in Africa the leader by far is British South Africa, with 1,279.

The continents, their percentage of the whole in number and in value and the average values of cars are, respectively: Pleasure cars—North America, 31 per cent., 38 per cent., $1,228; South America, 11, 12, $1,086; Europe, 31, 25, $800; Asia, 7, 6, $869; Africa, 5, 5, $896; Oceania, 15, 14, $974. Commercial cars—North America, 56, 60, $2,071; South America, 11, 13, $2,045; Europe, 23, 12, $852; Asia, 3, 3, $1,796; Africa, 1, 6, $861; Oceania, 6, 6, $1,895. The complete statistics are shown in the accompanying table.

The Week's Incorporations

Grand Rapids, Mich.—Reed & Blickley Auto Co.. under Michigan laws; authorized capital, $10,000.

Niles. Mich.—Bremer Wilson Mfg. Co., under Michigan laws; authorized capital, $100,000; to manufacture motor cars.

Hamtramck, Mich.—Vanguard Mfg. Co., under Michigan laws; authorized capital, $100,000; to manufacture automobile engines.

Detroit, Mich.—Silas Electric Co., under Michigan laws; authorized capital, $2,000; to operate a garage. Corporators—H. T. Silas, D. MacKay.

Detroit, Mich.—LaBell Funeral Motor Car Co., under Michigan laws; authorized capital, $25,000. Corporators—Alex LaBell, M. W. Benjamin.

Detroit, Mich.—Harris Bros. Co., under Michigan laws; authorized capital, $25,000; to deal in motor cars. Corporators—Abraham Harris, J. S. McDowell.

Cincinnati, Ohio—Motor Transportation Co., under Ohio laws; authorized capital, $250,000. Corporators—George Schorr, E. H. Hoelscher, W. G. Hoelscher.

Detroit, Mich.—Wilson-Schroeter Agency, under Michigan laws; authorized capital, $1,000; to deal in motor cars. Corporators—W. L. Wilson, R. F. Schroeter.

Rochester, N. Y.—Motor Register Co., under New York laws; authorized capital, $25,000. Corporators—T. B. Pratt, C. A. Huber, C. F. Mosher, all of Rochester.

Detroit, Mich.—Wetmore-Quinn Co., under Michigan laws; authorized capital, $50,000; to deal in motor cars. Corporators—H. S. Quinn, J. M. Wetmore. and others.

Boston, Mass.—Boston Prest-O-Ceal Co., under Massachusetts laws; authorized capital, $25.000; to deal in motor cars. Corporators—William G. Todd, Merrill F. Hubbard.

Detroit, Mich.—Warner-Detroit Motor Works, under Michigan laws; authorized capital, $100,000; to manufacture motor cars. Corporators—Hugh L. Warren and others.

Cincinnati, Ohio—Cincinnati Automobile Clearing House Co., under Ohio laws; authorized capital, $5,000. Corporators—Robt. Uricho, Charles F. Hornberger. Arthur R. Spangenburg.

Logansport, Ind.—Auto Distributors Co., under Indiana laws; authorized capital, $10,000; to deal in automobile accessories. Corporators—Frank C. King, O. H. Binns, Anna E. Binns.

Lynn, Mass.—Eastern Avenue Garage, under Massachusetts laws; authorized capital, $30,000; to operate a garage. Corporators—Warren H. Beede, Fred E. Smith, William J. Meloy.

Chicago, Ill.—Illinois Storage Battery Co., under Illinois laws; authorized capital, $25,000; to manufacture electrical supplies. Corporators—W. H. Fortune, L. H. Wheeler, M. Abele.

Chicago, Ill.—Storage Battery Co. of America, under Illinois laws; authorized capital, $10,000; to manufacture electrical supplies. Corporators—H. A. Boissat, W. H. Smith, N. Divilbliss.

Chicago, Ill.—Rotax Mfg. Co., under Illinois laws; authorized capital, $2,000; to manufacture and sell automobile accessories. Corporators—William H. Appleby, Charles B. Appleby, John C. Gill.

New York, N. Y.—Walzer Corporation, under New York laws; authorized capital. $10,000; to deal in motor cars. Corporators—Charles Pechner, Samuel Sperling, Solomon Strauss, all of 299 Broadway.

Chicago, Ill.—Scott Garage Co., under Illinois laws; authorized capital, $2,500; to conduct a general automobile and livery business. Corporators—Henry S. Blum, Isadore Wolfsohn, D. J. Conchester.

Williamsville, N. Y.—Williamsville Auto Repair & Garage Co., under New York laws; authorized capital, $500. Corporators—Sylvester A. Hirsch, Christine Hirsch and George W. Walters, all of Williamsville.

New York, N. Y.—Auto Supplies Export Co. of America, under New York laws; authorized capital, $5,000. Corporators—Frank William Keegan, Lillian M. Fay, Antranik Aprahamian, all of 1777 Broadway.

Mount Vernon, N. Y.—Mount Vernon Auto Station, under New York laws; authorized capital, $3,000. Corporators—Wm. Bunn, 34 Hildreth place; LeRoy A. Preston and Lucy Preston, both of 35 Hildreth place.

Akron, Ohio—Anti-Rust Co., under Ohio laws; authorized capital, $20,000; to deal in automobiles and accessories, supplies and paints. Corporators—C. T. Grant, Frank Rice, Lena Dewey, Bessie Rice, Alex. Sicherman.

Sharon Springs, N. Y.—Sharon Springs and Canajoharie Auto-Bus and Car-Line Co., under New York laws; authorized capital, $1,000. Corporators—William H. Craig, Otto E. Eigen, C. R. Winnie, all of Sharon Springs.

Falconer, N. Y.—Falconer Iron Works, under New York laws; authorized capital, $15,000; to repair motor cars and operate a garage. Corporators—Gardner L. Gilbert, James C. Wright, Judson S. Wright, all of Falconer.

Chicago, Ill.—Woods Mobilette Sales Co., under Illinois laws; authorized capital, $15,000; to engage in general motor car business. Corporators—F. A. Woods, Frances Armstrong Woods, Edward F. Blettner, John C. Long.

New York, N. Y.—Tyreservice Co., under New York laws; authorized capital, $10,000; to deal in automobile accessories. Corporators—John C. Travis, 2 Rector street; Chas. L. Clune, Peekskill; Marie M. Hovey, 2353 Davidson avenue.

Oshkosh, Wis.—Oshkosh Pneumatic Hub Co., under Wisconsin laws; authorized capital, $20,000; to manufacture and sell pneumatic hubs for automobiles and other vehicles. Corporators—Fred E. Zeuhlke, Frank Doemel, Joseph Laus, Jr.

New York, N. Y.—Packard Transportation & Repairing Co., under New York laws; authorized capital, $3,000; to conduct a motor car repair business. Corporators—Anna T. Vacarelli and F. Paul A. Vacarelli, both of 354 East 116th street.

New York, N. Y.—Bavier Lubrication System, under New York laws; authorized capital, $10,000; to manufacture and develop systems for lubricating motor cars, etc. Corporators—Emanuel Weil, George H. Duck and Charles S. Bavier, all of 150 Nassau street.

New York, N. Y.—Auto Pedal Pad Co., under New York laws; authorized capital, $10,000; to manufacture pedal pads and other automobile accessories. Corporators—Harry Reich and Edgar M. Lichter, both of 316 West 44th street; G. Thomas Young, 706 Amsterdam avenue.

Boston, Mass.—Massachusetts Carburizing Co., under Massachusetts laws; authorized capital, $100,000. Corporators—James

F. Walsh, Jr., Robert Whitworth, Ernest W. Woodside, George C. Slayton, Ellwood B. Spear, Walter S. Page, Patrick J. Craven, Angus M. Evans, John J. Swift.

New York, N. Y.—Peerless Non-Puncture Co., under New York laws; authorized capital, $600; to manufacture preparations for rendering tires puncture-proof, etc. Corporators—Maurice Uran, 1652 Lexington avenue; Harry Citret, 980 Tiffany street; Frank Eber, 152 West 144th street.

New York, N. Y.—Army Tire Co., under Delaware laws; authorized capital, $1,000,000; to manufacture, sell and deal in motor cars and all other kinds of wheeled vehicles. Corporators—George W. Griffin, Frank H. Kessel, Lorenzo J. Roll, Manuel M. Alegere, Jr., all of New York City.

Chicago, Ill.—National Association of Automobile Engineers, under Illinois laws; authorized capital, $2,500; to conduct a commission and brokerage business and deal in motor cars, motor boats and accessories pertaining thereto. Corporators—Arthur L. Pettet, William Roles, Leon P. Hutchins.

Minor Business Troubles.

Creditors are likely to receive payment in full, according to the report of the receiver of the Schacht Motor Car Co., of Cincinnati, Ohio. The statement, filed in the Insolvency Court last week, shows the liabilities to be $123,548.89, while the previously filed inventory and appraisement valued the assets at $243,854.73.

The Amplex Motor Car Co., of Mishawaka, Ind., which, when it built a big two-cycle car, threatened to become a real factor in the trade, has passed into the hands of a receiver. About a year since, when W. J. Mead relinquished the general management of the Olds Motor Works to become president of the Amplex company, a considerable hurrah was created, but the big things planned never came to a head and latterly the plant in Mishawaka has been devoted to the production of gasolene engines on what was a comparatively small scale.

Claiming his partner, Alva D. Stocker, will not permit him to examine the bank-book of their automobile business in Dayton, Ohio, at 16 South St. Clair street, Walter S. Smith has petitioned the court for a receiver, an accounting and a dissolution of the firm. Smith says the agreement entered into March 5, 1913, was that each should drew $30 a week and that, while he has received this amount he is unable to ascertain how much Stocker has collected of outstanding accounts. Smith further claims the equipment is worth $300 and that the indebtedness of the concern amounts to $450.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

Alvan Macauley, general manager of the Packard Motor Car Co., of Detroit, has been elected a vice-president of the company. The new office was created specially to honor him.

Howard Wagner, former sales manager of the Buffalo Electric Vehicle Co., has been added to the staff of the Nordyke & Marmon Co., of Indianapolis. He will serve as special factory representative.

A. E. Berdon, chief engineer of the Esterline Co., of Indianapolis, and designer of a number of electrical devices bearing his name, has tendered his resignation. His future intentions are not yet public property.

F. B. Ludwig, former sales manager of the Edwards Motor Car Co., of New York, has been appointed Southern district manager of the Velie Motor Vehicle Co., of Moline, Ill. He will make his headquarters at the Velie branch, in Atlanta, Ga.

Frank A. Groves, sales manager of the Speedwell Motor Car Co., of Dayton, Ohio, has resigned that office and will leave the automobile industry. He is to become sales manager of the Near-Side Car Co., of New York, which controls several street car devices.

C. H. Gray, manager of the Goodyear Tire & Rubber Co.'s branch in Milwaukee, has resigned that position and will return to Texas, where he expects to set up in business for himself. Gray had been identified with the Goodyear company for some nine years.

John B. Richards, for the past nine years superintendent of the Springfield Metal Body Co., has been appointed manufacturing superintendent of the Stevens-Duryea Co., of Chicopee Falls. He will relieve Geo. W. Kerr, who hereafter will devote himself wholly to the designing and engineering departments.

In order to devote himself to his personal business, C. A. Hawkins, manager of the White Co.'s San Francisco branch since its inception, has tendered his resignation, to take effect August 15th. He will be succeeded by George A. Urquhart, manager of the White branch in Dallas, Tex., who also is a veteran in the White service.

Hoover Holton, sales manager of the Empire Automobile Co., of Indianapolis, has resigned to become identified with the J. I. Handley Co. of that city. A. H. McIntyre, who has been identified with the oil trade in New England, has likewise severed that connection to become New England district manager for the Handley company.

F. R. Bump, one of the veteran sales managers of the trade, has been appointed general sales manager of the J. I. Handley Co., of Indianapolis, which recently was formed to market the outputs of the Marion and American Motors companies. Bump's most recent connection was with the R. C. H. Corporation, of Detroit, which he served as assistant general manager.

E. T. Georges, former consulting engineer of the General Motors Co., of Detroit, has been appointed superintendent of the Chase Motor Truck Co., of Syracuse, N. Y. J. W. McDonald, once chief of the experimental department of the Brush Runabout Co., and later master mechanic of the Elmore Mfg. Co., also has been added to the Chase staff in the capacity of master mechanic.

H. H. Newson, who in turn was manager of the Hayes Mfg. Co., of Jackson, and the McCord Mfg. Co., of Detroit, has been appointed manager of the Keeton Motor Co., of the latter city. Newson is a graduate of Purdue University and is a gas engine specialist. In his new position he will relieve Vice-President Keeton of many details, permitting the latter to devote more time to the Keeton-Canadian, of which he is president.

Recent Losses by Fire.

Mercer, Pa.—Moon Bros.'s Garage, destroyed. Loss not stated.

Albert Lea, Minn.—Hanson's Garage, destroyed. Loss not stated.

Brooklyn, N. Y.—J. Michaels, 324 Warren street, garage destroyed. Loss, $2,500.

Holyoke, Mass.—L. Stazey, 107 High street, garage destroyed. Loss, $2,000.

McKeesport, Pa.—George Baehr, 327 9th avenue, garage damaged. Loss, $50,000.

Cincinnati, Ohio—Thomas Egan, Edgecliff road, garage destroyed. Loss, $2,000.

Springfield, Ohio—Motor Service Co., McHenry building, building damaged. Loss, $5,000.

Akron, Ohio—Goodyear Tire & Rubber Co., waterproofing department destroyed. Loss, $20,000.

Pelham, Ga.—J. S. McClendon, garage and several cars destroyed. Drake & Glausier's repair-shop damaged. Loss not stated.

New Orleans, La.—Enterprise Electric Co., 413 Baronne street, vulcanizing department damaged. Louisiana Motor Car Co., same address, building and contents damaged. Loss, $50,000.

In the RETAIL WORLD

S. D. Stephenson, of Clovis, Cal., plans to erect a garage.

Royal & Moffett, of Monson, Conn., are building a new garage.

J. H. Kirk has completed a new garage in Los Angeles; it cost $15,000.

T. J. Pedicord, of Spokane, Wash., plans to erect a new garage; it will cost $2,000.

George D. Broaded has opened a garage in Covina, Cal. It is located on Citrus avenue.

Samuel Beab, of Rogers, Tex., has sold his automobile and garage business to R. B. Lewis.

M. K. McLaughlin is erecting a garage in Manchester, N. H. It will stand on Old Falls road.

Harold H. Adams, of Brockton, Mass., has opened a garage; it is located on Warren avenue.

E. M. Brown, of Orange, Tex., plans to build a garage; he has secured a site on Division street.

F. A. Boericke, of Bryn Athyn, Pa., is securing plans for a garage which he will build in that town.

M. B. Sherman is about to erect a garage in San Diego, Cal. It will be located at 563 22nd street.

The Van Dusen Tire Co., of South Gay street, Knoxville, Tenn., is having a building erected for its use.

Glenn E. Brubaker proposes to open a garage in Litchfield, Ill. A building is now being remodeled for his use.

Tiffany Garage is the name of a new business in Poughkeepsie, N. Y.; a garage is being erected on Market street.

William Butterworth, of Moline, Ill., is about to erect a building for use as a garage and stables; it will cost $35,000.

The Union Motor Car Co., of Bakersfield, Cal., proposes to erect a garage on 10th street; the estimated cost is $2,000.

Kowalke & Doty is the style of a new repair firm in Benton Harbor, Mich. They have located at 350 Territorial street.

The Morrison Motor Co., of Augusta, Me., will occupy when completed a garage which is being erected on Silver street.

The Greenlee-Hinshaw Automobile Co., of Hutchinson, Kan., will erect a new fireproof building; it will stand on 1st avenue.

Crawford & Buchner, of Bakersfield, Cal., are about to build a new garage and salesrooms on 19th street; they handle Maxwell cars.

M. Shrodt, of Shrodt & Merges, Albany, N. Y., plans to erect a one-story brick garage, 62 x 80 feet; it will stand on Quail street.

Claude Bradford of New Haven, Conn., has sold his garage business to John Laferty, of the same city; Laferty is a Moon dealer.

Sharp & Robbins have opened a garage in Trenton, N. J., on South Broad street; they also operate a repair-shop on South Clinton avenue.

A. M. Signor, Jr., of Scranton, Pa., is about to open a garage at 329 Adams avenue; the style will be Signor's City Hall Garage.

W. J. McCabe is to erect a garage in Duluth, Minn., on Howard avenue, between St. Andrews and Lewis streets; the cost will be $4,500.

The Central Garage is the style under which Thomson & King have opened up in Phoenix, Ariz. It is located at 227 North Center street.

Myerscough & Buchan have opened a garage in Andover, Mass., on Main street; they plan to install an up-to-date machine-shop equipment.

The Piqua (Ohio) Auto Supply Co. has opened for business at 133 North Main street; it deals in supplies, accessories, cars and motorcycles.

H. N. Smith, of Bridgeburg, Ont., has awarded the contract for a fireproof garage, 60 x 50 feet; it will stand at Niagara and Princess streets.

H. Newmark, of Los Angeles, has been granted authority to build a garage at 1248 Wholesale street; the application names $25,000 as the cost.

Samuel H. Ober, formerly of Salina, Kan., has entered the trade in Ottawa, in the same State; he has taken the Regal, Abbott-Detroit and Lozier agencies.

The Wheaton (Minn.) Auto Co. has been taken over by Jacob Neilemor, formerly of Granite Falls, in the same State; he will continue the garage business.

The James Horne Co., of Pittsburgh, Pa., has awarded the contract for a new garage to be erected on South street; it will represent an expenditure of $25,000.

Jacob F. Kress, of Johnstown, Pa., has secured permission to erect a three-story steel garage on Washington street; the estimated cost is $80,000.

Curtiss Dawson has purchased the interest of his partner, Reynolds Dale, in their repair business in Tiskilwa, Ill. Dawson will continue the business alone.

Horst & Streiter, of Rock Island, Ill., plan to establish a garage business in Port Byron, in the same State; they have rented and will remodel the Rogers granary building.

J. G. Wendel, of 158 Grand street, New York City, has secured permission to erect a one-story garage, 57.3 x 61.3 feet, at 7th and Lewis streets; the estimated cost is $8,000.

The Bentel-Mackey Co., of Los Angeles, will take possession of a new four-story building September 1; it is located on Grand avenue, between 10th and 11th streets.

The Hancock County Auto Co., of Marshalltown, Ia., has taken possession of a new brick, one-story garage; it is located on Main street and has a complete garage equipment.

The Auto Tire Repair Co., of Oyster Bay, N. Y., has reopened for business following a fire in its place of business; it is now in the Sagamore Garage building, on West Main street.

The Torrington Welding Co. has been formed in Torrington, Conn., for the purpose of conducting a garage and automatic gas cutting and welding business; it opened for business August 1.

Z. T. Eagleston and A. B. Shanks are about to enter the trade in Smithville, Tex., under the style Smithville Auto & Machine Co. They have leased and will remodel a building on 2nd street.

The Lawrenceville Auto Co. has taken over the automobile business of the Robinson Donaldson Buggy Co., of Vincennes, Ind. The company will handle Studebaker, Chalmers and Lozier cars.

E. B. Fitzsimmons, of Lindsay, Mich., is

Digitized by Google

preparing to remove his garage to Sarnia, in the same State; he has leased, in Sarnia, a building at George and Front streets, formerly used as a livery stable.

The Fort Dodge (Iowa) Auto Transportation Co., which is about to inaugurate a motor 'bus service in that city, will build a garage for its cars; the proposed building will be one-story and 40 x 100 feet.

The Cartercar Nebraska Co., of Omaha, of which W. E. Foshier is president, is about to establish an agency in Council Bluffs, in the same State; a location has been secured on West Broadway.

The Gilman-Garland Garage, of Saco, Me., has changed its name to Garland Auto Co. William A. Gilman and Ira Garland constitute the company; a concrete garage will be erected on Peperell square.

E. H. Preston, of Bloomington, Ill., and Fred W. Dooley, of Downs, Ill., have formed a partnership and will open salesrooms near Washington street, in Bloomington; they will distribute Oakland cars.

William Eaton, formerly an automobile salesman in Seattle, has formed a company in that city to handle the Pope-Hartford line for Washington, Oregon, Idaho and British Columbia; Eaton is aided financially by a wealthy resident of White River Valley.

R. J. Strong, for five years connected with the Ajax-Grieb Rubber Co., formerly as a traveling representative in the West but more recently in New York State, has resigned to enter business for himself; he has secured the Buffalo, N. Y., representation for Miller tires and has located at 846 Main street, under the style Miller Sales Co.

The Champaign (Ill.) Buick Motor Co. has taken over the Champaign branch of the Illinois Motor Car Sales Co., on West Hill street; the latter company plans to continue selling Michigan and Marmon cars in Urbana, in the same State. J. C. Fidler will direct the sale of Buick and Chalmers cars in the Illinois branch location for the Champaign Buick company.

H. D. Graves, of 120 Allyn street, Hartford, Conn., and the Capitol City Auto Co., at Allyn and High streets, have combined interests; Graves handled Henderson and Lozier cars and the Capitol company Mitchells and Stewart trucks, all of which now will be marketed under the Capitol City sign. Graves, who recently took over the Imperial Garage, has been made secretary of the Capitol City company; the other officers are: President, Bernard F. Smith; treasurer, W. F. Dahill.

J. J. Jones, of the Jones Auto Exchange, of Wichita, Kan., has had plans prepared for a six-story and basement building, 100 x 140 feet; it is said it will be the largest structure of its kind in the Middle West and, with the site, will cost $100,000. The building will include refinishing, repair, storage and all other departments essential to the operation of the business. Jones, who went to Wichita 12 years ago and borrowed $800 to start in business as a trader in almost anything, handles Fords and has taken on the new Wahl car. When the building is completed Jones's business and that of the R. C. H. Garage, 114 North Topeka avenue, will be consolidated.

'Frisco Dealers Claim Excessive Charges.

Nearly all of the principal dealers in San Francisco have joined in lodging a complaint with the Interstate Commerce Commission against the Lake Shore & Michigan Southern Railroad et al for excessive charges on carload shipments of automobiles from various Eastern factories. They claim that the overcharges are due to the practice of the railroad company of charging for the weight of the decking or flooring with which the freight cars are provided. The dealers maintain that, as this decking or flooring is furnished and installed by themselves without expense to the railroad, and as it permits the freight cars to be loaded to from 3,000 to 4,000 pounds in excess of the carload minimum, the railroad charge is unjust and unreasonable. It is significant that Western Classification No. 51, I. C. C. 9—a classification which is usually attacked by shippers for its unusually unfavorable conditions—in this case is in favor of the automobile people in that it provides, in rule 29, for the free transportation of such flooring.

Rajah-Grossman Relations Adjusted.

Although the Rajah Auto Supply Co., of Bloomfield, N. J., recently discontinued its suit in the United States District Court for the Southern District of New York against the Emil Grossman Co., of New York City, as previously stated in Motor World, the discontinuance has been followed by an adjustment of relations between the two companies regarding the Rajah removable porcelain spark plug patent, No. 825,856. The Grossman company had previously been enjoined from infringing the patent and the court had later refused to hold the Grossman company in contempt of court for selling porcelains, whereupon this second infringement suit was brought on the porcelain selling.

By the adjustment now existing the previous injunction is amended to include the selling of porcelains, knowing they are to be used in Rajah plugs, but the Grossman company is permitted to sell porcelains for other purposes. Also, the Rajah company agrees not to advertise its amended injunction, this agreement following the Grossman charge that the suit had been brought for advertising purposes.

Lansden Files Schedules in Bankruptcy.

According to its schedules in bankruptcy, filed on Friday last in the bankruptcy court in Newark, N. J., the Lansden Co. has assets of $304,046 and liabilities of $193,000. The assets are made up of machinery, $72,340; manufactured goods at Newark, $47,436; manufactured goods at Allentown, $70,842; finished parts in Chicago, $10,000; sundry material of the Auto Maintenance Co., $10,000; bills receivable, $32,516.

The debts represent some 300 creditors, the largest of whom is a Jersey City bank, whose claim is in excess of $31,000, partly secured, and a Newark bank, unsecured, $12,500. The largest unsecured claims, however, are those of the Edison Storage Battery Co. and the General Electric Co., amounting to approximately $30,000.

Bidwell's California Project Changes Name.

The Western I. A. L. Purchasing Corporation, of Los Angeles, has changed its name to the I. A. L. Tire Co. The enterprise is an outgrowth of the International Automobile League, of Buffalo, and was organized last year by A. C. Bidwell, its president. It has figured in the litigation in which Bidwell since has been involved in his home town.

Goble Forms a Firm in Detroit.

George E. Goble & Co. is the style of a new firm of manufacturers' agents who have opened an office at 600 Woodward avenue, Detroit. Among the accounts they will handle are those of the Lee Tire & Rubber Co., Victor Rubber Co., Axle Equipment Co. and the Universal Welding Co.

Peerless Branch "Takes on" Electrics.

The Peerless Motor Car Co.'s branch in Boston has "gone into" electrics, having taken on the agency for the R. & L. It goes without saying, however, that the Peerless gas cars will continue to be the branch's mainstay.

Studebaker Closes Two More Branches.

Continuing its policy of concentration, the Studebaker Corporation has discontinued its branches in Buffalo and Cleveland. B. F. Kinsman, former manager of the Buffalo branch, will, however, remain in the Studebaker organization.

Speedwell Debtor to Telephone Company.

Judgment for $61.54 was filed this week in the New York county clerk's office against the Speedwell Motor Truck & Service Co. The latter is located in New York City.

SEEKING SUBSTITUTES FOR "HORSEPOWER."

It is probable that in the course of time engineers throughout the world will agree on a method of power rating and a designating term that will have a definite meaning of its own and no connection with the animal kingdom; and it is probable that such a method of rating will be applicable to all fluid pressure motors, whatever their source of energy. It is not probable, however, that any such result will be attained in a day or a year. The problem is too difficult for snap-shot solution, as is indicated by the fact that eminent engineers, agreeing on the awkwardness of the present state of affairs, disagree as to the remedy; nor is it possible to bring about any appreciable degree of relief by substituting one more or less arbitrary standard or term for another.

While the suggestion frequently has been made that the kilowatt be substituted for the horsepower as a rating for motors of all kinds, and while German engineers have agreed to use it in place of horsepower, it is difficult to see what is gained by such a movement, apart from uniformity of terminology. Fundamentally a kilowatt is in exactly the same class as a horsepower; that is to say, it represents so much power without any reference whatever to the motor which generates that power. A given kilowattage may be developed by a small electric motor running at high speed or by a large motor running at slow speed, and the relation of voltage to amperage may be anything. Similarly, a given horsepower may be developed by a small high-speed engine or by a large slow-speed engine, and the ratio of piston displacement to horsepower may be anything.

The adoption of the kilowatt as a measurement of power could afford no relief, for the mere fact of using the same system of rating for both gasolene and electric motors would lead nowhere in particular. As Motor World has repeatedly maintained, the most practical and most sensible basis for a power rating for explosion motors is piston displacement, which has the immense advantage that it is a fixed quantity in the motor itself and for calculation affords an unchanging foundation, inherent in the engine, which cannot be said either of the horsepower or the kilowatt. If it is impossible or undesirable to arrive at a unit of horsepower based on displacement, designations in cubic inches would convey more than does the term in general use or the one adopted by the Germans.

PROTECTION FOR THE REAR TANKS.

The subject of the unprotected gasolene tank carried at the rear of the car is by no means a new one. It has been before remarked by Motor World, but the notable increase in the number of cars so equipped has given to the matter new importance.

The point is that while the tank is in such a position that it is exposed to danger of damage from manifold sources, no attempt has been made to protect it in any way. A tank hung in the rear may be struck by the wheel of a backing vehicle, or by the low-hanging tongue of a horse truck. It may be damaged by contact with a hydrant or other object if the car is backed a little too far. There are so many possible sources of danger that anyone can readily compile a long list of them. And that they are much more than mere potential dangers is patent to anyone who will keep his eyes open, for there are numerous tanks that bear marks of violence in the shape of dents and even patched punctures.

The fact that these tanks are unprotected is hard to understand, not only because of the strong possibility of damage, but because a puncture or the forcing open of a seam means the rapid expelling of the gasolene by the pressure designed to force it to the carburetter, and if a means of ignition is present a pressure-fed fire is the logical result. Such fires have occurred, with disastrous results. The proximity of the exhaust pipe to the tank is a point that affords much food for serious thought in connection with the fire risk.

There is no apparent reason why there should be any serious difficulty in adequately protecting a gasolene tank hung at the rear of the chassis. The frame of the car affords the same anchorage for a protecting device that it does for the tank itself, and the precise form of the protector is immaterial, as long as it is efficient. And there is yet another angle of view. The maker who first equips his rear tank with an efficient protecting device will be first in the field with an argument in favor of his car that can have no mean weight with people who think.

SILENT WORM BEVEL DRIVE IS DEVELOPED BY PACKARD

Clever and Complex Design that Substitutes Sliding for Clashing Engagement—Eliminates Back-Lash and Noise.

It has been fairly well known for the better part of a year that the Packard Motor Car Co., of Detroit, which always has been a stickler for quiet running of its automobiles, has been quietly working toward the development of a new type of gear for the final drive from the propeller shaft to the live rear axle. Part of the second floor of the gear-cutting department of the big factory was partitioned off for the special experimental work, and what went on behind the tightly closed doors did not leak out to any appreciable extent. In time, however, the fact that the object of the secret work was the production of what was termed a worm bevel drive became known, though not widely. By that time the first really practical gears had been installed in a car and given road tests which were of a character calculated to slightly "loosen up" the sources of information; but so careful have the Packard people been that formal announcement of the adoption of the new gear drive was deferred until the completion of long service tests, and, in fact, only just has been made.

The accompanying illustration shows just what the worm bevel is, and does so more satisfactorily than words alone could do. The teeth are so shaped that they come together with a gradual, sliding action, instead of the broadside slapping that characterizes the meshing of teeth cut in the ordinary way. The result is that noise in the running of the gears is eliminated to all intents and purposes, as is also the backlash that is so difficult to avoid in straight-cut bevels, or any other ordinary gears, for that matter. Because the teeth of the new gears are curved, they afford a greater area of contact surface than straight teeth, and at the same time the curving form results in a sort of overlapping of the meshing process, the meshing pair coming together before the unmeshing pair become separated.

The quiet running of Packard cars always has been a matter of special pride with the makers, and though the bevels formerly employed were as nearly silent as they could be made, they were not considered quite good enough, and though various gear forms were tried in the search for something better, no substantial improvement was found possible until the factory manager, F. F. Beall, who is a past master in gear work, suggested the possibility of developing the worm bevel. The work in the designing room required months, for simple though the gears may appear, they really are extremely complex, so far as matters of design and lay-out are concerned, and endless calculation and much experimenting were required. After the draughting room had finished its work, the tool-makers took up the actual construction of the gears, and it required three weeks to make the first set. So well had the preliminary work been done that these original gears, when installed in an experimental car, worked out so satisfactorily that the necessary machinery for manufacturing was installed. Incidentally, it was necessary to design entirely new machine tools for the purpose, owing to the exceedingly peculiar form of the teeth.

PACKARD SPIRAL BEVEL DRIVE

Ford Loses Fight to Protect Dealer.

Those 13 Ford Model T's, which caused trouble for the Ford Motor Co., Bowring & Co., exporters, and the steamship Minnehaha, last February, are in New Zealand by this time, or nearly there, anyway, and the suit which the Ford company brought in the Supreme Court for New York county to have the shipment held up was discontinued this week. So far as preventing their exportation, the litigation was unsuccessful.

Ford claimed the cars were sold from the factory with the understanding that they were going to Canada, but that Bowring & Co. secured possession of them and undertook to ship them to New Zealand, where the Ford company has a regular distributer; court proceedings were instituted and an injunction was denied, but pending an appeal the steamship company agreed to retain possession of them, in the hold or in London, until the suit was settled.

Ford carried its case to the Appellate Division and was again denied an injunction, wherefore the cars were permitted to go on to New Zealand and the suit was discontinued.

DE PALMA THE WHOLE SHOW AT BRIGHTON BEACH MEET

Only One Event Escapes Him, and That Because He Did Not Start—Wishart Good Second—Big Crowd in Attendance.

Ralph De Palma went over the Brooklyn Bridge to the Brighton Beach racetrack on Saturday last, and because he went there to take part in a racemeet promoted by the Motor Dealers' Contest Association there is very little more of the story to tell; any story of the races must begin with the name De Palma and end with it, and De Palma must be very liberally spread over all of the paragraphs and well down into the summary. De Palma is the whole story; he entered only five of six races and he won only five of them—won them so easily with his wire-wheeled and yellow Mercer that those who looked on just had to snicker because his performance was so satisfying.

PART OF IMMENSE CROWD THAT SAW DE PALMA WIN

Nevertheless, De Palma was not quite the whole of the story, after all, for Wishart—"Spence," to those who know him well—was there, too, also at the wheel of a Mercer, and he very ably upheld his reputation of being the greatest little runner-up ever. He won the curtain raiser—maybe it was because De Palma was not entered—and finished close up to the slender and smiling Ralph in every other race but one. Altogether it was a clean sweep for Mercer cars, for Armour Ferguson was there, too, and he added his little bit to the power behind the broom.

Between these three men, with Ralph Mulford in a fire-spitting and extraordinarily noisy Mason thrown in by way of diversion, there was much to distract the attention of the really tremendous crowd in the big grandstand and bleachers from the heat and the two accidents that served to quicken heart-beats. With what wind there was blowing from the South and the grandstand acting as a blanket, spectators literally sweltered, and long before the one and only original Fred. Wagner fired the first starting gun coats and hats were discarded and programs were turned into fans; the "soft stuff" vendors did a rushing business.

The first of the two accidents occurred in the first 25-mile race, and it put Jessopp, who had the wheel of a National, out of business for the rest of the day and probably for the rest of the month. Jessopp was driving very fast on the last quarter turn, leading into the stretch, when a rear tire blew out and after several skids his car rolled over a couple of times into the infield, a mass of broken wreckage. Luckily, Jessopp escaped with a broken arm and a broken leg, and his mechanician was unhurt, except for a few bruises. A little later and at the same spot, Le Cain in his Stutz narrowly averted a similar catastrophe; his car skilled completely around twice before he could get it under control and drive into the paddock. In the last lap of the second 25-mile race, Hickman in another Stutz essayed to take the grandstand turn at too great speed and came to grief against the outer fence; he was thrown clear of his wrecked machine and unhurt. The summaries:

EVIDENCE OF A WELL-FILLED GRANDSTAND—CARS BEHIND THE CLUBHOUSE

10 miles, Class C, 231-300 cubic inches—Won by Spencer Wishart, Mercer; second, Armour Ferguson, Mercer; third, Roberts, Roberts Special; fourth, O. B. Matthews, Mercer. Time, 10:17.81.

10 miles, Class C, 301-450 cubic inches—Won by Ralph De Palma, Mercer; second, Hickman, Stutz. Time, 10:10.

Five miles, Class C, under 600 cubic inches—Won by Ralph De Palma, Mercer; second, Spencer Wishart, Mercer; third, Armour Ferguson, Mercer; fourth, Roberts, Roberts Special. Time, 5:08.

25 miles, Class D, free-for-all—Won by Ralph De Palma, Mercer; second, Spencer Wishart, Mercer; third, Le Cain, Stutz. Time, 24:35 4/5.

25 miles, Class D, free-for-all—Won by Ralph De Palma, Mercer; second, Spencer Wishart, Mercer; third, Ralph Mulford, Mason. Time, 24:46 4/5.

10 miles, Class E, free-for-all handicap—Won by De Palma, Mercer (scratch); second, Wishart, Mercer (20 sec.); third, Mulford, Mason (40 sec.). Time, 10:25 1/5.

SUBDEALERS THAT DON'T PAY

Average Farmer-Dealer not Energetic Salesman and a Breeder of Desire for Cut Prices — Distributer's Experiences and Resolves.

"The idea of giving farmers a sub-agency in the hope that they will sell cars should be punctured; it doesn't do a thing for a dealer except spoil the sale of cars in that farmer's community at regular prices," is the statement of a dealer who is known among other dealers as a shrewd salesman and a good organizer and who sells cars in one of the hardest territories in the country. "Sooner or later, somehow or other, the neighbors learn that he has received the agent's commission and, instead of buying from him or through him, they want to get the same discount he got. And unless they get it they will not buy.

Trouble that Rural Dealer May Cause.

"On the other hand, if you go out into that farmer's territory and sell a car he is sure to hear about it, and the next train brings him to the city to claim his commission, whether he had anything to do with the sale or not. No more farmer subagents for me. I have none at all in this county, and next year will have none anywhere. Instead, I will put a real salesman on the road with a car and let him cover the territory thoroughly. That plan worked beautifully in this county last year, and it will do just as well in some of the others.

Makes Selling an Incidental Sideline.

"The trouble with the farmer is that he does absolutely nothing for you. Just drives around on his regular business. If he gets word of someone who is going to buy a car it is sure to be somebody he knows—and someone who knows all about how he got his car; has he any chance to put it over as an agent? Not much. Of course, there may be exceptions, but I have not struck any of them yet."

ONE WAY TO SELL CARS AND THREE KINDS OF SALESMEN

"I have learned that there is only one way to sell cars," says E. V. Chilson, Detroit agent for the Jackson line. "That is to keep everlastingly after the prospects till they buy. Of course, the factory assists us with a follow-up service to each prospect, but we have to do real work and follow up the man personally—closely, too, if we want to make a sale.

Hard to Get Salesmen Who Are Workers.

"Is it hard to get salesmen? Yes—hard to get real workers. There are about three kinds who try to get jobs. One is the fellow who picks the automobile business because he thinks it easy and thinks he can drive a car most of the time; if he makes one sale a month he is satisfied. Chances are he has tried every other business first—and drifts to this because it's new, besides having the look of luxury. Then there's the fellow who never worked at anything at all and picks the automobile business because it is up-to-date and he can drive a car. Two or three sales a year would make him think he is a real salesman. Then there are the workers who really appreciate that selling automobiles is about one of the hardest things a man can go up against; and know that you have got to work for all that is in you to make good. I have two such men. And they work. So do I."

ONE MAN WHO WASN'T AFRAID TO DO "JUST A LITTLE MORE"

Howard Elliott used to be a railroad rodman and a railroad clerk, the latter of which positions has proved the pigeonhole for countless hundreds of men who seemed unable to rise above the rut; to-day Elliott is waiting until September 1, when he leaves the presidency of the Northern Pacific Railroad to head the New York, New Haven & Hartford, which, as most everyone knows, is sadly in need of new management. One day, when this proposed change brought Elliott into new prominence in the East, he was asked the reason for his success. His reason is what, in its lacking, has kept many a man from rising. He said:

Went from a Little to a Big Railroad.

"There was no particular reason for my success, except that I was in the West where there were opportunities and I was willing to work. I always tried to do a little more than was expected of me. They found that out, and once when there was a little road to build up they put me in to help out. I made good and they gave me a bigger road. In that way I built myself up in the railroad world."

WHEN IT IS WISE NOT TO SEEK TO MAKE A SALE

"What would you do if you called on a dealer and could not sell him because he had plenty of goods in stock and did not need any more?" asked a live wire salesman of another whose opinion he valued very highly. Quick as a flash came the answer:

"If the dealer did not need the goods and had plenty in stock I would consider it poor salesmanship to sell him."

"You are the first man I have asked that question who has given me the correct answer," was the rejoinder. "I asked it of one of the efficiency experts who was addressing our salesmen the other day, telling us how to do things, and he had no answer; he just fumbled and tried to get away with generalities."

If you lose an order don't yell about it. Find out why you did not get it. If you know that, your chances for next time will be very much improved.

RESPONSIBILITY FOR DETAILS

Ability to Shift It to Assistants Sign of Bigness in Businessman — Also, Is Assurance Little Things Will Be Looked After.

To delegate responsibility is a sign of bigness. The man who is afraid to let someone else shoulder the responsibility can develop nothing larger than a peanut stand business. This brings up the point that it is impossible for one man to look after every detail. Therefore, if details must be looked after, the responsibility ought to be unhesitatingly shifted onto the shoulders of capable assistants.

Unclean Wash Basin Marred Salesroom.

The visitor to a modern garage was delighted to find a handsome salesroom, a clean, orderly garage and businesslike office. He wanted to wash his hands and was shown to a toilet room just off the salesroom. Originally it had been a clean place but apparently the wash basin had not been scrubbed for months, the mirror was all splattered with dirt, soap and water and the walls likewise. Here was a detail some one should have looked after.

Floor displays, window displays, looking after clean windows, etc., might have been settled comfortably on the shoulders of the indoor man—and he would have been glad of the compliment paid him by entrusting him with even such minor duties in addition to his larger ones.

Study your men and give them a share in the carrying out of details. You will find that they grow as you add to their responsibilities—and so will you.

WHEREIN THE HOME GARDEN SUGGESTS SALESMANSHIP IDEAS

Some men do not have a garden at home because it entails too much hard work. They would like to see the garden all right—would enjoy the vegetables and flowers—but that's as far as they go.

It is easy enough to get a garden started, but it is hard to keep it going and have it look like anything. Weeds spring up among the plants and choke their growth; the paths become hidden with long grass, and unless it is carefully tended the whole garden goes for naught.

It is a parable of business. Your territory is a garden. You sow the seed by advertising, calls, etc. Prospects grow up rapidly, but unless you keep after them carefully, systematically and regularly you are forgotten; the weeds grow up and choke your efforts—and your fine territory comes to nothing.

System and regularity is the only method of work that will keep a garden free from weeds and make it flourish; likewise system and regularity in making calls and mailing literature will keep a territory in flourishing condition and make it yield an abundant harvest.

SIGNS AND THE DIFFERENT STORIES THEY OFTEN TELL

"Too penurious to even repaint his sign. Look at it! Some of the gold leaf is off entirely; the background is green and it was originally black; and did you notice the lettering on the windows? Half of it is rubbed off; you can't decipher anything; I wonder what it's on there for? Guess he must be going out of business. That's what the signs say, anyway. Let's go somewhere else."

No, of course the signs did not talk out loud. But signs do talk—that's what they are put up for—and when they are "run down" they say a lot of things they were never intended to say. Did you ever think of that?

It does not cost much to have gilt or painted signs refinished, and the sort of talk a newly-finished sign puts up for you is the kind that gets you business. Proprietors get used to signs. The sign means little or nothing to them; they don't read their own signs. They forget the sign is for the other fellow—and to get his support it should be a prosperous, we're-in-business-to-stay sign. Do you believe in signs? Then take a look at your own and see that they are all right.

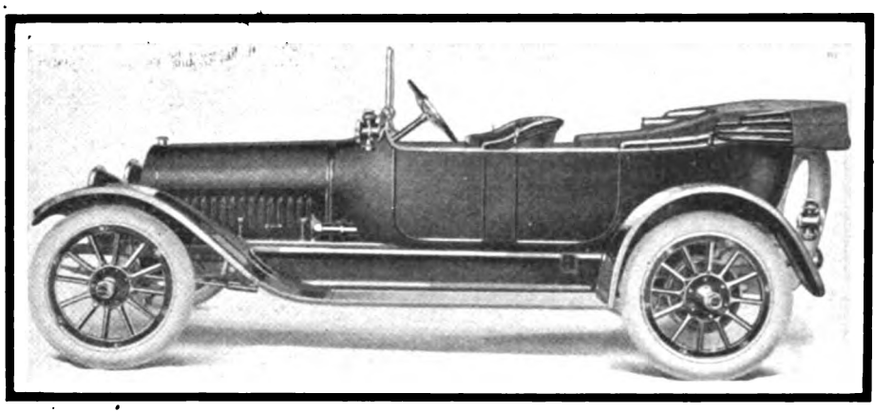
HOW GARAGEMAN KEEPS TOOLS AND ACTUALLY "KEEPS" THEM

How to keep tools, with the accent on the "keep," is a question that has puzzled many a garageman. One leader has solved the problem successfully by converting the upper half of a piano box into a tool chest. The sloping top is hinged to form a padlocked cover that, when raised, reveals the sign, "We do not loan tools." Inside are convenient shelves of various widths to conform with the sloping top. The bottom gives ample space for the storage of large wrenches, jacks, pumps and similar tools. The upper shelves are just the right width for tools of smaller size, including tap and die outfits, drills, etc. It is a good idea—preserves tools from dust and protects them against theft and at the same time "keeps" them handy.

"That'll Do" Style of Washing Car.

There are almost as many different kinds of washes and polishes as there are garages. Some of them clearly indicate the "that'll do" spirit; others show just as clearly that the garageman takes pride in his thoroughness; some come in between. What do yours show?

When and When Not to Ask for Order.



Sometimes you can get an order by asking for it; other times you get it by not asking for it. The salesman who can tell which is the right method—and apply it—is sure to win.

DELCO FOR ALL BUICKS INCLUDING THE NEW "SIX"

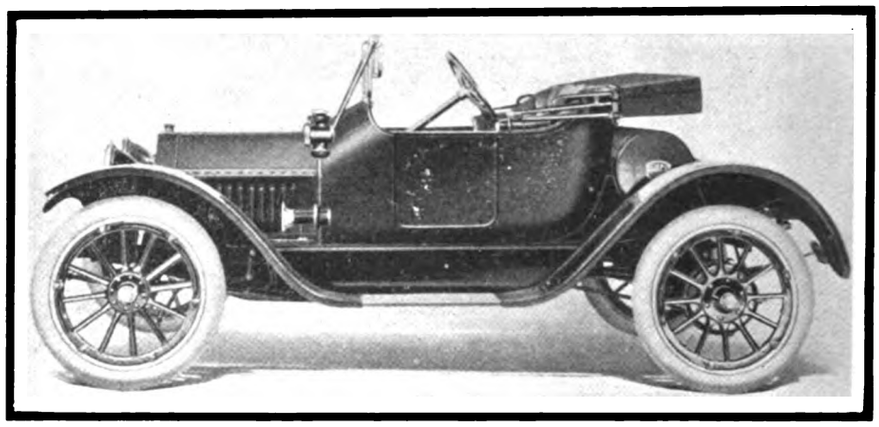
Larger Motor in One "Four" and Left Steer with Center Control for All Seven Models—Few Other Important Changes.

Seven models on three chassis, instead of five models on two chassis, will comprise the Buick line for the coming season, and, as was exclusively stated in Motor World under date of June 10th, every one of the

SIDE VIEW OF NEW BUICK "SIX," WHICH LISTS AT $1,985

models, including the new "six," will be equipped with an electric lighting and engine starting system which later information has disclosed is to be the Delco. Also, all of the models have been brought quite up to date by the substitution of left drive and center control for the right drive and control hitherto used.

Except for these two changes, the two smallest models in the line, which up to the present time have been designated models 24 and 25 but which now are styled B24 and B25, the former being a roadster and the latter a touring car, are almost exactly like their predecessors in construction, and no change has been made in price; the roadster lists at $950 and the touring car at $1,050. In the next larger size chassis, however, the motor size has been changed from 4 x 4 to 3¾ x 5—B36 and B37 take the place of models 30 and 31, which were roadster and touring car, respectively, and B38 is a brand new coupe—and a corresponding increase in price has been made. B36 and B37 list at $1,235 and $1,335, respectively, instead of $1,125 and $1,285, which were the prices of the older models; the coupe lists at $1,800 and the "six" at $1,985 in both roadster and touring car. Model 40, which had a 4¼ x 4½ motor, has been dropped from the line.



Except for a proper difference in the size of parts, all three chassis are made up of the same essential elements and there has been no change made from previous practice other than in the size of the motor in the larger four-cylinder car and in the wheel-base of that car, which now is 112 inches instead of 108 inches; a description of one model, therefore, will serve for all three. Motors, for instance, all are of the distinctive Buick overhead valve type with the cylinders cast in pairs and provided with liberal water jacketing. Ignition current is supplied by the Delco system, of course, lubrication is by constant level splash and cooling is by pump-circulated water and a vertical tube radiator. The dimensions of the smaller "four" remain 3¾ square and both the large "four" and the "six" have 3¾ x 5-inch cylinders, giving piston displacements of 221 and 332 cubic inches, respectively, and A. L. A. M. ratings of 22.5 and 33.75 horsepower.

Clutches, as heretofore, are of the cone type, large in diameter and fitted with soft leather facings to ensure smooth action. Three speeds forward and reverse are provided by the gearsets in each case, and the hand lever is placed in the center of the footboard within convenient reach of the driver. The steering wheel, which is placed at the left side for the first time, operates a semi-irreversible worm and split nut device which is easily adjustable for wear. Friction retained spark and throttle control levers are mounted atop the steering column.

In the smaller four-cylinder model, the wheelbase remains the same—i. e., 105 inches—though the rear axle now is three-quarter instead of semi-floating; the wheels are shod with 32 x 3½-inch tires carried on demountable rims. In the next larger "four" the wheelbase has been increased four inches and the wheels are shod with 34 x 4 tires all around; the wheelbase of the "six" is 130 inches, and the tires measure 36 x 4½ inches; a full-floating rear axle is used in this model. All models have two sets of brakes operating on rear wheel drums, one set being internal expanding and the other set of brakes being of the external contract-type.

Although the appearance of the two small "fours" has not been greatly altered except for slight differences in the lines, the appearance of the larger "fours" and the new "six" is quite different from previous practice, as is made plain by the accompanying pictures. The engine hood and body sides present an almost unbroken line aft, with a concave curve in the skuttle after the manner that appears to be gaining in popularity. The shape of the fenders also has been changed slightly and they fit better now than ever before.

Equipment in each case is the same and includes top with boot and side curtains, speedometer, windshield, Delco electric lighting, engine starting and ignition system, demountable rims, nickel trimmings and the usual complement of spare parts, tools, etc.

SMALLEST BUICK ROADSTER, THE PRICE OF WHICH REMAINS $950

New Engine Casting Foundry in Racine.

The Wisconsin Cylinder Foundry Co. has been organized in Racine, Wis., for the purpose of establishing a grey iron foundry for the production of engine castings. The company, which is capitalized at $25,000, is composed of Knut Tomsen, John Holz and E. J. Akr.

"My Best Sale and Why I Regard It as My Best"

St. Louis Salesman, in Motor World's Competition, Tells of the Contract Which Brought the Greatest Satisfaction in Seven Years' Experience—"Sale From the Fire" and the Man Who Demanded Less Than List.

How to make salesmen better, how to increase the standard of efficiency, is a problem in the automobile trade—and every other. Motor World believes salesmen are made better by being shown what other salesmen have done, and that the salesman who sits down, analyzes his work and puts it in writing is bettering himself, also. Your name will not be used, if you request, but if you have ever made a sale which was particularly satisfying to yourself, if you ever have achieved a task in selling which you regard as a worthy effort, get it on paper and send it in previous to September 1st. It may bring the attention your work merits, and the best four will bring awards of $30, $20, $15 and $10.

By C. L. MARTIN, St. Louis, Mo.

During my seven years experience as automobile salesman I have landed a great many interesting deals, but a sale I made last week probably afforded me more satisfaction than any deal I ever closed.

Mr. G——, a wealthy grain broker of this city, called in our salesroom and wanted to look over our "35." He was waited on by one of our salesmen and seemed impressed with the car, but took occasion to inform him that whoever sold him a car would have to make a concession, for three reasons: First, he had lots of money and would pay spot cash; second, his nephew was chief engineer of the P—— Co.; third, his son-in-law was sales manager for the H—— Co.

Our salesman told Mr. G—— that he could do nothing on his own authority; he would have to take up with the manager. (He should have told Mr. G—— point blank that there was nothing doing, instead of leaving him under the impression that he might get a cut.) When the case was stated to the manager he promptly turned down the proposal, as cut prices are strictly against our policy. Mr. G—— called again several days later, and when informed that no concession could be made, he left the salesman cold, saying that either Jones or Smith would make him a concession, and he liked their cars as well as ours, anyhow. I happened to overhear the conversation, and when he had left I asked the salesman if he was through with him. He advised me that he did not consider the prospect worth fooling with any longer and handed me his card.

Through a little detective work, I learned that Mr. G—— usually left his office for home about 4 P. M. daily; also that his pet hobby was music, so I jumped in our demonstrator and drove down to his office and waited until he came out. I expressed surprise at "running into him" and greeted him as though I had known him for years. When informed that he was on his way home, I invited him to jump in, as I was going his way and would be honored by his company. We drove along for ten minutes, talking generalities, but I was waiting for him to talk car, and finally he opened the subject by telling me of his negotiations with my house and his failure to get together on the price. I assumed ignorance of the deal and asked him what he meant by "getting together" on the price, telling him that we had only one price and that was list.

He understood that, he said, but he was no ordinary purchaser; he was a wealthy man, discounted all his bills, had prestige in the automobile world by reasons of his relatives holding big positions with two of the largest companies, etc. When he was through, I said: "Now, Mr. G——, your points are all well taken and I am honored by talking to a business man of your standing, and while ordinarily you certainly would be entitled to a concession, this is an unusual case and will have to be treated as such. The price of our car is fixed by the factory and the price is about $200 lower than anything on the market that can compare with it. This is possible only by reason of the factory's large output and their excellent facilities for turning out their goods. This car possesses grace, speed, power, simplicity and flexibility, and is as pretty as any car, regardless of price."

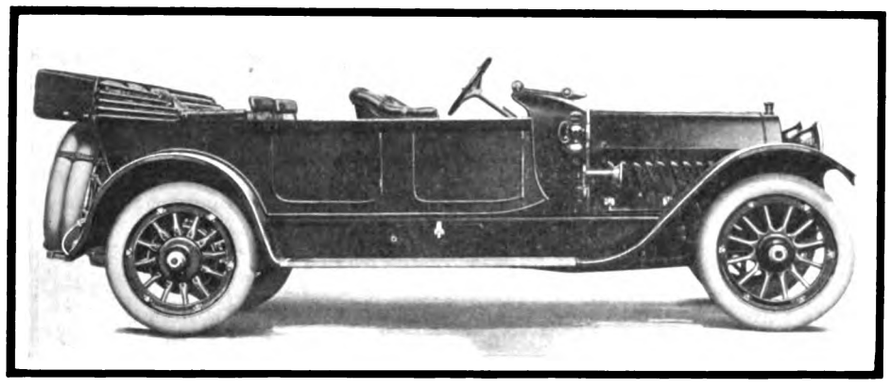
During my canvass on the car I was making it perform to suit my arguments.

"As to price," I went on, "if I should sell you this car at a cut price, assuming that I would be allowed to do so, you would immediately lose a certain amount of respect and confidence in the car, believing that the car was not worth list if we could afford to sell it at a discount; and you would be perfectly justified in thinking so; on the other hand, when you know that we have one price to all and that we cannot afford to sell them for less, you will naturally think and believe that the car is worth the money and will be better satisfied with your purchase."

Here I switched to the subject of music. Being somewhat of a musician myself, I discussed the latest opera that had been in town, but I soon saw that Mr. G——'s mind was not on music but on the car, for during my talk I was making it perform as sweetly as possible. Mr. G—— soon switched back to car talk, whereupon I assumed an air of indifference and simply answered his questions in a I-don't-care-whether-you-buy-or-not sort of way. I saw the turn the tide was taking and simply dropped a remark to the effect that we still had about 20 on our waiting list, and before the season was half over we were going to be offered premiums on the "35's," as our allotment was already more than half sold. I again switched to generalities, and once more he promptly switched to cars. I let him do all the talking, simply answering his questions, and by the time we arrived at his house, which was ten miles out, he had sold himself the car, together with a full equipment of extra tires, tubes, clock, bumper, etc., and all at full list price. I carried back his signed order with a check for $200 deposit.

Now, had the first salesman let this man go, we probably would have never seen him again, for he was cognizant of his own importance and it required just such tactics to bring him to his senses.

I knew he wanted our car, for he told us so when he offered a cut price. I also knew he would be very unlikely to return after being turned down the second time; his pride and vanity would not let him.



Likewise I figured that it would be poor policy to send the same salesman after him as it might lead him to think the company had something up its sleeve and would offer a cut price as a last resort, thereby causing him to withhold his order indefinitely, if not for all time.

OLDSMOBILE PRICES CUT AND MORE POWER ADDED

Two Hundred Dollars Lopped Off List Despite Multitude of Detail Refinements—Cars' Appearance Is But Little Changed.

Progress as exemplified by the newer products of the Olds Motor Works of Lansing, Mich, is indicated by a new series number—54 replaces 53—a substantial cut in the price of the two models that will be marketed and a general enlargement of the size of the motor in the single six-cylinder chassis upon which manufacturing activities will be concentrated. None of these changes are apparent in more than the slightest degree in the appearance of the car, however; in lines and in arrangement it scarcely differs at all from its predecessors. Instead of $3,200, the five-passenger car hereafter will sell for $2,975—which is a reduction of $225—and the price of the seven-passenger car will be $3,150 instead of $3,350. Equipment remains the same.

NEW SERIES OLDSMOBILE "SIX," WHICH SELLS FOR $3,150

Aside from slight alterations in the size of parts commensurate with the greater power delivered by the motor, the principal change in the car is in the bore and stroke of the cylinders, which now measure 4¼ x 5¼, giving a piston displacement of 496.7 cubic inches and an A. L. A. M. rating of 43.50 horsepower, as against 4⅛ x 4¾, which gave a piston displacement of 430.8 cubic inches and an A. L. A. M. rating of 40.8 horsepower; needless to add, these ratings are easily and quite considerably exceeded, as is indicated by the manufacturer's rating of 50 horsepower.

The external appearance of the motor also has been altered slightly by the application of white enamel to the intake manifold, water headers and fan blades, though the cylinders are still of the L-head type and are cast in sets of three. The size of the valves has been increased from 1¾ inches to 1 15/16 inches and, as heretofore, the Delco lighting, starting and ignition system finds a prominent place in the equipment. It is the refined Delco system, however, in which the wiring has been greatly simplified and the cranking power materially increased. Cooling is by water, circulated by a centrtifugal, instead of a gear pump, and lubrication is by a combined splash and force-feed system. A later type of Oldsmobile float-feed carburetter is used, and the mixture is fired through a single set of plugs operated by a dual ignition system in which a set of five dry cells furnishes current for starting or for emergencies. As heretofore, the motor and the gearset form a compact unit that is mounted at three points in the main frame.

The clutch remains of the same efficient cone type with leather face that has been used with such success in the past, and speed changes are obtained through a three-speed selectively-controlled gearset in which high speed is direct drive. Shaft drive is retained, of course, and power is transmitted through floating type rear axles mounted on a special type of imported and domestic ball bearings. Front wheels are mounted in Timken roller bearings.

In place of the single chassis length that has been used in the past, both five- and seven-passenger models being mounted on a 135-inch wheelbase, there now are two wheelbase lengths; the five-passenger car has a wheelbase of 132 inches, and in the larger car the wheelbase is 139 inches. Coincident with this change, the size of the tires has been made 36 x 5, both front and rear, instead of 36 x 4½ front and 37 x 5 rear. Tires now are mounted on Baker straight-side demountable rims, the two spare rims being carried on special brackets attached at the back of the tonneau, where they also serve as a measure of protection to the low-hung gasolene tank. The tank, by the way, holds 24 gallons, instead of 23, and there is a reserve supply of three gallons.

In the front the chassis is supported on long, flexible, semi-elliptic springs and in the rear the spring members are of the three-quarter elliptic variety and their action is supplemented by Gabriel Rebound Snubbers, which are part of the regular equipment. Both sets of brakes are carefully equalized and operate on rear wheel drums, the size of which has been increased from 16 x 2½ to 16 x 3¼ inches; the pedal-operated brake contracts and the emergency set, operated by lever in the orthodox manner, is expanding. Both are faced with Raybestos.

In external appearance, the new Oldsmobile well might be taken for one of the earlier models, for, as already has been made plain, there is little to indicate that it is of a later vintage. The lines are practically unchanged and still present an unbroken effect, softened slightly by a long, overhanging skuttle and an upward trend at the fronts of the forward doors. The steering column is at the right side and is distinguished by one slight change, in which the worm and wheel mechanism has been replaced by a worm and sleeve device. In the seven-passenger cars the auxiliary seats fold up close to the back of the front seats, where they are quite out of the way, and both models have tonneau electric lights, as well as "plug in" trouble lamps for "scouting" service.

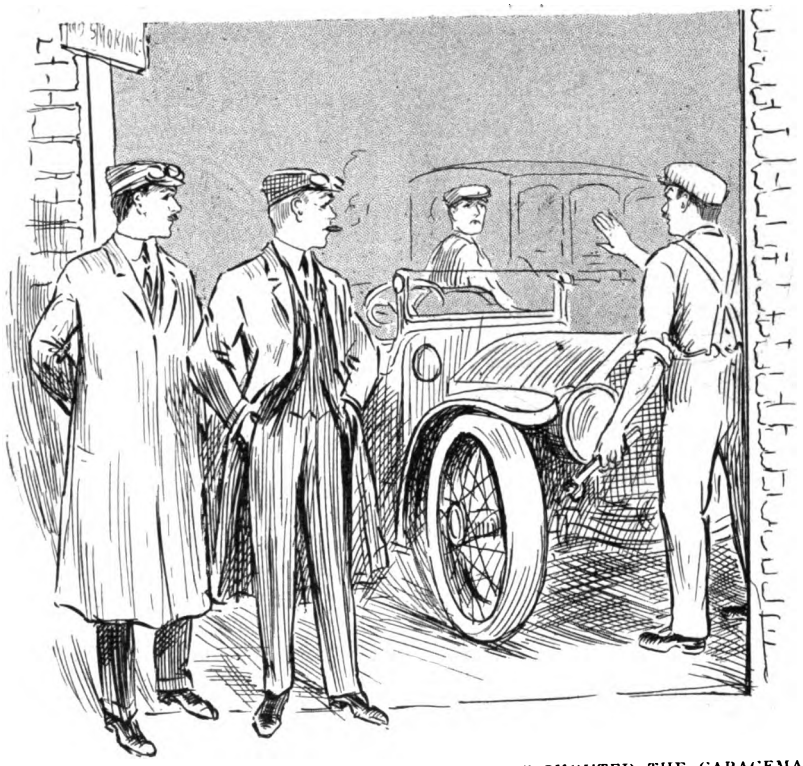
Equipment is complete, as usual, and includes the following: Top, boot, and patent adjustable side curtains; adjustable windshield built in place; 60-mile speedometer; clock; complete Delco electric lighting, starting and ignition system operating in conjunction with special combination electric oil lamps; Baker demountable rims with spare and carriers; tools; spare parts; tire repair kit, etc.

Pneumatic Hubs May Come from Oshkosh.

The Oshkosh Pneumatic Hub Co., which recently was organized in Oshkosh, Wis., and is reputed to have excellent backing, purposes to produce several specialties, chief of which is a pneumatic hub for motor vehicles designed by Joseph Laus, Jr., one of its organizers. The hub, of course, is designed to put the pneumatic tire out of business, so far as trucks are concerned.

Factory Acquired for Carnation Cyclecars.

The American Voiturette Co. has acquired one of the former Brush Runabout plants in Detroit, in which the manufacture of its Carnation cyclecar will be carried on. Incidentally, W. G. Houck, former sales manager of the Keeton Motor Co., has relinquished that office to devote himself entirely to the cyclecar project, in which the Keeton principals are interested.



The Pennsylvania Rubber Co. has opened a branch in Philadelphia at 651 North Broad street. It is in charge of W. H. Sharpe.

ENCOURAGING AND USING THE EMPLOYE'S IDEAS

Obstinate Garageman Causes Reilly to Place Value Upon Suggestions of the Mentally Active Workman — Cites Instances of How Sales Manager's Know-It-All Predecessor Blocked Progress.

Reilly and the Sales Manager stood in the door of a garage in Midvale and watched the cars roll by over the smooth State road; behind them, on the floor of the little building which answered the purpose of garage and repair-shop, the ex-blacksmith tinkered with the rod that joined the steering knuckles; it was like a man who comes back from a vacation—not broke, but badly bent.

"WHEN I WANT TO KNOW ANYTHING I'LL ASK YOU!" SHOUTED THE GARAGEMAN

It would not happen again in a thousand years, probably, and just how it happened was not clear to Reilly, but after driving away out in the roadside grass to get around a load of hay that had tipped over, and after experiencing a few bumps and jolts, he had reentered the highway with his front wheels badly askew. Driving all the way home was possible, but unwise; hence, a job for the Midvale garageman.

While the garageman worked on the rod his helper labored on another car. "Why not do it this way?" asked the helper, as he explained his version of how he ought to do the job he was working on.

"Damn it, Rafferty! How many times have I got to tell you that I'm running this shop? I was here before you were born, and when I want to know anything about how to do my work I'll ask you!"

Both Reilly and the Sales Manager turned as the wrathy smith answered his helper and, seeing their attention had been drawn, the garageman entered into a vindictive dissertation on these "know-it-all helpers" who "don't know their own place." He was still sputtering when Reilly and his companion pulled out and resumed their overland journey from the factory to Reilly's home town.

"Fool!" muttered Reilly, as he gave the steering wheel a wrench and stepped on the accelerator in his hurry to get away from the garage.

"Old crab, I should judge," commented the Sales Manager.

"Ever since I was a kid, he's been that way."

"But he must do a rattling transient business in that location," said the Sales Manager.

"He's taken what came to him in the past," replied Reilly, "and that has been quite a little; but he's losing now that a decent young fellow has opened up further along. There's his place now," said Reilly, pointing to a brightly painted new garage. "That helper could give the old man more business pointers than he ever could dream up in a life time, but take them? Never! He talks about know-it-all help! He knows it all himself."

"The helper does seem like a smart young man," admitted the factory man.

Getting Only Part Value from Helper.

"I don't suppose you could make that old-time blacksmith see in a thousand years that he is trimming himself and is not getting all he's paying for in that helper," asserted Reilly. "He pays the helper wages to help him, and then all he will accept is physical labor applied in the hog-headed way he insists upon. The helper is full of ideas and, I dare say, could help him build up a good supply and accessory trade, but the old cuss imagines that by accepting an idea he is displaying his own ignorance, so he goes ahead with his rule-of-thumb system and insists that anything the helper thinks of must be wrong."

"That helper is a fool to stay there," said the Sales Manager.

Pays Employe for Acceptable Ideas.

"And he won't stay there," added Reilly. "I almost hate that garageman, he's so darned pigheaded. If a man that works for me can tell me anything about running my business, he finds out quick that I appreciate it. If it's an idea than we incorporate in the business he gets paid what it's worth; and, anyway, he learns we're glad to have suggestions."

"That's fair."

"Fair! It's common sense!" exclaimed the dealer. "No man ever got very high without someone's help. My salesman thought out one of the best little prospect follow-up schemes I ever heard of. A man like Old Grouch back there would have turned it

Digitized by Google

down cold, but it's been worth a great deal to me. This putting a damper on your subordinates and setting yourself up as the one big I-know-it-all-and-what-I-don't-know-is-wrong is one of the best ways a man can set out to acquire a millstone about his own business neck."

"We work that system on a sensible basis in our shop. If a man thinks of anything that looks good to him he speaks to Williams about it and Williams thinks it over; some of the things he comes to me about. Maybe he goes back later to get a more complete idea from the man, and they talk it over informally. We haven't a big establishment and don't use a suggestion box, for I don't think we need it; wet get along pretty well as it is. And it is absolutely contrary to Hoyle in our establishment to turn a frosty look on a man with an idea."

"The factory uses the suggestion box."

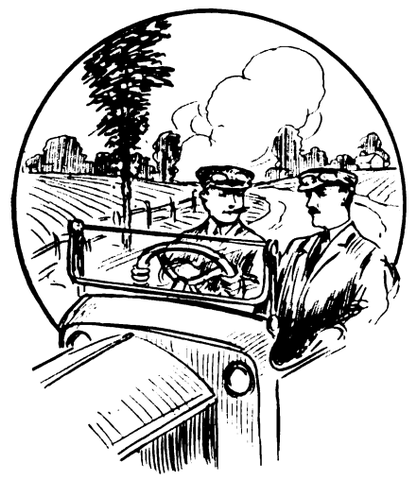
Suggestions Resented by Predecessor.

"You've got a bigger establishment than I have," argued Reilly, "but," he asserted, "you didn't have much of a suggestion system when your predecessor, Marvo, was sales manager."

"No?"

"Decidedly no! You didn't need it; he knew all there was to be known about selling and everything else. You should have seen the first few sales meetings the Old Man pulled off; they were hot sessions. He used to let Marvo run things pretty much, and while Marvo couldn't very well turn down the Old Man's sales meeting scheme he proceeded to make a bum of it to the best of his ability."

"How so?"



"Well, as a starter, he assumed that he would preside and preside he did. The salesmen were gathered in the directors' room at the factory, and along with them were a few of us dealers. Marvo called things to order, and one or two of the salesmen who were full of ideas and had made good on the outside got up and got their ideas and schemes out of their systems. And every time anything was suggested Marvo proceeded to throw cold water on it. He was the sales manager, in capital letters, too, and not much of anything seemed to make a hit with him. To sum it all up, when the meeting was over there was nothing in particular to show for the trouble. The Old Man always supposed Marvo knew what he was talking about, and therefore the Old Man thought his meeting scheme was a failure.

"But he tried several things after that, and each time Marvo gave them a frost. Some of them the Old Man was sure were good and bye and bye he decided that Marvo knew too much for his own good; that was the first grease on the slide for him, and it is what paved the way for your coming."

"No one ever told me all that about him; of course, I knew they didn't like him very well."

"That was his one big trouble; he was handicapping the Old Man's business. There the Old Man was spending good money to get capable men with brains to work for him, and Marvo was playing just such a game as the old grouch of a garageman back there; he actually refused to let the Old Man get what he was paying for. He was like many more of that ilk; he seemed to be afraid that if he admitted anyone knew more than he did it would affect his standing with the company, or, if not with the company, with himself.

"I don't say he never took up a suggestion, for he did; but he did it in such a darned contemptible way that morally I regard him as a thief. One of the lads in the office—he isn't there now, however—once came along with an idea. Marvo said there might be something in it, but didn't warm up at all, but after letting it lapse for quite a while he broached the thing to the Old Man and it turned out to be quite successful. But do you suppose he gave the lad in the office credit for it? Not much! By the time it was an assured success it was a Marvo idea."

"NO MAN EVER GOT FAR WITHOUT SOMEONE'S HELP," SAID REILLY

"That's a ——— of a way!"

Clever in Purloining Others' Ideas.

"Yes, and what's more, he had another way of getting around it. If he realized that an idea was good and he didn't want the man to know he had thought up something good he would say, 'Yes, I have been thinking of that same thing myself, and we may do it as soon as I get around to it.' He sprung that on me once and it made me so darned mad I could have choked him. I knew when he said it he was lying, and when he put the scheme into effect I was almost tempted to tell the Old Man what I thought of him."

"Huh!" was the Sales Manager's exclammatory and sole comment.

"This idea of taking advantage of the brains of employes is taking a firm hold in the business world to-day and the concerns that are getting to the top and forging to the front are the ones that are willing to accept assistance even from an office boy. It applies not only to corporations but to individuals as well, and in almost any trade or occupation. When Jerry Crandall went down to be general manager for the Cress Mfg. Co. he knew he had tackled a big job. They felt that there was a future for them and they were willing to make it a good thing for any man who could pull things up where they wanted them.

Cashed in on Other Men's Mind Work.

"Jerry started in to dig. He went around the factory and got acquainted with everybody. He got everyone's angle of view on everything and he grabbed at ideas right and left. If a man had a good idea Jerry didn't hesitate to tell him so, and where the old manager had been discarding ideas Jerry collected them. It wasn't long before the men began to class the 'new boss' as a 'good scout,' and the men with ideas began to get promoted.

"Jerry singled out the live ones, and some of the old rule-of-thumb foremen went down the scale or out entirely. He built up a factory organization that was alive from top to bottom and that actually became enthusiastic. He went into the sales work the same way, and the salesmen all began to pull together like a team of horses. The knockers and don't-cares were wiped out and every man became a rooter."

"Crandall must be a pretty good man," commented the Sales Manager.

"He is, and the Cress people know it and they wouldn't let him go if they could pay him enough and avoid bankruptcy. But that isn't the point. Jerry is a good man, but he never got where he is by himself; he had to have help and be willing to be helped. He wanted the men to help him and he was glad to help the men, and he practically boosted himself to where he is on the shoulders of the organization. He could have climbed considerably by himself, but when he got the whole bunch helping him they just shoved him away up beyond what he ever dreamed. He cashed in on other men's ideas—and the other men were only too glad to have him do it."

"That makes me think; I have an idea," said the Sales Manager, as the car rolled up to Reilly's salesrooms.

"Well, keep it until I get back," said Reilly, who climbed out and headed for Mike the Cigar Man's.

"BOOST INDIANA" TOURISTS LOOK BACK AT THEIR TRIP

One of the Passengers Tells What Left Most Vivid Impressions—Lively Reminiscences of Dust, Mud and 'Dobe.

Those "made in Indiana" tourists are back. And some of them are jolly well glad of it, too. Even those who are not so glad to get back to real civilization again are likely to remember their experiences for many a long day, for nearly every one of those to greet home folks once more have tall tales to tell of mud and of dust and of struggles over prairies and assaults on villanous mountains; some of the experiences were laughable and some were not so laughable, and almost without exception they make very plain the fact that cross-continent touring, even on the easy schedule that was followed, is a strong man's work at best.

LOS ANGELES CLUB AND DEALERS WELCOMING TOURISTS AT OWENSMOUTH

James Rohde of the Eisemann Magneto Co., of New York City, is one of the returned tourists who is a little bit glad he is back on the home heath, for though he had a "bully good time," to quote his own words, he also had some pretty hard times that were not shared by all of those who made up the party; his reminiscences reveal many interesting sidelights on the 4,000-mile trip from Indianapolis to the Pacific Coast. Rohde went along to look after the Eisemann magnetos carried by 11 of the 18 cars in the procession, but he did not have much to do; he took with him a trunk full of repair parts, but he sold them all, down to the last brush, to the Eisemann Pacific Coast dealer, and he is particularly proud of the fact that not one of the 11 instruments, eight of which are American products, manifested the slightest trouble during the whole of the trip. And that the "going" was particularly hard on ignition apparatus is made very plain by his recital of some of the events that took place on the long jaunt.

"What bothered us most?" Rhode reiterated after the Motor World man. "The heat," he answered laconically, and went on:

"We asked a farmer in Kansas the temperature on a particularly hot stretch of road, and he said that when we noticed the grasshoppers roosting in the shade of the telegraph poles it was over 100. But we were not stopping to look for grasshoppers; one way to create a breeze was to keep on going. The heat did not seem to have much effect on the motors unless we travelled with whatever breeze there was; then they commenced to overheat a little. But as long as there was a breath of air stirring and we could head into it, we had no trouble when the roads were level. Further along, on some of the hills, steam was fairly common, though none of the cars had any trouble in climbing the grades.

"When we got up into the real mountains there were few of the gasolene cars that did not lose quite a little power because of the rarified atmosphere, but it did not seem to effect the 'coal oil' car (referring to the Henderson fitted with Harroun's kerosene carburetter) a bit. Harroun would open her up and she'd sail over the hills in great shape and never a puff of smoke from her exhaust pipe. I know, because I rode behind it in the other Henderson.

"After the heat, I think the dust worried us about as badly as anything else. The alkali dust will get through anything I ever saw — goggles, clothes, tightly-covered trunks and all—and if it gets into person's eyes it smarts terribly. When we struck the alkali country it was a case of clean gasolene strainers every night, and sometimes we could not wait until night.

"We struck the worst roads of the trip in Utah and in parts of Colorado where the alkali dust was so thick you could not see your hand before your face if there was another car within a radius of a mile of you. But we did not mind the taste and the feel of the stuff half as much as we did the very effective way in which it disguised the bumps in the road. It filled up all the little hollow spaces between the high spots and made the road appear smooth, and as soon as a car had plowed through it it settled down again to fool the next driver.

MISS C. S. GEARY, SECRETARY LOS ANGELES CLUB, AND ELWOOD HAYNES "UP FRONT"

Digitized by Google

"When it was no dust it was mud—beautiful, rich adobe mud that sticks tighter than your shirt on a hot day. I think I've shovelled enough of the stuff and waded around in enough to fill the Panama Canal. Getting into Kearney's Ranch, it took us two hours to travel half a mile; as fast as we put the mud hooks on the tires they ripped off again, and finally we had to fairly build a road out of rocks before we could move at all. We could see the lights of the town and those on the cars that had gotten through, and there we were—marooned for just two hours by the clock.

No Water and Beer 25 Cents a Quart.

"Drinking water is terribly scarce in some of those Western towns and we had a funny experience at Fish Springs. We got a little sulphur water for the radiators, but they would not give us any to drink nor would they turn their backs long enough for us to steal some. Instead they offered us beer—at 25 cents a quart. And we had to take it—warm, too, mind you—or go thirsty. It was in that same town that the price of 'gas' reached the high mark; it was selling for 65 cents a gallon. Back at Kearney's Ranch it was 60 cents.

"The people in the town of Price, in Utah—it's nothing but a little bit of a Western gambling town—were so anxious for us to go through their settlement that the whole town turned out and built a road through the canyon to get us to come in. We were the first and only motorists to go over the road, and we had to look sharp to avoid the empty dynamite cases that strewed the roadway, part of which had been blasted out of the solid rock. That night a cloudburst washed out the road, and now very little remains to show where it was.

Cloudburst Follows Terrific Heat.

"Speaking of cloudbursts reminds me of a 'peach' we ran into just as we reached Thompson, Utah. The heat had been terrific and for hours we had driven with the bonnets over our engines raised, despite the dust. With scarcely any warning, the cloudburst struck us, and I think the deluge was the worst of any I have ever seen; the rain was punctuated by bursts of hail and the road became a sea of mud in no time at all.

"In the mountains the roads were a little better, on the whole, though in nearly every case the turns slanted off and made driving hazardous. In several cases it was necessary to get out and walk beside the car, holding it onto the road with all our strength to keep it from sliding over the edge. Grades? Why, you don't know what grades are in this part of the country. When you have to poke your head out from under the top and get a crick in your back from looking up, I guess that's going some! In Dugway Pass one of the cars could not get up at all, and 40 of the men in the party got on a long rope and towed it up, assisted by its engine. Geared a little too high for that particular hill, I guess, for it had no trouble in getting up all the others. But that piece of grade certainly was a real sticker.

"In every town we struck we were royally treated and even in Kansas, which is supposed to be dry—very dry!—nobody had any trouble to get a drop of the stuff that cheers. There was always one room in the hotel that had a bath in it filled with cracked ice and bottled Budweiser. Not even the presence of Governor Hodges had any effect on that feature. I don't know who was responsible for it, but it certainly looked good to us.

When Escorts Made Selves Nuisances.

"Sometimes the welcome we got proved embarrassing, and in not a few cases the would-be escorts that came out to meet us got to be real nuisances. We were glad to have local motorists follow along behind us into their home towns, but they always wanted to lead the procession. Which was all right as long as they did lead. But when one of 'em got a blow-out or a puncture and stopped to repair it, he was always determined to regain his original position in the line, and the chances some of them took on those mountain roads would turn one's hair grey. Three or four bad accidents resulted from just such tactics.

"We had a great trip all the way through, and it really surprised me the way the tires stood up under the strain. In Kansas, where the heat was greatest, blow-outs were fairly frequent, though on the rough mountain roads we had very little trouble by comparison."

To-morrow (Friday) night the tour will be lived over again by nearly all of those who took part in it, for the Indianapolis Chamber of Commerce, the Board of Trade, the Commercial Club and the Hoosier Motor Club will give a joint banquet to those who rode in the cars, when they will be told nice things about themselves and generally boosted in turn for the boosting they have done for Indiana and Indiana-made products.

Possible Danger in Cowl Fuel Tanks.

With the present tendency toward the adoption of fuel tanks contained within the skuttle dash, there is room for slight danger at least of confusion in refilling tanks and radiators, and while it is conceivable that gasolene might serve as a fairly good cooling medium—albeit a rather expensive one—water certainly will not serve as fuel. It is true that the two filling orifices may be and generally are quite a distance apart, though it will do more good than harm to warn garage attendants which is which.

Ohio Law for Protection of Carriers.

Automobiles left standing at the curb in Ohio cities will be pretty safe from molestation if the Fellinger law, which went into effect last week, acts as any sort of a check on small boys and others whose delight in the past has been to see how much they could "monkey" with a car without getting themselves into trouble. Not only does "stealing" a car carry a good, stiff penalty, but so much as picking off a metal monogram—any part, in fact—means from three to six months in jail or a fine of from $100 to $500.

Tinkering with the gears or the starting device is made punishable by a sentence of from 30 days to six months or a fine of from $50 to $100, and under the same penalty are included these prohibited things:

Cutting, marking, scratching or damaging any part of a motor vehicle, top, robe, covering or upholstery.

Destroying with liquid or other substance any part of a motor vehicle or its appurtenances.

Draining or starting the drainage of the radiator or oil tank of a motor vehicle.

Putting a metallic or other substance or liquid in the radiator, oil tank, carburetter, grease cup, oilers, lamps or machinery of a motor vehicle with intent to injure or impede its operation.

Tightening or loosening any connection of a motor vehicle.

Releasing the brake of a standing motor vehicle with intent to injure the machine.

Parking Forbidden in Michigan Avenue.

The problem of what is to be done about parking cars in Michigan avenue, Chicago, still disturbs automobile and municipal circles, and in view of a new order to the effect that cars cannot be parked in the center of the street after Saturday, 16th inst., the would-be solvers of the problem are unusually busy. Those who drive downtown to their offices used to park their cars wherever they could, but several months ago the police commissioner was responsible for an order that all cars be parked in the center of that broad thoroughfare.

Then, a few weeks ago, it was proposed to build a subway garage that would accommodate 2,250 cars, but the South Park Commission did not approve the project; the Chicago Automobile Club then offered to build part of the garage, but the offer has not been accepted, and now the authorities have issued the anti-parking order, which is likely to work a hardship on business men who own cars.

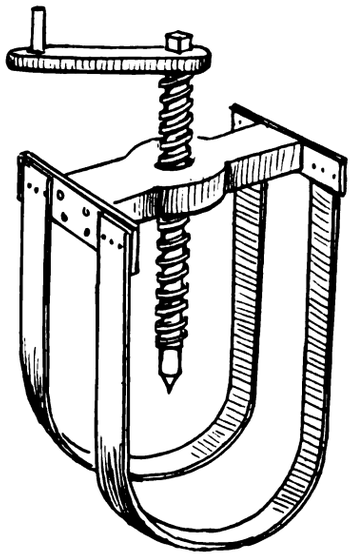
PUSHING THE PISTON PIN INSTEAD OF HAMMERING IT

Adjustable Appliance for Moving Wristpins Without Danger of Damage — For Solid or Hollow, Large or Small Pins.

Many jobs that are encountered in the process of repairing and overhauling an automobile require the use of a hammer, and in doing them the hammer is the essential tool. There are not a few other jobs, however, where the hammer is used not because it is the proper tool or the best tool but because it is the most convenient one.



For such work as removing the piston pin from a piston the hammer is not the proper implement to use, despite the fact that it is the tool that is commonly employed for the purpose. A piston is a mighty delicate thing, as a matter of fact. Not only is it finished with a great deal of care, and not only does a great deal depend upon the preservation of its accuracy, but it is made of cast iron, which is notably brittle and is decidedly susceptible to injury from the blows of a hammer. It is not necessary that the piston be struck directly to cause it to crack more or less seriously; the blows struck when driving out a rather tight piston pin are quite capable of starting a crack under conditions favorable to such a disaster.

The accompanying illustration shows a simple and thoroughly satisfactory method of making a piston-pin pusher that will answer for any piston within a reasonable range of sizes. Like many other special appliances, it can be varied a good deal in constructional details, without, however, making any change either in the principle of operation or in its usefulness.

Where the pin-pusher is to be used in a repair-shop, where it is likely to be subjected to considerable wear and tear, the heavy crosspiece and the screw should be of steel, though for the occasional use of an owner who does his own work, wrought iron is quite good enough. The diameter of the screw for all-round service should be about five-eighths of an inch and the crosspiece should be of a thickness at least equal to the diameter of the screw and should be enlarged by "upsetting" in the middle to avoid weakening by the drilling of the hole.

The two flexible bands which cradle the piston should be of heavy spring steel about five-eighths of an inch wide, riveted to short steel spreaders fastened by screws to the ends of the cross-piece. The spreaders should be long enough to allow clearance between the bands for the passage of the largest piston pin that will be operated upon. The screw must be of sufficient length to push the longest pin almost through; a little block of wood can be used for the last inch or so, if necessary. The inner end of the screw should be flat and square and drilled to take a pointed center similar to a lathe center. The center need not be removed ordinarily, for in the case of a hollow pin it will usually go into the hole, and in the case of a solid pin its point will enter the lathe-center in the pin end.

If the appliance is made for use on one engine only the flexible steel bands need be made only long enough for the pistons of that engine and the screw may be made with a flat end or with a permanent point, according to the design of the pins of the particular engine. For that matter, the affair can be greatly simplified, when only one size of piston is in view, by using a single wide band of ordinary flat, thin iron with a hole for the piston pin to pass through, instead of two steel ribbons, and a much shorter cross-piece with a plain hole in it and the screw, which may be a common bolt with a long thread, working through a nut held against the under side of the cross-piece by the pressure of the screw itself. A wrench on the bolt-head may take the place of the crank; the crank, however, very greatly reduces the time required for removing a pin.

SIMPLE PISTON PIN REMOVER

The pin may be pushed back into place by the same appliance if the bands are made sufficiently long; it should be started as far as possible by being worked in by hand, so that it will go straight and true when the screw is applied. While it may perhaps seem an unnecessary caution, it will do no harm to suggest that the set-screws or other retaining devices should be well out of the way, both when removing and when replacing a piston pin.

WINNIPEG TRACTOR TRIALS MAKE ALL ENTRANTS HAPPY

All Entries Win Prizes in Microscopically Divided Classes — Gasolene and Kerosene Machines Worsted by Big Steamers.

It may be that manufacturers of agricultural tractors are so busy taking and filling orders that they are able to give but scant attention to such matters as competitions and trials; it may be that they do not consider the game quite worth the candle, and therefore elect to eschew it; it may be that the public, or at least that portion of the public which is expected to take a deep interest in agricultural tractor demonstrations, is stingy in evincing its appreciation; or it may be that there is some other reason or combination of reasons of a nature unfavorable to the holding of trials of power and efficiency between the big machines that are doing so much to reduce the cost of farming on a large scale.

However that may be, it is a fact that this year's tractor competition at Winnipeg, an annual event that has become a sort of classic in its particular field, attracted fewer entries than either last year or the year before. There were but 19 competitors this year as against some 30 machines shown last year, and only three firms entered as against 12 last year. It may be said, however, that a few of last year's tractors were merely run and operated as demonstrators, not entering the competitions, and in two cases the same machines contested in both gasolene and kerosene classes.

The three concerns this year represented were the J. I. Case T. M. Co., of Racine, Wis.; the Avery Co., of Peoria, Ill., and the Sawyer-Massey Co., of Hamilton, Ont. The Holt caterpillar, the four-wheel drive Heer, the Rumely Oil Pull, the Pioneer "limousine," the four-cylinder Diamond T, the American Gas tractor, the Gould, Shapley & Muir, the Aultman Taylor, the one-wheel-drive Hackney, all of which served to enliven the 1912 competition, were among the absent. And it is no less disappointing that so far at least as the official reports are concerned, there were no representatives of the small motor plow doing the work of one or two horses—a type of machine that certainly has been brought to a state of development where it might be expected to figure in competition and which makes an appeal to hundreds where the big, costly machine is financially visible only to scores.

The competitors were segregated into three divisions, for gasolene, kerosene and steam machines, respectively, and each di-

Digitized by Google

vision was subdivided into three classes graduated according to horsepower. As there were separate prizes for each class of each division, it is reasonably clear that there was but little opportunity for any machine entered to get away without a prize of some sort, and, as a matter of fact, every maker who competed won premier honors in something or other—a state of affairs that makes it seem a little surprising that more manufacturers did not make bids for the numerous medals and diplomas hung within such temptingly easy reach.

Steamers Make High Scores.

While a list of the winners in the various classes is little more than a rearranged list of entries and conveys no useful information, the data obtained from the trials and compared irrespective of power or class is of some interest. Strange to say, the steam machines made the best showing on total points, a Case tractor with a single huge cylinder of 12 inches bore and 12 inches stroke having accumulated 437.30 ponits out of a possible 500, while a double-cylinder steamer of the same make ranks second with 406.7 points. Third and fourth also went to the steamers, the machines being another Case and a Sawyer-Massey, respectively. Last year the kerosene class led the whole field, with gasolene a close second and steam a good third.

A little investigation of the penalizations of the internal combustion engined machines brings to light the fact that many points were lost for reasons that do not necessarily impair the real value of the machines. For instance, a gasolene tractor was penalized 100 points for stopping after the test had commenced. In the plowing test many points were sacrificed for having plows out of the ground too long and for lack of sufficient water for a continuous run of eight hours.

Among the internal combustion tractors, excluding the steamers entirely, the gasolene machines ran one, two, three, a Sawyer-Massey taking first and Avery machines second and third. The scores were close, however, the leading gas tractor having 359.05 points, the second 355.55 and the third machine 352, while the Case kerosene machine, which ranked fourth in the internal combustion group, had 338.4 points.

Computing the Cost of Plowing.

The steam machines scored again, and handsomely, in the cost of fuel per acre plowed. Again ignoring horsepower classifications, the best record was made by the same big Case machine that won on total points, its fuel cost amounting to 37 cents per acre plowed, and the second place in point of fuel cost was taken by the Case that was second in total points, with 37.4 cents per acre. A Sawyer-Massey was third with 42.8 cents and another Case fourth with 43.6 cents per acre. Two kerosene machines were fifth and sixth; both were Case tractors, and the figures were 43.8 cents and 45.8 cents per acre, respectively. An Avery gasolene machine with a four-cylinder motor made the best showing in its division, its cost for fuel amounting to 46.5 cents per acre plowed. Of course, the cost figures have only a comparative value, for it is clear that local fuel prices must govern in such matters. The scores are based on a cost of coal of $8 per ton of 2,000 pounds, for gasolene of 27 cents per gallon of 7 pounds and for kerosene of 14.5 cents per gallon of 7.9 pounds. While the liquid fuel prices appear high, it must be remembered that they are for the Imperial gallon, which contains 160 fluid ounces as against the 128 fluid ounces of the American gallon.

Mechanical Troubles Are Few.

Quite a strong light is thrown on the progress that has been made in the matter of reliability by the fact that on the score sheet there are comparatively few penalizations for mechanical troubles. In the column devoted to carburetter and ignition troubles, for instance, there is but one entry, and that not a heavy one, indicating that the makers have succeeded in eliminating what once were the most serious drawbacks. There were more penalizations for variations of speed and for vibration than anything else, the judges evidently having rather firmly fixed opinions on such matters; but for the most part the penalties inflicted were trifling. Only four cases of bearing trouble were penalized, and three of these were in the steamers. The steamers and the kerosene burners ran about equally in the matter of points for vibration, while the gasolene machines averaged better than either of them. The fact that there were several four-cylinder motors in this division of course had its effect in the matter of vibration.

Enormous Weights of Tractors.

Two-cylinder motors predominated in the internal combustion divisions, there being five of them in the gasolene classes as against three "fours," and four in the kerosene classes against a single "four." Four of the six steamers had single cylinder motors, the two double cylinder machines having compound engines. Big cylinders and slow rates of revolutions per minute were the rule, as might be expected in such machines. The smallest cylinder in the lot measured 6½ x 7 inches bore and stroke, respectively, this being the dimensions of the two-cylinder motor of the 15-horsepower Case, while the 30-horsepower machine of the same make has cylinders of 10 inches bore and 12 inches stroke, and the huge Sawyer-Massey steamer, which is rated at 35 horsepower, has one cylinder of 12 inches bore and 14 inches stroke. This big machine runs at only 230 revolutions per minute, while 600 revolutions per minute is the maximum rated speed of the lightest of the motors.

While it is not expected that an agricultural tractor should be particlarly light, the weights of some of the machines are a little amazing. The 12- and 15-horsepower gasolene tractors are comparatively reasonable in weight, scaling 5,600 pounds; the 20-horsepower machines, however, run up to 12,000 and 14,000 pounds, the 30- and 40-horsepower weigh over 24,000 pounds, or 12 tons, while the two largest steamers weigh 39,000 and 40,000 pounds, respectively—20 tons! Yet the steam engines of the last two are rated at about 35 horsepower.

The competition was held in connection with the Winnipeg Industrial Exhibition. The judges were J. B. Davidson, L. J. Smith and H. W. Riley, while the engineer in charge of the trials was L. W. Chase.

Bablot Victor in French Grand Prix.

Driving a Delage car, Bablot won the French Grand Prix race which was run over the Le Mans circuit in France on the 5th inst., his time for the 330 miles being 4:21:50, which is at the rate of 76.98 miles an hour. Albert Guyot, who finished fourth at the wheel of a British Sunbeam in the last 500-mile Sweepstakes race on the Indianapolis Speedway, was second to Bablot, at the wheel of another Delage, his time being 4:26:30, or 75.40 miles an hour, and Pillette, who was fifth in the 500-mile race in a Mercedes Knight car, finished third in a Mercedes; his time was 4:27:53, which is at the rate of 75.38 miles an hour. The next three places were won by Salzer (Mercedes), whose time was 4:34:53; Duray (Delage, whose time was 4:35:03, and Lautenschlager (Mercedes), whose time was 4:36:51.

Although 16 cars were scheduled to start, the two Peugeot entries, which were to have been driven by Bilot and Guyot, were withdrawn at the last minute, for which no reason has been made public, leaving only 14 to start. The eight cars not previously mentioned were three Schneiders, all of which were eliminated by broken pistons, two Excelsiors and one each Opel, Brazier and Benz. As was the case with the road race over the Amiens course that was won by Boillot, the amount of gasolene was restricted, and if present plans are carried out the number of tires allowed each contestant will be prescribed by the officials in next years' race; it is proposed to limit each entrant to seven tires, including the four on his car.

COOPER AND HIS STUTZ TAKE SANTA MONICA RACE

Cover 445-Mile Course at 74-Mile-an-Hour Pace—Oldfield and Nikrent, in Mercers, Follow Him Home —Crowd Mars Finish.

Over a winding eight-mile course well lined with eager spectators, Earl Cooper, at the wheel of a Stutz car, easily won the Santa Monica road race in California on Saturday last from a field of 14 starters; he completed 53 laps of the course, which in exact figures measures 8.417 miles, making the total distance 445.2 miles, in 6:01:52, which is at the rate of 73.86 miles an hour. His time, therefore, is considerably slower than the time made by Tetzlaff last year, when he rounded the course 36 times in a Fiat at an average rate of 78.5 miles an hour for the 303 miles. Barney Oldfield, who attempted to come back last year in the same race, came back to better purpose on Saturday; he finished second to Cooper with a Mercer in 6:07:45, and Louis Nikrent in another Mercer was third in 6:28:17.2.

The race that was won by Cooper was the only one that thrilled onlookers. The two light car races—one for cars between 101 and 230 cubic inches piston displacement and the other for the next larger sized engines having between 231 and 300 inches displacement—were abandoned chiefly because of lack of entries, though they scarcely were missed because of the much greater distance travelled by the big cars, which were driven under class E free-for-all rules.

Promptly at 9 o'clock in the morning the first of the 14 starters was sent away and the others followed at 10-second intervals, the complete list of starters and the order in which they started being as follows: Gaston Morris (Mercer), Harris Hanshue (Apperson), Barney Oldfield (Mercer), Theodore Tetzlaff (Fiat), Louis Nikrent (Mercer), E. F. McConners (Speedwell), Dave Lewis (Stutz), Earl P. Cooper (Stutz), John Ophsahl (Buick), Charles Soules (Cadillac), Frank B. Goode (Apperson), T. J. Beaudette (Cadillac), Frank Siefert (National), Frank Verbeck (Fiat).

From the first lap it became apparent that the race would be won in close to record time, and before the lap was finished the gruelling pace set by the leaders told on the engine in Lewis's Stutz and the car was withdrawn. Soon after the sixth lap, Siefert in his National worked himself up into the first position, pushing Cooper and Oldfield back to second and third, respectively, but his triumph was short-lived, for by the time 100 miles had been covered Cooper had regained his place and thereafter Siefert dropped way back. A little later, his National caught fire and was withdrawn, and almost immediately afterward Hanshue's Apperson also blazed up and was taken out of the race. Oldfield then was second, about two minutes behind Cooper, whose time for the 100 miles was 1:18:15.

In the 15th lap Oldfield raised the hopes of his host of followers by nosing out Cooper for first place, but Cooper, who lost little time in making tire changes, soon regained the lead and never lost it again. At the 200-mile mark Oldfield still was second, some five minutes behind Cooper, who was clocked for the distance in 2:57:02, and Goode, who had been driving a consistent race in his Apperson, was in third position. This was the position held by the three leaders up to the 47th lap, when engine trouble put Goode out of the race and Nikrent, who had been driving "wide open," came up from the rear and slid into his place. Tetzlaff, who had been looked upon to do great things, in view of his two previous victories, never was a serious contender and quit at the 200-mile mark.

At the end of the 40th lap, or 336 miles, Cooper still held onto his lead, his time for the distance being 4:32:34⅘, with Oldfield second, three minutes behind him, and Goode three minutes behind Oldfield. Morris (Mercer) and Ophsahl (Buick) quit soon after the 40th lap, leaving nine cars still in race, and of these nine, only Nikrent's Mercer was within 10 laps of the leader.

Six laps from the finish Oldfield, who had stopped at the pits for tires, had dropped two minutes further behind Cooper, who still was in the lead; Nikrent was trailing along behind the redoubtable Barney, and this was the order held until the finish. Immediately after Nikrent crossed the finish line, the great crowd of spectators, too long held in check by the guards, surged across the course and made the going so hazardous for both drivers and spectators that the race was called off and the survivors flagged.

Cooper's Stutz and both the Mercers driven by Oldfield and Nikrent were sparked by Bosch magnetos and fired with Bosch plugs, as were eight of the other 12 cars entered; both Cooper's Stutz and Oldfield's Mercer were shod with Firestones.

Organize Against Car in St. Louis.

Because the automobile is regarded as having "got the horse on the run" in St Louis, Mo., a $250,000 corporation has been formed in that city to take over practically all the undertaking and livery establishments in town and endeavor to check the inroads of the motor car on the horse-drawn vehicle livery business. Former State Senator Collins, who owns three undertaking establishments, is one of the organizers.

PECULIAR CONTEST TANGLE CANCELS WISCONSIN RUN

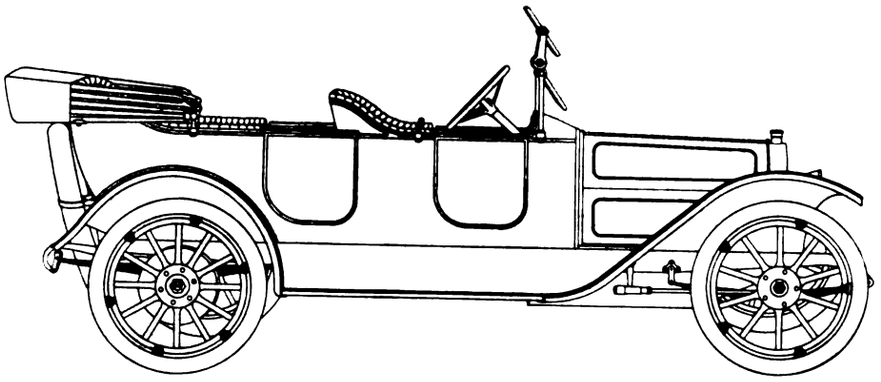
Manufacturers' Failure to Register Stock Cars Prevents Dealers Getting What They Want—Substitute Offer Refused.

The reliability contest which was to have been started from Milwaukee on the 25th inst. by the Wisconsin State Automobile Association is all off, and thereby hangs a tale. It is off because the Contest Board of the American Automobile Association could not, if it would, issue a sanction for the event, all of which hinges on the failure of manufacturers to list with the A. A. A. their stock models. Because last years' tour, which was run under Grade III reliability rules, was easy and because something harder was desired by the dealers, sanction was requested for an event to be run under Grade I rules, which are for registered stock cars and which provide penalties for time and work and for failures disclosed by a final technical examination, and for pretty nearly everything else that is not "just so." But—and here's the stumbling block—no stock cars have been registered with the Contest Board of the A. A. A. and so no sanction could be issued. In lieu of the Grade I sanction, Chairman Schimpf offered a Grade III sanction, but this the dealers refused. Consequently the event has been killed by indefinite postponement, and although the A. A. A. is hardly to blame, there is some talk of "seceding."

Green and White in Connecticut's Tags.

Green and white are the colors to be used on Connecticut's license tags for 1914, Secretary of State Albert Phillips having placed an order for 30,000 of the new automobile appendages; they are to be three inches shorter than the 1913 tags and will have the letters "Conn" placed vertically at the left of the number and "1914" in the same position at the right of the number. "C" as an insignia is not used. Pleasure cars will have white letters on a green background and commercial cars green letters on a white background. Manufacturers' tags will have green letters on white with an "M," dealers' tags the same, but with a "D," and livery cars the same but with an "L."

Cars Prizes for Suspenders Jobbers.



Six jobbers in the C. A. Edgarton Mfg. Co.'s suspenders, who lead in sales July 10, 1914, will receive automobiles as prizes, the winners to head six different classes; the order for the cars has been secured by the C. T. Silver Motor Co., Overland dealer in the metropolitan district.

BOTH "FOURS" AND "SIXES" IN BIG AND LITTLE OHIOS

Four Models that Range from 35 to 80 Horsepower—Left Drive and Center Control in Three Larger Cars.

Ample opportunity for selection is afforded in the well-balanced series of Ohio cars brought out by the Crescent Motor Co., of Cincinnati, Ohio, which includes two "fours" and two "sixes," a big and a little car of each type. While there are naturally some differences between the various models such as are incident to the different sizes and powers and to the different numbers of cylinders in the motors, the main features are alike throughout the line. All the motors are of the T-head design and all have long stroke-to-bore ratios. The unit power plant system has been adopted, with shaft drive to the rear axle, and the body lines are worked out in the same general way throughout the line.

SIDE VIEW SHOWING LINES OF OHIO "4-50" TOURING CAR

The two four-cylinder cars are designated, according to horsepower and number of cylinders, as the "4-35" and the "4-50"; similarly the "sixes" are called the "6-60" and the "6-80." All are five-passenger touring cars, with the exception of the "big six," which has a seven-passenger body, and all except the "little four" have left steer and center control. Both the "fours" have three-speed gearsets and both the "sixes" four speeds and all, it almost goes without saying, are selectively controlled. All the motors—or, more correctly speaking, the unit power plants—are suspended directly from the main frames on the the three-point system, which protects the power plants from the effects of twisting or weaving of the frames when the roads are rough.

All rear axles are of the full floating type and the shafts run on annular ball bearings. Long, thin-leaved semi-elliptic springs are the suspension members in all models; in the "fours" the front springs are 40 inches long and the rear springs 54 inches long. The springs are nearly flat, so that the maximum play of the leaves is available for the absorption of road vibration. The easy riding qualities of the springs are assisted in no small degree by the large tires, the smallest "four" having tires 34 x 4 and the larger "four" 35 x 4½, while both the "sixes" have 4½-inch tires, but the "little six" has 35-inch wheels and the "big six" 36-inch wheels. The wheelbases of the "fours" are 116 inches and 122 inches, respectively, and of the "sixes" 132 and 138 inches, respectively.

All the motors, as already has been mentioned, are in the long-stroke class and each one is especially adapted for its particular work. The smallest "four," rated at 35 horsepower, has a bore and stroke of 4¼ x 4¾ inches, and the larger "four," which is rated at 50 horsepower, has a bore and stroke of 4½ x 5¼ inches. In the "sixes" the stroke is the same in both engines—that is, 6 inches; the bore is 4 inches for the "little six" and 4½ inches for the "big six." Block casting of the cylinders is employed for the "6-60," while the cylinders of the "6-80" are cast in pairs.

All models are liberally equipped with the various things that the owner is more or less certain to need or to want if he does not get them with his car. From the smallest car to the largest electric lighting and starting systems are installed, the Jesco dynamo-motor being used in conjunction with the Willard storage battery. The mohair tops have covers and Jiffy curtains, and in the larger models the curtains are housed, when not in use, in pockets at the front, which makes a very neat and convenient arrangement. All wheels are fitted with demountable rims, those on the larger "four" and on both "sixes" being Firestones, and each car carries an extra rim. Tire holders are attached to the rear of the body. Roomy tool boxes are supplied with a good assortment of the usual tools that are found necessary and, of course, tire repair outfits, jacks, etc. Speedometers are standard equipment, and also rain vision and ventilating windshields, which are attached without unsightly stays or other awkward supports.

The body finish is either Brewster green or royal blue, at the option of the purchaser, while the sheet metal parts, such as hood, fenders and the like, are black. Bright metal parts are finished in nickel. The upholstering is executed in genuine leather, stuffed with really good hair, and is ten inches deep.

The prices are $1,275 and $1,750 for the "little four" and the "big four," respectively, and $1,985 and $2,485 for the "little six" and the "big six," respectively, including electric lighting and starting system and full equipment.

Bloods of Kalamazoo to Make Cyclecars.

Blood Bros., of Kalamazoo, Mich., who manufacture universal joints and other automobile parts, are preparing to engage in cyclecar production. They will not only make a complete vehicle, but also supply cyclecar parts to all comers.

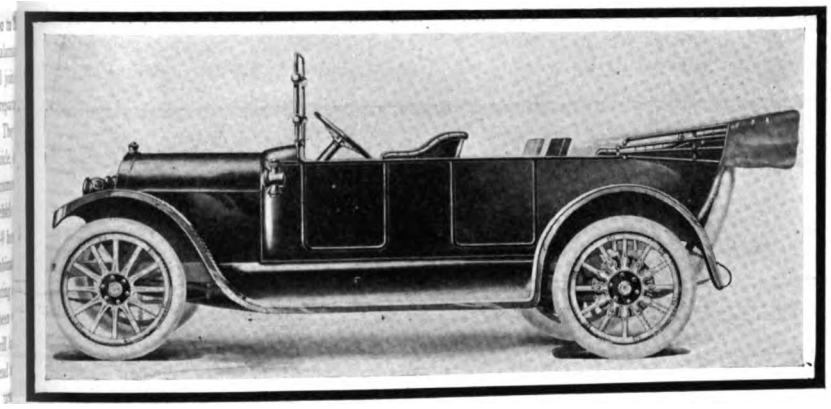
The Kalamazoo vehicle will mount a Spacke two-cylinder 7-9 horsepower engine and will employ a combination friction and bevel drive, incorporating some exclusive features which have been worked out by the Bloods. The car will have a wheelbase of 96 inches, 36-inch tread and 28 x 3 tires. It will be fitted with tandem seats with wheel steer in front, will weigh less than 400 pounds and will be priced in the neighborhood of $375.

Cyclecar manufacture, however, will not be strange to the Blood brothers, as in 1903 they produced about 100 of such vehicles, which were sold by the Michigan Automobile Co., of Kalamazoo. The car was styled the Little Michigan and utilized a four-cylinder, air-cooled engine, chain drive and wire wheels. It had a tread of 36 inches, wheelbase of 54 and tires 2 x 28.

McClintock Has New Type of Engine.

The McClintock Engine Co., of Detroit, which last week secured a $200,000 Delaware charter, purposes locating a plant in Detroit for the manufacture of a new type of gas engines for automobiles, the nature of which, however, is not public property. The principals of the company are Chas. D. McClintock, Francis C. Osborn and G. Edgar Allen.

Sternberg Doubling its Factory Capacity.



The Sternberg Mfg. Co. of Milwaukee, maker of the truck of that name, has purchased ground for a $50,000 addition to its plant at 46th avenue and Burnham street. It is expected that the enlargement, which will be completed by October 1st, will double the Sternberg working force and output.

EVERLY DESIGNED MOTOR IN PARTIN-PALMER CAR

ock Cylinders Integral with Top of Crankcase—One-Piece Head, Cageless Valves and Water-Cooled Exhaust.

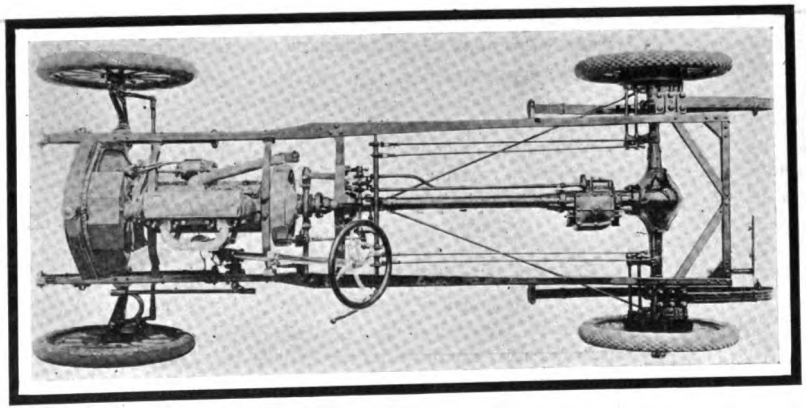
Fortunately for everyone who has anying to do with automobiles, whether it be aking profits from them or spending oney for them, the days have gone when achines were built around single ideas that is to say, when a man would conceive

FIRST PRODUCT OF PARTIN-PALMER FACTORY, THE "38"

n idea, materialize it in metal with the itmost care and then hastily and carelessly uild the rest of the car around that idea, roducing a machine that rarely was of any alue and usually had a brief existence. The nowledge of good and evil in mechancal matters now is so thoroughly dissemnated that ignorance is hard to tolerate. Having said which, it is in order to state hat, while the Partin-Palmer "38" is far, ar from being a one-idea car, or even a wo- or three-idea car, for that matter, its motor is of rather particular interest, not because it defies precedent, which it does not, but because in it novel means are adopted for carrying out principles that have been proved and tried in actual service, not once, but many times.

The Partin-Palmer car is the first product of the Partin Mfg. Co., of Chicago, and only the first; others are to follow, as already has been stated in Motor World. The factory located in Detroit is devoted to the production of this one model, however, which is a six-passenger touring car with a motor of 38 horsepower, a wheelbase of 115 inches and a price of $975.

The motor that forms such a conspicuous part of the car is of the overhead valve type, with unusual features in the valve arrangement, and has its cylinders cast en bloc, and they, too, have their unusual features. Not only are the cylinders in a single casting, but with the cylinder block is cast the upper half of the crankcase. The number of parts is reduced by this construction and the cylinders and crankcase are absolutely rigid in their relation and there are no connecting bolts or studs to loosen and give trouble.



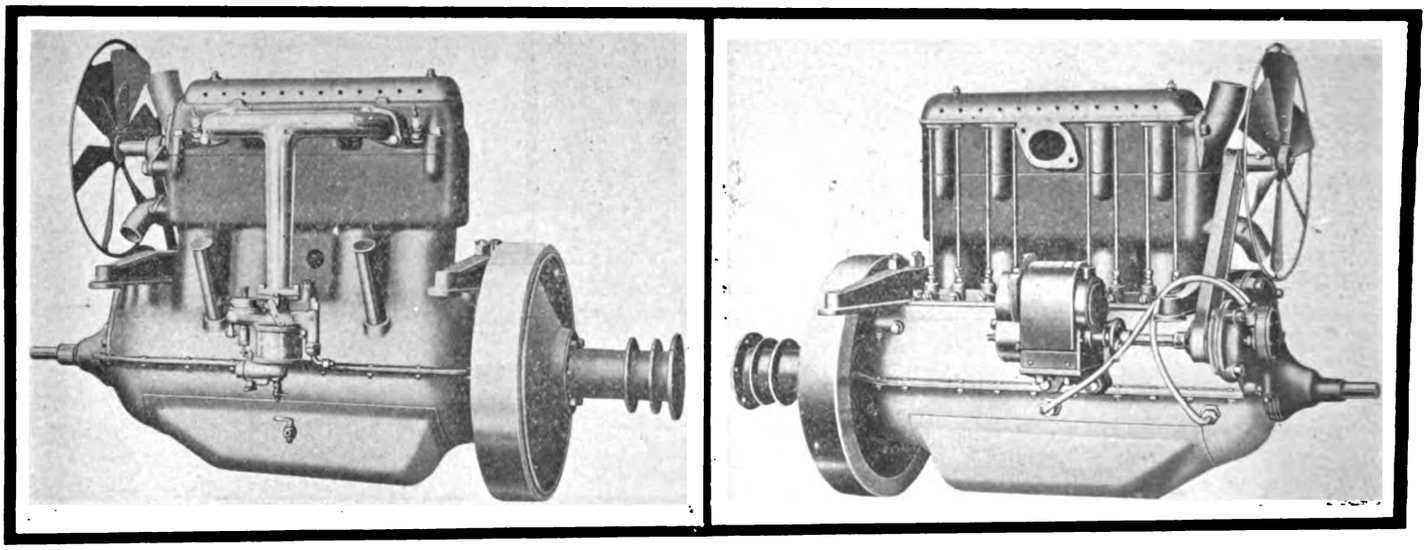
In the overhead construction the same idea of reducing the number of parts and increasing the strength of those that remain is carried out. As might be expected from the combination of the cylinders with the upper crankcase section, the upper ends of the cylinders are left open and the heads bolted on. A single casting serves to cover all four cylinders, however, and owing to the stiffness of both cylinder and head castings a small number of bolts is sufficient to do the work. The joints are made with copper-asbestos packing rings having a resistance of some 3,000 pounds per square inch.

Not only are the heads formed in a single casting, but the cages commonly employed to carry the valves where overhead valves are used are eliminated by forming the valve seats directly in the head casting. Both intake and exhaust passages are cast in the head section. The head and the valves are thoroughly cooled by the water jackets with which they are surrounded, and the exhaust manifold also is jacketed, to the minimizing of back-pressure and noise in the escaping gases. It is a comparatively simple matter to remove pistons and connecting-rods through the open-ended cylinders. The removal of the common head is facilitated by the fact that the water connection is bolted on; by removing the bolts from this connection the radiator and other water joints need not be disturbed.

Other details of the motor are carried out in a more conventional manner, though the three-bearing crankshaft is made a little unusually heavy, being 2 inches in diameter at the front bearing, 2 7/64 inches at the middle and 2 9/64 inches at the rear bearing, where the strain is greatest. The lengths of the three bearings are 3 inches, 2½ inches and 3 11/16 inches, respectively.

The method of casting the cylinders and heads is very favorable to the thermo-syphon system of cooling, which therefore is employed. Lubrication is effected by a constant circulation system and by splash, the latter being adjustable. That the circulation of the lubricant is decidedly active is evidenced by the fact that the pump, under average working conditions, will move 1½ gallons of oil per minute. Ignition is by a dual system, a Briggs magneto being the source of current.

The material used in the construction of the body is alumnoid steel, which means that steel plates are covered with a heavy coating of aluminum. The result is a combination of many of the desirable features of both metals. There really is ample room for the six passengers the car is designed to carry. Two must sit, of course, in auxiliary seats, and these are 15 inches wide and 14 inches deep, with automatic catches for the legs; they fold under the front seat, out of the way, when not in use. Doors are 20 inches wide, giving plenty of room to get in and out. The arrangement of the front seat and the steering wheel are such that



PARTIN-PALMER CHASSIS, SHOWING CLEAN DESIGN

Digitized by Google

the driver can get out of his place without difficulty—which is not always the case in a car of moderate dimensions.

Center control of the three-speed selective gearset is the appropriate accompaniment of left steer. Other items of the power transmission system include a leather-faced cone clutch, the usual propeller shaft and bevel gears and a three-quarter floating rear axle. The car is suspended on semi-elliptic front and three-quarter elliptic rear springs. The brakes, which act on drums 14 inches in diameter, are of the internal expanding variety.

Electric starting and lighting equipment are not included in regular equipment, but will be fitted to the car, either before or after purchase, at a moderate advance in price. Regular equipment includes mohair top and top cover, curtains, windshield, speedometer, Prest-O-Lite tank, gas headlights, oil side and tail lamps, an extra demountable rim, rear tire carriers, horn, robe and foot rails and the usual tools and tire outfit.

INTAKE AND EXHAUST SIDES OF MOTOR USED IN PARTIN-PALMER CARS, SHOWING OVERHEAD VALVE ENCLOSURE

More Motors Coming from Milwaukee.

The Davis Mfg. Co., Milwaukee, which produces motors for commercial vehicles, tractors, etc., has purchased a seven-acre site in West Allis, a manufacturing suburb of Milwaukee, on which it immediately will begin the construction of a $150,000 motor plant, 250 x 290 feet. It will be the third factory which the Davis company has erected in 10 years.

Semi-Turbine Engine Looms up in St. Louis

The American Semi-Turbine Motor Co. has been organized in St. Louis and will locate in the Roe building in that city. It purposes producing a new type of automobile engine, the nature of which is indicated by its title.

DEPARTMENT STORE TO TELL HOW TO SAVE TIRE MONEY

New York Establishment to Engage in "Semi-Philanthropic" Work — Tuitionless "School in Tire Repairing and Upkeep."

That department stores are progressive in their adaptation of modern merchandising ideas is well known, and department managers are kept busy thinking up new things, one of the latest of which is an automobile tire service department and which has been installed in the Gimbel Bros. store in New York City. The aim of the store is to render assistance to the motorist in a manner not surpassed by those who specialize in tire selling, and to make the owner a tire repairman if he so desires.

Of course, the store will hardly undertake to set itself up in the repairing and vulcanizing business, but aims, rather, to equip the car owner with a foreknowledge which will enable him to get the greatest satisfaction from the tires he buys of Gimbels. As the prime mover in the scheme, Harry S. Twitchell, of the Goodyear Tire & Rubber Co.'s service department, has been assigned to the Gimbel tire and tire supply department and is acting as the medium between the store and the public.

The store classes its new feature as a "school for tire repairing" and states that "we have organized a section of our business to render valuable service to automobile owners who want to secure longer service from the tires and who wish to learn to do their own repairing in the quickest and most efficient manner.

"We also have engaged an expert tire man to tell the motorists who are interested exactly how to get the longest mileage out of their tires; how to protect and repair them in the quickest manner when they are damaged on the road and in the most thorough manner when they are at home. This service is entirely without charge and will save the careful motorist many dollars in repair bills and greatly lengthen the life of his tires."

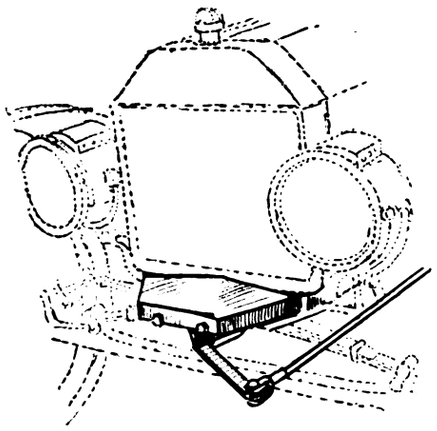
Here's the "Non-Skid" Dancing Shoe.

The "non-skid" idea has laid hold of the shoemaking fraternity—or else it has been brought to their notice by the rubber people—and the result is that rubber plugs and patches are being inserted in the soles of dancing shoes to prevent "side-slipping" and other involuntary antics on the glassy floors. If dancing becomes any more violent than it is at present it seems more than likely that rubber plugs will have to give way to regular chains.

To Keep the Dashboard Cool.

There are some cars in which the rear cylinder of the motor is so close to the dashboard that the latter becomes too warm for its own good and for the comfort of the occupants of the front seat. Considerable relief can be obtained by covering the dashboard on the motor side with asbestos millboard, leaving a little air space, if possible, between the lining and the dash. Usually it will be unnecessary to cover the whole board, unless the heating is very pronounced.

Grit for Grinding in Valves.



An excellent abrasive for valve grinding is the "sludge" deposited in the bottom of a grindstone trough. It is less sharp than emery and carborundum, but is excellent for valves that do not need a great deal of cutting down and for finishing work.

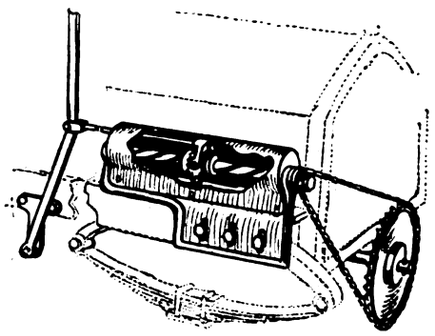
[ECHANICAL STARTERS WITH MUSCULAR POWER

ong Levers and Powerful Pedals That Permit Economical Application of Energy—Starting From Seat a Feature of Mechanical Crankers—Automatic Devices Eliminate Trouble From Back Kicks.

A long time will elapse before machinery displaces muscle completely; the achines "that do everything but think" ill require the direction of the human will through the intermediary of human muses. And until Luther Burbank or Jules erne or some other theoretical or practical wizard succeeds in producing a real echanical man, brain, will-power and all, onditions are likely to remain unchanged. When that mythical mechanical man does ee the light of day, it is not unlikely that ome 20th century automobile engineer will orner his services, and it no longer will e necessary to say or to think when an utomobile engine shall be started or topped. In the mean time, there is the mechanical engine starter, which is a

DETROIT MECHANICAL STARTER



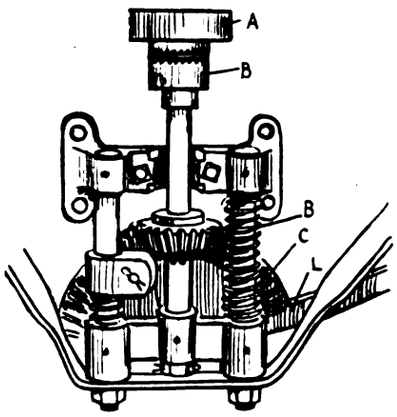
mechanical man directed by the brain of the man behind the steering wheel. The man behind the steering wheel sets his muscles in action with the aid of his brain and his muscles set the starter in operation. In this way he comes about as near to starting his engine by will power as he ever will.

Direction Instead of Execution.

The amount of muscular power required to carry out the dictates of the operator's will varies, of course, according to the type of starter attached to the engine. If it is an electrical starter, simple pressure on a button suffices; the same holds good in case of the compressed air device; the operation of the spring starter may require the expenditure of a little more muscular energy to release the power in the spring, though there is no reason why it should. These three types of engine starters rely upon something other than human muscle to perform their real work; actually they utilize part of the power of the engine.

Mechanically Boosted Leverage.

In the various types of lever or pedal operated engine starters, which are entirely different from the compressed air and spring devices that have been illustrated and described in the last three issues of



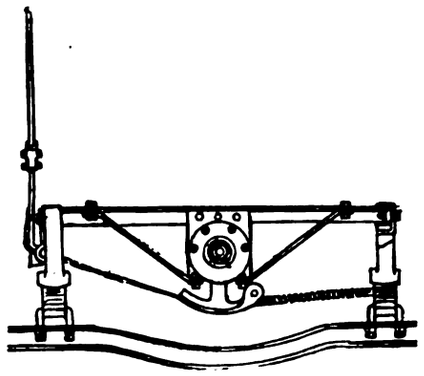
KEEN SCREW DEVICE

Motor World, designers have made frank acknowledgment of the reliability of the human machine by causing it to perform all, or nearly all, of the work of starting the motor; in doing so, however, they have made the work immeasurably simpler and easier than is the case when the time-honored and nearly obsolete hand crank, dangling from in front of the radiator, is used. They have considerably increased the leverage obtainable in every case, but what is of the greatest possible importance, they have made it possible for the operator of a motor car to start his engine without leaving his seat behind the steering wheel; and they have made it practically impossible for injury to result from back kicks.

These lever and pedal-operated engine starting devices are of several distinct types—no less than six are illustrated and described herewith—and though they are all the same insofar as their ultimate results are concerned, they all are essentially different in construction and operation. Their design implies first a material increase in leverage in order to permit the engine to be "turned over" easily, and secondly, practical insurance that no harm will result to the operator if the engine should kick back. Neither of these requirements necessitates complexity of construction, and there is nothing in any of the devices described that will require care other than the occasional application of a few drops of oil; just where the oil should be placed is well indicated by the devices themselves. Although many of the lever and pedal-operated starters on the market have been designed primarily for application to Ford cars, they may be applied just as easily and with just as much assurance of successful operation to almost any other light- or medium-weight car.

For Fords or Any Other Light Cars.

The Detroit mechanical starter, which is produced by the Detroit Mechanical Starter Co., of Detroit, Mich., for instance, is one



DETROIT STARTER MECHANISM

that was developed primarily for Ford cars, though it may be applied to a great many others quite as easily. It is operated by means of a long lever next to the lever that operates the emergency brake and it makes the starting of the engine about as easy as "rolling off a log." In the front view of a Ford car that is given herewith, the appearance of the starter in place is shown quite clearly; it slips on in place of the usual hand crank and scarcely takes up any more room than that device. Its extraordinarily simple internal economy is shown in another sketch, from which it is plain that there is nothing to get out of order and about three places that require a squirt of oil now and then.

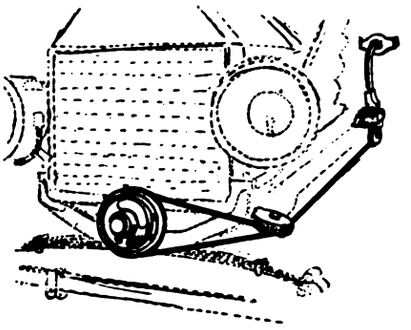
The part marked A in the accompanying picture of the "insides" of the starter, at-

Digitized by Google

taches to the extension of the crankshaft that normally engages the hand crank; its face has a number of teeth on it which engage with teeth in the part B, which is keyed to a short shaft rotated by the pinion D by means of a semi-circular bevel gear ring C. This bevel segment is firmly at-

HERCULES LEVER STARTER

tached to the lever L which, in turn, is attached to the hand lever by means of a rod.



Lever and Screw Combination.

When the starting lever is pulled, the shaft carrying the part B shifts slightly, engaging the teeth; further movement of the starting lever gives the crankshaft one-quarter turn and when the starting lever is released the teeth are disengaged and the lever returns to its normal position automatically. In case of back kicks, the teeth automatically are kicked out of engagement and movement therefore cannot be transmitted to the starting lever. The device can be put in place by any mechanic who is entitled even to the designation "amateur."

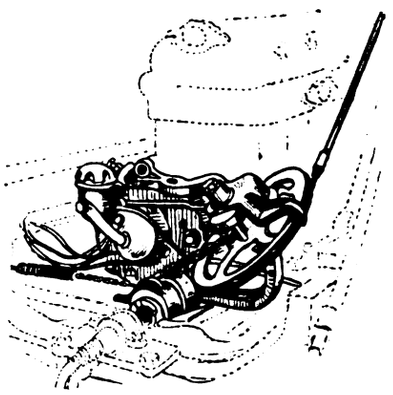
The Keen starter, which is illustrated herewith in part section and which is produced by the Keen Starter Co. of New York City, is the only one of them all to employ the tremendous power of the screw to "turn over" the engine. In its essential elements it consists of a long shaft contained within a casing that is simply bolted to one of the side frame members of the chassis. This shaft has a long spiral thread cut upon it and at one end it carries a sprocket over which runs an ordinary bicycle chain; a second sprocket is attached to the crankshaft extension that normally carries the starting crank. On the spirally slotted shaft there is a runner—for simplicity it may be likened to a nut turning on a bolt—which is connected to the starting lever by means of a rod. Hence, when the starting lever is pulled, the nut slides along the slotted shaft and in doing so rotates it, the movement being imparted to the engine crankshaft through the bicycle chains and sprockets. In case of back kicks the little teeth on the runner automatically disengage, and to prevent the device running when the engine is in operation there is a simple clutch. Like the Detroit starter, the Keen device can be attached by almost any one and the only attention necessary after it has been attached is the application of a few drops of oil to the moving parts.

Takes the Pull Round the Corner.

The Hercules starter, which is made by Hercules Auto Starter, Inc., of San Francisco, Cal., can best be described as a device to transmit a pull around a corner; it is little more than that, as is made plain by the accompanying sketch. There is a long hand lever, which is placed next to the emergency brake lever, a cable from it running over a pulley to a supplementary lever on the crankshaft extension, and that is about all there is to it. It is true that the supplementary lever is attached to a small casing and that in the casing there is the mechanism that prevents back kicks from

MESNARD PEDAL STARTER

kicking back to the operator, but no one need ever be concerned with that, because it is so simple that it cannot get out of order and therefore it must always work; there is nothing to lubricate and so no oil holes are provided.



In operation, when the starting lever is pulled, a small shaft in the casing attached at the front moves longitudinally and attaches itself through a ratchet collar to the engine crankshaft; the connection between the starting lever and the engine thus is established, and when the lever is moved the length of its travel the engine is "turned over." But between the ratchet collar and the supplementary lever to which the cable is attached there are two friction plates and the pressure between them can be adjusted so that it it is just sufficient to hold when the engine is cranked against compression. Hence, if a back kick should occur, the friction plates simply would slip one on the other and no harm would be done the mechanism, for the ratchet collar cannot be turned the wrong way.

The Triplex engine starter, which is manufactured by the Bremer-Wilson Mfg. Co., of Chicago, Ill., is another that has been designed primarily for attachment to Fo cars, though with slight alteration it can attached to many other makes as well. it the manufacturers have made use o very simple and very positive releasi mechanism which is quite automatic in o eration. After attachment, the visible p tion of the device is a small handle on th dash, and this handle is attached to t mechanism that gives the crankshaft its itial revolution.

The construction of this mechanism is shown by the accompanying sketch, whic shows its position before the engine has been started—in full lines—and after the engine has been started — in dotted lines When the dash handle is pulled, the firs movement presses down a small trigger which makes positive connection between the engine crankshaft and the starting device; and when the handle is pulled ou to the limit of its travel this trigger is released, as is shown by the dotted lines in the picture, and the handle is returned to its normal position, tight up to the dash, by means of a spring. As is the case with all the other starters, there is nothing to get out of order and the only attention necessary is contained in an oil can and released by the pressure of a finger.

Worked from the Dashboard.

The Boston starter, which is produced by the Automatic Appliance Co., of Boston, Mass., is still another that has been designed primarily to ease the burden of Ford owners, though this one, too, can be arranged to start engines other than those that come from the immense Ford factories Like the Triplex, the visible portion of the device is a small handle that normally lies

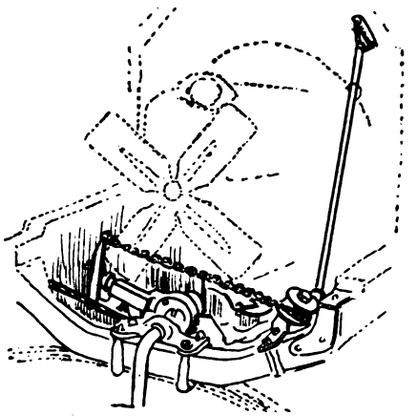
BOSTON LEVER MECHANISM

nearly flush with the dashboard and scarcely would be noticed by the average individual. The handle connects with a rod which, in turn, is connected to a short cable running over a fairly large wheel; the wheel has attached to it a short chain which runs over a sprocket, or what corresponds to a sprocket, on the extension of the engine

Digitized by Google

crankshaft, the whole arrangement being shown by the accompanying sketch.

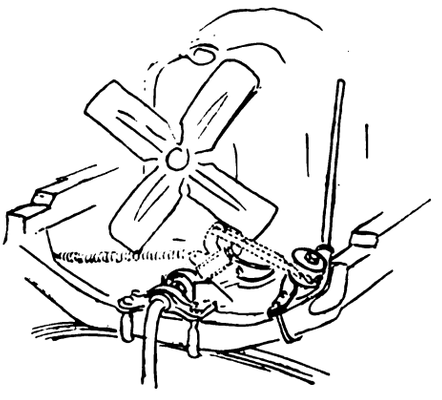
In operation, one pull on the starting handle rotates the engine crankshaft through the intermediary of a simple roller clutch which releases automatically instantly there is any tendency on the part of the engine to be cantankerous and to kick back in the wrong direction. After the engine has been started and the starting handle is released, it slips back into its normal position against the dash and is ready for the next start; a spring pulls it back out of the way. One important feature of the Boston starter is that it is not necessary to remove the existing hand crank, though for various reasons it is desirable and advisable to do so. One thing is certain: If it is removed there is no possibility of its catching on anything in the road, as remote as that possibility may be.



The Mesnard starter, which is produced by the Modern Sales Bureau, of Chicago, Ill., and is designed to fit Reo, Krit, Hupmobile, Overland, Paige-Detroit and Studebaker pleasure cars and Federal trucks, in addition to Ford cars, is different from any of those that have been described in that it is operated by means of a pedal instead of a hand lever. Just how it looks in place on a Ford car is shown by the accompanying sketch, which makes fairly plain both the design and the method of operation of the device. The pedal actuates a large drum mounted on the crankshaft extension through a cable which runs over the drum and back to a smaller drum containing a spring which draws the pedal back to its original and normal position. Inside the drum casing there is a simple mechanism which takes hold when the pedal is depressed and lets go instantly the engine starts or in case of back kicks.

Good Reasons for Installing Starters.

As already has been made plain, the advantage of these various mechanical engine starters lies not so much in the fact that they render easier the actual starting of the engine as it does in the fact that they make possible the completion of this operation from behind the steering column, which really is the logical place from which to start the engine anyway. Incidentally, all of these devices provide a ready excuse and a ready means for the incorporation of safety apparatus designed to protect the operator from the evil effects of unexpected back kicks. Aside from these things, they may be viewed also as legitimate enemies of that unnatural wear and tear which results when the engine is permitted to run idle for periods of varying length while the car is at rest, for they encourage the practice of stopping the engine when the car is stopped—except during traffic blockades of short duration, of course. For this reason they also may be expected to reduce fuel consumption, which in the end really amounts to increasing mileage per gallon of fuel.



"Cranking" and "Starting."

It is unnecessary to point out, of course, that mechanical engine starters—or electrical ones or those operated by compressed

TRIPLEX BEFORE CRANKING

air or springs, either, for that matter—are designed to "crank" the motor, and because the average motor usually starts when it is cranked, all such devices have come to be styled engine starters. Actually, however, they are not engine starters in the true meaning of the words, for it is the "gas" and the spark that really start the motor, or rather, that really start it generating power.

CRANKING OPERATION COMPLETE

Any one of them will "crank" a motor, and in this respect may be regarded as practically infallible, but none will start a motor unless the motor is properly prepared for starting. In other words—the words of the beginner, in fact—no amount of cranking will start a motor unless the throttle is partly opened and the ignition current switched on.

The intelligent care of any one of the various pedal or lever-operated starters requires merely a knowledge of the beneficial effect of good lubricating oil properly applied. Wherever metal moves against metal lubrication is necessary from time to time, and if its application is not put off until squeaks proclaim its need, no trouble can visit the the apparatus during the length of its natural life.

Offered Car for Fine But Went to Jail.

The old 1904 car that has been carrying Allen R. Chappel around Brooklyn, N. Y., doesn't stand very high with its owner, despite its faithful service, for he went to jail last week rather than pay a $25 fine on it. He was haled to the Flatbush Court by a policeman, who said Chappel was going 26 miles an hour.

"Why, that old rattletrap couldn't make 26 miles an hour," said Chappel. "The thing isn't worth the money I spend for gasolene."

"Well, I find you guilty and fine you $25," said the court.

"Take my automobile, your honor!" cried Chappel. "The fine is worth more than the car."

"This court doesn't deal in automobiles," replied his honor. "You will have to pay or go to jail."

"All right, I'll go to jail, then," said Chappel. And he did, and left the car standing in front of the court.

To Brighten Leather Upholstery.

One of the most old-fashioned and, according to many who have used it, one of the best methods of cleaning and brightening leather upholstering, is to rub it well with a cloth or sponge dipped in white of egg that has been beaten up a little to prevent its being stringy, and then give it a final rubbing with a dry, soft cloth to remove all traces of the egg. The effect is said to be exceedingly satisfactory.

When French Chalk May be Harmful.

Although French chalk placed between a tube and the shoe is a very desirable adjunct to prevent the adhesion of these two essentials, too much of it may prove as bad as or worse than none. If too much is used, it is likely to work up into little balls when the continual rubbing and rolling around will ruin a tube in short order and make it almost beyond repair, or scarcely worth the cost of the work.

Noises Arising from Buckling Metal.

A form of noise that is annoying and at the same time difficult to trace is that caused by the slight buckling of a sheet metal part under vibration, a portion of the sheet being curved just enough to allow it to snap back and forth and makea noise in doing so. The remedy is either to eliminate the curve, if that be possible, or to stiffen the place so that the buckling cannot occur.

RUNNING TO RIOT ON UNIT CONSTRUCTION

Binks and the D. E. Figure Out Future Car—Space Saved by Extending Unit Idea—Hood, Separate Frame, Levers and Pedals to Be Exterminated—Ultimate Car to Be "All Buttoned Up" With Electrical Controls.

"Has it ever occurred to you," asked Binks, "that the skin of a racing car is a whole lot closer to its bones than it used to be?"

Binks and the Designing Engineer had been looking over a number of photographs of racing cars, mostly of the kind in which a small motor with a low horsepower rating runs at an enormous number of revolutions per minute and shoots the machine along at something like 100 miles an hour.

"If you mean the style of construction that makes the car so narrow that you can't see the hood unless you stand off to one side, while the driver's elbows stick out to port and starboard of the machine," replied the D. E., "I have noticed it—sure! What's the matter? Don't you like the looks of it? Maybe we can induce the makers to change the shape to suit your critical eye," and he grinned cheerfully.

"It's not that," replied Binks. "But since you gave me that awful whirlwind of figures on the air resistance of car bodies, I have been doing a little thinking on my own hook——"

The D. E. straightened up suddenly with a look of incredulity on his face.

"Try something else, old man," he suggested. "I can't believe that."

Binks Begins Elucidating.

"On my own hook," continued Binks, calm and unruffled. "And I have come to the conclusion that some of these days the skin and bones will be combined, and there will be a whole lot less room wasted in the average car than there is now. Some of the things they do on racing cars are good enough to be done on regular machines, and I shouldn't wonder if this was one of them."

"If you have something on your mind, get it off," advised the D. E. "At the present moment you've got me going."

"I certainly have. Do you know that there's a whole lot of valuable space wasted on every car? Heaps of it. I thought that out all by myself, too. I never heard anyone put it just that way, but it's a fact, and if you think the thing over you'll see that any number of people think the same thing in a restricted sort of way; only they apply the principle locally and fail to take a broad view of it.

"Looking at those pictures just gave me the cap-stone for the structure I have erected in my mind. Oh, you might as well resign yourself. I'm doing the lecturing this time, and I'll use all the high-sounding phrases I please. Now, this unit power plant construction has brought the motor and gearbox together in what amounts to a single housing. The valve stems are covered up, the timing gears likewise, and in a good many motors the only parts that are left out in the cold are the magneto and the carburetter. All right. Well, now, the whole engine is covered up by an enormous hood that doesn't do a blessed thing but keep the dust off the lovely cast iron surface of the engine and protect the magneto and carburetter. Why not go a step further and enclose the magneto and carburetter in the power plant housing, smooth up the whole outside and chuck out the hood altogether? Let the engine stand out by itself. It wouldn't do any harm, and it could be designed so that it would look all right, once people got a little accustomed to it."

The D. E. Comes to the Rescue.

"Well, well!" commented the D. E. "That's going some, I must say. What would you do with the radiator—put that in the engine housing, too?"

"I hadn't thought of the radiator," admitted Binks, a trifle crestfallen. "That would be a poser, wouldn't it?"

"Not necessarily," the D. E. came to his friend's rescue. "How many cars have you seen with radiators behind the motor?"

"That's the idea!" cried Binks, his enthusiasm again bubbling. "Why, what a chance for the fellows who build cars with those sloping hoods! They would have twice as much room for their radiators, or they could make them much more compact, if they wanted to.

"There's more to it than that, though. Of course, different people do things in different ways, but if you pick out some of the designs and combine them, and carry things a step or two further, as I have done with the hoodless motor inspiration"—here Binks swelled his chest and stuck his thumbs in the armholes of his waistcoat—"you can save a lot of space. Suppose you build a car with the starting and lighting motor and dynamo in the flywheel—yes, yes, I know all about those systems—put the gasolene tank up under the cowl of the dash, and wipe out your gear-shift levers by using an electric or pneumatic gear-shifter. Look at the stuff you get rid of! And then why not go a step further and replace your brake levers and pedals with little switches or valves? If electricity and air are reliable enough for gear-shifting I can't for the life of me see what's the matter with applying the same principles to braking—and to working the clutch, too, for that matter."

"Oh, all of those things have been done at one time or another," said the D. E.

"That's all right," retorted Binks, warmly, getting well astride of his hobby. "But they have been done one or two at a time and not all on one car. Why the devil doesn't some one make a grand combination and put up a car that would make every other car look like a—a—a—well, like a whole collection of stuff that no one seems to have tried to get rid of all at one sweep."

"If I wasn't afraid of making you swell up and burst with pride," said the D. E., "I might say that I think there's a good deal of sense in your nonsense. Anything more?"

Pedalless, Leverless Car Forecast.

"Yes," exclaimed Binks, "there's a good deal more. I venture the modest prediction that it won't be many years before some of the manufacturers will come around to my way of thinking, and you'll be proud to think that you knew the man who conceived the noble—er—conception. Why, everything points that way. Lamps and mudguards are being combined, and so are lamps and radiators——"

"Thought you were going to have your radiator back of the engine?"

"Well, is that any reason why I can't have a lamp on my radiator if I feel like it? Didn't you ever see a car with a lamp on the dashboard? Don't argue with me, man!"

"Certainly not. I'm with you; and when you build your hoodless, leverless, pedalless and heaven knows what-less car, you might work in my old hobby of combining the frame with the body and the whole power plant with the rear axle by running a big sort of torque tube from the rear axle to the power plant housing. That isn't new, either,

Digitized by Google

out it ought to help out your combination. You can go back in automobile history for some more ideas, too. Springs and frames have been combined. Some light machines on the other side are combining springs and axles. Seat backs have been used for gasolene tanks."

"When I shut my eyes," Binks took up the conversation, suiting the action to the word, "I can see the car of the future. There won't be a lever in sight; the driver will sit at his ease and play with his fingers on a row of buttons which will turn on the power that will do all the work for him. If he wants to look at his engine all he has to do is to—look at it. No hood to lift, or anything of that sort. He presses a button to start the motor; presses a button to stop it; presses a button to change gears; presses a button to work the clutch; presses a button to apply the brakes; presses a button to light the lamps; presses——"

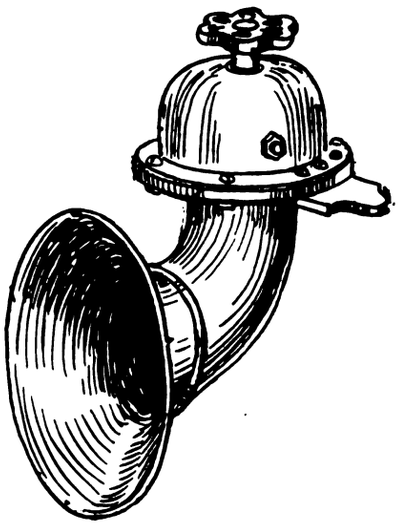
"Good Lord, man! Your car's going to look like the back view of an up-to-date dressmaker's creation—all buttons! What'll you do if a button comes off—fix it up with a safety pin?"

Binks sprang to his feet with consternation written all over his face.

"I'm lost! I'm undone!" he gasped. "Speaking of buttons and safety pins reminded me that I promised to meet my wife at Sax & Snooper's department store, and if she hasn't gone she has been waiting three-quarters of an hour. Oh, Lordy!"

And Binks vanished.

Hand-Book on Starting and Lighting.



It is a fact that electric lighting and starting systems do not go out of commission very often when they are properly cared for; but it is true, also, that the average gasolene man is not an electrical expert, and when trouble does occur in the electrical department he is apt to be at a loss to locate it, however simple it may be. Therefore the hand-book that has been issued by the Electric Auto-Lite Co., of Toledo, Ohio, should be welcomed by those whose cars are electrically lighted and started, for it gives concise directions for the care of electrical systems generally, without reference to any particular make, and contains a large folding chart which provides a method of tracing trouble, in whatever for mit may show itself. The fact that the Auto-Lite system is mentioned in not unfavorable terms detracts not at all from the usefulness of the book. While the regular price of the hand-book is 50 cents, users of the Auto-Lite system can obtain it for the nominal price of 10 cents.

Replacing Electric Light Bulbs.

Lamp replacements in an electric lighting system should be made with some care, for if low-efficiency bulbs are put in where high-efficiency bulbs were intended to be used the battery or the generator may be overloaded, even though the candlepower of the lamps is unchanged. This is for the simple reason that a low-efficiency lamp requires more current to produce a given candlepower than a high-efficiency lamp. Similarly, it is not safe to replace lamps with others of higher candlepower without consulting the makers of the lighting system as to the ability of the plant to take care of the extra work imposed by the more powerful lamps.

Here's Simplicity in a Diaphragm Horn.

Large as is the number of makes of horns embodying the vibrating diaphragm principle of creating sound, there are almost as many different methods of producing the

PILOT DIAPHRAGM SIGNAL

requisite rapid oscillation of the hidden steel disk, ranging all the way from a diminutive but powerful and effective electric motor to a mere pair of gears and a toothed wheel. Representative of the extremely simple class is the Pilot horn, manufactured by the Nonpareil Horn Mfg. Co., of 75 Wooster street, New York City, the outward appearance of which is shown by the accompanying illustration.

As to the parts that are hidden under the neat, dome-shaped casing above the diaphragm, they are almost ridiculously few and simple. The little wheel that surmounts the dome is carried on a short spindle, the other end of which carries a bevel gear meshing with a bevel pinion. The pinion carries a toothed wheel which makes a contact with a little steel button on the diaphragm in the usual way. That really is all there is to the mechanism of the Pilot. It is obvious that by turning the wheel by hand gently or forcibly the tone and volume of the sound can be varied from minimum to maximum, and the blast emitted need be no stronger than the occasion requires.

Sprinkles Sand to Stop Skidding.

Taking a leaf from the locomotive engineer's book, the Auto Sand Grip Co. has commenced business at 690 Woodward avenue, Detroit, Mich., with a sanding device for automobiles that is designed to prevent slipping and skidding when the roads are slippery and to provide a good hold when the brakes are applied. J. Fletcher Williams is president and general manager of the company, Philip C. Sanderson vice-president and C. B. Shotwell secretary-treasurer.

The sanding device consists of a sand container which is placed on the running board or under the body of the car and has a pipe discharging on the ground in front of each rear wheel, and a valve on the steering wheel which admits compressed air or exhaust gas to the sand container and forces the gritty stuff through the pipe.

Key-Fitting that's Fit for Nothing.

It is not at all an uncommon thing for a mechanic who is in a hurry to "refit" a key in a keyway by bending it or otherwise deforming it with a hammer so that it will drive in hard. Unquestionably, this procedure has the effect of tightening the key for the time being, but the contact surfaces are so small that they are bound to be flattened down in a short time, leaving the key in worse condition than before. Such "fitting" may be excused as a temporary makeshift, but as a permanent job it is simply out of the question.

Short Circuits from Slopping Acid.

Acid solution on the top of the storage battery may cause leakage of current from terminal to terminal—a partial short-circuit, in fact—and so cause a shortage of current in the working circuit. If it is found that the acid has a tendency to splash out, measures should be taken to remedy the defect, for, aside from the possibility of a "short," the solution will be wasted and possibly the tops of the plates may be exposed, to their own damage and to the weakening of the current output.

Spring that Lightens Valve Grinding.

The work of grinding valves is made much easier if a spring of some sort is placed under the valve to raise it when the pressure on the brace, screwdriver or other tool used to rotate the valve is released. Any old spring that can be worked in will do, or even a heavy rubber band, or a strip of rubber from an old inner tube. Otherwise it is necessary to reach down and lift the valve by hand, which is a nuisance and takes time and energy.

1,048,743. Shock-Absorber. Fridolin Schimmel, Faribault, Minn., assignor to Schimmel, Reid & Co., Faribault, Minn., a corporation of Minnesota. Filed Jan. 29, 1912. Serial No. 674,016. (Toggle shock absorber with conical frictions and varying pressure.) 3 claims.

1,048,748. Steering Gear. George W. Seaman, Mansfield, Ohio, assignor to The Aultman & Taylor Machinery Co., Mansfield, Ohio, a corporation of Ohio. Filed May 5, 1911. Serial No. 625,329. (Steering wheel column adjustable to angle.) 1 claim.

1,048,760. Hydro-Carbon Engine. George A. Taff, Colorado Springs, Colo. Filed Sept. 13, 1909. Serial No. 517,380. (Motor with two-diameter pistons.) 3 claims.

1,048,770. Automobile Construction. Charles L. Walker, Detroit, Mich., assignor to James W. Lucas, Benton Harbor, Mich. Filed Dec. 18, 1909. Serial No. 533,912. (Four-wheel-drive system.) 7 claims.

1,048,783. Automobile-Lock. Thaddeus Zwolinski, San Francisco, Cal. Filed July 27, 1911. Serial No. 640,890. (Lock acting on gear-shifting lever.) 5 claims.

1,048,813. Resilient Wheel. William F. Doll, Liberty, N. Y. Filed Jan. 18, 1912. Serial No. 671,846. (Wheel with oppositely disposed spirals of spring metal instead of spokes.) 12 claims.

1,048,828. Gasolene Strainer. Cyrus A. Haas, St. Louis, Mo. Filed Jan. 11, 1912. Serial No. 670,090. (Wire gauze strainer in tubular casing.) 1 claim.

1,048,832. Interrupter for Ignition Machines. Otto Heins, Edgewater, N. J., assignor to The Firm of Bosch Magneto Co., New York, N. Y. Filed May 26, 1911. Serial No. 629,599. (Breaker construction permitting wide range of adjustment.) 4 claims.

1,048,890. Steering Mechanism. Frederick M. Sadler, Ellsworth, Minn. Filed Dec. 18, 1911. Serial No. 666,386. (Steering pivot mounted inside hub.) 3 claims.

1,048,900. Dash Construction for Motor-vehicles. Charles L. Sheppy and James R. Way, Buffalo, N. Y., assignors to the Pierce Arrow Motor Car Co., Buffalo, N. Y. Filed Sept. 13, 1912. Serial No. 720,144. (Dash carrying instrument board and attached to chassis, permitting removal of body without disturbing instruments.) 7 claims.

1,048,903. Current Distributer and Timer. James M. Smith, Philadelphia, Pa., assignor, by direct and mesne assignments, of one-half to Charles Adsit Magruder, Bryn Mawr, Pa. Filed Jan. 13, 1909. Serial No. 472,097. (Interrupter with quick make-and-break and long contact.) 3 claims.

1,048,904. Elastic Wheel for Automobiles and Other Vehicles. Arturo Sordi, Lugano, Switzerland. Filed May 9, 1911. Serial No. 626,006. (Wheel with inner and outer rims separated by short cylinders of resilient material resting in transverse grooves.) 1 claim.

1,048,918. Gas Engine. Horace Russ Van Vleck, Montclair, N. J. Filed May 10, 1912. Serial No. 698,375. (Double-acting engine with rotary valve.) 8 claims.

1,048,9292. Internal Combustion Engine. Walter C. Westaway, Rockford, Ill., assignor by mesne assignments, to Chicago Pneumatic Tool Co., Chicago, Ill., a corporation of New Jersey. Filed Aug. 3, 1908. Serial No. 446,673. (Means for forcing cooling air into cylinders between working strokes.) 3 claims.

1,048,940. Tractor for Agricultural Implements and the Like. Mahlow J. Bushong, Manassas, Va. Filed June 8, 1911. Serial No. 632,057. (Two-wheeled tractor with pivoted reach for connection to body.) 3 claims.

1,048,950. Carburetter. Alfred K. George, Kansas City, Mo. Filed Feb. 2, 1912. Serial No. 674,954. (Floatless carburetter with fuel flow controlled by air valve.) 2 claims.

1,048,955. Valve for Automobile Tires or the Like. Frank A. Gilchrist, Kearney, Neb. Filed Sept. 10, 1910. Serial No. 581,388. (Double valve with concentric heads.) 2 claims.

1,048,958. Protective Casing for Pneumatic Tires. Walter R. Green, Chicago, Ill. Filed April 24, 1911. Serial No. 622,982. (Tire protective casing made of interlocking sections.) 10 claims.

1,048,969. Spring Wheel. Thomas P. Horger, Orangeburg, S. C. Filed Feb. 14, 1912. Serial No. 677,407. (Wheel with sectional spring-supported rim.) 5 claims.

1,049,001. Vehicle Spring. William Roper, Philadelphia, Pa. Filed May 15, 1912. Serial No. 697,423. (Coiled spring and linkage suspension.) 2 claims.

1,049,038. Carburetter for Internal Combustion Engines. Welch Barstow and Seymour K. Bradford, Palo Alto, Cal.; said Barstow assignor of one one-hundredth of the right to said Bradford and forty-nine one-hundredths of the right to B. B. S. Manufacturing Co., a corporation of Arizona. Filed Nov. 4, 1911. Serial No. 658,489. (Fuel flow regulated by collapsible vacuum chamber.) 2 claims.

1,049,046. Spring-Cushioned Wheel. Samuel W. Buercklin, Prague, Okla. Filed Dec. 7, 1911. Serial No. 664,312. (Wheel with small pneumatic tire around hub.) 2 claims.

1,049,061. Safety Cranking Device for Internal Combustion Engines. Francois Dion, Manchester, N. H. Filed March 29, 1911. Serial No. 617,552. (Anti-kick crank with ratchet mechanism.) 3 claims.

1,049,063. Speedometer. Elisha J. Eakin, Estes, Miss. Filed Oct. 21, 1911. Serial No. 655,949. (Centrifugal speedometer with cam movement.) 2 claims.

1,049,067. Resilient Tire for Vehicle Wheels. Otto Erickson and Olaf G. Sunden, Chicago, Ill. Filed Feb. 17, 1912. Serial No. 678,336. (Tire with helical springs between inner and outer rims.) 1 claim.

1,049,071. Spring Tire for Vehicles. Porter C. Fox, Spokane, Wash., assignor to Fox Spring Tire Co., Inc., Spokane, Wash., a corporation of Washington. Filed May 11, 1912. Serial No. 696,688. (Inner and outer rims separated by springs.) 3 claims.

1,049,084. Motor Starter. Morgan W. Hartshock, South Bend, and Guy Stutzman, Mishawaka, Ind. Filed April 1, 1910. Serial No. 552,983. (Friction clutch and gearing for motor starters.) 3 claims.

1,049,090. Device for Repairing Pneumatic Tire Tubes. Adolph R. Hoeft, Chicago, Ill. Filed Oct. 3, 1910. Serial No. 585,010. (Spring clamp for patching tubes.) 1 claim.

1,049,092. Three-Wheel Auto. Clem Clarence Holden, Flint, Mich., assignor of one-half to Ephraim D. Rice, Flint, Mich. Filed June 12, 1912. Serial No. 703,252. (Three-wheeler with one of rear wheels driven and single front wheel in line with driving wheel.) 4 claims.

1,049,097. Vehicle Spring. George M. Huston, New York, N. Y. Filed Aug. 7, 1912. Serial No. 713,827. (Two C-springs with a semi-elliptic between and linked to them.) 5 claims.

1,049,115. Electrically-Operated Motor Vehicle. James C. Macfarlane and Henry Burge, Arc Works, Chelmsford, England, assignors to Crompton & Co., Ltd., Chelmsford, England. Filed June 6, 1912. Serial No. 702,124. (Driving system for electric vehicles.) 7 claims.

1,049,122. Starting Device for Explosive-Engines. Herbert L. Meeder, Fremont, Neb. Filed Oct. 16, 1911. Serial No. 654,921. (Starter supplying compressed charges to cylinders.) 5 claims.

1,049,129. Resilient Wheel. Henry C. Moore, Cleburne, Tex. Filed May 11, 1912. Serial No. 696,774. (Hoop springs between rim and hub and also radial coiled springs.) 3 claims.

1,049,146. Detachable Wheel-Securing Mechanism. Stephen Jamieson Ralph, Stockton, England, assignor to George Keeble, Lincoln Road, Peterborough, England. Filed May 12, 1911. Serial No. 626,868. (Detachable hub for wire and other wheels.) 5 claims.

1,049,142. Tire-Alarm. Joseph B. Polo, Clear Lake, S. D. Filed Jan. 27, 1912. Serial No. 673,926. (Magnetic valve and whistle operated by escaping air.) 4 claims.

1,049,157. Tire. Percy G. Seward, Petersburg, Va. Filed Feb. 13, 1912. Serial No. 677,325. (Sectional cushion tire.) 1 claim.

1,049,190. Mowing Machine. Axel J. Anderson, East Hampton, Conn. Filed Oct. 17, 1911. Serial No. 655,131. (Motor-driven mowing machine.) 6 claims.

1,049,206. Automatic Starting Device. Eugenio Cantono, Rome, Italy. Filed Nov. 27, 1909. Serial No. 530,099. (Starter actuated by helical spring and rack-and-pinion gearing.) 2 claims.

1,049,210. Automatic Truck Body Lifter. Leslie Percival Cole, Jr., Weehawken, N. J. Filed March 23, 1912. Serial No. 685,754. (Hoisting device for truck body.) 2 claims.

1,049,220. Speedometer and Mileage-Indicator. Vincent Frank, Chicago, Ill., assignor to Shaftless Speedometer Co., Chicago, Ill., a corporation of South Dakota. Filed Sept. 29, 1908. Serial No. 455,249. (Pneumatic speedometer.) 3 claims.

1,049,246. Spring Wheel. John Lunz, Belpre, Kan. Filed April 11, 1912. Serial No. 690,048. (Spring wheel with curved spokes between hub and rim.) 4 claims.

1,049,247. Electrically-Operated Motor Vehicle. James C. Macfarlane and Henry Burge, Arc Works, Chelmsford, England, assignors to Crompton & Co., Ltd., Chelmsford, England. Filed June 6, 1912. Serial No. 702,125. (Driving system for electric vehicles.) 6 claims.

1,049,272. Acoustic Apparatus. Ernest Rubes, Brooklyn, N. Y. Filed Sept. 26, 1911. Serial No. 651,389. (Motor operated diaphragm horn. 7 claims.

1,049,286. Hood-Extending device. Benjamin Harold Baker, Southbourne, England. Filed May 20, 1912. Serial No. 698,545. (Frame for automobile top.) 4 claims.

1,049,287. Clencher Tire-Retaining Device. Samuel Barnett, Tipton, England, assignor to Joseph Darius Griffin, London, England. Filed Sept. 9, 1912. Serial No. 719,471. (Rim with expanding hoop under base of tire.) 4 claims.

1,049,294. Spring for Supporting Radiators. Herman F. Farr, Springfield, Mass., assignor to Knox Automobile Co., Springfield, Mass., a corporation of Massachusetts. Filed Dec. 16, 1911. Serial No. 666,188. (Radiator spring with coiled ends.) 3 claims.

1,049,030. Vehicle Wheel. Schuyler C. Hatfield, Baltimore, Md., assignor of one-half to George W. Smith, Baltimore, Md. Filed April 20, 1911. Serial No. 622,206. (Wheel with pneumatic tube around hub.) 3 claims.

1,049,313. Protective Shoe for Tires. James A. Murphy, Holyoke, and Robert J. Harrison, Chicopee Falls, Mass., assignors of one-third to Charles H. Morgan, Holyoke, Mass. Filed June 7, 1910. Serial No. 565,584. (Tire protector of non-stretching fabric.) 3 claims.

1,049,318. Carburetter. Walter C. Westaway, Chicago, Ill. Filed April 18, 1910. Serial No. 556,066. (Carburetter with single valve for both aid and fuel regulation.) 8 claims.

1,049,334. Buffer for Automobiles. Oscar F. Brinkman, Lancaster, Pa. Filed Aug. 30, 1911. Serial No. 646,876. (Spring buffer and attaching clamps.) 1 claim.

1,049,338. Folding Seat for Automobiles. Samuel D. Butterworth, Lansing, Mich. Filed Sept. 25, 1911. Serial No. 651,262. (Seat with automatic spring folding device.) 6 claims.

1,049,374. Oil-Engine and Vaporizer Therefor. Albert Lebrecht, New York, N. Y., assignor to De La Vergne Machine Co., New York, N. Y., a corporation of New York. Filed March 30, 1910. Serial No. 552,423. (Motor with fuel injection system and extended combustion chamber.) 11 claims.

1,049,417. Carburetter. Alfred C. Stewart, Los Angeles, Cal. Filed Feb. 27, 1911. Serial No. 611,288. (Oil carburetter with oil heating device.) 1 claim.

1,049,421. Steering Mechanism for Motor Vehicles. James H. Venners, Brooklyn, N. Y., assignor of one-fourth to William L. Millspaugh, one-fourth to Walter W. Court, and one-fourth to Frederic Venners Court, Brooklyn, N. Y. Filed Aug. 23, 1911. Serial No. 645,565. (Steering gear operated by motor.) 4 claims.

World's Stock Champion.
Fastest Stock Mile

National

World's Fastest 500
Miles in Competition

Be more than a "dealer"

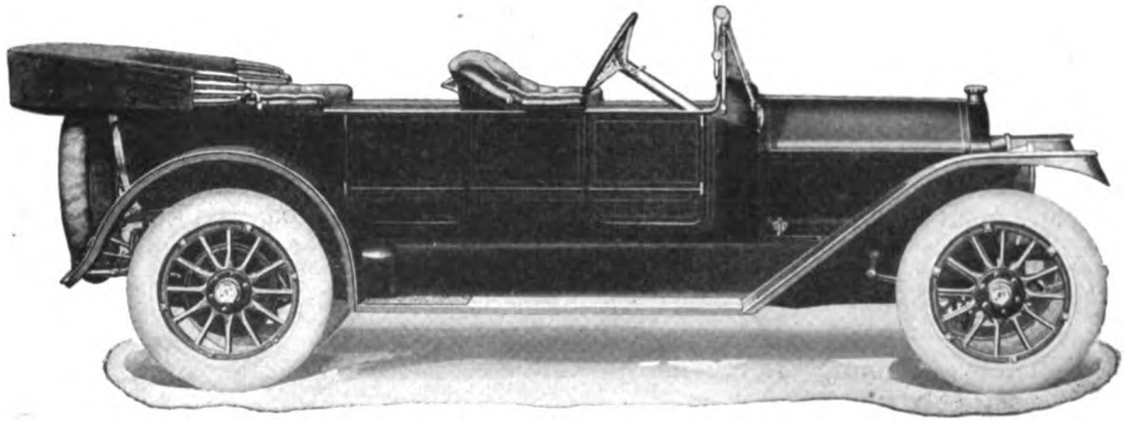
You are more than a "dealer" when you are a *National* Dealer. You become a member of the *National* family; an integral part of the great *National* sales organization. We take you into our confidence, we work for you and with you. You are as much a part of our organization as though you moved your desks into our factory offices.

First, we give you a guarantee that cannot be surpassed, a guarantee of good faith and reliability based on the quality of our cars and our reputation for dependable business methods.

Second, we give you practical assistance and complete and permanent service. Not a service in name only, but an actual, concrete service, the value of which is demonstrated by the success of our present dealers and the fact that year after year they are glad to remain with this growing and here-to-stay organization.

We would like to have you visit our factory. Here you will learn, as many others have learned, how and why *National* cars continue to maintain their enviable position in the trade.

Our manufacturing methods and facilities are a revelation. We build for quality. The efficiency, care, skilled workmanship and high grade materials that combine to produce *National* cars set the standards for the world.



If you will write us at once and let us know exactly what day and what train you will arrive on, we will meet you with a *National* car. Now is the time to do your investigating for the coming season. You can't afford not to let us tell you about our proposition.

We are building for the future. Every one of our dealers is building a permanent, positive, money-making business, with a backing of satisfied customers who are always ready and willing to "boost."

Remember—the day has arrived for a greater popularity of the quality car; the inferior car has been tried and the educated public now demands the 100% reliable and capable machine.

The *National* in power, speed, reliability, comfort, convenience, flexibility of motor, beauty of design and noiselessness is the one car whose only superior is a better *National*.

Pathfinder *Quality* Arguments Appeal to Live Dealers

¶ As a successful dealer in motor cars you can best appreciate the value of ***quality*** in a selling argument especially when statements can be backed up by ***facts,*** and a fine ***performance*** record to boot.

¶ Knowing automobiles, you have long held the opinion that when you found a car possessing all the necessary factors of quality, a car appealing to the large family trade and a ***good looker*** in any company, you would immediately take steps to handle the agency.

¶ Pathfinder quality is made up of not one but all of the following factors:

Quality of raw material ***Quality of design***
Quality of workmanship ***Quality of appearance and finish***

¶ Some cars get by with ***one*** of these qualities, whereas the Pathfinder's claim to distinction is harmony of construction in ***all*** of them which is the real secret of the Pathfinder's unquestioned success.

¶ Of course you won't want to decide before getting fuller details. But remember, the facts are open to your inspection and if you can't get in to see the new line, just drop us a line saying you are "interested." Your name and address on the margin of this page will do.

THE MOTOR CAR MFG. CO.

Overland

1914

THE 1914 Overland is ready for demonstration and delivery. See full description on *opposite* page. Our production for next year has been *increased* to 50,000 cars. This greatly increased production, combined with the natural manufacturing economy of restricting ourselves to *one chassis*, again enables us to make our customary annual offer of *considerably* more car for *considerably* less money.

While the price has gone *down* the value has gone *up*. The motor is *larger;* the wheel base is *longer;* the tires are *larger;* the tonneau is *roomier;* the equipment is *better*—including such costly additions as *electric lights;* the body is *more handsomely finished*, in rich dark Brewster green, with heavy nickel and aluminum trimmings. In fact, in every single and individual respect it is an *improved* car at a *reduced* price.

We already have applications on file for *more* cars than we can deliver during the month of August. Therefore, it is advisable for you to see the nearest Overland dealer *promptly,* in order to secure an *immediate* delivery.

1914 catalogue on request.

Please address Dept. 50

The Willys-Overland Co., Toledo, Ohio

Digitized by Google

$950

Overland Model 79

35 horsepower
114-inch wheelbase
Electric head, side, dash and tail lights
Timken bearings
New Splitdorf magneto
Model R Schebler carburetor
Three-quarter floating rear axle
33x4 inch Q. D. tires
Cowl dash
Turkish upholstery
Genuine hand buffed leather
Clear-vision windshield
Mohair top, curtains and boot
Stewart Speedometer
Electric horn
Flush U doors with disappearing hinges

MOTOR — Four cylinders, cast singly and set off center. Bore, 4⅛ inches; stroke, 4½ inches. Five bearing crankshaft; three bearing camshaft. Improved type of pushrods and guides, adjustable and easily removable.

COOLING—Thermo-syphon, or natural water system, without pump. Radiator has large tubes and all water pipes and connections are extra large, insuring perfect cooling.

FRAME—Pressed steel channel section reinforced with angle irons and cross members, hot-riveted.

CLUTCH—Leather-faced cone, with new type brake to permit noiseless gear changing.

TRANSMISSION — Selective, sliding-gear type, with three speeds forward and reverse. Center control. Gear case, extra strong, cast in one piece, keeps all bearings in line. Main and countershafts are short, preventing any springing.

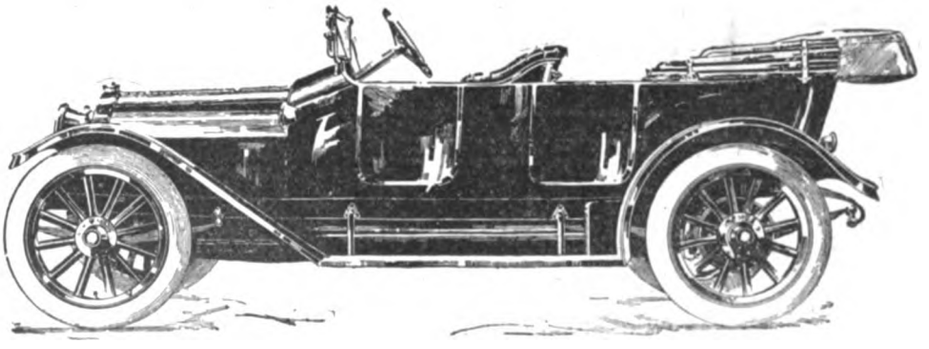
LUBRICATION—Splash system, pump-circulated, with sight-feed on dash.

BRAKES—Double, contracting and expanding on drums on rear-wheel hubs, easily adjustable. Either set of brakes will keep car under perfect control at any speed, with full load.

SPRINGS — Semi-elliptic front, three-quarter elliptic rear, with bronze eye-bushings all around and compression grease cups on all bolts.

STEERING GEAR — Worm and gear type, easily adjustable and anchored to side frame member. Column of large diameter. Wheel, 18 inches in diameter.

FRONT AXLE—I-beam section, drop-forged in one heat, without welding. Timken bearings in front wheel hubs.



REAR AXLE — Three-quarter floating type. None of the weight of the car on the driving shafts. Hyatt bearings in rear wheel hubs.

WHEELS — Hickory, artillery pattern, with twelve spokes and bolts in each.

BODY-FINISH — Brewster green, with light green striping. All exposed metal finished in nickel or aluminum.

BODY — Five passenger; metal reinforced with wood framing.

Completely Equipped $950. With Gray & Davis Electric Starter and Generator—$1075 f. o. b. Toledo

American Made For American Trade

New Departure

Ball Bearings Throughout, and Why

By the use of New Departure ball bearings throughout the entire chassis, the manufacturer of this car has reduced power losses, repairing and operating costs to a minimum.

New Departure ball bearings eliminate friction. Friction is expensive, wears away the parts, hastens depreciation, and makes frequent repair necessary.

By eliminating friction New Departure ball bearings waste so little of the motor energy that maximum driving power is transmitted to the rear wheels. By eliminating friction there is practically no wearing away of the parts. The life of the entire car is longer and repairs are fewer.

All of these advantages are secured without sacrificing bearing efficiency. New Departure ball bearings will carry the load under all conditions of service equally as well as any bearing made.

Have you seen our interesting brochure on "Friction Elimination"? If not, drop us a card today and it will be forwarded to you by return mail.

The New Departure Mfg. Co., Bristol, Conn.

This Is the 1914 Oldsmobile That So Many Dealers Have Been Clamoring For

The Greatest Six-Cylinder Car Ever Produced

OUR entire sales organization, engineering department and factory managers not only endorse the statement that this is the greatest six-cylinder car ever produced, but insist upon advertising it as such—there is no other expression which so adequately and truthfully describes the new 1914 Oldsmobile Model 54.

We have never before in our sixteen years of automobile manufacturing made so strong a statement. Our policy has ever been, and will continue to be, a truthful adherence to facts, and when we commit ourselves we believe we can prove by demonstration or comparison that we have not underestimated the position occupied by Model 54 among sixes.

From the purchaser's viewpoint this 1914 Oldsmobile contains every feature of refinement, stability, luxury and power that can be found in cars of greater price.

From the dealer's angle it has back of all these features a reputation as solid and as old as the industry itself.

It is fair to state that there is not another six-cylinder car in America any better or wider known than the Oldsmobile.

It is not necessary to introduce the Oldsmobile. Olds Motor Works was founded in 1880, and after 34 years of successful manufacturing we celebrate anniversaries not introductions.

You, who are familiar with motor car values, compare the 1914 Oldsmobile with higher priced cars and see for yourself if there is any reason why we should not be classed with the highest priced. Compare with cars of cheaper make and try to find an argument for not adding just a few dollars more in order to secure an Oldsmobile.

Dealers interested in six-cylinder cars have displayed a keener interest in the 1914 Oldsmobile than in any other model ever produced by the Olds Motor Works, and have unanimously pronounced it a supreme achievement among sixes.

The complete equipment on the Model 54 is the finest that money can buy.

Four or Five-Passenger Phaeton touring body type $2975
Seven-Passenger Touring Body, $175 extra
Limousine 4300

Wire Wheels—Oldsmobile Trunks and extra tires at additional cost

To reliable dealers we have an interesting and profitable message

Only Your Private Whether It's Time to

The automobile business *is* a business—not a pastime. It pays better for brains and backbone than most businesses. It penalizes mercilessly the chap who attempts to play with it and repays most liberally the man who works at it intelligently.

Your Bank Roll is the Product of Your Brain

When you select a line of motor cars your fate is absolutely in your own hands. Success or failure is yours. Will you choose a car which eats up all your profits in service or will you select the car which stands up and keeps going smoothly in the hands of the average user?—that's the fellow you have to figure on. He's the chap who drives his car *hard,* breaks everything that will break, and tries to make you take the cost of maintenance out of your own profits. When you start to investigate various cars—think. While you are investigating them—*think.* Before you sign anybody's contract—THINK.

Make the maker whose contract you sign answer these questions to your satisfaction:

First: Is your car standardized—is it made out of parts which the public knows are the best parts in the world's market—the standardized parts—the parts which offer the least possible sales resistance? The more easily a car sells the more sales you can close and the more money you make—friend dealer.

Second: Is the stuff in your car so good that it is not continually breaking and costing the dealer unnecessary service expense? Service is the rat-hole down which most dealers put their profits. The sooner you stop this rat-hole with a Cole contract the sooner you will

Make More Money

Third: Is your factory discounting all its bills—has it done so from its very beginning? Is it sound, and permanent and resourceful enough to always insure prompt fulfillment of orders? Will it be here to make good to your patrons the promises you have made them in good faith? Ask Bradstreets and Duns about them. It's rating and financial integrity which counts in this business, which gives you the backing which in turn makes it possible for you to—*Make More Money.* The Cole Motor Car Company in its entire history has never yet failed to discount a bill.

Fourth: Is the car in question beautiful,

Cole Motor Car Company, Indianapolis, USA

Digitized by Google

Ledger Can Show Hook Up With Cole

luxurious and full of eye appeal, aside from being sturdy and stout and strong? Remember that the woman in the case must like it before the man in the case will put up real money for it. The Cole is Motordom's fashion plate—the standard of beauty and the acme of "guts." It couldn't be otherwise, because actually the world's greatest designers live over the drawing-boards whereon the lines and the construction of the Cole are determined—it is this beauty and beefishness of the Cole which helps you—make more money.

Fifth: Then show Mr. Manufacturer this Roll of Honor, and ask him how many of these standard parts are in *his* car. Then just silently bear in mind that the Cole has *all of them.*

There's no use going any further, now. You either believe in making more money or you are—content. If you believe in—more money you believe in the Standardized Car—the Cole. If you're content, stay with your present proposition—we can't make money for contented men. We want men who fight for supremacy—who stick out their chrome nickel jaws and bore in after business till competition tucks its tail and runs. That's the kind the Cole Sales organization is made of. If you're our kind we can certainly guarantee that you—make more money. Just drop us a line. We need more men—like you.

Incidentally we have doubled our output and are in shape to make immediate deliveries. Nothing is of more importance to you than being able to deliver cars early.

The J·I·Handley Co·

Announce This brand new

Better Manufacturing

The J. I. Handley Company is a new corporation headed by J. I. Handley, President of both the American Motors Company and the Marion Motor Car Company. It has been formed for the express purpose of relieving the above mentioned factories of EVERYTHING PERTAINING TO ADVERTISING, SALES AND SERVICE.

Thus the American Motors Company will confine its efforts EXCLUSIVELY and SOLELY to the building of the already famous American Underslung, and will by this plan of specific concentration build them even better than heretofore.

The Marion Motor Car Company will devote its every ounce of energy and thought to the production of the sturdy Marion Four and Sixes, and will thus be able, through this plan of definite departmentization, to give the Marion owner even GREATER VALUE than ever before.

This DOES NOT in any degree change the individuality of either product.

It DOES NOT change the financial or production program of either company.

BUT IT DOES give each factory the full and natural advantages that always come through definite concentration.

Marion

Sole Selling Agents

plan of specific concentration

Better Service

This newest and most advanced plan of specific concentration enables this new selling company to "get closer" to and render A HIGHER CHARACTER OF SERVICE to both dealer and owner.

All departments are in charge of the highest type and most efficient and experienced men available in the industry.

This plan DOES NOT in any way affect the dealer's individual connection.

The American dealer's relationship to the American Underslung remains EXACTLY as heretofore.

The Marion dealer's relationship to the Marion Company remains EXACTLY as heretofore.

But it DOES give every American and Marion dealer and individual owner the advantages of BETTER SERVICE which result from specific concentration.

Our dealers' sales contract is exceedingly broad and liberal.

We are delivering THE 1914 MODELS NOW.

We have sixteen division sales managers NOW IN THE FIELD.

A wire from you will bring one of them to you quickly and his story will be mighty interesting.

Wire us TODAY.

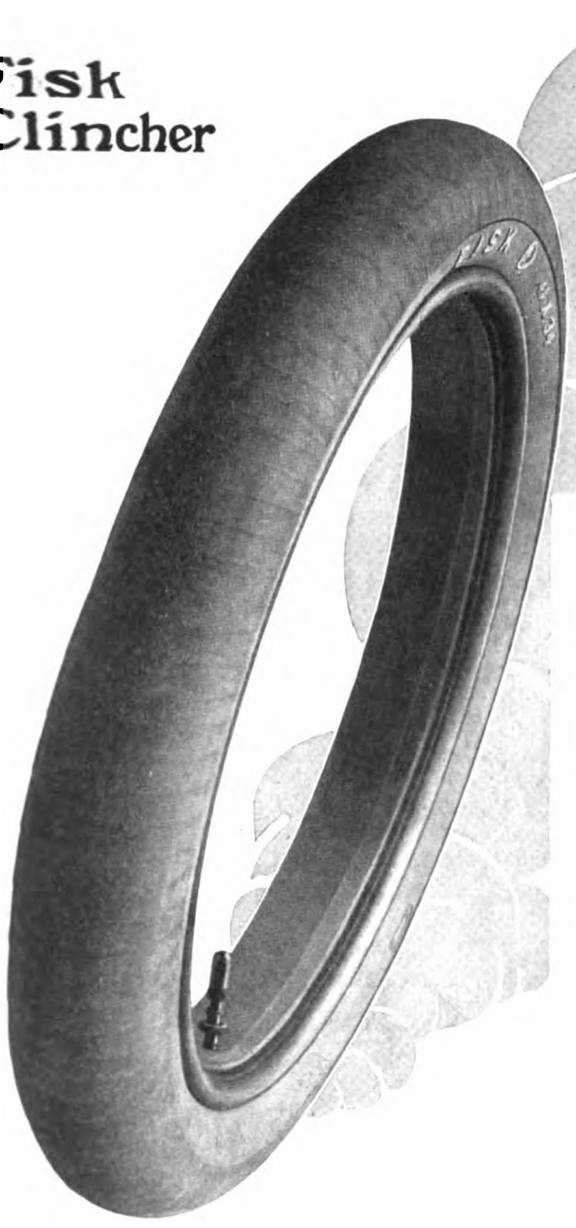
Concentration of Thought Upon Rim Construction Only Has Proven Its Worth

¶The concerns in this country manufacturing steel rims used on motor vehicles do not exceed twelve in number, and out of this number the Jackson Rim Co. of Jackson, Mich., is the ONLY one whose product consists of rims EXCLUSIVELY. Consequently we claim a superiority over other producers, because we devote our entire time to "Rim THOUGHT."

¶The men connected with us are trained mechanics—*rim* trained—and have spent their time in developing and perfecting machinery that is individually ours. Special treatment of the steel in our rims has brought them to the highest possible standard, to meet the strain and requirements to which rims are subjected.



¶Our new plant is of concrete, steel reinforced and is absolutely fireproof, and this protection should in itself appeal strongly to every manufacturer of automobiles. Our Capacity of 2,000 sets of rims per day is a safeguard in placing your specifications with us.

HUDSON SIX 54—$2250

SEVEN-PASSENGER

The New Ideal of a Distinguished Car

HERE now is a car which typifies the ideals of the time. This streamline body—this long, sloping hood—this absence of angle at the dash—this low-hung chassis—these crowned fenders—this placing of extra tires so the front doors are left clear—these things belong to the car of today.

The concensus of the world's best opinion is that this type of body marks the coming ideal car. These are radical changes but they are coming as surely as foredoors came—and as suddenly.

All the best foreign cars—English, French and German—will this year exhibit exclusively this new streamline body. And all men know that what they adopt in body design becomes the world-wide vogue.

Our designers have added a hundred minor effects. They have Americanized—have Hudsonized—the type. So the car is distinctive. There will be no other just like it. But it embodies what we regard as the highest conception of the modern trend in bodies.

And we believe that every connoisseur will consider this new HUDSON Six the handsomest car exhibited.

Engineering Pauses

We can claim in this car no great advance as regards fine engineering and no HUDSON owner expects it. Fine engineering has limits. For the past four years Howard E. Coffin and his able engineers have given their best to the HUDSON. Last year they brought Sixes pretty close to perfection. So close that the HUDSON Six jumped in one year into the foremost rank among Sixes.

These men have worked out in this new-model car a vast number of minor engineering improvements. They have added scores of new mechanical features—some of them quite important. But we never expect to build a much better chassis than we built in our last year's Six.

This year's advances lie mainly in beauty, in comfort, in conveniences, in room. We have combined the best in lines, finish and equipment with the best in engineering. We have succeeded in making the HUDSON Six the masterpiece it is.

Now the Ideal Car

We now feel that this HUDSON 54 offers the utmost in every wanted feature. It has the staunchness of steel Pullmans. It has the comfort of Turkish lounging chairs. It has the speed of express trains. It is free from all the troubles which annoy the inexpert.

No man knows how to build a car more handsome and impressive. No conveniences are absent, no modern features lacking.

And all these things are here included in a Six 54, with seven-passenger body at the record price of $2250 (f. o. b. Detroit, Michigan).

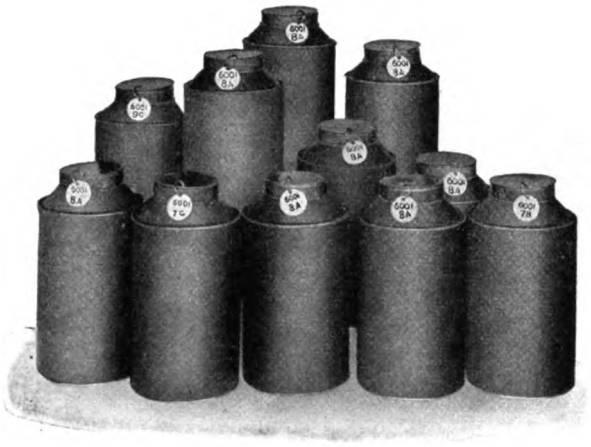
The New Features

These are among the new features we bring out in this model. No mention is here made of the countless features in previous HUDSON models which we still retain.

Seven-passenger body.
135-inch wheelbase.
Left side drive. Right hand control.
36 x 4½-inch tires.
Extra tires carried—as never before—ahead of the front door. This leaves both front doors clear.
Four forward speeds.
Pure streamline body.
Low-hung body.
No angles at the dash.
Wide tonneau doors.
Gasoline tank in dash.
Electric self-cranking with the rapid type of the Delco system built especially for this car.
Powerful electric lights with dimming attachment for city driving. They also act as ordinance lights.
Extra seats in tonneau fold into back of front seat, entirely out of the way.
Jeweled magnetic speedometer in dash, with new concealed noiseless gears.
Every operation and control placed within reach of the driver's hand. Gasoline and oil control, lights and starter.
Individual Yale lock on ignition control, prevents theft of car.
Rain-vision windshield built as part of the car.
Genuine Pantasote top. Curtains that are carried in the top can be instantly adjusted.
Electric horn—trunk rack—tire holders—license carriers—everything.

Go See It—Go Today

Go to the local HUDSON dealer and see this new achievement. It is not merely an improved car—it's a real innovation. It will display to you all the best thought of the day in automobile designing. Go see it while it's new.



Our catalog on request.

No Loafers in These Cans!

WHY are the tapered rollers for Timken Bearings securely sealed in sheet steel cans—cans that are never unsealed till they stand on the benches of the men who assemble the bearings?

To make sure that no off-size roller gets into the Timken Bearing!

For a "low" roller would "loaf" and throw its share of burden on its neighbors. A "high" roller would carry more of the load than it should.

TIMKEN ROLLER TAPERED BEARINGS

So every roller for every size of the Timken Bearing goes through an automatic size-gauging machine—the machine of the sixteen traps. Each trap catches the size roller for which it is set—and no other—and drops it into a can.

The millions of rollers must not get mixed after they've passed through the size-gauging machines. So each can is sealed when filled. On the metal seal the size is stamped—exact, to a quarter of the thousandth part of an inch.

Precautions like this are taken so that users will get something more than the Bearing whose "different" principles of design enable it to meet greatest radial load, plus end-thrust, to offer greatest resistance to wear, and to adjust perfectly for the slight wear that must come with long use.

That "something more" means longer life; smoother, quieter running; greater safety. It means an overflowing measure of satisfactory service.

THE TIMKEN ROLLER BEARING CO.
Canton, Ohio, U. S. A.

Every Timken Bearing, large or small, is of just one Timken Quality, through and through

The Foreign Trend

The builders of motor cars abroad are constantly introducing new ideas, new body designs, new equipment and new methods of construction.

There are wire wheels and worm drive now. And other things are promised.

But some things there, as here, are standard.

One is The Jones Speedometer.

Seven years ago The Jones became Europe's most popular speedometer.

It won the Royal Automobile Club's gold medal for all around superiority in a test that covered 2,000 miles and lasted 30 days.

It was placed on the cars of the King of England, the Emperor of Germany, the Czar of Russia, the King of Italy, the King of Spain, and the Kings of Siam, Norway, Sweden, Denmark and Belgium. The President of Switzerland and the President of France, and hundreds of other notables used it.

It is used by these rulers and thousands of others on the best cars today.

No other speedometer ever gained such prestige or was ever so widely sold abroad. No other sells there today like the Jones. The love of new things—the foreign trend—doesn't dislodge the Jones.

It is regarded as the Standard Instrument because of its accuracy. And nobody ever thinks of displacing it. The makers of thousands of American cars are factory-equipping their product this year with the New Jones Speedometer.

They expect their cars to be used the year 'round and they know the Jones isn't affected by temperature. The Jones is the Universal Speedometer. Makers and owners are finding this out. It is accurate, ***always***. The simplest in principle. And the longest-lived.

It's the product of Jos. W. Jones, the inventor of the speedometer as used on motor cars. Nothing else will ever serve like the Jones Speedometer.

Let us send you the man who knows it in detail and can give you the fullest information in regard to placing it on your car.

THE JONES SPEEDOMETER

Broadway at 76th Street NEW YORK CITY

This is the Gold Medal presented to The Jones Speedometer by the Royal Automobile Club of Great Britain and Ireland. Eleven different instruments competed in the test—foreign and American makes. The Jones made the only perfect score on seven points of superiority. And the Jones is the only speedometer that has ever won this medal.

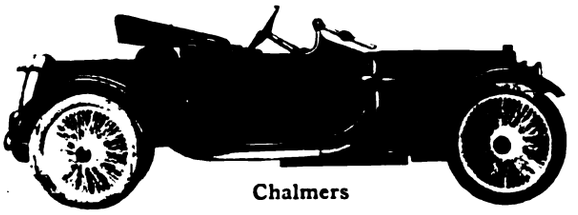
YOUR recommendations to the manufacturer whose cars you sell carries weight especially if your recommendations have to do with better car service. The reason why you should talk wire wheels to your manufacturer and to your customers is because your cars, wire wheel equipped, will ride easier, be much safer and give greatly increased tire mileage.

We spoke of better riding qualities; wire wheel construction really furnishes resilient suspension to the car's weight instead of a rigid support, as is the case with wooden wheels.

We have told you that wire wheels add to a car's safety. Do not be surprised when you learn that their strength to resist side thrust such as skidding against the curb, is about fifteen times greater than wooden wheels, and that their carrying strength is over five times that of wooden wheels.



The real value of wire wheels comes in their economy on tires, and this is about 50%.

Oakland

Palmer and Singer

Henderson

Haynes

There is the theory of all metal construction for motor cars which favors wire wheels and which militates against wooden wheels. But all theory forgotten, can wooden wheels stand much longer against wire wheels, especially when every practical reason such as strength and safety calls for wire wheels. Can the wooden wheel precedent stand against better riding qualities of wire wheels, or can any reason stand against wire wheels with their 50% more tire wear?

Every dealer should demand wire wheels on his cars and should talk wire wheels to his customers. The reason is better car service. Don't think your customers are not thinking—they have to pay the bills.

A Car Is as Strong as Its Springs

Cleveland-Canton Automobile Springs

Equipped with cheaply-made springs, a car gets such constant jolting, bumping and vibration that the engine soon racks to pieces. One spends vastly more for repairs than good springs would have cost originally.

We could save surprisingly in making Cleveland - Canton Chrome - Vanadium Springs if we used old-style steel. But such steel wouldn't endure, wouldn't so surely stand severe strains and shocks.

So we use "cross-rolled" chrome-vanadium steel. This steel is made by a unique process. It is rolled both longitudinally and transversely, uniting the elements in a manner impossible with ordinary methods.

Thus there are no "pipes" or "snakes" in it, no "blow-holes." It never seams, cracks or splits. It is amazingly tough, elastic and strong.

Cross-Rolled, Chrome-Vanadium

"Not a Bump In One of Them"

"Built for Life-Long Endurance"

Cleveland - Canton Chrome - Vanadium Springs are tested to endure greater strains than any motor vehicle ever encounters. *In five years not one Cleveland-Canton Chrome-Vanadium Spring returned because of breakage or settling.*

They are tempered in oil, fitted by hand. Made like no other springs that we know. And the result is motorists everywhere are demanding them. They want the certain protection such springs give, the freedom from jolts and shaking they ensure. You should know more about them. Send us your blue-prints and let us figure with you.

OhiO Announcement

Model "4-35" 5 Passenger—$1,275
" "4-50" 5 " — 1,750
" "6-60" 5 " — 1,985
" "6-80" 7 " — 2,485

Illustrating the OhiO "4-50", Price $1,750

YOU, as a foresighted dealer, know that the forthcoming year will be one of exceptional values. OhiO dealers are more than ready for the test with their 1914 line.

Keen buyers who have seen the OhiO line invariably say, "How do you put so much value in it at the popular price?"

HOW we do it is unimportant. What counts for the OhiO dealer is the fact that the OhiO car for 1914 is a maximum value in sturdiness, comfort, economy and "class."

Read these specifications and decide for yourself.

SPECIFICATIONS 1914 CARS

OhiO "4-35" Five Passenger---Price $1,275

Motor—4¼ x 4¾.
Axles—Full floating on annular bearings.
Transmission—Three speeds and reverse.
Clutch—Multiple disc.
Inside control; right-hand drive.
Speedometer—Stewart.
Rims—Demountable.
Tires—34 x 4.
Wheel Base—115 inches.

OhiO "4-50" Five Passenger---Price $1,750

Motor—4½ x 5¼.
Axles—Full floating on annular bearings.
Transmission—Three speeds and reverse.
Clutch—Multiple disc.
Center control; left-hand drive.
Speedometer—Stewart.
Rims—Firestone demountable.
Tires—35 x 4½.
Wheel Base—122 inches.

OhiO "6-60" Five Passenger---Price $1,985

Motor—4 x 6.
Axles—Full floating on annular bearings.
Transmission — Four speeds and reverse, direct on fourth.
Clutch—Multiple disc.
Center control; left-hand drive.
Speedometer—Warner, flush type.
Rims—Firestone demountable.
Tires—35 x 4½.
Wheel Base—132 inches.

OhiO "6-80" Seven Passenger---Price $2,485

Motor—4½ x 6.
Axles—Full floating, annular bearings on rear; taper roller on front.
Transmission — Four speeds and reverse, direct on fourth.
Clutch—Multiple disc.
Center control; left-hand drive.
Speedometer—Warner, flush type.
Rims—Firestone demountable.
Tires—36 x 4½.
Wheel Base—138 inches.

ALL CARS HAVE THE FOLLOWING STANDARD EQUIPMENT:

Starter and Lighter—Jesco. Top—Mohair, with dust hood and Jiffy curtains. Windshield—Rain vision and ventilating. Trimming—Black and nickel. Lamps—Full electric. Ignition—Dual magneto on all models. Willard battery, tire carriers, one extra rim, tools, etc. Colors for all models—Sheet metal parts black; body and chassis, option of Brewster Green or Royal Blue. All models have luxuriant ten-inch upholstery.

A complete line you notice—a car for every buyer and every pocketbook. Each model electrically started and lighted, and fully equipped.

If you are not one of those who now possess an OhiO Dealership, the next page holds for you a message of consuming interest.

Read it, and then ACT.

Digitized by Google

for 1914?

There Are Thirty Opportunities Open

Thirty up-and-doing dealers are going to snap up the OhiO car agency this week—
But only thirty, bear in mind.

Our increased output for 1914 requires but thirty additional dealers to take care of the increase, and only this number can possibly be accommodated.

We have told you what an exceptional value the OhiO car offers the buyer. You want to know what we will do for you if you obtain the OhiO dealership.

Here's What We'll Do for Our New Dealers

Occasionally you have the opportunity of tieing up with an organization that believes that your success and theirs is one and the same thing—that YOUR success as a dealer is vital to their success as a manufacturer.

We not only believe that, but we are spending much time, money and brains to make your success a permanent and assured fact.

We're willing to go the limit to make the OhiO car THE car of your community.

Now then—if you want to cash in on a wonderful car-value plus real profit-building factory-co-operation, quick action is your play. The quicker the better.

Wire us at our expense, because right now there is probably some other keen dealer who is planning to get the OhiO Dealership in your territory.

Are you going to let him beat you to the wire?

$850 Fully Equipped **Detroiter** **$900 Special Equipment**

No Season Models—Always Up-to-Date

The Detroiter is never left unsaleable on a dealer's floor because of the announcement or the expected announcement of a lot of radical changes. Every new improvement is incorporated with the next thousand lot of cars to go through the factory. This plan helps the dealer—is helping over 600 Detroiter dealers right now—will help you if you take on the car.

And where will you find another car that offers you in sales possibilities all that the Detroiter does, at less than $2,000 or over? Look at the beauty. It has a better appearance than many that cost three times as much. Look at the strength, the roominess.

Note The Economy, Too

The Detroiter is not a heavy car, yet the makers have avoided the other extreme of making it too light. Though it has weight enough to give it abundant strength at every vital point, it will run as economically on fuel and tires as any car made, bar none. 20 to 25 miles on a gallon of gasoline, and over 100 to a quart of lubricant is its everyday record.

The Nine Big Features

These are the nine big features that have made the Detroiter the leader of its class:

1. **Ball bearing throughout.**
2. **Long stroke, high power motor, unit power plant fully enclosed.**
3. **Full floating rear axle.**
4. **Left hand drive, center control.**
5. **Extraordinary braking surface.**
6. **Multiple disc clutch running in oil.**
7. **Extra capacity tubular radiator.**
8. **Enclosed valves all on one side.**
9. **Platform rear spring.**

What These Features Guarantee

The long stroke motor gives tremendous power on all speeds.

The full floating rear axle, with its powerful gears, could drive a car of double the weight and power.

The large brakes guard the car against accidents and trouble.

The platform spring in rear eliminates the road shocks.

Every one of the nine big features has been proved by years of experience.

Service Made Sure

With such features as these, found only in other cars that average $3,555.80, it is plain that the Detroiter offers the utmost in motor car value at the least possible price. You can pay more, but you cannot get more. You can pay less, but you will not get half as much.

Years of Study Behind It

This car is the result of years of study and the experience of men who have been in the automobile business from the beginning. These men have brought together the strongest points in many different makes of motor cars; have carefully avoided the weak ones, and at last in the Detroiter produced a perfection of finish and design that is the talk of the motor world.

Dealers: **Get the Detroiter proposition by return mail—now is the time to prepare to make more money in 1914.**

HYATT QUIET BEARINGS

HYATT ROLLER BEARINGS require no adjustments after the car has left the factory. Once properly installed and given a little lubrication now and then, and they will give a care-free service that is unequalled.

The hollow Hyatt Roller retains a large quantity of the lubricant and the spirals, alternating from left to right, constantly distribute it over the surface of the bearing.

Grit and dirt that ordinarily grind between bearing surfaces is forced into the hollow center of the Hyatt rollers through the spirals, keeping the bearing exceptionally free from foreign matter.

Flexible Hyatt Rollers cushion the road shock, absorb vibration, reduce noise, and give under strain just enough to relieve the gears and shafts of excessive duty, yet are rigid enough to carry the load.

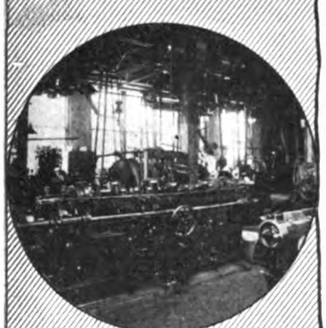
Who machines your Crankshafts?

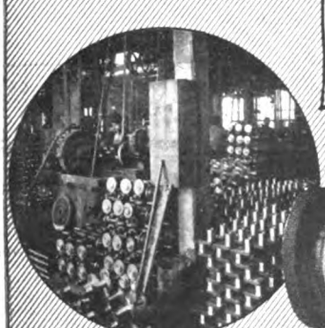


A 50% increase in capacity—and what it signifies

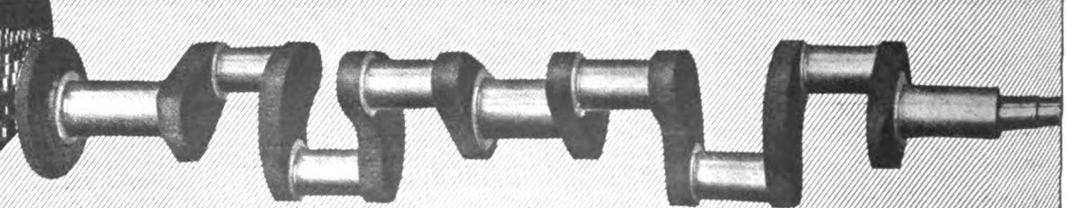
Recent additions to our plant give us a fifty per cent. increase in capacity.

This is significant of the trend of the industry. It points unmistakably to a keener appreciation of the niceties of crankshaft finish. It indicates that both engineers and purchasing agents are reckoning upon a perfectly balanced, perfectly finished crankshaft as a big factor in producing that steadiness of pull and continuous flow of power sought for by the car wise.

It shows an opening of eyes to the fact that true refinement begins **inwardly** and works **outwardly**; that **realities**, not superficialities, are the things that count.



You can't build a fine machine without fine machine work



This has been our conviction for seven years, during which our machine work on crankshafts has become part and parcel of many famous motors. Gradually, but surely, faith in our ability to do the right sort of machine work and deliver it as scheduled, has permeated the industry.

That is the significance of our large increase in capacity.

There is a message in it for you. Who machines **your** crankshafts? If we don't, supposing you get in touch with us.

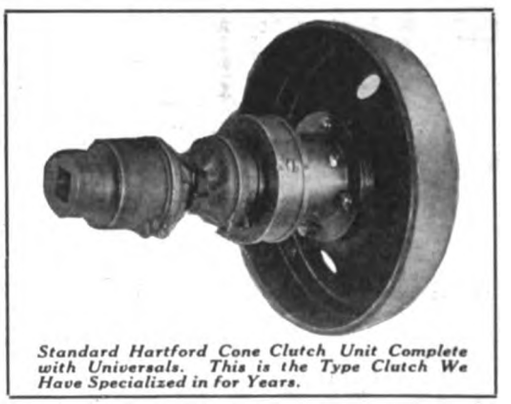
Hartford CONE CLUTCHES



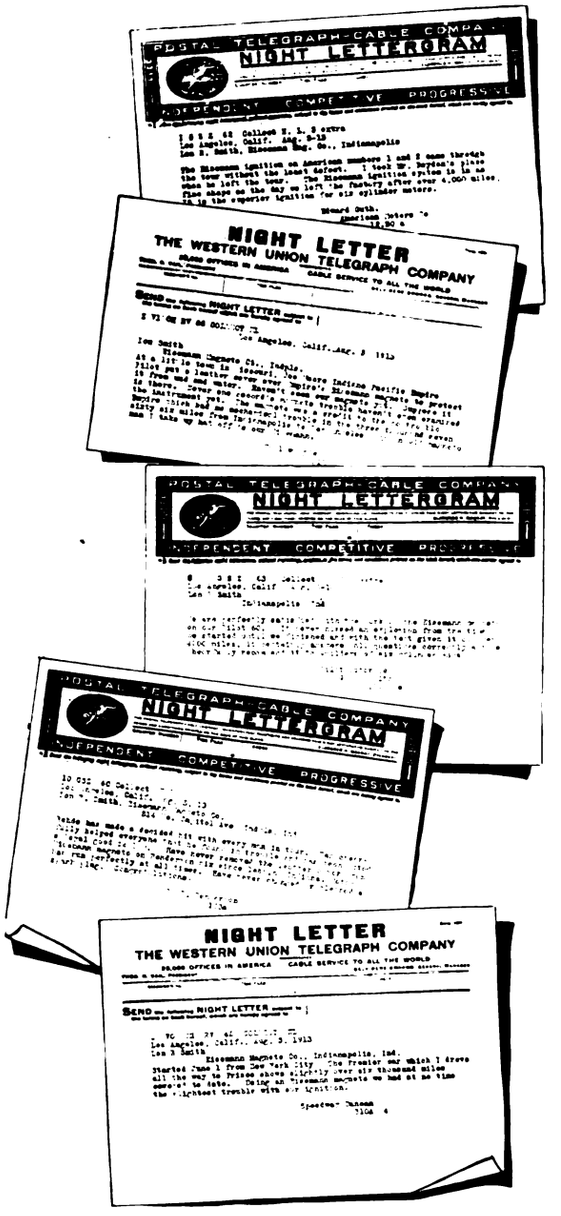
Common Cone	Dry Disks	Expanding Ring
Inverted Cones	Disks running in Oil	Contracting Ring
Double Cones	Dished Disks	Spiral Band, etc., etc.
Metal-to-metal Cones	Metal-to-metal Disks	
Leather or Lining Faced Cones	Disks faced with Lining	
Cork Insert Cones	Cork Insert Disks	

These are some of the various kinds of clutches.

Which ones do you recognize readily? In other words, which kind of clutch is in more general use? Why is it that some one or two of all the various kinds of clutches are more familiar to you because of more general use than others?

For no other reason on earth than their efficiency for the purposes of clutches—unless it be that the one or two particular kinds of clutches have stood the test of time longer than the others.

In the last analysis the cone type clutch dominates—for trucks as well as for pleasure cars. In their decision, rendered at the request of the U. S. War Department, the S. A. E. selected the cone type clutch as the one calculated to give the best results.



Standard Hartford Cone Clutch Unit Complete with Universals. This is the Type Clutch We Have Specialized in for Years.

Cone Clutches have always been the principal product of this company Regardless of the price of the cars on which they are used there is only one quality of Hartford Cone Clutches—the best that materials, skilled workmanship and rigid inspection can produce. In regard to prices, our equipment of special machinery enables us to make clutches of the highest quality at commercial prices. Deliveries of all orders placed with us will be made strictly according to schedule. Let us figure on your clutch requirments.

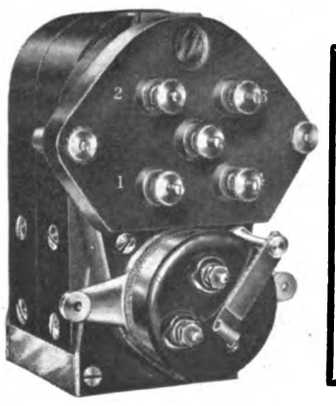
Eisemann Efficiency an In Greatest Ignitio



Everyone of the 11 Eisemann Equippe cars, of the 19 that made the tour fro Indianapolis to San Francisco finished th trip without one iota of ignition troubl Surely no greater demonstration of th wonderful efficiency and dependabilit of an ignition apparatus has ever bee recorded in the history of motor ca

It was tribute enough to the high standing of the Eisemann product when eleven entrants decided to depend upon Eisemann Ignition while the other eight were divided by five other manufacturers of ignition devices. But to have all eleven Eisemann Systems (each and every one just regular standard equipment) go through this terrific test without showing one deficiency or one even temporary breakdown, shows beyond all contradiction that there is no exaggeration in our claim of producing the most efficient and the most dependable ignition system on the market.

Mark well that this is no victory on a macadam race track where uniform conditions of speed, air and temperature are obtained—but rather the severest kind of test over steep, sandy grades and mountains, dust and alkali, in high altitudes and low. Particularly does this performance show the remarkable features of the hot, fat spark so conspicuous in all Eisemann Ignition devices. At high altitudes such as were encountered during this tour, the mixture usually becomes very poor and hard to ignite. Then it is that such a spark as that for which Eisemann products are noted is absolutely necessary to prevent missing.

Herewith is shown a list of the cars and the type of Eisemann Ignition carried. Note that only three of these were

*In the case of one car, trouble of some sort developed which was thought to be a short circuit on the distributor block of the magneto, but upon investigation it developed that the trouble was not magneto trouble at all.

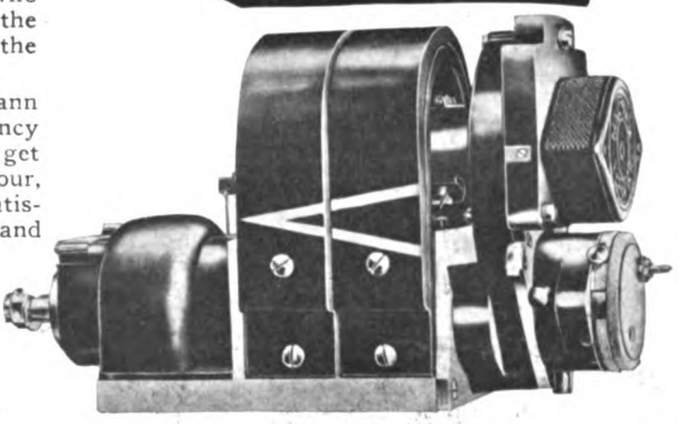
nstruction. According to the telegrams 0 of which are reproduced herewith) nt by the various entrants there was ot a single case which required even oking at the magneto and most of the rivers have gone so far as to report at the magnetos never even missed shot.*



imported outfits, the other eight being manufactured in the American factory.

Pathfinder	**4 cyl.**	**EUR and D2U coil**
Haynes	**4 cyl.**	**EMR and DC coil**
Haynes	**6 cyl.**	**EMR and DC coil**
Premier (2 cars)	**6 cyl.**	**EUR and D2U coil**
American (2 cars)	**6 cyl.**	**EMR and DC coil**
Pilot	**6 cyl.**	**EMR and DCR coil**
Henderson	**6 cyl.**	**EMR and DC coil**
Empire	**4 cyl.**	**EM single ignition fixed spark**
Brown	**4 cyl. truck**	**EM single ignition fixed spark**

Just a glance at these telegrams will show conclusively in what regard Eisemann Ignition is held by the men who made this trip. Note the varying types of cars that used the ignition and remember that the showing was made under the severest conditions ever imposed upon an ignition system.

Then remember that if you are not already using Eisemann products, if you are not personally enjoying their efficiency and dependability, it will be much to your advantage to get in touch with us. What these stock systems did on this tour, thousands of others are doing every day for thousands of satisfied car and truck operators throughout this country and abroad.

-DEALERS-

Europe's Leading Car

Lancia

sells at AMERICAN PRICES

Town Coupe.
30 H.P.
Price $5500

The average would-be owner of a foreign car associates out-of-ordinary quality with prices beyond reason. He, in common with the majority of those who understand car value, wants such a car; but the prices of European products are prohibitive.

Lancia cars with all of the swing, dash and exclusive design, that only foreign designers and artizans can make possible, sell at American prices.

Lancia cars, made from steel that only Europe can turn out and with engineering features that America cannot touch, sell for American prices.

You, Mr. Dealer, have a market place for the Lancia, the car of durability, silence, flexibility, speed and rakish design. We will help you make your sales. Write and get our plan and proposition.

Regal

Mr. Dealer—the Big Question Is—

Cars You Can Sell Easily Because of Quality and Price

You are in this motor car business to make the biggest profits possible this year. That means you *must* sell a *large number* of cars.

What cars sell in largest numbers?

The automobiles that offer efficient and lasting service, with low up-keep, at prices within reach of the majority of prospects.

That is why *Regal dealers* sold their cars easily and made large profits last year.

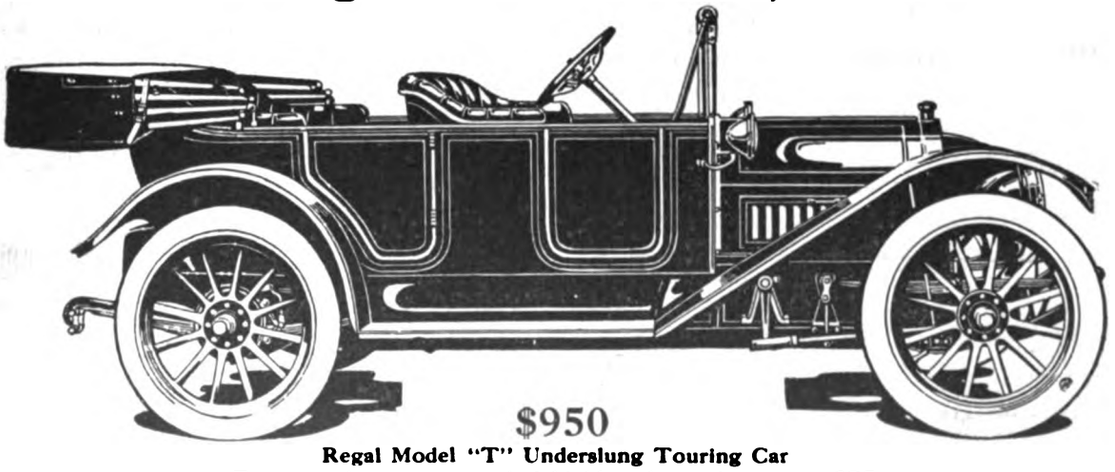
Regal Underslung Cars

Our cars sell in the "around $1000" class—the big market that is going to be bigger this year. The underslung construction presents selling features you cannot find in any overhung car at or near the price.

Investigate our claims. Let us prove why you should handle Regal Underslungs—*for your profit—increase this year.*

Regal Underslung Features

You can't *offer* a prospect a safer car. The underslung construction reduces skidding to a minimum. The "turning turtle" peril is eliminated.



Remarkable ease of riding is achieved by our distinctive spring construction and method of attaching. The limited upward rebound of these springs saves tires. The straight line drive saves power and *gasoline.*

Our *engineers* have attained a remarkable degree of strength, durability, dependability and power in these cars.

We claim that in point of body design Regal Underslung cars are not surpassed by automobiles costing double or even treble the price. Compare the low, sweeping, rakish lines of a Regal with those of other cars and you will be convinced of the truth of our claims.

Now is the time to act. Write today for our catalog and dealer's proposition. We've got a story of vital interest to every dealer in the United States. Write for catalog. N.

The Regal Motor Car Co., Detroit

MARATHON
SPEED ENDURANCE

A Red Tube Without Equal

That's a strong claim, you say. But we'll prove it—and we'll let you be the judge.

We will send you, on request, a sample section of a Marathon **stock** tube. Compare the quality, strength, thickness, toughness and life with any other tube made, and you'll say **Marathon** is without equal.

Then if you want further proof, we'll send you a full tube, and if it isn't as good as the sample, we'll make you a present of it.

Now if you really want to sell the **best tube made**, write us for a sample section.

Note the Picture

The picture is from an actual photograph of a Marathon 34 x 4 stock tube section. Note that it is almost an eighth of an inch thick by the rule.

That shows its great thickness.

Pure Gum, Too

Marathon is a **pure gum** tube. Not a compound tube. We use the **finest rubber**, and give it greatest strength, toughness and life by our special formula.

Best We Can Make

We put all the quality—and the finest quality—into Marathon Red Tubes that **can be put into a tube.** No expense whatever is spared in building Marathons. We will not limit the quality of either Marathon Tubes or Tires.

6-ply Stock

To obtain utter perfection, we use 6 plies of finest rubber. (9 plies in 4½ to 6 inch sizes.) That prevents the possibility of defect—and prevents slow leaks. Any possible, invisible defect in one ply is positively corrected by the others.

Weighed and Measured

Every Marathon tube is subjected to a double test for accuracy and uniformity.

The raw tube is first weighed and then measured. It must test to the fraction of an ounce and the eighth of an inch, or it cannot pass.

Heat Resisting

We use a special red coloring matter that renders the pure rubber highly heat resisting. The Marathon Red Tube positively will not stick to the casing no matter what the friction heat or the weather conditions.

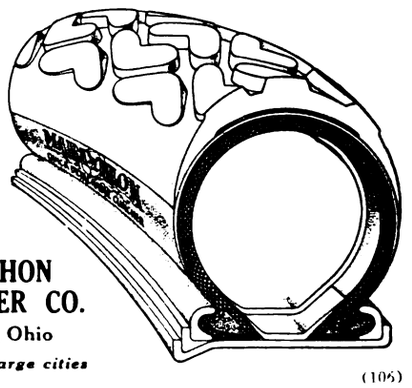
Dealers

We want exclusive distributors in every locality for this tube—and the Marathon tire. **Write for a sample section and our special proposition.**

The Marathon Tire

Remember these facts about the Marathon Tire.

Marathon is hand built, very slowly, by experts. That insures utmost precision—insures perfect construction.



We use only Top-Test materials—the finest rubber and costliest fabrics. No expense is spared to make Marathon the Top-Test quality

We use a special Marathon single cure process, in open steam. That gives greatest rubber-toughness and unitizes the construction — all parts become one.

We apply a double tread—a thick plain tread, and a heavy angle non-skid above.

We concentrate the tread—put the rubber where the wear comes.

Write for our exclusive agency proposition.

Tire troubles?
You can't have any—with

You can't have punctures or blowouts with an airless tire—there's nothing to puncture or blowout. And you can have ease and comfort (Dayton Airless Tires are smoother riding than pneumatics).

And you can—and do—have complete freedom from the worry, delay, vexation and expense that go with punctures and blowouts.

You're not only getting rid of tire troubles if you are using Dayton Airless Tires, you're getting longer wear, and saving the expense of extra tires, casings, etc. We guarantee Dayton Airless Tires for 5000 miles (8000 on a light car like the Ford).

They cost you more when you buy them; they cost you far less as you use them. Besides the big difference on tire repairs and accidents there's a definite sum of $102.70 to be saved by using Dayton Airless Tires. Ask us to show you how.

"I Want

a set of spark plugs that I won't have to bother—plugs that keep their efficiency long after the new has worn off—plugs that are free from carbon troubles and soot, and, above all, plugs that give good hot sparks and do not leak compression or break."

What your customers really want, Mr. Dealer, are Mezger Soot-Proof Spark Plugs. For years Soot-Proof Spark Plugs have set the standard for spark plugs and are the remedy for all engine troubles which inferior sparking may be responsible for. Soot-Proof users know no such troubles, they only know their Soot-Proof Plugs are the best they can buy, so they stick to them.

Next time a customer complains of poor sparking, recommend and sell him "Soot-Proof." He will remember the name and talk about them. Your spark plug trade will increase because of the greatest asset any article can have—satisfied users. Millions of Mezger Soot-Proof Spark Plugs are in use today.

THE STURDY STUTZ
MADE GOOD IN A DAY

Stutz value is as consistent as its performance

The foundation of Stutz success has been built on that fundamental principle of successful motor car construction—***sturdiness.***

Its reputation—made in a day—was due to the splendid quality of all its parts and superior mechanical principles.

No important mechanical change has been made in the new Stutz Series "E" Car. Just a few details have been altered which make it sturdier than ever before, insure even greater service and power to its owners.

We have prepared a simple booklet containing illustrations and detailed specifications of our Series E Models. Compare any car at any price with the Stutz—on paper and on the road—and you'll soon learn where to make a certain investment in motor car satisfaction.

The best car for the individual is the best car for the dealer. We appreciate letters for information from both sources. Write for the new Series E Catalog, No. A15.

STUTZ MOTOR CAR CO., Indianapolis, Ind.

Six-Passenger Touring Car
Four-Cylinder, $2150 Six-Cylinder, $2400

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

Full information may be obtained from

Information

Dixon's Graphite Transmission Grease No. 677

The gear teeth in your transmission and differential wouldn't wear out if they were not rubbing one upon another. The use of Dixon's No. 677 puts a layer of pure graphite over the metal surfaces—a surface that is unctuous and almost frictionless. And instead of a quick-wearing metal-on-metal grinding, you have a long-lasting graphite-on-graphite gliding. The results appear in lower repair bills, and a more lively car. Let us send "Lubricating the Motor," No. 23.

75% of all tire trouble is due to under inflation

THERE is no method yet discovered of ascertaining the pressure in the inside of a tire, except by the use of a pressure gauge. A casing containing 40 pounds of air looks and feels exactly like a casing containing 80 pounds. If your tires require 80 pounds and you only give them 40, they're on the quick road to the scrap-heap.

What is a REAL Tire Protector?

One that does not chafe the tires.

What is the cause of chafing? Loose fitting protectors, due usually to stretching.

Can stretching be prevented? No—leather, and even fabric, is bound to stretch.

Can it be overcome? Yes—by pulling the protectors tight by means of stiff springs which take up the stretch automatically.

Are such protectors made? Yes—the spring attachment is a patented feature of the oldest and most successful make of protectors—

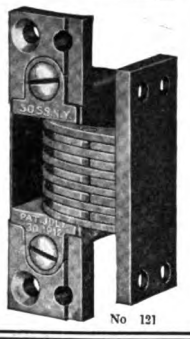
AUBURN, IND.

NEW SOSS CONCEALED DOOR HINGE NO. 121



This new hinge requires a pillar only ⅞ inches wide. It is detached by removing two screws as indicated in illustration. The trouble avoided and time gained in hanging doors when using Soss Hinges are important factors.

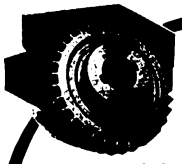
Soss Concealed Hinges can be installed flush with the outside of the pillar, allowing the steel or aluminum panel to be turned over flush on to the face of the hinge, and fastened down securely in the rabbet provided on the edge of the face to receive it, thus allowing more than ordinary clearance.

The non-corrosive case attached to the pillar section of the hinge, prevents water from reaching the wood of the pillar through the hinge.

Description:

Face of hinge on pillar, ⅞ in. x 3¼ in.
Face of hinge on door, ⅞ in. x 2½ in.
Water-proof case mortises into pillar, ⅞ in. x 1⅝ in. x 1¼ in. deep.
Clearance in opening, 11-16 inches.

Further particulars on application



Soss Manufacturing Co.
433-435 Atlantic Ave., Brooklyn, N. Y.

BUDD ALL STEEL BODIES

represent the last word in the art of truck body building. They stand for strength, stability, sturdiness and efficiency. Made entirely of steel, they will not rot or crack. They cannot warp or split. They will stand the maximum use or abuse and are practically indestructible. They eliminate fire risk. They are light in weight and easy on tires—pleasing in design and attractive. Summed up in a word, they give the highest degree of Service.

They are made in many styles—of any desired capacity. Estimates promptly furnished. Write us today for full information.

STAGGARD TREAD
The Tire Perfect!

Dealers! If you want to cash in on a competent PROFIT-builder write TODAY for circular of this new labor and tire saving motor driven tire pump. Of proved superiority! Most of the prominent car manufacturers have adopted it either as regular or special equipment. Only plunger-diaphragm pump. Goes on easy, keeps oil from tube. Every motorist needs and buys one when he sees it. We also make portable garage pump on same principle.
Write today!
Give make and model of car.

Weed Tire Chains enable you to safely make sharp turns and quick stops when a momentary loss of control means loss of life.

The above picture illustrates one of the numerous situations in which you may be placed during bad road weather — when suddenly someone appears directly in your path and in a fraction of a second you must make a sharp turn and apply the brakes. It is then you require a firm unfailing grip on the road which can only be obtained by equipping ***all*** tires with

Weed Anti-Skid Chains

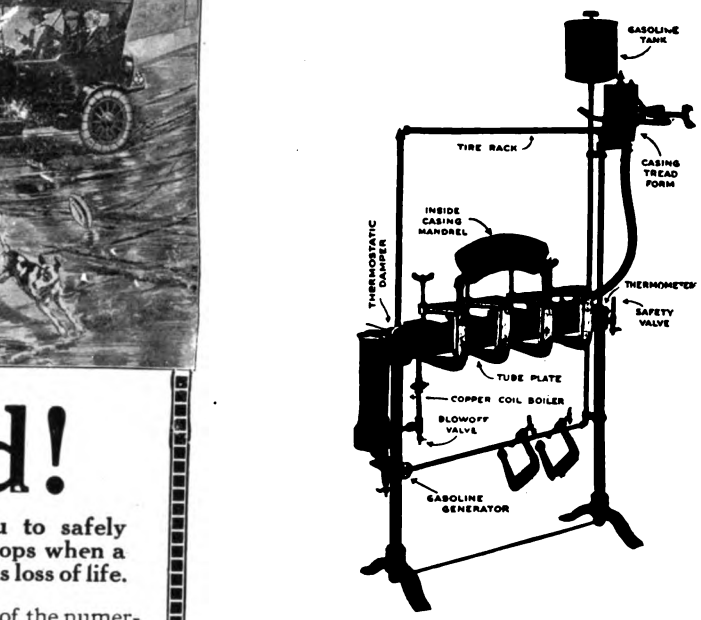
The Only Device that Absolutely Prevents Skidding

The memory of one accident deters future enjoyment in the use of a car. Why run the risk of such accidents and why forfeit the pleasures of motoring ***forever after, when safety can surely be yours by equipping all four tires with WEED CHAINS?***

WEED CHAINS cannot injure tires because "they creep." Easily put on in a jiffy without the use of a jack or other tools. Directions packed with every pair.

Universally Used

WEED CHAINS are generally regarded as the most profitable accessory for the automobile Dealer — Extensively Advertised — Easily Handled — Quick Sellers — No Dead Stock — No Dull Seasons — Liberal Profits — Satisfaction Guaranteed.



Attractive, Decorative, Convincing Hangers regularly supplied to Dealers upon request

DOMINION CHAIN CO., Limited, 137 McGill St., Montreal, Can.

Complete Vulcanizing Plant $45

A great money maker for the garage or repair shop. Handles every practicable kind of tire repairing, from a tube puncture to largest casing blow-out.

No experience necessary for its successful operation as the steam pressure is automatically controlled and held at the vulcanizing point. Steam generated in a copper coil boiler that heats the machine as quickly as you can get a tire ready.

Place your order at once and insure delivery of your vulcanizer when you want it. Be prepared to handle the most profitable part of the repair business.

SHALER

Vulcanizers for Every Requirement of Motorist or Repairman

The Shaler line of vulcanizers, the only complete line in the world, includes models to suit everyone—from the motorist with one small runabout, to the garage handling large quantities of work. A full line of electric, steam and gasoline heated vulcanizers. Write for catalog today.

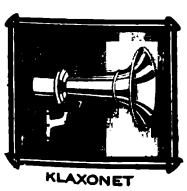
The car maker who claims to make "High Grade" Cars can't afford NOT to equip with the Klaxon

There are a dozen well-known makes of tires.



There are several speedometers, carburetors, magnetos, starters; all are equally well known, equally high-grade.

By equipping with any of them the car manufacturer can fullfill his claim of a "high grade" car.

But when the manufacturer comes to select his warning signal he faces no such latitude of choice.

He finds just one "high grade" signal universally recognized as such. There is no other. He MUST equip with the Klaxon.

He knows that if he doesn't he casts suspicion and doubt upon his claims for his car. He burdens his agents with the necessity of arguing, defending, explaining the unknown "horn" -- and of frequently having to add a Klaxon at his own expense to satisfy the customer's demands.

A New Line of Black Finishes for Automobile Parts

From the complete line of Berry Brothers Raven black finishes, you can get just exactly what you need. These Japans are made to use on fenders, hoods, tool boxes and other parts requiring a high grade finish.

These finishes live up to the high standard of Berry Brothers quality and have features that adapt them particularly to automobile work.

They come in a variety of shades, you can get any finish from a perfectly flat black to a high gloss.

Raven No. 10—This is a rubberoid finish leaning toward the gun metal effect.

Raven No. 13—A perfectly flat black, no gloss.

Raven No. 11—This finish is about half way between the flat black of No. 13 and the rubberoid No. 8.

Raven No. 8—This is a true rubberoid.

Raven No. 12—A bright finish tending toward the brilliant.

Lionoil Raven—An excellent undercoat for fenders, hoods, tool boxes and other similar parts. It is a proven rust preventative. There is no better metal primer made.

In addition to these finishes, there is Raven Black which produces a brilliant black enamel finish.

These finishes all have excellent baking properties. With the exception of Raven Black, they will bake at either high or low temperature. This adapts them especially for use on automobile lamps and other articles which must be baked below the melting point of solder. Raven No. 10, No. 13, No. 14 or Lionoil Raven will air dry.

Our consultation department offers you the services of an expert. We will help you choose the finish best adapted to your needs; furthermore we will show you how to obtain the best results from its use.

Write us for more information.

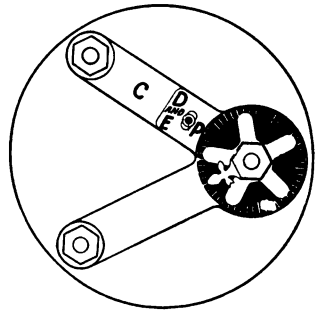
New Automatic Shock Absorber Has Three Distinct Spring Controls



Roads can be fairly divided into three classes—the good—the moderately rough—and the abnormally bad.

Each kind of road really demands a separate and distinct spring control, if the action of the springs is to be kept normal at all times.

It was in recognition of this need, which no shock absorbing device fulfilled, that Mr. E. V. Hartford designed the New Automatic Three Degree Friction Absorber, which adjusts itself to meet each condition separately and provides the correct degree of tensional control for each.

When travelling over smooth roads, the center arm "C"—shown in the diagram below—is the only arm that is working. This is the first control and it is designed to successfully eliminate the slight but noticeable spring oscillation from the little inequalities found on even the smoothest road.

The arms "D" and "E" remain stationary until a rough stretch of road or a bad cross-walk is encountered. Instantly the arm "C" by means of the pin "P"—which is an integral part of "C"—picks up and operates arm "D" on the back side of "C" thus doubling the amount of controlling friction This is the second control.

Should the road grow worse or the crossings extremely severe, arm "E" is also brought into immediate play, thus giving the full effect of the absorber and supplying a third control calculated to meet and overcome the most violent rebound of the car's springs.

The New Automatic does not deviate from the tried and proven design of the original Truffault-Hartford, but instead of one constant frictional tension, provides three distinct tensions, the advantage of which is apparent.

Increased comfort and longer tire wear—less upkeep expense—and all around better car satisfaction are realized through the use of the

New Automatic

Truffault-Hartford

SHOCK ABSORBER

When attached it presents the same neat appearance of the other Truffault-Hartford models, which, unlike other devices, do not detract from the appearance of the car. $60 per set of four. Further interesting information on this new model and the four other Truffault-Hartford models may be had by writing for our booklet. Five models, $15 to $60 a set.

Erase Excess Tire Expense

THE monthly garage bill is a pretty good barometer of tire efficiency. Gasoline, lubricants and small adjustments are necessities. You can't expect to reduce them materially. But tires are different—you can economize in this direction and you should.

Firestone Non-Skid Tires are today erasing a big proportion of garage bills for experienced motorists everywhere. Charges for patching, vulcanising, and retreading are being reduced or eliminated entirely.

You motorists who have never tried Firestone Non-Skid Tires should ask for a copy of "What's What in Tires" by H. S. Firestone, a book by a tire authority written from the motorist's standpoint. Write for it.

Firestone pneumatic tires are guaranteed when filled with air at the recommended pressure and attached to rims bearing either one or both of these inspection stamps. When filled with any substitute for air or attached to any other rims than those specified our guarantee is withdrawn.

Overland

THE motor is *larger;* the wheelbase is *longer;* the tires are *larger;* the tonneau is *roomier;* the equipment is *better*—including such costly additions as *electric lights;* the body is *more handsomely finished,* in rich dark Brewster green, with heavy nickel and aluminum trimmings. In fact, in every single and individual respect this is an *improved* car at a *reduced* price.

$950 Completely Equipped

With Gray & Davis Electric Starter and Generator—$1075 f. o. b. Toledo

35 horsepower
114-inch wheelbase
Electric head, side, dash and tail lights
Timken bearings
New Splitdorf magneto
Model R Schebler carburetor
Three-quarter floating rear axle
33x4 inch Q. D. tires
Cowl dash
Turkish upholstery
Genuine hand buffed leather
Clear-vision windshield
Mohair top, curtains and boot
Stewart Speedometer
Electric horn
Flush U doors with disappearing hinges

1914 Catalogue on request. Please address Dept. 50

The Willys-Overland Company
Toledo, Ohio

MOTOR WORLD

Vol. XXXVI New York, U. S. A., Thursday, August 21, 1913 No. 9

NEW YORK LICENSE TAGS TO BE CHOCOLATE COLOR

White Figures on Brown Background Specified in Contract Just Let—Five Figures on a Plate and Index Letters.

Except for a difference in color, the New York State license plates for 1914 will be very little different from the plates now in use. Instead of a blue background, the new plates will have a chocolate colored background; the distinguishing figures will be white, as heretofore. The contract for the new identification tags was awarded to the Manhattan Supply Co. of New York City on Tuesday by Secretary of State Mitchell May, and the specified contract price was 38 cents a pair.

Although at one time it was proposed to alter the size of the plates and the style of the figures in order to make the lettering more easily read, the plates are to remain the same size, as do the figures upon them; the plates measure 16 x 6 inches and the figures will be four inches high with each stroke five-eighths of an inch in width. As is the case with the present plates, there will be only five figures on each of the new ones, the system of adding index letters in order to reduce the number of necessary figures being continued. The first 9,999 plates will have no index letter; thereafter, however, each series of 10,000 plates will be distinguished by an index letter, A, B, C and D being used in their natural order. The new plates will be ready for delivery by October 1st, though the fiscal year of the department dates from February 1st.

Thus far this year 120,000 license tags have been issued, two going to each owner. For the 1914 season 150,000 tags will be required, a gain of 30,000.

At the same time the contract for plates was awarded, Secretary of State May awarded the Union Badge & Decorating Co., of New York City, the contract for furnishing the chauffeur's badges; they are to cost the State seven cents each.

Winton to Equip with Electric Starters.

By way of supplying the increasing demand for electric engine starters, the Winton Motor Carriage Co., of Cleveland, Ohio, one of the oldest, if not the oldest, user of compressed air as a starting medium, is preparing to equip its cars on demand with the U. S. L. electric lighting and engine starting system instead of the pneumatic system that has been used for so long. The action, it is stated, is not to be taken as presaging general adoption of the electric system to the total exclusion of the pneumatic system. As heretofore, the latter will remain standard equipment on all models specifications of the U. S. L. system increasing the list price of the car to which it is attached by $200. Delivery of cars equipped with the electric system will be commenced about November 1st.

Curtiss Develops Automobile Engine.

Without previous intimation of its intentions, the Curtiss Aeroplane Co., of Hammondsport, N. Y., has quietly developed its six-cylinder aeroplane engine for use in automobiles, and is prepared to turn it out in quantities for that purpose. As might be inferred, the motor is exceptionally light and weighs complete but 275 pounds, despite the fact that it is water-cooled and develops no less than 70 horsepower on the brake. Cylinders measure 4 x 5 inches and the construction is standard throughout, the flow of gases being controlled by the familiar poppet valves.

Chase Water-Cooled Truck Denied.

Despite recurrent rumors to the effect that the Chase Motor Truck Co., of Syracuse, N. Y., is preparing to bring out a water-cooled commercial vehicle to supplement or to replace some or all of its air-cooled trucks, there is no truth in such statements, according to one who has authority to say so. It is stated that no change is contemplated in the cooling.

COURT DECLARES CITY MAY REGULATE TAXICAB SERVICE

Hard Fight Against New Ordinance in New York Ended in Favor of Municipality — Injunctions Overturned and Claims Denied.

That the right of a municipality to regulate the taxicab service which uses the city streets is undisputed, is the gist of a decision handed down yesterday, 20th inst., in the Supreme Court for New York county by Justice Samuel Seabury in actions brought by various taxicab companies of New York City to prevent the enforcing of an ordinance which was to have gone into effect August 1; temporary injunctions which were secured a day or two prior to the date when the ordinance would have become effective are set aside and the Bureau of Licenses hastened to place cab stand signs which had been withheld.

The ordinance does away with privately rented stands in front of clubs and hotels, establishes lower rates of fare and places the entire cab service completely under the regulation of the civic authorities; the opponents of the measure, mostly those who had paid for the privilege of maintaining stands in front of hotels and clubs, objected on the grounds that the rates were confiscatory; that the law is unjust; that expensive meters are required; that unreasonable penalties are required for incorrect meters; that drivers are subjected to unreasonable requirements; that the provisions for revoking licenses are unreasonable; that it is unreasonable to permit drivers to solicit fares only when seated in their cabs; that it is unreasonable to refuse to permit anyone to sit in front with the driver, and that the law is unconstitutional. It also was claimed that the ordinance was hastily adopted and that the Board of Aldermen went beyond its jurisdiction and invaded the constitution of the United States.

In his opinion, covering 39 typewritten

Digitized by Google

pages, Justice Seabury said that "the ordinance was not hastily adopted. Careful and thorough examination and investigation of the whole subject matter involved preceded the framing and adoption of the ordinance. Upon the whole, the ordinance must be pronounced a serious, well-considered attempt to remedy nuisances which have grown to such an extent as to make an application of a remedy imperative."

As regards the charge of discrimination made by the big taxicab companies, Justice Seabury ruled that the old system was as unjust as the new one is claimed to be, and that because of conditions which prevailed some remedy was necessary. He added: "The effect of provisions of the old ordinance and the licenses granted pursuant thereto gave to hotels and other owners of buildings abutting on the public streets the right to maintain private hack stands. These special privileges in the streets of the city enabled those in front of whose property special hack stands were established to sell for their private profit the right to use a part of the public streets.

"Licenses issued pursuant to such ordinances discriminated against the rights of other public hackmen than those who made contracts with the abutting owners to enjoy equal rights in the public streets. It is in evidence before the court that an investigation made by the Commissioner of Accounts shows that over $860,000 is paid annually to the hotels and other abutting owners for the sale of these privileges, and the report of a commission appointed by the mayor to investigate the whole subject of cab service estimated the amount paid for such purposes as not less than $500,000."

It was claimed that under the new rates taxicabs cannot be operated at a profit, but evidence indicated that smaller operators are making money, exacting only the two-passenger rate, whereas the ordinance permits a rate about two-thirds higher for three and four persons. Regarding rates, Justice Seabury said:

"The affidavits submitted upon these motions fall far short of satisfying the court that the rates of fare prescribed are unjust and unreasonable. On behalf of the defendant, evidence is adduced to show that such motor driven vehicles can be operated at a profit upon the rates prescribed."

Since the injunctions were secured conditions in the metropolitan taxicab service have been more or less chaotic, for while some of the cabmen, mostly the smaller operators, accepted the new ruling and were licensed, many were not licensed and charged the old rates. The big taxicab companies may appeal, but since the city hastened to post its cab stand signs it will now be a question of getting them taken down instead of preventing their being put up.

SEARCHLIGHT ASSETS GO TO ONLY BIDDER FOR $175,000

Protective Committee Buys in Gas Company's Property at Receiver's Sale—Takes Entire Plant but Guards Future Plans.

But one bidder appeared on Thursday last, 14th inst., when the assets of the Searchlight Gas Co. were put up at receiver's sale in Warren, Ohio, and the entire property of the company was knocked down to what was termed the Searchlight Protective Committee for the round sum of $175,000; this committee included a representation of the creditors, most of which are banks, and was otherwise made up of the officers of the embarrassed corporation. Horace B. Pearson, general manager of the company, is the receiver.

The assets that were sold include a 1½-story building, about 50 x 100 feet, in Warren, plants in Canton, O., Chicago, Minneapolis, Bexar county, Tex., and Harrison, N. J., and a quantity of tanks. The property had been appraised at $424,000 as a going concern and was estimated as being worth $350,000 as a non-going company, and against the corporation are creditors' claims of more than $200,000. The consummation of the receivership will, it is stated, leave little, if anything, for the stockholders and will probably not afford payment in full for the creditors.

What is to become of the business has not been divulged by those who have secured the assets. The failure came in January last following the Searchlight victory over the Prest-O-Lite Co. in a long line of patent litigation; the petitioner was the Continental and Commercial National Bank, of Chicago, which held notes the face value of which was $50,000. The actual bidder at the sale was John S. Rountree, of Chicago, who has acted as attorney for the Searchlight company on other occasions.

Connecticut Electric "Goes into" Cyclecars.

Following preparatory work, carried on in a very quiet manner, the American Cyclecar Co., which was incorporated early in the year under Michigan laws with a nominal capital of $1,000, has been as quietly taken over, lock, stock and barrel, by the Connecticut Electric Mfg. Co., of Bridgeport, Conn., which, in turn, is owned and controlled by A. H. and I. B. Trumbull. A. H. Trumbull has been elected president of the company, which will retain its original name; Harry J. Stoops has been made vice-president and I. B. Trumbull secretary and treasurer. Coincident with the transfer of stock, the capitalization was raised from $1,000 to $200,000, with an ultimate prospect of $500,000 in view. The car that is to be produced will have a four-cylinder water-cooled motor with cylinders measuring 2⅞ x 4 inches, 80 inches wheelbase and a tread of 44 inches; the body will accommodate two passengers seated side by side. It is proposed to list the car at $390 with equipment including top, windshield, electric lights and tools.

Chevrolet Incorporates in New England.

Following the snuffing out of the name Little by the absorption of the Little Motor Car Co. of Detroit, Mich., by the Chevrolet Motor Co., its near relation, and the renaming of the Little car Chevrolet, the Chevrolet company has perfected plans for writing the name of its product still larger. To take the place of the Republic Motors Co. of Massachusetts, which heretofore acted as sole distributer in the New England territory for both Little and Chevrolet cars, there has been incorporated the Chevrolet Motor Co. of New England, with $10,000 capital stock. W. C. Durant, who is the moving spirit behind Chevrolet affairs, is vice-president of the new company, and W. C. Sills is president and treasurer. The old quarters of the Republic Co. in the Motor Mart in Park Square, Boston, will be retained.

Bosch Opens Eastern Territory Branch.

The Bosch Magneto Co., of New York City, has opened a branch which will handle the Bosch business in what it terms the "Eastern territory," a field including all States east of the Mississippi and Ohio rivers; the branch has been located in the Bosch building, 223 West 46th street, New York City, and is under the management of Alfred J. Poole, formerly assistant chief engineer of the Bosch company.

Stearns Opens Coast Factory Branch.

The better to care for its Pacific Coast trade, the F. B. Stearns Co., of Cleveland, Ohio, has opened a factory branch at 742 South Olive street, in Los Angeles. The location is only temporary, however, as land has been purchased and the erection of a suitable building will be commenced immediately. J. H. Duffee, long Western manager for the Stearns company, has been placed in charge.

Ford Adds Another Assembling Plant.

With assembling plants already established in a great many of the more populous trade centers, the Ford Motor Co., of Detroit, Mich., has added still another to the long list. An 11-story building to cost approximately $600,000 will be erected on Fifth street in Minneapolis, Minn.; work will be commenced at once.

URT POSTPONES ACTION ON WALPOLE RECEIVERSHIP

lvises Disputants as to Additional Receiver to "Get Together" and Seek Amicable Adjustment—Creditors Favor Advisor.

nstead of making definite decision in the tter of the appointment of a coreceiver the Walpole Tire & Rubber Co., of Wal- le, Mass., which failed August 2, the Fed- l court in Boston, when the matter came for a hearing Saturday last, 16th inst., journed the case for a week with the ad- nition to the creditors that they en- avor to arrive at a decision which would satisfactory to as large a number of se concerned as possible.

The court intimated that if the minority editors, who are in favor of the appoint- nt of a coreceiver, and the stockholders n agree on a man who would not be an- gonistic to the present receiver he would nsider the appointment of an additional icial; he suggested that the stockholders d creditors confer during the interven- g week and suggest the names of some en acceptable to both sides of the con- oversy.

On Friday of last week the creditors, out 200 in number, met in New York ty and discussed the question, and the ntiment of those present was that Robert Fisher, the company's treasurer, who was med receiver, is quite sufficient for the casion, but it was suggested that the cred- ors name a committee from their number advise the receiver. Fisher stated he ould be only too pleased with such an ar- ngement.

Certain of the Walpole stockholders, how- er, desire that someone favorable to their n particular interests be given a hand in e receivership proceedings and object to e course followed when the failure of the mpany's bank brought down the tire mak- s. These stockholders demand an audit- g of the Walpole accounts and the making blic of its exact financial standing.

Michigan Failure Drags Down Dealer.

Following the failure of the Michigan uggy Co., which had discounted notes iven it as future payment on cars, the estern Implement Co., of Sioux City, Ia., as made the object of a bankruptcy peti- on yesterday, 20th inst., by three Detroit nd Cincinnati banks, which hold the im- lement company's paper to the amount of 0,000; a temporary receiver was appointed. his sum is said to represent but a part of aper to the extent of $250,000 which the nplement company, also a dealer, gave the buggy company in payment for 200 cars which it never received. Instead of hold- ing the notes the manufacturer discounted them and the banks demand their money.

Little Disclosed at Midland Hearing.

Although the hearing of the creditors of the defunct Midland Motor Co., of East Moline, Ill., which was called for August 5th, was continued over three days and some 25 witnesses were examined, little of an enlightening nature has been permitted to escape, though it is understood that as the result of preferential payments made to creditors in the form of cars shipped to them in lieu of cash, several suits will be instituted seeking to compel the return of the cars. The hearing has been extended to August 29th, when it will be taken up again in the Federal Building in Peoria.

Carburetter Coming from Rochester.

Charles Pembroke, who is the moving spirit behind the Key Lox Mfg. Co., of Rochester, N. Y., has quietly developed a gasolene carburetter and proposes shortly to enter the trade with it. Although little regarding the construction of the device has been permitted to become public, it is understood that it operates on a somewhat new principle, which insures a considerable increase in mileage per gallon of fuel.

Commercial Vehicles from Johnstown.

For the purpose of building commercial vehicles and motor-driven fire apparatus, the Johnstown Motor Car Co. has been formed in Johnstown, Pa. R. R. Herchelroth, who owns a number of patents around which the vehicles will be built, is the prime moving spirit behind the venture. A factory soon is to be erected.

Michigan Welding Adds to Factory.

To permit of needed expansion, the Michigan Electric Welding Co., of Detroit, just has completed an addition to its factory, which practically doubles the floor space. Drag links, brake rod assemblies, torsion and tie rods, brake expander cams and a variety of other electrically welded parts are produced.

Bayerline to Visit Pacific Coast.

J. B. Bayerline, president and general manager of the King Motor Car Co., of Detroit, departed Saturday last for a swing around the trade circle, which will include the Pacific Coast. He will be absent about four weeks.

Dash Maker "Goes Into" Taxicabs.

The Benham Mfg. Co., of Detroit, Mich., which produces wood dashes in considerable variety, is preparing to place on the market a taxicab.

KLAXON WOULD STOP TALK OF HUDSON CAR SALESMEN

Sues Because it Claims "Boosting" of Hudson and its Equipment "Boosts" Sparton Horn—Latter Charged with Patent Infringement.

Because, so the Lovell-McConnell Mfg Co. claims, the sales activity of the A. Elliott Ranney Co., Hudson distributer in the metropolitan district, is damaging it by advertising the Sparton horn, an alleged infringer of the Klaxon patents, the Klaxon company brought suit this week in the United States District Court for the Southern District of New York; the Lovell-McConnell company charges the Hudson distributers with infringing the Klaxon patents, Nos. 923,048, 923,049 and 923,122, granted May 25, 1909, and seeks an injunction and damages.

The Sparton horn, which is made by the Sparks-Withington Co., of Jackson, Mich., also is the device at issue in other suits brought some time ago in the same court against three New York automobile and accessory houses, and the reason for the additional suit is made plain in a statement by F. Hallett Lovell, Jr., president of the Lovell-McConnell company, in which he says that the suit is not for pecuniary damages.

"The principal damage in cases of this kind," said Lovell, "is done by the salesman in demonstrating and praising the infringing horn as one of his talking points in selling his car. What a car seller says is especially damaging because his attitude is naturally that of a disinterested intermediary who is not trying to sell the horn. Moreover, the inquirers he talks to are practically all prospective horn users and his demonstrations of the infringing horn outnumber his car sales about 20 to 1.

"To prevent this damage is more important to us than the considerable profits which might be recovered in case the horn could be proved to be the decisive factor in effecting the sale of the car."

Traveller Prepares to Launch Cyclecar.

Following its organization last March by J. P. Lavigne, the Traveller Motor Car Co., of Detroit, Mich., is preparing to market a light vehicle which will come in the category of the cyclecar, quotations on parts already having been asked for. At the time of its formation, the Traveller company acquired property on Grand River avenue comprising a two-story brick building 80 x 100 feet, which since has been partly remodeled and made more suitable for the production of cars.

TEXAS OIL'S EARNINGS IN YEAR EXCEED $25,000,000

Net Income Nearly Half This Amount and $1,620,000 Goes to Dividends —Surplus $7,500,000 — Other Items in Annual Statement.

For the fiscal year which ended June 30 last the Texas Co. earned the gross sum of $25,882,863.91, which income is indicative of an unusually profitable business year, even though the company in its annual statement just issued says that "the apparently abnormal showing of gross earnings may be attributed in part to increased value of stocks of oil and of producing properties." As is shown in the accompanying table, of this gross sum $1,620,000 was applied to the payment of dividends, while $5,043,123.36 was carried to the surplus. The surplus at the end of the preceding fiscal year was only $2,456,876.64, less than half the sum carried over this year, and which makes the surplus now $7,500,000. The net earnings were $12,044,218.85.

The company's outstanding capital stock is but slightly in excess of its gross earnings, being $27,000,000, although there are included in the liabilities $14,000,000 of 6 per cent. convertible debentures and $2,400,000 of 6 per cent. serial notes outstanding. As compared with accounts and bills payable to the amount of $6,531,248.14, there are accounts and bills receivable to the amount of $14,395,634.48. In the assets are included bonds and mortgages valued at $3,026,000.

The plant account, which means investments in real estate, leases, rights of way, pipe lines, tankage, terminals, distributing stations, natural gas wells and equipment, is valued at $28,895,452.59, and the crude and refined oil in stock and in process of manufacture is entered in the assets at $16,703,363.61. On the liability side of the account is provision for the notes and debentures in the form of $360,000 for interest on the latter and $72,000 as interest in the former, while for taxes the sum of $143,534.78 is set aside. Bad accounts are cared for by the setting aside of $250,000 for this item. The stock, debentures and outstanding notes total $43,400,000, but this sum is exceeded by the $45.598,816.20 valuation which the company places on two single items of physical assets, its plant valuation and its stock of manufactured and unfinished product. The cash in hand is placed at $2,233,347.54 and the reserve for sinking fund and depreciation $8.761,186.60. The balance of the sheet is $67,517,969.52.

The company has made application to list on the New York Stock Exchange $3,000,000 additional stock and $2,000,000 of the debenture bonds, all of which is included in the statement; the application is the final step in the transfer of the Producers' Oil Co. to the Texas Co. Stockholders in the Producers received one share of Texas for each share of Producers and one Texas debenture bond for each Producers bond held.

Abbott Discontinues Detroit Branch.

Discontinuing its factory branch in Detroit, Mich., the Abbott Motor Car Co. of that city has placed the business in the hands of the Gaston-Richardson Co., which will act as the agent for the company. The new firm is composed of George T. Gaston, who has held several municipal positions and is making his entry into the automobile business, and Douglas C. Richardson, who for two years was associated with the local branch of the Warren Motor Car Co. The present quarters at Jefferson avenue and Brush street will be retained.

Town Again Heads Duplex Company.

At the annual meeting of the stockholders of the Duplex Power Car Co., of Charlotte, Mich., which was held on Thursday last, all the old officers with the exception of two were re-elected; Frank P. Town re... president, Frank L. King, vice-pres... and M. J. Lamson, secretary. T. L. G... replaces James H. Brown as treasurer ... as a member of the board of direc... from which K. S. Ranger also retires; ... place is taken by M. Bollstrom, of E... Creek, the new board of directors in... these men and George A. Williams ... H. H. Bryan.

Gemmer to Produce Engine Starter.

George A. Gemmer, who nearly a ye... ago retired from participation in the affa... of the Gemmer Mfg. Co., of Detroit, Mich... to take up the production of an engi... starting device, has incorporated the Ge... mer-Detroit Starter Co., with $200,000 ca... tal stock. L. W. Smith is associated w... Gemmer in the venture.

American Safety Changes Corporate Name.

In order the better to distinguish its bus... ness, the American Safety Appliance Co... of Milwaukee, Wis., has changed its co... porate title to Milwaukee Die Casting Co... The company produces aluminum castings for lamps.

The Week's Incorporations

IN THE LEE OF THE FORD PLANT IN DETROIT; 1,000 CARS—A SINGLE DAY'S OUTPUT—READY FOR SHIPMENT TO THE FOUR QUARTERS OF THE GLOBE; THE CARS ARE COMPLETE EXCEPT FOR BODIES

Albia, Ind.—Citizens' Automobile Co., under Indiana laws; authorized capital, $25,000.

Grand Rapids, Mich.—Reed Blickley Auto Dealers, under Michigan laws; authorized capital, $10,000; to deal in motor cars.

Jefferson City, Mo.—Automatic Tire Rest Co., under Missouri laws; authorized capital, $200,000. Corporators—Peter Lattner and others.

Wilmington, Del.—American Cyclecar Co., under Delaware laws; authorized capital, $50,000. Corporators—M. E. Dorsey, E. J. May, F. Giles.

San Marcos, Tex.—Bradley-Moore Auto Co., under Texas laws; authorized capital, $6,000. Corporators—J. M. Moore, W. Frank Bradley, I. W. Wood.

Philadelphia, Pa.—United Traction Improvement Co., under Delaware laws; authorized capital, $100,000; to manufacture, sell and deal in motor cars.

Jefferson, Wis.—Jefferson Auto Co., under Wisconsin laws; authorized capital, $6,000. Corporators—Henry W. Ruel, Jacob N. Heid, Clarence J. Puerner.

Fort Worth, Tex.—Chandler Motor Car Co. of Fort Worth, under Texas laws; authorized capital, $5,000. Corporators—B. K. Smith, M. H. Smith, R. E. Souther.

Detroit, Mich.—Internal Gear Drive Co., under Michigan laws; authorized capital, $6,000; to manufacture motor vehicles. Corporators—A. F. Mais, Ben Marks.

Portland, Ore.—Montavilla Garage, under Oregon laws; authorized capital, $2,500; to operate a garage. Corporators—C. H. Lacey, Theodore Roy, C. M. Hurlburt.

Sharpsburg, Pa.—Atlas Welding & Supply Co., under Delaware laws; authorized capital, $25,000. Corporators—J. Gehring and F. C. Rugy, of Pittsburgh; J. B. Anderson.

Selma, N. C.—Selma Motor Car Co., under North Carolina laws; authorized capital, $25,000; to deal in automobiles and operate a garage. Corporators—W. G. Ward and others.

Detroit, Mich.—Blumenthal-Prager Tire & Rubber Co., under Michigan laws; authorized capital, $1,000; to manufacture rubber goods. Corporators—Louis Prager, David Blumenthal.

New York, N. Y.—Velvet Co., under New York laws; authorized capital, $5,000. Corporators, Walter D. Ramsburgh, Harry C. Proctor, Arthur H. Miller, all of 290 Broadway, New York City.

Cleveland, Ohio—The Falcon Co., under Ohio laws; authorized capital, $15,000; to deal in motor cars. Corporators—James H. Cassidy, D. C. Heck, Mary A. Copeland, C. Verbsky, W. S. Mitchell.

St. Louis, Mo.—Palmer-Meyer Motor Car Co., under Missouri laws; authorized capital, $100,000; to deal in cars and accessories. Corporators—Charles W. Palmer, Frederick C. Meyer, Ferdinand A. Meier.

Dover, Del.—Havana Motor Omnibus Co. of Brooklyn, N. Y., under Delaware laws; authorized capital, $1,500,000; to manufacture, sell and deal in motor cars, motor omnibuses and other kinds of cars. Cor-

Digitized by Google

porators—Ralph S. Hull, Brooklyn, N. Y.; Alexander S. Andrews, Flushing, L. I.; Ralph A. Gamble, Larchmont, N. Y.

Los Angeles, Cal.—The Motor Cars Distributors Co., under California laws; authorized capital, $75,000; to deal in automobiles. Corporators—F. W. Beau de Zart, A. C. Labrie, C. W. Fish, J. T. Bunn, M. W. Beau de Zart.

Milwaukee, Wis.—Milwaukee Grinding Wheel Co., under Wisconsin laws; authorized capital, $65,000; to manufacture disk grinders, emery wheels, abrasives, etc., for garage, farm and machine shops. Corporators—R. M. Paul, O. W. Bow, C. W. Buchen.

Cold Spring, N. Y.—Herbert F. L. Funks Co., under New York laws; authorized capital, $10,000; to deal in automobile supplies. Corporators—Henry M. Brigham, 27 William street, New York City; Aaron Michelson and Herbert F. L. Funks, both of 116 Broad street, New York City.

Minor Business Troubles.

A petition in bankruptcy has been filed against the New Taxicab Co., of Birmingham, Ala. The petitioners are the Highland Garage, the Standard Oil Co. and the William Wise Co.

Irving J. Gorton, a dealer in oil at White Plains, N. Y., has filed a petition in bankruptcy; his liabilities are $2,206 and his assets $628, consisting of accounts and several shares of stock, as follows: Oxford Linen Mills, 20; Estabrook Co., 20; United Motors Co., 10. The Standard Oil Co. is a creditor for $2,026.

Following the discovery of a shortage of $200,000 in the accounts of the Roseville Trust Co., of Newark, N. J., and the disappearance of Raymond E. Smith, the secretary and treasurer, the sheriff has seized the garage of the Oakland Motor Sales Co. and the automobile supply shop of L. C. Smith in East Orange, N. J. Smith is said to have been the whole or part owner of these businesses. The vice-president of the bank declares that Smith owes the institution $305,000 and is a fugitive.

As a solution of the financial troubles of the Donaldsonville (La.) Garage and Automobile Supply Co., a committee which was appointed to liquidate the company's assets has accepted an offer of K. A. Aucoin, organizer and manager of the company, whereby he will assume all assets and liabilities and settle with the stockholders on a 12½ per cent. basis. The company was incorporated in October, 1911, with a capital stock of $10,000, and owns a completely equipped garage and repair-shop but never paid any dividends. Aucoin will continue the business.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

H. C. Grannis has been appointed manager of the Cadillac branch in Indianapolis; formerly he was chief tester for the National Motor Vehicle Co.

Charles K. Thomas has been appointed manager of the Federal Truck Co.'s New York branch. Previously he represented the Chase truck in the West.

J. S. O'Rourke has been made purchasing agent of the Cartercar Co., of Pontiac, Mich. Formerly he held a similar position with the Jackson-Church-Wilcox Co., of Saginaw, Mich.

L. R. Acton has been appointed manager of the Tiffany Electric Car Co., of Pontiac, Mich. The Tiffany company was recently incorporated for the manufacture of two electric models.

S. Christensen has been appointed field sales manager and advertising adviser for the Vanguard Mfg. Co., of Detroit, Mich. Previously he was connected with the Emil Grossman Co., of New York City.

L. E. Rood, formerly field sales manager for the Thomas B. Jeffery Co., of Kenosha, Wis., has been appointed manager of the Rambler branch in Chicago; he succeeds Z. C. Elkin, who resigned to enter business for himself.

W. H. Edenbeck, formerly special representative of the United States Tire Co., has been appointed manager of that company's branch in Worcester, Mass. He succeeds L. E. Hevaner, who resigned to open an agency for cars.

W. W. Austin has been appointed superintendent of the new Studebaker plant in Pontiac, Mich., known as Plant 15; it formerly was the plant of the Vulcan Gear Works and is now used for the manufacture of replacement parts.

R. W. Lytle, formerly with the Velie Motor Vehicle Co., Moline, Ill., and later factory manager of the Lycoming Foundry & Machine Co., Williamsport, Pa., has been appointed factory manager of the Hazard Motor Mfg. Co., of Rochester, N. Y.

E. A. Williams, who has been manager of the Castle Lamp Co., in Battle Creek, Mich., has been made assistant manager of the Gramm Motor Truck Co., of Lima, Ohio. His transfer followed the removal of the lamp works to the Willys properties in Toledo.

H. H. Leckler, formerly a member of the engineering staff of the International Harvester Co., has been appointed mechanical engineer of the Emil Grossman Co., of New York City. He has served also in the engineering departments of the Winton and F. B. Stearns companies.

W. McK. White has resigned as advertising manager of the Marion Motor Car Co., of Indianapolis; while he has not divulged his future plans, it is understood that he will not leave Indianapolis. His past connections include the Premier and United States Motor companies.

C. A. Forster, who was appointed commercial manager of the Maxwell Motor Co., of Detroit, in February last, has resigned; prior to his Maxwell connection he was assistant general manager of the Burroughs Adding Machine Co., and it is understood he will return to that organization.

Charles LaPorte, formerly with the United States Motor Co., and who also had experience with the Brush, Reo and Thomas companies, has been appointed chief engineer of the Aristos Co., of New York City. He will have charge of the design and production of Mondex shock absorbers and other Mondex devices.

W. S. Jewell has been made vice-president and sales manager of the American-Marion Sales Co. of New York, the metropolitan distributer of those cars; Jewell has been identified with the trade 12 years, originally as a promoter of a taxicab business in New York, and later as manager of the Franklin Automobile Co.'s New York branch, general manager of the Motors Engineering Co. metropolitan distributors of Kelly trucks, and as distributer in the same territory for the R. C. H. Corporation.

Wayne Wants Garageman to Settle.

Because Olaf P. Hansen, who trades in Chester, N. Y., as the Chester Auto Garage, failed to pay for the apparatus he bought March 15, 1913, from the Wayne Oil Tank & Pump Co., of Fort Wayne, Ind., the latter filed suit against him this week in the Supreme Court for New York county; the amount asked is $100.

Changes in Capitalization.

Detroit, Mich.—Hudson Motor Car Co., from $1,000,000 to $2,500,000.

Birmingham, Ala.—Blacklock Tire & Rubber Co., from $3,000 to $5,000.

Bridgeport, Conn.—Blue Ribbon Auto Garage & Carriage Co., from $100,000 to $6,000.

Recent Losses by Fire.

Sault Ste. Marie, Mich.—Lock City Auto Co., garage damaged. Loss, $10,000.

Digitized by Google

In the RETAIL WORLD

J. B. Sparks will open a repair-shop in usanville, Cal.

John Johnson plans to build a new garage n Dewey, Okla.

Harry Bellamy has opened a garage in Manchester, Conn.

Kanive & Brickner have opened a new garage in Lacon, Ill.

Smith & Belville have erected a new garage in Tehamah, Neb.

Charles Vaninetti, of Lee, Mass., has secured permission to erect a garage.

The Auto Sales & Repair Co., of Everett, Wash., has opened a new repair-shop.

R. L. Nash, of Palmetto, Fla., is building a garage; it will stand on Myrtle street.

Adolph Baatz will erect a garage in Miami, Ariz. It will stand on Broad street.

N. P. Nelson, proprietor of the Breit Motor Co., of Mason City, Ia., is building a garage.

C. M. Akes, of Leon, Iowa, has commenced the construction of a garage, 60 x 90 feet.

Trowbridge Bros., of Fort Smith, Ark., are building a garage; they also operate a laundry.

William Carlisle, of Atchison, Kan., is about to erect a new garage; the site is on 3rd street.

The Kruse Motor Car Co., of Cincinnati, Ohio, is erecting a new building; the site is on 8th street.

J. T. Higgins and A. C. Starrett are building a garage in Morgan Hill, Cal. The site is on Monterey street.

J. W. Waynick, of Roanoke, Va., has established an agency in Bluefield, W. Va. He is a Cadillac dealer.

The John Finn Co., of Cincinnati, Ohio, plans to build a repair-shop on Charleston avenue; it will cost $15,000.

Ray Alberts has purchased a half-interest in the garage of H. J. Hornung, in Eureka, Cal. It is located on 5th street.

L. J. Schwab is about to open a garage and salesroom in Yoakum, Tex. The location is at Irvin and Hugo streets.

William Hoffmaster has launched a taxicab service in Battle Creek, Mich. His initial equipment is three Ford cabs.

The Fred M. Smith Co., of Hibbing, Mich., has changed its name to Advance Auto Co. G. N. Buchart is president.

C. D. McNeil and Dr. M. B. Huff, of Corona, Cal., will enter the garage business; they will erect a building on 6th street.

E. Kullengen, of Chicago, has secured permission to build a one-story garage; it will be located at 2739 West North avenue.

V. H. Van Sickle, of Des Moines, Ia., has entered the list of dealers; he has secured the Read agency and will operate a garage also.

James Taylor, of Philadelphia, Pa., has secured plans for a new garage to be erected at 62d and Osage streets; the cost will be $10,000.

A new two-story garage will be erected for A. Wilmarth in Brooklyn, N. Y., at 360 Cumberland street; the estimated cost is $14,000.

The D. C. Tiffany Co., of Boston, which has operated an exclusively electric garage, has become a dealer; it has taken the Ohio electric agency.

A. E. Dickey has entered the trade as a dealer in Hollywood, Cal. He handles Overland and Kissel cars, Baker electrics and Federal trucks.

Maxwell & Chamberlain, of Denver, have secured permission to erect a garage and salesrooms at 1711 Sherman street; the cost will be $17,000.

The Republic Rubber Co. of California has opened a branch in Fresno under the management of A. H. Simon; it is located at 1931 Mercer street.

Earl D. Loomis is about to establish an automobile livery business in Jackson, Mich. Until recently he was engaged in the undertaking business.

The Oakland Motor Co. branch in Boston has been installed in new salesrooms at Newbury street and Massachusetts avenue; Fred Walsh is manager.

Curtis Dawson has purchased the interest of his partner, Reynolds Dale, in the Tiskilwa (Ill.) Auto Co. Dawson will continue the business alone.

David E. Reed and Charles Blickley, of Kalamazoo, Mich., have formed a partnership to operate a garage; they also will handle cars and accessories.

The M. S. Buckley Co., of Los Angeles, is about to convert a concert hall on 17th street into a garage; the company is Pacific Coast distributer of Autocars.

James McClure and his brother, Robert T. McClure, have formed a partnership in Columbus, Ohio; they will open a garage and salesrooms at 183 East Gay street.

Plans have been prepared for a garage to be erected in Los Angeles on Rampart street, for F. O. Engstrom; the specifications call for an expenditure of $16,000.

The Carolina Cadillac Co., of Winston-Salem, N. C., has opened a new two-story garage and salesrooms at Main and 2nd streets; the building contains 10,000 feet of floor space.

The Hudson Automobile Co. is a new entrant to the trade in Washington, D. C. It has located at 1136 Connecticut avenue and stocks Hudson cars. Howard G. Kneessi is manager.

Authority has been granted to C. Shongood, of 439 Broadway, New York City, to erect a three-story garage on 1st avenue, between East 42d street and 43d streets; it will cost $30,000.

The Cincinnati (Ohio) Automobile Co. is having a new building erected on Court street; it will open up September 1 on an enlarged scale. The company handles supplies and accessories.

The Hoppe-Hatter Motor Co., of Milwaukee, Wis., will open a new service station in September at Martin street and Broadway; the company handles Chalmers cars and Rauch & Lang electrics.

The Transcontinental Garage, of Cedar Rapids, Ia., which has been reorganized, has leased the Faulkes Garage on North 3rd street, a two-story building, 90 x 150 feet; the company handles Moline cars.

J. Hamacheck & Sons, of Two Rivers, Wis., have opened a garage and repair-shop on Washington avenue; Julius Hamacheck, Jr., until recently connected with the Mitchell-Lewis Motor Co., of Racine, Wis., is manager.

Charles J. Clapp, formerly employed in Toledo, Ohio, by H. E. Thorne, has entered the trade for himself; he has secured the Winton distributing agency for northwestern Ohio and is located temporarily with Thorne.

J. Armistead Eggborn has been appoint-

Digitized by Google

ed trustee in bankruptcy for the B. F. Board Motor Truck Co., of Washington, D. C. The testimony of the company's officers will be taken September 9 by the commissioner in bankruptcy.

Harry L. Hornberger, former manager of the Oakland branch in San Francisco, has formed the Henry L. Hornberger Co., with headquarters in the same city; he has secured the agency for the Palmer & Singer for California, Oregon, Washington and Idaho.

Frank Reed, of Chicago, has purchased the American House garage, in Kalamazoo, Mich., from C. T. Goodrich; he will operate a taxicab service. Reed conducts a taxicab business in Chicago and has purchased six Ford and four Thomas cabs for his new business.

The Nebraska Automobile Specialty Co. has been incorporated in Omaha, Neb., and is temporarily located at 219 North 11th avenue; it will move later to "Automobile Row" and act as distributer of the Gray pneumatic gearshift and engine starting apparatus.

J. C. Kendall, formerly of Pittsfield, Ill., has opened a new garage in Hillsboro, in the same State, at Broad, Wood and Berry streets; the site, building and equipment cost $14,000. Besides operating a garage and machine-shop, Kendall will maintain an automobile livery.

The Miller Bros. Automobile & Supply Co., of Washington, D. C., has leased a building at 1st street and Pierce place northeast and will open a service station; the company handles Fords. The building covers an acre of ground and is now used as a Studebaker service station.

William Fraser, of Polo, Ill., has purchased the interest of J. J. White in the Schlig Garage in Rockford, on Elm street; following this transfer of interests Fraser was elected president, J. B. Knight secretary and treasurer and John Schlig vice-president and general manager.

The Chanslor & Lyon Co., of Los Angeles, has opened a branch in Oakland, Cal., in a new building at 2537 Broadway; Geo. A. Morrill is manager. The company, which is an accessory and supply dealer, now has stores in Los Angeles, San Francisco, Fresno, Seattle, Portland, Spokane and Oakland.

The Cincinnati Automobile Clearing House has been formed in that Ohio city with a capitalization of $5,000 to handle new and used cars and operate a repair-shop; the incorporators are Charles F. Hornberger, Robert Orihco, Arthur R. Spangenberg, Samuel Bromley and G. R. Chadwick. Uricho will be president, Spangenburg secretary and Hornberger treasurer.

POPE TO CONCENTRATE ON "SIX"; NEGOTIATES LOAN

Hartford Manufacturer to Build One Type Only—Loan to Afford Ready Capital — Investigation Explodes Derogatory Rumors.

Although numerous and persistent rumors regarding the financial standing of the Pope Mfg. Co., of Hartford, Conn., have been more or less prevalent and have emanated from various and mostly dubious sources in the trade, an investigation from truly authentic sources of information reveals the fact that the Pope-Hartford company is enjoying a standing better than it has in several years. The light in which the company is truly regarded by men familiar with conditions within and without the corporation is probably best made plain in the statement of a manufacturer who, on Thursday, made plain to a Motor World man that he would "sell the Pope company all they may want."

While the statement of the company for the fiscal year ending July 31, 1911, showed that the tremendous expense of building up the business had not permitted as large profits as had been hoped would accrue, the statement for the fiscal year which followed, terminating July 31, 1912, exhibited a marked recovery of tone and indicated that the company then was in a much better condition. This condition has continued and the company's status has improved monthly.

The company has made no secret, however, of the fact that it is negotiating for a loan that it may have available more ready capital to replace temporarily the vast sum which has been used in building up the industry; Col. George Pope, himself, stated to Motor World that the company is about to secure $2,000,000 through a ten-year mortgage loan on the company's property, but that the move is not attended with any financial unsoundness within the corporation.

While his statement is backed up by men familiar with but outside the corporation, the recent persistency of the disparaging rumors doubtless has been accentuated by the fact that alterations are being made in the Pope line of cars; although it only last year added a four-cylinder model, listing at $2,250, thus virtually marking the entry of the company into the medium-price field, it now announces that this model is to be discontinued and that hereafter production activities will be centered on the building of "sixes"; in the meantime, however, attention will be devoted to the disposal of the few remaining model 31 "fours," and as an inducement to hurry their removal from the floors of the half dozen or so dealers who will receive them as fast as they can be made up from parts on hand, a substantial cut in their price has been made; instead of $2,250, they will be sold, completely equipped, for $1,650. Further than that no more four-cylinder pleasure cars will be built, no information regarding either construction or prices of the new "sixes" was disclosed.

Agner Takes on an Electric Horn.

The Raymond C. Agner Co., of Burlington, Wis., will add several new accessories to its line of grease guns, wrenches, plugs etc. The new articles are a grease gun and an electric signal horn. At the annual meeting, Hugh Agner was re-elected president; Edward Brook, vice-president; Dr. C. H. Meyst, secretary; and George Weiler, treasurer. Agner continues as general manager.

Garageman Burned in Garage Fire.

William Dennison, one of the proprietors of the Lock City Auto Co., of Sault Ste. Marie, Mich., was severly burned last week when the company's garage caught fire; his injuries rendered his condition critical, but he will recover. The fire started from a tank of gasolene and did $10,000 damage.

Studebaker Gets Drawback on Gear Cases.

The Treasury Department last week allowed the Studebaker Corporation, of Detroit, Mich., a drawback on gear casings when exported as part of the rear axle and gearset of Studebaker model "25" cars. The cases are made from imported aluminum by the General Aluminum & Brass Castings Co., of Detroit.

Braender Tire Asks Unpaid Account.

The Braender Rubber & Tire Co., of Rutherford, N. J., filed suit this week in the Supreme Court for New York county against G. O. Reynolds, Inc., of New Rochelle, N. Y. The complainant asks $140.40 for goods sold between February 10 and March 23, 1913.

Deserts Milwaukee for "Windy City."

The El Starr Mfg. Co., which produces automobile supplies and at present is located in Milwaukee, Wis., has leased the sixth floor of the Wilson Building, 223-229 Erie street, in Chicago, Ill.; the entire business will be removed to the new location.

Indian Pursues Oneida County Man.

The Indiana Refining Co. this week commenced suit in the Supreme Court for New York county against L. E. Worden, of Whitestown, N. Y., for $48.37; the amount is the balance of a bill for goods sold between July 23 and November 22, 1912.

SOLVING THE FENDER PROBLEM.

When, during the last automobile show season, the products of factories all over the country were lined up and critical comparisons could be made, it became apparent at once, even to those who were not much given to critical survey, that greater attention had been paid to fender design during the year gone by than had been the case in any previous year. It became apparent that fenders had been made to fit more properly, that their lines had been smoothed out, so to speak, and that due regard for glossy paintwork was in a fair way to being acknowledged.

And now that the newer crop of cars is coming through the factories it is just as plainly apparent that the promise of something still better is being fulfilled. Among the new cars that already have been made public, a sufficient number to warrant attention being called to the fact, are fitted with domed fenders of a type that may be expected to afford maximum protection to paintwork and to passengers.

These domed fenders are not new, of course; they have been known abroad for a number of years, and a few—a very few—American cars have been fitted with them in years gone by. But this is the first time that there has been evidenced any general tendency on the part of manufacturers of low and medium-priced cars to adopt them, despite their beauty of outline and their greater utility as compared with the straight fenders with which every one is familiar.

Their shape permits them to be so placed that they hug the tires more closely than do straight fenders, and for this reason they not only enhance the appearance of the car to which they are fitted by eliminating the gaping holes between fender and wheel, but they materially reduce the possibility of mud splashing, which is far more important. On either score, their adoption is a laudable attempt to make better something that never has been surpassingly good.

TWO-SPEED AXLES AND "GAS" CONSUMPTION.

Whether or not the rocketing price of gasolene has influenced the designers on both sides of the Atlantic who have evolved two-speed axles—that is, bevel gear drive systems providing two direct drives, each through its own individual pair of bevels—it is difficult to say; not unlikely it has done so. It is a fact, however, that the two-speed axle is conducive to gasolene economy, in theory at least, though just how far practice and theory agree in this instance only time can tell.

The reason why the two-speed axle should be conducive to gasolene economy is not difficult to understand; it greatly increases the range of gear ratios and makes it possible to run the motor at the most economical speed for the existing conditions. To illustrate the principle involved: Suppose a car to be ascending a grade at a speed the motor is capable of maintaining at 600 revolutions per minute, but that the nearest to the proper gear ratio forced the motor to run at 800 revolutions per minute. It is clear that the motor would be burning "gas" to no purpose, and at the same time wasting power and causing wear and tear by internal friction. With a proper gear ratio, however, the motor would give maximum power for the fuel consumed. A point to note in this connection is that where it is necessary to run on a low gear and yet throttle the engine to prevent racing, the partial closing of the gas intake causes partial vacuum in the cylinders. It requires energy to produce the partial vacuum, and gasolene to produce the energy.

VALUE OF PROPER SHOP EQUIPMENT.

Good men count for much in the repair-shop. Without them neither good work nor profits can be looked for. But no amount of skill or conscientiousness on the part of the men can compensate for time lost in doing by hand things that can be done much quicker and much better by mechanical aids. The repair man who is obsessed with the idea that he can wriggle along somehow without modern appliances, competing with shops that are modernly equipped, stands an excellent chance of being left behind in the rush for business and financially falling by the wayside. He is far less likely to get business than the more enlightened proprietor.

Portable cranes, which are treated elsewhere in this issue of Motor World, are important time-saving devices; but they are by no means the only devices that are available for use by those who are sufficiently far-sighted to perceive their real value in holding customers and, in the long run, increasing profits.

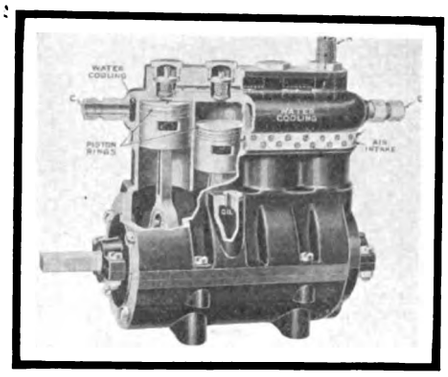
POWER TIRE INFLATORS ADDED BY STEWART-WARNER

Cylinders Are Block-Cast and Have Ring-Packed Pistons—Two- and Four-Cylinder Models, Air and Water-Cooled.

Soft and yielding as the atmosphere is on some occasions—in the spring, for instance—there are times when it becomes exceedingly hard and stubborn, and needs no little forcing to get it to go where it is most needed—into a tire, for instance. And it is just because the air so obtsinately resists compression that a pump intended to handle it rapidly and in considerable quantities has to be a decidedly substantial bit of mechanism. To go a step further, that is the reason why the Stewart-Warner Speedometer Corporation, of Chicago, has taken the pains it has to make a little bit of a four-cylinder air-pump extremely strong and sturdy—in fact, it is built for all the world like a little gasolene motor.



The four cylinders, which have a bore of 1 7/16 inches and a stroke of 1⅛ inches, are cast in a single block, of gray iron, and the upper half of the crankcase is integral with the cylinders. The pistons are die-cast, fit the cylinders accurately and are provided with two ground and lapped rings each, so that not only is the compression good, but the lubricating oil in the base cannot work into the compression space. The compression space is thoroughly cooled by a water jacket or by cooling flanges, the jacketed type being best for hard and continuous work and the air-cooled machine best for intermittent work, such as the occasional inflating of tires.

The shaft is a plain, straight piece of ¾-inch steel and on it are mounted four eccentrics, by which the pistons are reciprocated through substantial hardened steel connecting rods. The shaft runs in two long bearings, each of which is provided with an oil pocket with its opening inside the crankcase so that it receives splashed oil in liberal quantities. On the bottom of the crankcase are lugs for bolts by which the machine may be screwed to a base or to the running-board of a car. A drain cock affords means for occasionally removing old oil and a combined vent and filler opening permits refilling.

As befits a machine that is intended to run for a long time without special attention, the valve system has been made exceedingly simple and what few parts are used are not liable to derangement from any ordinary cause. No valves, in the ordinary sense of the word, are used for the intake; in-tead, there are ports in the cylinder walls which are uncovered by the pistons, just as are the ports of a two-cycle motor. The intake air openings are screened to prevent the ingress of dirt. The delivery valves are located in the cylinder heads—one to each cylinder—and are of the poppet type.

While every precaution is taken to prevent oil from working up past the pistons in excessive quantities, it is difficult to avoid a slight amount, and to take care of this there is a separator in the delivery line. This is an effective little device that thoroughly purifies the air before it enters the tires. A drain cock on the separator provides a way of getting rid of oil that may accumulate after long running.

In addition to the four-cylinder pump described, the Stewart-Warner people are building a two-cylinder pump which, however, differs from the "four" only in the number of cylinders and, of course, the consequent reduction of capacity. The four-cylinder pump is a compact affair, measuring 8 inches in length, 7½ inches in height and 4 inches in width. When the pump is to be operated by hand a suitable crank is furnished for the purpose. With each pump there is supplied a 10-foot length of air hose with the requisite connections.

STEWART-WARNER PUMP

Lincoln Highway Now "Lincoln Way."

Although it always has been referred to as the Lincoln Highway, President Henry B. Joy of the Lincoln Highway Association has rechristened that much-mooted transcontinental road; he has styled it instead "The Lincoln Way," and as he has gone to the trouble of copyrighting the new name, it is likely that in time it will be formally adopted and will replace the old.

To Attack Ohio's State License Law.

Following the example of motorists in some other States, the Ohio State Automobile Association has decided to attack the new automobile State license law which practically doubles the tax, which ranges from $5 to $18; the attack will be upon the grounds of the constutionality of the tax and upon the charge of exorbitancy.

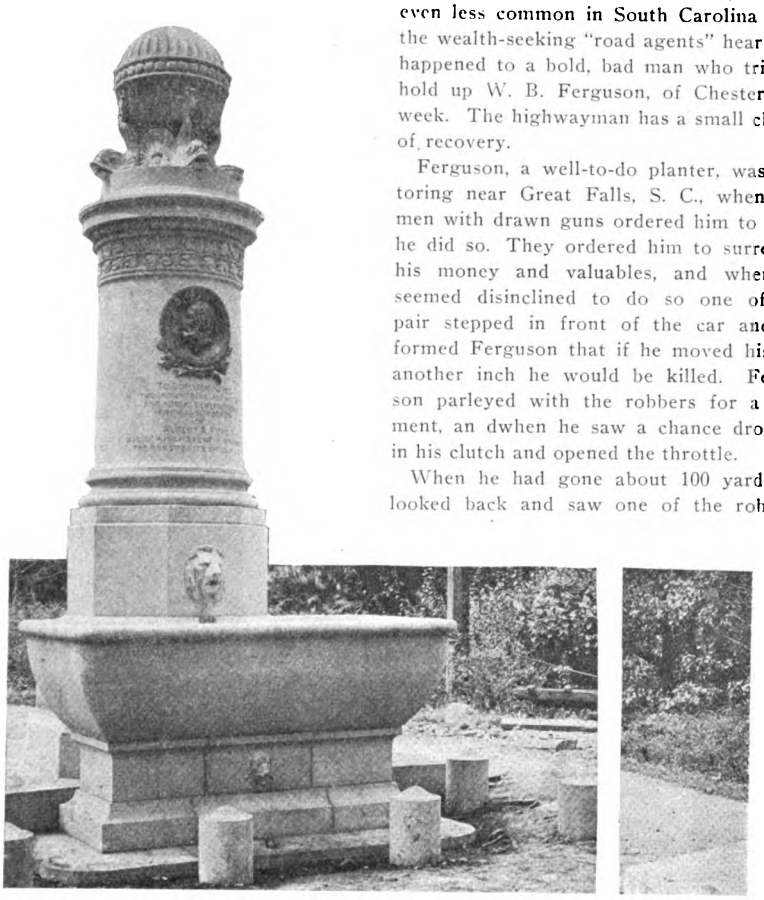
MAKE READY TO DEDICATE POPE MEMORIAL FOUNTAIN

Monument Already in Place at Entrance to Pope Park in Hartford—To Commemorate Deceased Manufacturer's Activities.

Although the date of the dedication and the details of the attendant ceremonies have not yet been decided, the Pope Memorial Fountain at length has become a whole reality, and it now stands, as originally was intended, at the entrance to Pope Park, on Capitol avenue, in Hartford, Conn., opposite Terrace Park.. Except that the ground around the monument requires a little manicuring, the fountain is complete and is a fitting tribute to the untiring efforts of Col. A. A. Pope in promoting good roads, and to his business acumen which probably first was felt as long ago as 1878, when the American bicycle industry commenced to rear its head and then to assume such gigantic proportions.



Although best known for his interest in that industry, Col. Pope's interest in the manufacture of motor vehicles dates back to 1897, when a motor carriage department of the Pope company was formed to produce an electric vehicle. Later, the Pope-Hartford gasolene car and the Pope-Tribune both were directly developed by the Pope company, though Pope-Tribune long has ceased to exist.

Credit for the original idea of erecting the fountain as a memorial to Col. Pope belongs to the Bicycling World and Motorcycle Review, which shortly after his death on August 10, 1910, suggested the monument and headed a fund for its erection with a donation of $100. The fund grew rapidly and, though most of it was subscribed by Col. Pope's business associates other than those directly connected with the automobile industry, that those in that industry took an active interest in the project is revealed by the fact that a substantial part of the total amount donated came from automobile dealers and manufacturers, among which are the Pope Mfg. Co., the Pierce-Arrow Co., the Hartford Rubber Works, the Columbia Motor Car Co., and others.

As may be seen by the accompanying illustration, the fountain is an imposing work of art. The stone portion of it is red Westerley granite and the base is arranged with drinking facilities on one side for thirsty horses and dogs and on the other side for pedestrians. Water to fill the great horse trough, which is hollowed out of a single block of stone, falls from the gaping jaws of an antique lion's head carved out of the granite, while water for the low dog trough appropriately flows from a stone dog's head near the base. On the opposite side is a sanitary "bubbler" at which "humans" may slake their thirst. A cleverly carved fish is placed over the "bubbler" bowl, but its only use is that of an ornament. Above the lion's head, on the granite pillar, there is a striking bronze portrait of Col. Pope. The pillar has a molded cap and is surrounded by a large granite ball supported by dolphins. The ball, which is about 2 feet 6 inches in diameter, has a band encircling it filled with smaller balls, suggestive of the ball bearings which formed the foundation of Col. Pope's early success in the bicycle industry. The inscription beneath the bronze portrait is as follows:

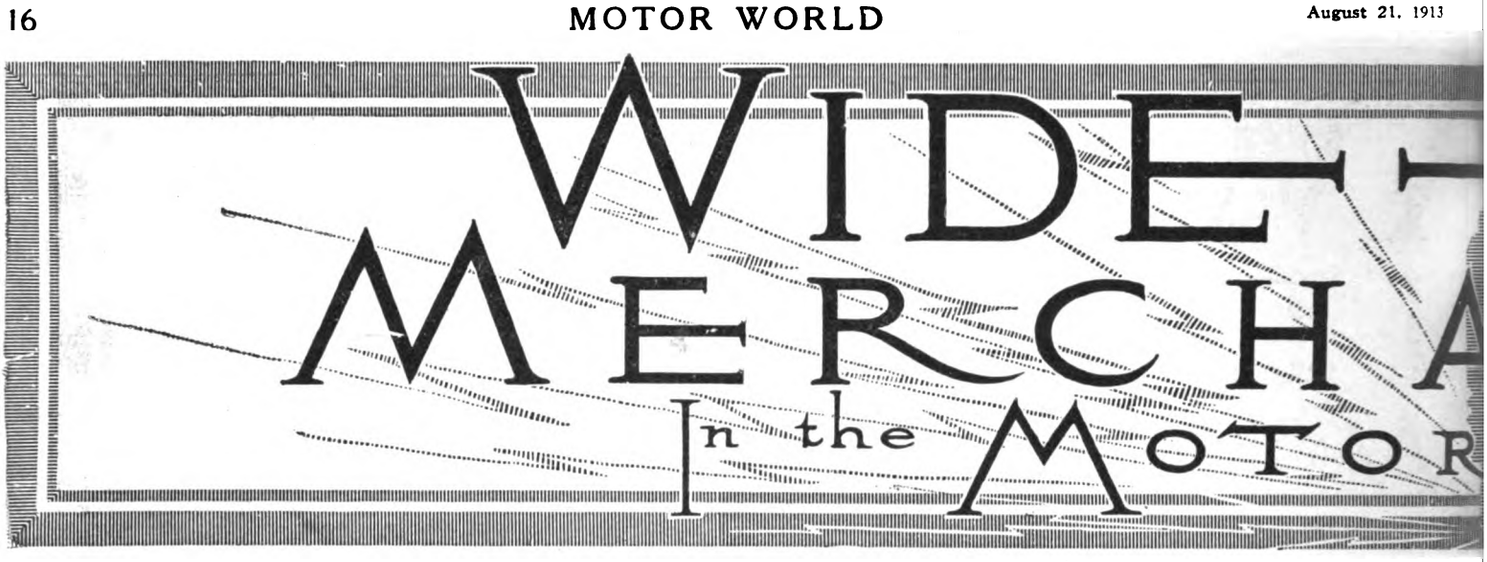
To Commemorate
The Industrial Activities
and Public Benefactions
From 1880 to 1905
of
Albert A. Pope
All of Which Greatly Advanced
The Prosperity of Hartford.

It is expected that the dedication exercises will be held some time next month after vacations are over and those interested in the monument have returned to the city.

POPE MEMORIAL FOUNTAIN AS IT NOW STANDS IN HARTFORD

Runs Car Over Would-be Highwayman.

Robbing motorists at the point of a gun has not as yet proven a common pastime with highwaymen, and it probably will be even less common in South Carolina when the wealth-seeking "road agents" hear what happened to a bold, bad man who tried to hold up W. B. Ferguson, of Chester, last week. The highwayman has a small chance of recovery.



Ferguson, a well-to-do planter, was motoring near Great Falls, S. C., when two men with drawn guns ordered him to stop; he did so. They ordered him to surrender his money and valuables, and when he seemed disinclined to do so one of the pair stepped in front of the car and informed Ferguson that if he moved his car another inch he would be killed. Ferguson parleyed with the robbers for a moment, an dwhen he saw a chance dropped in his clutch and opened the throttle.

When he had gone about 100 yards he looked back and saw one of the robbers running away, while the other lay prostrate in the road. Ferguson summoned a physician, went back, picked up the injured man and carried him to a hospital.

Chalk Marks Aid in Law Enforcement.

In Los Angeles, where there is an ordinance forbidding the owner or driver of a car to leave the car at the curb for more than 15 consecutive minutes, the police have evolved a systematic method of keeping track of the cars and of enforcing the ordinance; when a car stops, a patrolman marks with chalk on the tire and on the curb adjacent the time the car was halted and if the car is still there after the allotted time has elapsed a court summons is attached to the steering wheel. If the owner does not respond to the summons the police look him up, having taken a record of the car and number.

"HIGH BROW" SALESMANSHIP

Fine-sounding Methods of Efficiency "Experts" That Do Not Always Work Out in Practice—Must Understand Disease Before Trying to Cure It.

The efficiency "expert" is frequently heard from nowadays addressing salesmen in all lines of business. He tells them how to do things as seen from his idealistic point of view, and it looks awfully logical to the salesmen while they are "in convention assembled."

Some of the men wonder why they have been such dubs for a long time and how it is they have managed to get the business in spite of their ignorance. But some of them aren't jollied a bit. They view the talk-fest in the light of their own practical experience, and they know that conditions as they actually are require entirely different kind of treatment. They listen respectfully and arise with the rest when the "boss" asks, "Is everybody in favor of this?" and then they go out and sell goods their own way. And they sell them.

Must Believe in Goods to Succeed.

Sometimes even the sales manager knows that the stuff that is being handed out does not ring true, but he lets it get over just the same. Why is it that men of capacity will fool themselves in this way? These same men know that unless a salesman knows his goods and honestly and sincerely believes in them, he will never make a howling success. And yet they will try to sell the entire selling force of the company an idea which they do not sincerely and honestly believe in themselves. It cannot be done.

The only way to tell men how to do things in a better way is get out and face their conditions in the field as they actually exist and not as they exist in our imaginations. If you want to know the correct remedy you must thoroughly understand the disease. There is much more to be said on this subject, and it is well worth thinking over carefully.

CHARACTER AND ITS VALUE IN THE COMMERCIAL WORLD

Character is the modern basis of credit. Men will take a chance with the man who has character for the very reason that they know they are not taking such very big chances after all, when a man with the right sort of character at the helm.

That is why commercial agencies and credit concerns always try to get a line on the personal character of the individual concerned. It counts more than money. The testimony of the late J. P. Morgan during the investigation of the so-called Money Trust gave character first place.

Could anything be more encouraging to men who are striving to develop character? Character is the only thing that can never for very long be successfully counterfeited. Character is an expression of what is within. If you are "square," men will find it out. If you are "crooked," much talking about your squareness will avail nothing; men will find you out.

Sincerity, honesty, initiative, persistency, combined with clean living and right thinking must develop the right sort of character. The law is immutable.

DETAILS THAT MEAN MORE TO PROSPECT THAN CAR ITSELF

On one of the big D. & B. boats there is a beautifully designed Gothic smoking room. The effect is that of an ancient Gothic chapel with its aisles, pews and organ. At one end is a noble fireplace with a big, solid shelf like a bit from some old castle. The wood carving is fine in design and execution. The lighting is beautiful. It is a new idea on a fresh-water boat, and wins enthusiastic praise from those who love and appreciate such things. It was interesting to note the different features that appealed to different persons. To some it was the entire conception of the magnificent salon, but to the many it was some particular detail.

"Isn't this fireplace grand?" "My! These seats are comfortable!" "That's carved from solid oak." "Did you notice the candle effect of the lights?" "Say! That's a great imitation of a fire." Those were the expressions most commonly heard.

Few Grasp More Than Part of Details.

What has this to do with better merchandising? Simply this: It drove home to the listener the fact that in salesmanship, no matter how splendidly a proposition is presented, there are few who grasp more than some of the details.

You can go into the matter as deeply and thoroughly as you will, and when you get through you often find that it is the details that have lodged—and not the big idea. Thus it is that cars have been, are being and will be purchased on the strength of some more or less important detail like the color of the body, the style of the upholstery, the kind of clutch, the type of motor, the clever little conveniences for storing away caps and goggles, and so on.

Happy is the salesman who can read his customer with sufficiently keen analysis to discern the point of appeal and concentrate his attack accordingly.

When It Is Time to Leave Prospect.

When the other fellow is not interested and continues to sign letters and answer 'phone calls, beat it. Your story is too valuable to both of you to be lost between a telephone and a pen. A remark that you see he is busy (business of rising and reaching for hat) will sometimes cause him to sit up and take notice. But even then it is best to go—and come back some other time, preferably by appointment.

"SELF-DEVELOPED" PROSPECTS

How Best to Get Trade of Man Who Is Not Known to Be in the Market Until He Buys—Reputation for Squareness as "Silent" Advertisement.

Every dealer and salesman who is candid with himself realizes that there are many prospects who really develop themselves into buyers. This is attested by the fact that time after time sales of cars are made to individuals who, up to the moment they declared themselves, had apparently neither the inclination nor the coin to purchase an automobile.

In many cases the salesman or dealer is able to recall that he met the self-developed prospect before; it may have been socially or it may have been in some business transaction, but whenever or wherever it was there was nothing to indicate that the individual concerned was a first-class automobile prospect.

Not Known as Prospect but Buys.

Suddenly this person comes in and buys a car from him or from some other dealer, and he realizes that he has been talking to a prospect all the time and knew it not.

If the sale is made by you there is no cause for worry; if not, it is certainly worth while to try and find out why the buyer was attracted elsewhere. In either case, the thought suggests itself that if there is one buyer of this type, there must be others, and therefore it would seem good business to give a share of attention to plans for the luring of this "self-developed" or "silent" prospect.

Inasmuch as one does not know who he is or where he is, one cannot very well go after him with a follow-up system. The daily papers will probably reach him as effectively as any means of advertising, but the thing that will pull him in stronger than any printed word is your reputation. The fact that you give every buyer a square deal; that you look after the customer's interest as well as your own; that your guarantee means something; that it is a pleasure to do business with you, etc., is sure to leak out. The obvious conclusion is, therefore, that to draw your share of the business of the self-developed prospect class, reputation will prove the most powerful magnet.

It would pay some dealers to get out among their customers in disguise. If they were willing to learn they would discover some amazingly wholesome truths that would cause a startling change in policies and methods.

DEALER WHO FOUND PROFIT IN "PROFITLESS" GASOLENE

"I have made a hit this spring and summer selling gasolene to Ford owners at practically what it cost me," says Dutee W. Flint, Providence, R. I., Ford dealer, in the "Ford Bulletin." "Perhaps my experience in this matter may interest you Ford men.

"At the outset, I had no idea how popular the plan was going to be. It looked to a good many motorists hereabouts as if the price of fuel was being pushed higher than necessary. We heard lots of grumbling. One day I had a chance to buy about 1,000 gallons of gasolene right. I put up a notice in my salesroom that Ford owners could have the gasolene 'while it lasted' (a la department store ad.) at cost.

Thousand Gallons Didn't Last Long.

"Believe me, that thousand gallons didn't last long!

"When it was gone, the brethren kept at me for more. I had a stream of them in the store all day, every day for a week. Prospects took an interest in the matter; they kept asking our salesmen if they could get gasolene at cost, should they buy a car. Many of these questioning prospects were 'hard customers'—men our salesmen had about given up. You know the kind I mean! The immense popularity of the idea set us a-thinking. Result: So far this season (June 15) we have turned over 76,679 gallons of gasolene strictly to Ford owners. I buy in big quantities, store in my own tank, and sell at the bare cost of goods, plus a small handling expense. One man gives his time and attention to this department. It is no trouble to the regular staff—and I come out whole financially. No dollars and cents profit—that's the idea; we give the Ford public the benefit of our buying and ask nothing in return but good-will.

Publicity and Good-will the Profit.

"Q—Where does our profit come in?

"A—Profitable publicity.

"I have kept a close watch on our gasolene experiment. My personal observations, together with salesmen's reports, warrant me placing the number of sales since February 1st, in which low-price gasolene played an important part, at 200 cars.

"Besides, to my thinking, it is another tie that binds the whole Ford family closer together, at least the Rhode Island branch of that grand, universal family of Ford owners."

CLEANLINESS AN EFFECTIVE ADVERTISEMENT FOR GARAGES

Cleanliness is a great advertisement for a garage. It may take the form of clean windows, shining and spotless in the noonday light; on the other hand, it may be the garage floor which is dustless and free from rags, odds and ends and dirt, and just as spick and span as the housewife's kitchen; again, it may be the clean sink, where customers and employes can wash hands and wipe them on a clean, white towel, that attracts patrons. But this one thing is sure—that cleanness never fails to attract nor dirt to repel. A dirty garage or salesroom, like a dirty suit of clothes, advertises the owner as careless—and it is hardly the kind of advertising that pays.

HOW A 20% PROFIT MAY BE PROFIT OF LESS THAN 20%

Adding One-fifth to Cost Does Not Give a One-fifth Gain on Selling Price — Fallacy Explained — Comparative Percentages.

If a dealer buys a car for $1,000 and sells it for $1,200, what per cent. profit does he make on his selling price? No, he doesn't; he makes 16 2/3 per cent. If he wants to make 20 per cent. profit on his selling price it is necessary to add 25 per cent. to the cost —not 20 per cent. It sounds puzzling, but it illustrates the wrong course of reasoning followed by many business men every year in figuring profits.

As a concrete illustration: Suppose a dealer buys his cars at a certain price, adds 20 per cent. of this price, sells them at the advanced figure, does the same with all accessories and supplies, and at the end of the year had $120,000. Is his profit 20 per cent. of the $120,000? Decidedly not; it is but 16 2/3 per cent. To make 20 per cent. profit on the selling price, he must add 25 per cent. to the cost, thus giving him $125,000. A little arithmetic will show where the twist comes; he has made 20 per cent. on his cost, but 20 per cent. of his gross receipts is not profit. He has made $20,000, which is 20 per cent. of $100,000, the cost, but not 20 per cent. of $120,000, the selling price. If he adds 25 per cent. of the cost, or $25,000, the selling price will be $125,000 and the profit $25,000, which is 20 per cent. of $125,000. Other percentages are:

5 per cent. added to cost is 4¾ per cent. profit on selling price.

7½ per cent. added to cost is 7 per cent. profit on selling price.

10 per cent. added to cost is 9 per cent. profit on selling price.

12½ per cent. added to cost is 11⅛ per cent. on selling price.

15 per cent. added to cost is 13 per cent. profit on selling price.

16 per cent. added to cost is 13.8 per cent. profit on selling price.

17½ per cent. added to cost is 15 per cent. profit on selling price.

20 per cent added to cost is 16 2/3 per cent. profit on selling price.

25 per cent. added to cost is 20 per cent. profit on selling price.

30 per cent. added to cost is 23 per cent. profit on selling price.

33 1/3 per cent. added to cost is 25 per cent. profit on selling price.

35 per cent. added to cost is 26 per cent. profit on selling price.

40 per cent. added to cost is 28½ per cent. profit on selling price.

50 per cent. added to cost is 33 1/3 per cent. profit on selling price.

60 per cent. added to cost is 37½ per cent. profit on selling price.

70 per cent. added to cost is 41 per cent. profit on selling price.

80 per cent. added to cost is 44½ per cent. profit on selling price.

90 per cent. added to cost is 47.4 per cent. profit on selling price.

100 per cent. added to cost is 50 per cent. profit on selling price.

Here's the Vest Pocket Route Guide.

The asking and answering of questions at crossroads and doubtful places still is a conspicuous part of automobile touring, and

CALDWELL'S POCKET GUIDE

probably always will be; but what with road maps, both "live" and otherwise, route cards and the like, the task of picking out the right road is considerably easier than it once was. And it is the aim of Henry Caldwell, of 137 East 16th street, New York, to make it even easier through the use of cards that fit into a leather case, leaving only the face of the top card exposed. The case is arranged to be buttoned over the rim of the steering wheel right under the eye of the driver. The arrangement of the information is shown in the illustration.

The running directions on the cards, which number 360 and cover New York, Long Island, New Jersey, Pennsylvania and New England, have also been bound in the form of a vest-pocket book with flexible leather cover; the book contains a key map with routes numbered to correspond with card numbers. For those who use cards only the key maps will be furnished free. It is planned to extend the scope of the scheme to cover the entire country, which will call for some 3,000 cards and six books. Garage and hotel lists will be included when this is done.

KISSEL COMMERCIAL LINE GIVEN NEW TONNAGE RATES

Three Models Are Lightened and Six-Ton Vehicle Added — Sub-Frame, Spring-Supported Motor Construction for All.

In figuring out what could be done in the way of improving its line of trucks preparatory to launching a new series, the Kissel Motor Car Co., of Hartford, Wis., apparently found little that could be criticised in the machines, for apart from the things that are stereotyped as "minor details," the changes decided upon are chiefly concerned with the capacities of the various models. Instead of tonnages of ¾, 1, 2, 3, 4 and 5 tons as formerly, the machines now run into intermediate capacities, the figures being ¾, 1, 1½, 2½, 3½ and 6 tons.

The motor suspension system is a new one with the Kissel people. The motor is bolted to a sub-frame and the sub-frame is mounted on four spring supports, the springs being compressed helicals, so that motion both up and down is cushioned. Left drive and center control are retained, as also is the four-speed gearset with selective control by a centrally located lever. Both radiator and fan construction have been improved, and the radiator spring suspension has been made a little better than in previous models.

The 1½-ton truck, the first of the new series to make its appearance, has a four-cylinder motor of 4¼-inch stroke and 5¼-inch bore, rated at 36 horsepower, driving through a large leather-faced cone clutch. Final drive is through side chains. The front wheels are 34 inches in diameter and the rear wheels 38 inches, and the tires, which are solids, are 3½ inches and 5 inches, respectively. The wheelbase is 132 inches. Top gear gives a maximum speed of 10 miles an hour under the control of a Pierce speed regulator.

The loading space back of the driver's seat is 8 feet long in the regular models, though a 10-foot length can be had at a slight extra cost. The weight of the chassis is 3,900 pounds. The turning radius is 25 feet. The usual truck equipment of two oil dash lamps, horn, jack and set of tools is provided. The chassis is sold separately "in the lead" or the car complete with any desired style of body.

Clark Truck Nearly Ready for Market.

The F. G. Clark Co., of Lansing, Mich., which has been developing a motor truck for some time, has its vehicle almost ready for the market. Clark himself is a former Detroiter.

"My Best Sale and Why I Regard It as My Best"

Indiana Salesman, in Competition for Motor World's Awards, Tells How an Early Morning Chance Prospect Bought on First Demonstration—Weaving Birthday Sentiment Into the Argument That Closed Sale.

By J. H. McKINNEY, Columbia City, Ind.

It was in the month of June, and as I turned the key in the lock and pushed open the door of one of the leading branch houses of the Middle West, the clock on the wall registered the seventh hour of the morning.

It was a beautiful morning, and I was feeling even better than the weather. I had risen shortly after sunrise, taken a cool dip in the tub and had motored downtown to get an early start after some of my particular prospects.

I had just stepped back into the offices to get some necessary papers, when I chanced to look out upon the street and noticed a lady and gentleman stop in front of the salesrooms; they were looking over my demonstrating car. Well, you know how a fellow's heart goes out to a person admiring his car, and I lost no time in letting that good old heart of mine take me with it.

Nice Morning an Aid to the Sale.

Stepping up to their side, I remarked upon the beauty of the morning and how refreshing it was to be out humming over the country roads inhaling the crisp morning air. Every "old fisher" who has handled a rod and reel has made at some time a freak cast. That's just what I did right there. Being strangers to me and also to the city, I just "cast" as I myself was feeling from my morning spin. "Ker-splash!" Away went my "spinner," as I heard the lady remark to her companion, "That's just what the doctor told us both," I immediately got busy with my reel handle attached to the car, and almost before the echo of her words had ceased I sat behind the steering wheel with the gentleman by my side and the lady resting contentedly in the rear seat.

Out to the country I headed as fast as good judgment and speed laws would permit. I chose a course along the river banks, where I knew I could find plenty of good old health-producing air and beautiful scenery.

When I had reached an ideal spot along the road, I arose and invited him to place himself behind the wheel and see what real sport really was. It did not take any coaxing, for the voice in the rear was "for" me, and we were soon bowling along at 15 miles an hour.

Motor World offers four awards of $30, $20, $15 and $10 for stories by salesmen of what they regard as their best sale. Have you ever made a sale which you think required real salesmanship? If so, send your story before September 1. Your name will not be used if you so request. The competition is open to every salesman in the automobile trade, whether he sells pleasure cars, trucks or accessories.

Silently we wended our way around the river, up the hills and down through the crop-laden valleys, the man absorbed in his work, the woman drinking in the beauty of the ride; and as for myself, I was giving my "fish" plenty of line, consisting mostly of the wonderful advantages and benefits that were being reaped by the use of the motor car.

Shortly we drew near to a very favorite spot, which I'll call the "Chicken Inn." I turned the key in the switch and let the car come to a standstill right in front of the door.

Breakfast Fitting End to Drive.

I remarked that, having forgotten my regular morning exercise commonly known as fighting flies from the breakfast table, that I would indeed be pleased to have them join me at this particular time and place. That 12-mile drive had worked wonders with those two frail appetites, the same as it had with mine; in fact, the house lost money on those three meals.

Two good cigars and a packet of gum started us back to the city, and then I began to land my cast. Out-bound I had noted and studied my man from every point and had grown to know their likes and dislikes pretty well. I learned that they had come to the city to look at one of our competitor's cars, but had found their salesroom locked and had just strolled on up the street until they had reached our place. Being the first car they had come close to, they stopped merely to look it over.

Interested in my work and in my companions, I had not fully thought who was driving until we had crowded a horse into the ditch and missed the buggy only by the narrow margin of a couple of inches.

This just put the finishing to his driving; in other words, it gave him full confidence in his ability and had its share in the sale later.

Arriving at the branch, I took no chances, but drove them to the rear and into our garage before letting them out. Here I took them through our repair and parts departments, showing them our method of taking care of our owners' cars and our ability to supply any part or number of parts, at any time upon a minute's notice. I made them feel that we were a great deal more interested in their welfare after buying than before.

Impressive Climax to a Real Sale.

Entering the salesroom, I requested them to sit in the floor model and note the comfort of a new car. Sitting in the car, they recited the story of their ill health and the advice given by their physician to secure a car.

I paid the strictest attention to every question asked and answered it in language that they could easily understand.

I talked but little of the mechanical features of our car, but instead laid great stress upon its comfortable, serviceable and durable qualities. I learned that the coming day was a birthday for the lady, so when I began to feel about for just that one little thing at the very last minute to help close the deal, I bumped right into this yearly birthday present idea, and "Slap! Bang!" I let him have it full force. He had a wife, she had the birthday and, lucky for them both, I had the car—in fact, they didn't have to wait several days or perhaps weeks for it, but they could get it now—this very car they were in—and could spend the next day on a birthday joy ride going back home. You should have seen that little woman get on my line also; and as I handed him the order book and pencil she leaned over the back of the front seat and—well, for his sake I looked the other way, but I heard the smack, followed by that pleasing sound of the pencil chasing itself across the order pad.

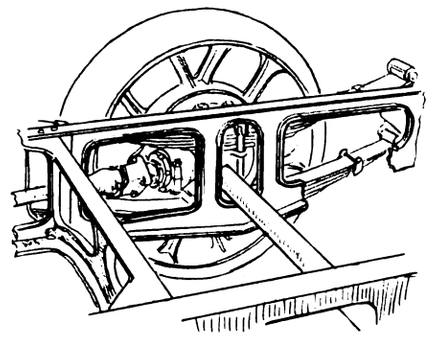
HARTFORD SHOCK ABSORBER WITH GRADUATED FRICTION

Old Maker Modifies Original Idea to Compensate for Big Bumps and Little Ones—New Construction Made Plain.

The fact that the retarding effect of a shock absorber should be at its minimum when the car is riding over smooth roads and at its maximum when the going is very rough has been recognized by the Hartford Suspension Co., of Jersey City, N. J., in fitting its latest models with a device which brings about just such a state of affairs.

The accompanying illustration shows that the new "automatic" model differs but little from its predecessors in appearance, at least. The upper arm, however, really is a compound arm and is in three parts. One is the regular long arm extending from the friction joint to the point of attachment to the frame, while on each side of it are short-

TRUFFAULT-HARTFORD "AUTOMATIC"



er arms, the front one showing in the picture.

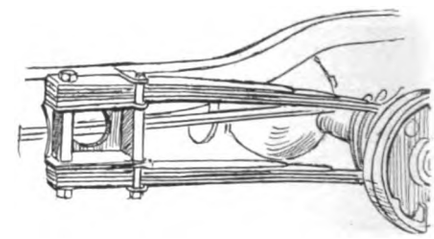
The short arms receive motion through pins on the long arm; but as the pin holes are elongated, the short arms do not commence to move until the oscillation is sufficient to move the pins a greater distance than the length of the slots. The back arm has the longest slot. On smooth roads the long arm only is working, and the friction is slight. A rougher road causes a wider range of movement, and the front short arm is picked up on the pin, and it doubles the friction. A very rough road increases the swing of the car on its springs and the second short arm is picked up, still further increasing friction. Thus there is ample retardation when it is needed, but not when it is unnecessary.

Develops Unusual Frame Construction.

Whether or not it has sufficient merit to warrant the trouble and expense of the decidedly complex construction involved, the frame, drive and spring design of the British Austin delivery wagon certainly is ingeniously worked out and is, to say the least, different from others, as is very clearly shown in the accompanying illustration of the rear end of the machine.

The frame, to begin with, is of open girder construction, which undoubtedly gives great vertical stiffness for a given weight of material, and the rear axle, of the dead type, passes between the upper and lower members; vertical integrally formed braces extend between upper and lower members before and behind the axle, which thus is in a sort of slot in the frame, the opening being amply large to afford all the play required even on the roughest roads. While it is difficult to say whether the frame should be called underslung or overslung, as it really is both, it is equally difficult to

AUSTIN FRAME DESIGN



apply proper terminology to the springs, which are in the same dubious class. There are two semi-elliptic springs, one above and one below the axle, which is rigidly clipped to the centers of the springs. No torque rods or radius rods are required with this spring arrangement, despite the fact that the drive is taken wholly through the springs, for there is sufficient rigidity for the purpose.

Most unusual of all, perhaps, is the driving system, which is of the bevel gear type, despite the fact that the axle is dead. The answer to the seeming conundrum is that there are two separate drives, one to each rear wheel, each wheel having its separate propeller shaft, bevels, housing and so on; the shafts are, of course, fitted with the universal and slip joints necessary to compensate for both vertical and longitudinal relative movement between the frame and the wheels. The details have been worked out with extreme care, and the machine is said to be a decided success, at least from a mechanical point of view. One advantage that is claimed as a result of the somewhat extraordinary construction is a very low loading platform and a low center of gravity. It is also said that all the working parts are very accessible, though it is a little difficult to see how the bevels are to be reached any more readily than with the usual type of single shaft drive—in fact, it would seem as if access were less easy, to which must be added the fact that there are two sets of bevels instead of one.

DOUBLE CANTILEVER SPRING EVOLVED BY BRITISH MAKER

Unusual Construction that Materially Increases Resiliency by Reducing Internal Friction—Damping Effect not Sacrificed.

The variations that are possible in the arrangement of springs are almost endless, though it goes without saying that some of the possibilities are not practicalities. The accompanying illustration shows a rear suspension employed in a British gasolene car, the Waverley; the resemblance to the Lanchester or cantilever design is plain, but there is the important difference that, instead of the single spring of the Lanchester system, there are two springs, one terminating above and the other below the rear axle and with their butt ends clipped to and spaced by a bracket which is bolted to the frame of the car. The arrangement is said to be extremely easy-riding and to possess shock-absorbing qualities to an unusual degree. The principle of subdividing the springs into a considerable number of thin leaves is one that is recognized as being conducive to quick response to vibration, and the use of two comparatively light members instead of one heavy member eliminates a certain amount of spring friction and permits strong construction and simple and satisfactory fastenings at the axle end.

BRITISH WAVERLEY SPRINGS

Work and Overwork for Starters.

An engine-starting electric motor is designed to turn over the engine as much as may be necessary to start it under all ordinary conditions, and usually has a considerable surplus capacity so that abnormal conditions may be dealt with to a certain extent. That is no reason, however, why the electric starter should be kept turning the motor over if it refuses to start, instead of promptly locating and remedying the defect that prevents starting. Electric cranking will not start a motor that is not in condition to start any more than hand cranking. If the electric motor is kept running it will so reduce the capacity of the battery that a start will be impossible when adjustments have been made.

TELLING THE TRUTH ABOUT NEW SERIES CARS

Reilly and the Sales Manager Discuss Relations of Manufacturer, Dealer and Prospect When Old Series Is Expiring—Reilly Declares in Favor of Frankness—Suggests How to "Move" the Old Cars.

"Come out into the factory, Reilly, and e how the new series cars are coming rough," said the Sales Manager, as he ose from his desk and reached for his hat. They're going to look pretty good."

"Everything moving according to sched-le?" asked Reilly, as the two went out ward the humming shops; if the Sales

"IF I CAN'T BE SQUARE AND SELL CARS, I'LL QUIT!" ASSERTED REILLY

lanager made any answer to the question eilly never heard it, for just at that mo-ent they opened a door and the screaming f a big turret lathe made inaudible all ore moderate noises.

Down between rows of smaller lathes and rills they picked their way and through e engine assembly, where Reilly insisted pon stopping to examine the first of the ew series motors which even then were ell on their way to the testing depart-ent. But the Sales Manager wanted eilly to see some of the new bodies, which ere not so much different after all, and t this department of the factory they final-arrived.

"What's the idea?" asked Reilly, point-g to a body which in color, shape and early everything else stood out from the thers like a straw hat at Christmas.

"It's more than I can tell you; the cus-tomer ordered it that way; it's just an idea of his, I guess."

"Do we get these new ones according to schedule?" inquired Reilly, thumbing the as yet unattached end of a piece of up-holstery leather.

"I don't know why not," was the reply. "Everything is moving according to sched-ule. Why? Have you got some old series cars left over?"

"One or two, but that isn't worrying me; I was just wondering if I was going to be able to make deliveries when I expected. But Gott dir helfen if you slip up on my demonstrator!"

Doesn't Cover Up Points of New Series.

"Are you going to be able to get rid of the old series cars?"

"Oh, I guess I will," replied Reilly. "I always have."

"At list?"

"I ought to."

"Are you saying much about the new cars and the new starter? And the lower price?"

"I certainly don't cover it up," was Reilly's answer. "Why should I? People ask about those things, so I tell them."

"Doesn't it make selling the old cars harder to make a noise about the new cars while you have old ones in stock?"

"That's something that is the cause of a lot of trouble in the trade, Jim, but I've found that the best way out is to tell the truth and take a chance on landing right side up in the long run. I think it pays."

"That sounds logical, if you can do it, but most factories and dealers hesitate to attempt it."

Dealer's and Manufacturer's Problem.

"I know it, Jim, but it's something that's got to be figured out sometime or other; it puzzled me, and I thought it over for a long time before the matter resolved itself into a definite policy. Now I tell the truth to my customers pretty much and I find that it works out well."

"Don't we at the factory tell the truth, too?" inquired the Sales Manager.

"Yes, you're pretty square with the public," meditatively responded Reilly. "I suppose it is a problem with a manufacturer to unload his old product before his new is on the market, but, nevertheless, I can't persuade myself that it is right to do business the way some of them do. There are two phases to the proposition—the dealer's and the manufacturer's—and as concerns the manufacturer, I don't think some of them pursue a fair and honest policy in handling their product."

"For instance."

An Advertisement That Misrepresented.

"Well, there's the ——— company. You probably noticed some time ago, just at the time when people naturally expected they would be bringing out a new lot of cars, that they ran considerable advertising stating that in the new series of cars, or the new year's cars, whichever you chose to call it, they were obliged to boost prices a little, owing to the quality of car they were offering. They said it was a question either of cutting down the quality or of boosting the price, and that they firmly believed the public would rather pay a little more for such a good car than the same or less money for a car not as good.

"The scheme worked fine from the manufacturer's standpoint, temporarily, at least. People thought, 'Here's the ——— car, a

Digitized by Google

mighty good car. I have been thinking of buying one. If I wait it will cost more than it does now, and it is so good now that any little improvement won't make much difference. It has a starter, electric lights and is thoroughly modern. I guess I'd better get one now.' The result was that the stock on hand moved off quickly and when it was time for the new series the old cars were all cleaned out.

Cut the Price Instead of Raising It.

"But then what? Instead of boosting the price, as they had said they would, they brought out the new series with a cut in price; of course, there was a fine explanation as to why it had been found possible to lower prices instead of boosting them, but do you suppose people are going to fall for that kind of bunk? Not for a minute! Those who bought the old series cars on the strength of that promised raise in price are a pretty sore bunch of people now. They find themselves stung to the extent of one or two hundred dollars in each case. And do you suppose anything that manufacturer says in the future is going to have as much weight with them as his previous statements did? I don't think so."

"Oh, Lord! We wouldn't do that!"

"I know you wouldn't," continued Reilly. "But it only shows you what some of them will do. I may be old-fashioned in my business methods, but I never could swallow this high-finance stuff. That goes for the dealer's end of it, too. To start with, no dealer should get more cars than he is fairly sure he can sell. If he works on that basis he ought to be able to be pretty well cleaned out by the beginning of the next season. But there are dealers, and not a few of them, too, who deliberately misrepresent things to their trade in order to move the cars of an expiring series.

Said He Knew Nothing About New Cars.

"One dealer whom I know told one of his customers—I suppose he told all of them, for that matter—that he had no idea when a new series would be out or what changes were contemplated in the line. And all the time he was telling it he knew they were going to add a little 'six,' and that it would be announced in about two weeks. He succeeded in selling the customer a 'four,' and so far as the car itself was concerned it gave the owner the best of satisfaction. He had no fault whatever to find with it, but I'll bet money he'll never buy another car of that dealer.

"And why? In two weeks the company opened its advertising campaign and flashed the new little 'six'; the owner went to the dealer and asked why the dealer had said he didn't know anything about the new car. The dealer still insisted that he hadn't known anything about it until the ads were almost ready, while at the time the ads appeared he had his demonstrator on the floor. The owner said that if that was all the dealer knew about the line of cars he handled he was a damned poor dealer and that if he had known more the dealer was an infernal liar, all of which is true; and any man with common sense, the owner included, will incline to the belief that the dealer was a liar."

"Why didn't he try to make a trade and sell him one of the new 'sixes'?"

"The owner didn't want a 'six' particularly; he was satisfied with the 'four,' but it did rankle when he thought how the dealer

THE SALES MANAGER WAS WANTED AT THE TELEPHONE

had put one over on him. He was mad on general principles."

"What would you have done?" asked the Sales Manager.

"I would have done what I do every year. If a man asks me if we are going to bring out a new series I tell him the truth about it. But here is an angle that is seldom thought of in that connection: If a man wants a car he wants it now, and the having it all the time between now and the time he can get a new series car is well worth while. When I get a prospect at this time of the year, or when an old series is on the verge of running out, and he starts that new series talk, I proceed to show him the car I have on hand and show him that instead of being about to become obsolete and a back number it is a mighty good piece of work.

"These periods generally are in the early summer, so far as the trade as a whole is concerned, and the summer time is when a man wants a car and wants it badly. At that stage of the game he is going to waste a good portion of the summer if he waits for a new series car, for while they will be announced in a few weeks and I will likely have a demonstrator, it will be considerably longer than that before I will be able to deliver a car to him; and meantime he has lost most of his summer touring. That argument, I have found, is unusually effective, especially with the prospect who really wants a car, for there is no argument so powerful with a prospect as his own desire for a car. When he wants it he wants it. He is liable to make up his mind entirely on the strength of one single, nice day; but when he does make up his mind he wants the car and wants it then.

Old Series Cars Not Back Numbers.

"If a dealer isn't overstocked he ought not to have so many cars that he can't get rid of them; and if he is overstocked somebody is to blame—and it isn't always the dealer. The improvements that are being made to-day aren't so much as they were some years ago, and the man who waits for a new series car isn't getting an entirely different car, as he used to when the industry was younger. The old series cars that are about to make way for a new series of cars are not a back number; they are perfectly serviceable and up-to-date, as cars ago. They will give any man satisfaction, and he is likely never to regret having bought one. They generally can be sold and sold on a right basis; all that is required is a little salesmanship."

"It sounds well, anyway," commented the Sales Manager.

"It's just as sound as it sounds, too," asserted Reilly. "But in any event, I won't lie to a man. If I can't be square and sell cars I'll quit."

"Quit what—being square?"

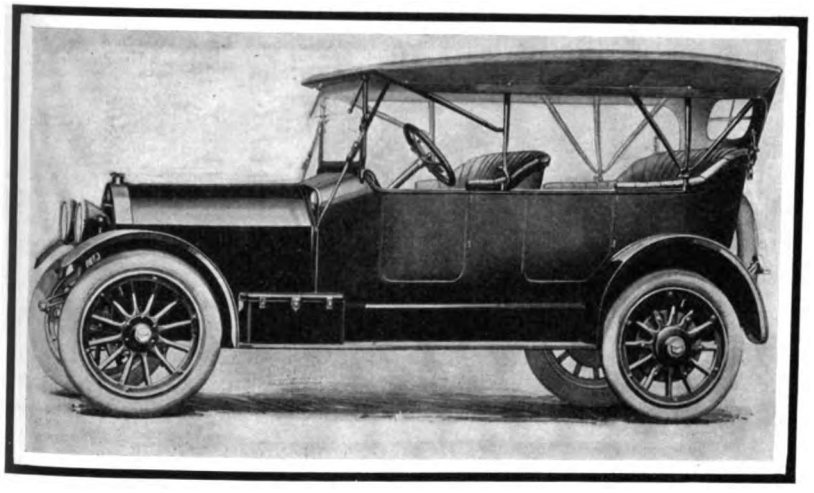
Would Lose Profit Rather Than Lie.

"I'll quit selling cars!" snapped Reilly. "If I have an old series car and can't get rid of it in any possible way before the new series cars come along I'll keep it, and if the new series cars are lower in price and I can't do anything else, I'll drop the old series car down to level with the new series car and sell it. I'll lose my profit on it before I will misrepresent things to my customers."

"But it's some problem, just the same," declared the factory man, "and it's one which ——"

Both turned as a shrill whistle sounded through the shop; when their eyes had located its source, they saw the foreman waving a summons. The Sales Manager was wanted at the telephone.

"Where have you been?" said the telephone girl. "I've traced you all over the shop, and always just a lap behind. Someone wants you in your office."



"Reilly's to blame for this, he coaxed me up here," he replied.

IX CYLINDER MARION CAR BUILT ON STANDARD LINES

earset Mounted on Rear Axle and Controlled by Central Lever — Equipment Includes Electric Lighting and Starting.

It cannot be said that there is anything the shape of radically novel construction the car that marks the entry of the Mar- n Motor Car Co., of Indianapolis, Ind., to the six-cylinder ranks. The machine, enerally speaking, follows more or less onventional lines and sticks quite closely to onstructional features that are known to e good, as is clearly indicated by the brief escription published in Motor World sev- al weeks ago. There are not a few de-

SIDE VIEW OF MARION "SIX," LISTING AT $2,150

ails, however, that stand out because of heir merit and that show careful attention o little things.

By way of brief recapitulation, it may be tated that the motor is of the L-head type nd has three bearings, which are hand fit- ed; the cylinders are cast in two blocks f three each, and the bore and stroke meas- rements are 3¾ and 5¼ inches, respect- vely, which, it is plain, entitles the motor to ntry in the long-stroke class. The A. . A. M. rating is 33.75 horsepower and the iston displacement is 347.8 inches. The amshaft is driven by "silent" chain and the nagneto and pump by spiral gears. The wheelbase is 124 inches, the tires are 35 x ½ inches, and the equipment, which is eally complete, includes a Westinghouse lectric lighting and starting system.

While the new machine is built in two nodels, known as model G5 and G2, the hassis is identical in both cases, the differ- nce being that in the case of model G2 he body is of the two-passenger roadster variety, while in model G5 the body is a comfortable touring body with seats for five passengers.

A detail of the motor that is better grasped by a glance at the illustration than by perusal of an extended description is the construction of the exhaust manifold, which is so formed as to give the exhaust gas the easiest possible path to the muffler. To this end the cylinder branches are connected with the main pipe of the manifold at such an angle that the gases have extremely easy turns and back-pressure due to resistance in the manifold is reduced to a minimum. The fact that all the valves are on one side makes it comparatively easy to enclose them in tight compartments. An ingenious method of lubricating the valve mechanism and at the same time eliminating the usual breather pipe consists in drilling small holes from the crankcase into the valve mechanism pockets, so that the alternations of pressure in the crankcase serve to blow a mist of oil on the moving parts of the valve operating gear and keep it well oiled without other special provision. Small holes in the cover plates provide against accumulations of pressure. The oil formerly wasted is used by this means, the breather is done away with and the task of keeping the exterior of the engine clean is made just so much easier.

Drive from the Westinghouse starting motor is effected through a "silent" chain transmitting power direct to the front end of the crankshaft, there being a reduction of 15 to 1 in the system. The chain and its sprockets are enclosed in an oil-tight casing and the system that lubricates the motor is made to take care of the starter drive, too. The magneto—it is a high-tension machine and forms part of the dual ignition system—is coupled to its driving shaft by flange couplings so arranged that changes in timing of as small an interval as two degrees can be made without fussing with the gears. The system is simple enough, consisting in the drilling of bolt-holes in such positions that by shifting the bolts from one set of holes to another the required changes in timing easily can be made. This is a detail which, though it might be considered insignificant by some, is like a revolver in that it is not needed very often, but when it is needed it is needed badly.

Power is transmitted from the motor to the rear driving mechanism through a disk clutch running dry and having nine driving and ten driven plates. The propeller shaft lies between the clutch and the gearbox, the latter being mounted on the rear axle, rigidly bolted to the differential housing. Three speeds are provided, with the usual selective control through a centrally placed ball-handled lever, the high speed or direct drive having a ratio of 3¾ to 1. The rear axle is of the full floating type; drive from the live shafts to the wheels is not through the usual dogs fitting into notches, however, but through flanges extending from the shafts and bolted to the hubs of the wheels. The wear that occurs in driving notches and dogs thus is eliminated. Both sets of brakes are of the internal expanding type housed in pressed steel drums on the rear wheels, and the braking surface is large enough so that the wheels can be locked without exerting any great pressure on the lever or the pedal, as the case may be. The rocking shafts and other brake connections are worked out in a decidedly neat manner and all are amply strong to stand the stresses that are likely to be placed on them.

As in the past, the Marion chassis is mounted on springs of English Sheffield steel, the front springs being semi-elliptics and the rear springs three-quarter elliptics. The eye-bolts in the springs are made hollow and act as oil reservoirs, and wicking is provided to carry the oil gradually to the bearing surfaces. Once the little reservoirs are filled, the driver can forget this part of the car for months at a time, and there are no grease cups or oilers to forget and to get knocked off.

A decidedly sensible method of carrying the spare tire on the rear of the car is a feature of the new Marion. The usual pocket and set of straps is replaced by a tire rim securely bolted to the car; on this rim the spare tire is placed and held by a single lug which is easily loosened with the tire wrench, holds the tire firmly and can be manipulated a good deal more quickly and easily than a multiplicity of leather straps and buckles.

The car is thoroughly up to date in the matter of control. The steering wheel is on the left side, the ball-handled gear-shifting lever is in the center with the brake lever beside it, and there is a cowl-board on

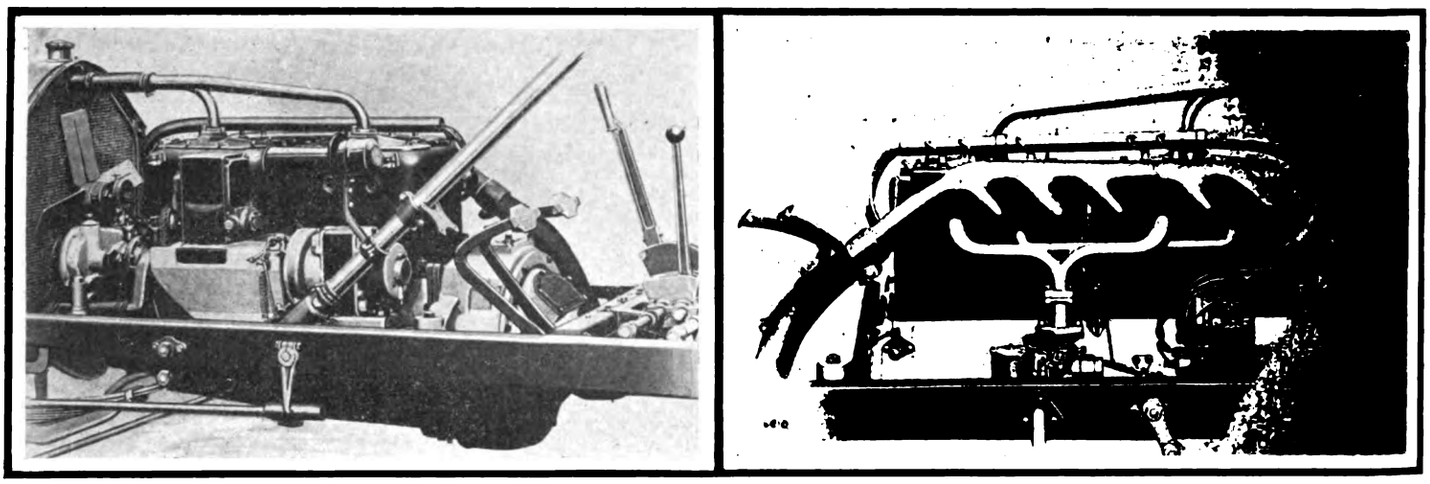
Digitized by Google

which are ranged the volt-meter, ammeter, the gauge indicating the pressure of air in the 20-gallon gasolene tank hung at the rear of the chassis, 60-mile speedometer, switches, etc.; the board is placed sufficiently far under the cowl to be protected from the worst of the weather, but not so far as to be obscured from view. The electric motor starter is set in motion by pressure on a special pedal. A feature of the fuel system is a gasolene gauge with its dial at the top of the cylindrical tank where it is readily seen.

As might be expected of a car which is regularly fitted with an electric lighting and starting system, the equipment is thoroughly good and includes top with cover and side curtains, 60-mile Stewart speedometer, rain vision windshield, robe- and foot-rails and the usual tools and the like. The rails and the usual outfit of tools, jack, tire repair kit, tire irons, and the like. The price complete is $2,150.

Applying Theory in Taking up Wear.

When the steering gear and connections become worn and loosened to such an extent that the front wheels show signs of wabbling on the road, it is high time to take up the lost motion. The wabbling looks like the dickens; but what is far worse, the thumping and pounding due to the lost motion greatly increase the rapidity of wear. In other words, the more a part is worn the faster it will continue to wear. Another way of considering the matter—and this is an angle of view that may be applied to all wearing parts—is that it is much easier to take up very slight wear and do it several times than it is to take up the total amount of wear in one operation. The chief reason is that as wear increases it becomes unequal, and when it is necessary to take up a great deal of wear a satisfactory job cannot be made, as a rule, unless the surfaces are refitted.



BRITISH COOLING SYSTEM SQUIRTS WATER IN CYLINDERS

No Water Jackets and No Overheating Despite Overloads — Heat Taken Directly from Combustion Chamber Walls.

The bold proposition to cool the cylinders of a gas enginse by spraying water against the inside walls of the combustion chamber and the head of the piston, thereby eliminating the water jacket, has been made by Professor Hopkinson, a British engineer and scientist, who has taken his own medicine to the extent of equipping a 50-horsepower stationary engine with a spraying system and testing it under actual service conditions. The engine has run for no less than two years and, though the results are said to have been entirely satisfactory, it is only now that details of the method have been permitted to escape.

The spraying device includes a "rose" or multiple jet head with holes 1/40 of an inch in diameter through which water, forced in by a small plunger pump operated from the camshaft, is thrown directly on the walls of the combustion chamber, the cylinder head and the head of the piston The idea is to effect cooling, not by reducing the temperature of the gases, as is done when water is injected with the charges, but by abstracting heat directly from the heated cylinder walls. This amounts to taking up heat already wasted, and therefore of no value from a power point of view, while the spraying of water with the charge takes heat and pressure from the burning gas, chiefly, and very little indeed from the cylinder walls. An exhaustive series of tests was made to determine accurately these facts, and it was found that the beneficial effects of injecting water with the gas were very slight and had little actual cooling effect.

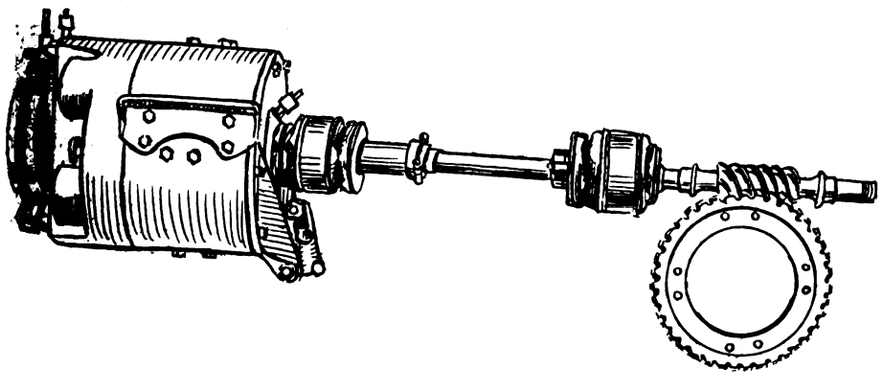
The engine tested by the British engineer not only ran satisfactorily without a water jacket, the cylinder being a plain, smooth casting, but it developed practically continuously greater power than it would develop for a short time only with a water jacket, without heating, and proved economical in fuel consumption. Water was sprayed only on the cylinder and piston heads and on the walls of the combustion chamber, the injection taking place while the piston was at the head end of its stroke; thus interference with lubrication was entirely avoided, and it was found that the cooling effect was all that could be desired, the convection of heat through the piston being sufficient to keep the cylinder walls cool below the combustion chamber. A rather curious thing is that, despite heavy deposits in the cylinder, due to dissolved matter in the water, there was no pre-ignition, due, of course, to the effectual cooling of the coated surfaces.

RIGHT AND LEFT SIDES OF MARION "SIX," SHOWING ELECTRIC INSTALLATION AND MANIFOLDS

Variety in Hub Cap Threads

Although every one does not know it, hub caps are of two varieties—right hand and left hand. Which is to say, the hub caps on the right side of the car facing the radiator generally are fitted with right-hand threads, whereas the others have left hand threads. It is obvious that turning a left hand thread in the same way as a right hand one would be turned to loosen it will tighten the left hand thread instead.

To Keep Dirt Out of Tires.



Because tire pumps invariably are carried beneath the tonneau seat and also because dust and dirt are certain to lodge there, it is a wise precaution to "blow out" the pump once or twice before the hose is connected to the tire valve. In this way the possibility of forcing dirt into the tire will be avoided.

SHAFT DRIVE SYSTEMS FOR ELECTRIC CARS

Various Highly Developed Methods of Applying Simple Mechanical Device—Propeller Shafts in Worm, Bevel, Spur and Chain Power Transmission Systems—Long Shafts, Short Shafts and Almost No Shafts at All.

When the purchase of an electric pleasure vehicle is contemplated, it is safe to assume that the "contemplating purchaser" has bestowed due consideration upon the almost spectral quietness with which a good electric is capable of running and also upon the comparatively recently acquired ability of the "lightning wagon" to cover a good round distance on a single charge of the battery. In fact, anyone who listens to the seductive—and usually truthful—arguments of a salesman, or peruses the ornate pages of the artistic catalogs the electric car makers issue, must be impressed with the fact that the electric is, par excellence, a machine of few sounds. And it may be said that quietness and efficiency are very apt to go hand in hand.

RAUCH & LANG MOTOR AND WORM DRIVE

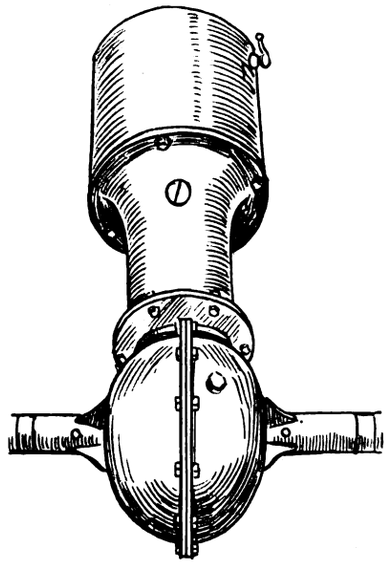
DETROIT CHAIN AND SHAFT

Economy Goes With Silence.

When electric vehicles were young their gears were constructed much upon the order of the back-gears of a lathe, to judge orally; and it is certain that the mileage in proportion to the volume of current consumed was very much lower than it is at present. The causes of noise usually are also causes of inefficiency—friction, lost motion, lack of adjustment and so forth and so on—and prodigality of noise and of power have decreasesd concurrently; and though it hardly can be said that they have decreased in the same degree—for in that case the car would run on next to no current—it is perfectly correct to say that eminently satisfactory progress has been made in both respects.

Conspicuous among the trends in electric vehicle construction has been the widespread adoption of shaft drive from motor to rear axle, to the elimination of numerous gears and chains. As shaft drive has become more and more conspicuous in gasolene car construction, to the practical elimination of the once popular chain drive to the rear wheels, so the manufacturers of electric cars, working out their own salvation in their own way, have come to the conclusion that shaft drive is best for them, too, and have made it their own, of course with the changes and modifications necessitated by the difference in motors and other governing conditions. Widespread is the correct word, not universal; for though shaft drive is greatly in the ascendancy there are other driving systems that have been developed to a remarkable degree, and which ask no odds whatever of the shaft systems. These have been taken up in detail in Motor World in the past. But the fact that a large number of different makes of electric cars are employing shaft drive brings up the point that there must be various methods of employing the shaft in order to comply with the special requirements of special cases, and these different ways of bringing about similar results make it interesting to look into constructional details to see just what points of difference there are in some of the better known electric pleasure cars with shaft drive.

The variations in shaft drive methods range all the way from the extremely simple to the moderately complex. That is to say, some systems have the least possible number of mechanical parts, while others have cared less about keeping down the number of parts than for attaining some end which has necessitated the use of comparatively complex mechanism. To the latter class belongs the drive employed in the Church-Field electrtic, which augments the low-speed pulling power of the electric motor by a gear reduction obtained through a planetary set of special design, the final reduction being through bevel pinion and gear in the rear axle.



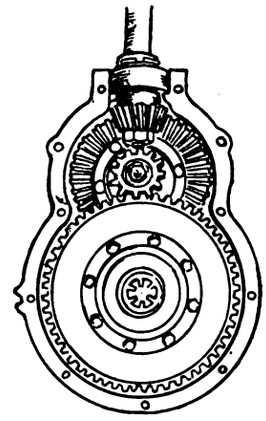
It would not be fair, however, to lay stress on the complexity of the Church-Field system, for while it includes a two-speed gear, which other electric systems do not, the gear is of the planetary type, which not only is among the simplest devices of its class, but to all intents and purposes is eliminated when the car is running "on high," as it rotates in unison with the motor and the shaft just as if it was a flywheel or other solid part. And even when its gears are working, when the car is "in low," it is wholly lacking in delicate parts and components that are likely to make trouble.

Multiplying the Torque.

As for the reason to which the planetary gear owes its position in the driving system of an electric car, which usually is considered all-sufficient with no gearing other than that which is necessary in order to obtain enough reduction to permit the motor to run at its normal rate while driving the car at is normal speed, it is that with a low gear it is possible to increase the hill-climbing capacity of the machine without increasing the size or weight of the motor, making possible the surmounting of difficult grades with a minimum current consumption. This is due to the fact that the

Digitized by Google

motor is permitted to rotate at comparatively high speed while the car moves at a moderate pace. Also, as there are five controller speeds, which are effective on both high and low gear, the car has a total of no fewer than ten changes of pace, which, of



HUPP-YEATS SYSTEM

course, makes for convenience in handling in traffic. It may be added that the control system is of such simplicity that it adds practically nothing to the trouble of driving the car.

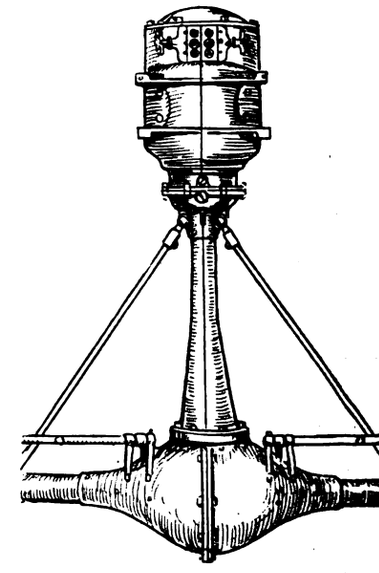
Torque of "Gas" and Electric Motors.

The application of a two-speed gear to an electric drive calls for designing along somewhat different lines than when such a gear is used in a gasolene car. The torque characteristics of an electric motor are very different from those of a gasolene motor. The electric motor is capable of drawing an enormous amount of current and exerting a heavy pull at very low speed, while the gasolene motor, as everyone knows, becomes less and less effective as the speed drops, and must be kept going at speed if high power is required. It is a difficult matter, however, to produce an electric motor that will be as economical in the use of current through a wide range of speeds as it is at a single speed, whatever the rate may be, or through a comparatively restricted range. Therefore the Church-Field people find that by designing the motor and the two-speed gear to work in harmony, the gears permitting the motor to run at all times at a reasonable speed, a substantial economy of current is effected—and no one needs to be told of the importance of this saving in a vehicle which is restricted in the matter of available energy, as is an electric.

Going to the opposite extreme and reducing the electric drive to what would seem to be the simplest form possible with an axle of the live type, the Argo Electric Vehicle Co.'s system may be cited as a striking example. In the ordinary acceptance of the term, there is no shaft drive—that is to say, there is no shaft between the motor and the driving pinion. The housing which carries the motor is bolted direct to the housing of the rear axle, and the motor shaft is extended only sufficiently to carry the bevel driving pinion. It is obvious that there is no necessity for universal joints and no necessity for special provision for keeping the motor in alignment with the axle, for with the housings forming what is practically a unit, there is no opportunity for any relative change of position.

STANDARD DOUBLE REDUCTION

The bevel gears are of the herringbone variety that has been brought to such a pitch of efficiency and quietness by electric vehicle manufacturers.



Another excellent example of the most direct driving system is found in the Hupp-Yeats electric. As the illustration shows, the motor casing is bolted direct to the rear axle casing, as in the Argo, though there are some differences that are plain to the eye. The chief difference between the two, however, is in the fact that the Hupp-Yeats employs bevel gears of extreme accuracy for the drive, and not only are the gears made, hardened and finished with the utmost closeness, but there is a screw adjustment which permits a final setting of almost microscopic fineness, the result being that the gears are made to run under the best possible conditions.

Worm and gear drive has brought to the manufacturer of electric vehicles a transmission system with possibilities in the way of lack of noise, large reduction of speed at a single step, smooth operation and economy of space that have been eagerly seized upon, developed and made practical and efficient. Observing the running of a worm-driven electric, it is a practical impossibility to criticize. The frequently employed term "velvety" actually describes the power application, and as for noise, it is a practical impossibility to locate any, apart from the faint hum of the motor and the swish of the wheel spokes and tires. The peculiarities of the worm system, as well as its advantages, have been taken into full consideration by the makers of the Rauch & Lang electrics. Of course, the worm system is preeminently a propeller shaft system, and in the Rauch & Lang the absolute necessity for absence of forces tending to interfere with the vital matter of accuracy in the relationship between worm and gear has been recognized, and the worm freed from all stresses other than those which are normal by providing the propeller shaft with two universal joints, one close to the motor and the other close to the worm, and a telescopic joint which is incorporated with the universal nearest the motor.

Straight-line Drive with Normal Load.

The design of the vehicle as a whole is such that when the weights are normal the motor, propeller shaft and worm are practically in a straight line, and the points are subjected to a duty that is so light as to be of no practical account, which also is true of the power lost through the joints. It goes without saying that the joints are provided with casings that afford perfect protection from dust.

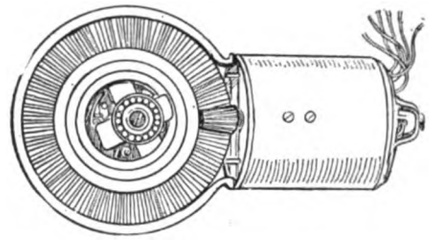
The striking feature of the shaft drive employed in the Standard Electrique is that, while a double gear reduction is used, all the gears are housed in the rear axle casing, with the result that their alignment is no less perfect than their protection from the

DETROIT MOTOR AND AXLE

intrusion of outside influences, whether in the form of dust and dirt or of a more forcible nature, tending to disturb alignment. The motor is suspended from the frame of the car at the forward end of a comparatively long tube which encloses the propeller shaft and, by virtue of its substan-

Digitized by Google

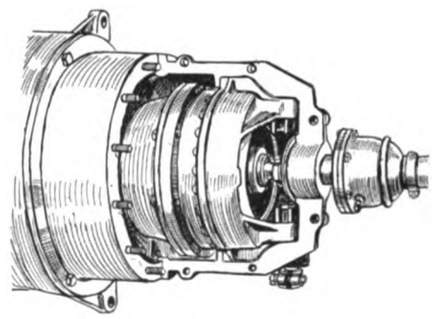
tial construction, renders unnecessary the use of universal joints. In fact, the motor is practically a unit with the rear axle. Any possibility of disturbing the angle between the tube and the rear axle casing is provided against by a pair of heavy braces extending from the axle, at a point close to the spring perches, to the motor casing.



The propeller shaft drives through a bevel pinion to a bevel gear which, however, is not as large in proportion to the pinion as is usual because of the second reduction. This further step-down is effected through a spur pinion, mounted practically as a unit with the bevel gear and meshing with a spur gear on the differential. The extreme compactness and neatness of the system is well shown in the illustration; but its smooth running and practical efficiency can be appreciated only by actual experience with a Standard car.

But One Gear Reduction in Detroit.

A motor that is especially designed to operate at a low normal speed—that is to say, 800 revolutions per minute—is an extremely important factor in the design of the transmission system of the Detroit electric car, in that it necessitates only one gear reduction, and that of moderate ratio. As in the Standard, the motor is connected by means of a tube with the rear axle casing, and is braced by rods which prevent relative displacement. While a slow-speed motor, such as is used in this car, necessarily is of larger size than a high-speed motor of equal capacity, the makers state that the increase in weight is offset by the decrease in the weight of the transmission system. Further, it is claimed that the larger motor and heavier windings are particularly well able to withstand the heating effects of overloads of long duration and will give an extremely good account of itself in slow, hard pulling. Despite the rigid construction of the casings, assurance that there will be no binding in the bearings is made doubly sure by inserting a universal joint between the motor shaft and the propeller shaft.



Double Reduction by Chain and Bevel.

At once simple, silent and efficient, the double reduction system that is embodied in the shaft transmission of the Baker electric is obtained by the use of a combination of chain and bevel gear drive, the chain being of the "silent" type and operating under the most favorable conditions. A short shaft, parallel to the motor shaft and carried in a casing bolted to the motor casing, is driven by the "silent" chain, there being, of course, a considerable reduction in the relative speeds of the motor and driven shaft. The propeller shaft is virtually in line with the short second shaft, the connection being through a universal joint, while a second universal is placed where the propeller shaft makes connection with the short stub shaft of the bevel pinion. The propeller shaft itself is bare, but the short shaft at the motor end of the system is completely enclosed, together with the chain and its gears, and so is thoroughly protected, while the bevels are housed in the rear axle casing in the usual way. As is usual in shaft drives where universal joints are employed, the shaft system forms a straight line when the car is normally loaded, and the universals have only to compensate for the movement due to spring action.

ARGO BEVEL GEAR DRIVE

Despite the very considerable differences that exist in the various driving systems, and despite the very considerable differences of opinion harbored in the minds of respective makers—for it is but to be expected that each will consider his own system decidedly superior to all others—when it comes down to actual service under every-day conditions all the better cars will be found to have transmsisions that are remarkably efficient as well as remarkably quiet in operation. The manufacturer who uses gears or chains can take advantage of certain constructional features that are not open to users of direct connected motors, and on the other hand, the absence of intermediate speed reduction mechanism permits forms of construction that the user of gears or chains cannot command.

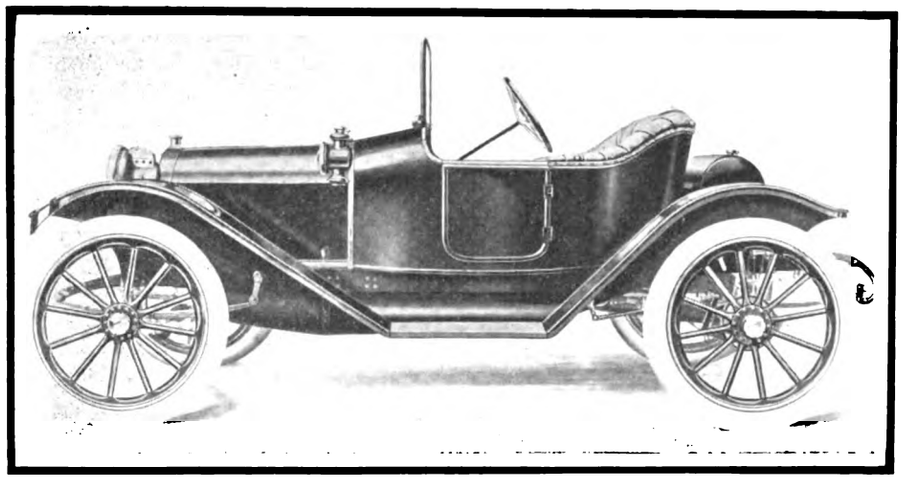
CHURCH-FIELD TRANSMISSION

In this respect electric cars are very much like anything else that is made by human hands. No one machine can possibly combine all the advantages of all forms of construction. Otherwise it is not difficult to see that there would be but one kind of car built, and it would be more nearly perfect than most things are. But one form of design appeals to a man—or a woman, for the electric is largely a woman's veheicle—where another will not, and this is entirely regardless of efficiency, power and so on. There even are cases where a purchaser would be willing to sacrifice things of some little importance in order to be exactly suited in some particular respect. Fortunately, however, it is possible for most people to get what they want in matters of detail without having to sacrifice things that are vital, and it is safe to say that if a purchase is made from any of the well-known makers the buyer can very safely seek to satisfy his ideas as to small matters, if he wants to, and take it for granted that the essentials of the machine are as they ought to be.

Handbook That Makes "Gas" Engine Plain.

From the veritable flood of so-called textbooks on automobiles and automobile design and construction which in reality are little more than glorified catalogs and are valuable chiefly as such, it is refreshing to pick up the revised and practically rewritten edition of Roberts's Gas Engine Handbook that just has been brought out by the Gas Engine Publishing Co., of Cincinnati, Ohio; like its predecessors—this is the seventh edition—it is a small book, but it is chock full of useful information, well illustrated and written in a style that will neither tire the engineer nor confuse the layman. The book is chiefly valuable because it is practical rather than densely theoretical In any book of the kind formulas are a necessity, of course, but where those given in the Roberts's handbook are even slightly abstruse their use is made very plain with the aid of practical example. Design, installation and care of both gas and gasolene engines are treated very fully and particular attention has been devoted to the two-cycle type of machine with the view of correcting the very erroneous ideas concerning it which still obtain. The volume is very completely indexed and cross-indexed—a feature that is absolutely essential in any book of reference.

Insulating Quality of Shellac.



Shellac is used to such a large extent in electrical work that the impression has spread abroad that it is a particularly fine insulating substance. Such is not the case, for while shellac is an insulator to a certain extent, it is not by any means as good for the purpose as are many other things. It is extremely useful, however, as a protective coating, as a sort of cementing medium, as a filler and so forth, and its quick-drying qualities make it extremely convenient to use.

VULCAN SINGLE-MODEL CAR ENTERS LOW-PRICE FIELD

Touring and "Speedster" on Same Chassis Sell for $850 and $750 Fully Equipped—Unit Power Plant and Left Steer.

The right way to build an automobile is to build it complete, from the ground up, in its own factory and without outside assistance, according to the Vulcan Mfg. Co., of Painesville, Ohio, which accordingly is proceeding to build Vulcan pleasure cars in this very way at its Painesville factory. And in this case building means not only the finishing and fitting of all the parts of the chassis and body, but even the making of the castings and forgings that enter into its construction. Special tools and machinery have been installed for the turning out of Vulcan car parts, and preparations made to produce cars on a large scale. These preparations have been in the making for a long time, and little has been known of what was to be expected, for the Vulcan people prefer to talk about what they have done, rather than what they are going to do.

VULCAN SPEEDSTER MODEL WHICH SELLS FOR $750

The Vulcan Mfg. Co. has as its president F. H. Murray; R. G. Ewell is vice-president, E. D. Heartwell treasurer, and these officers, together with H. E. Hammar, J. C. Ward, Wm. Truby, E. E. Lawrence and W. H. Backer, form the board of directors. The company has agreed on a policy of concentration on a single model, practically, though two bodies will be mounted—a touring car carrying five passengers and a roadster for two, the only difference in the chassis being the addition of a few inches in the length of the wheelbase in the case of the touring car and slightly heavier rear springs. The roadster, which will be termed a speedster, is listed at $750 and the touring car at $850, with complete equipment in both cases. Left steer and center control are standard.

The motor, which is the beginning of all things in an automobile, is of the block-cast type and has an emphatically long stroke—5 inches, as against a bore of 3⅜ inches—and, as the accompanying illustration shows, is mounted with the gearset as a unit power plant. It is stated that the rating of 27 horsepower is decidedly conservative and that the motor possesses to an unusual degree the ability to "hang on" at low speeds and to pull well uphill. The power plant is supported at three points, the single point being at the front, of course; the rear-end support is unusually stiff and heavy and is bolted through the center of the gearcase.

The crankshaft is of the two-bearing type and is 1⅞ inches in diameter at the journals; the rear bearing is no less than 5½ inches long. Both main and connecting rod bearings are of die-cast white bronze. As the motor is of the L-head type all the cams are on a single camshaft, the cams and shaft being made in a single forging. A center bearing provides a support which prevents springing of the camshaft. The valves are 1⅝ inches in diameter and the valve stems and springs are enclosed, the cover plates being removable by the loosening of a couple of handscrews. Ignition is by high-tension magneto, no battery or coil being used. The complication of a pump and its driving gear is avoided by the employment of thermo-syphon cooling, and a 12-inch fan is mounted behind the radiator. A plunger pump keeps the lubricating oil circulating; the oiling system is a combination of constant level splash and force feed. A reservoir under the crankcase holds 6 quarts of oil and a float gauge indicates the height of the oil at all times.

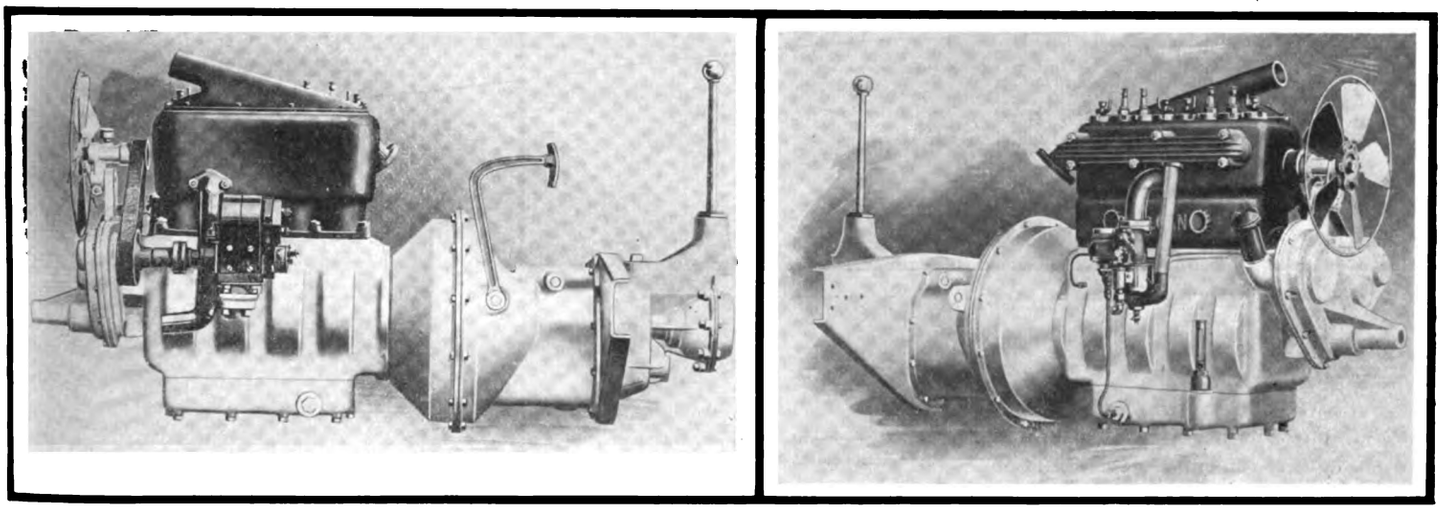
The clutch, housed with the flywheel in that part of the power plant casing which connects with the crankcase and the gearbox, is a leather-faced cone of generous dimensions engaging under the pressure of eight helical springs. The collar is fitted with roller bearings and the pressure required to operate the clutch is light, which is a point in favor of the car for feminine drivers. The gearset provides three speeds, selectively controlled by a centrally placed ball-handled lever, and a feature is that the lowest speed is exceptionally low, which gives tremendous leverage for pulling up precipitous grades, out of mud-holes, and makes it easy to handle the car in tight places where a particularly slow rate of speed is desirable. The gears are all of 3½ per cent. nickel steel and have teeth that are unusually wide for the size of the car, the maximum face being 1⅛ inches and the minimum ¾ inch. The H-plate is cast into the top of the gearbox.

An ingenious idea is that of casting the front half of the universal joint socket integral with the gearcase; the socket is completed by bolting on a pressed steel cap. The ball is a drawn steel product pressed and riveted to the end of the torque tube. The universal joint itself is of heavy steel forgings and the hollow ball forms a grease-tight enclosure for it. The bearings of the joint are said to be considerably larger than is usual in such parts, so that looseness can occur only after long use and much service.

The propeller shaft runs on ball bearings in the torque tube. It is of sturdy construction and so are the bevel gears, which have a tooth width of 1¼ inches and are cut from solid 3½ per cent. nickel steel and, like other gears, heat treated. A feature of the rear axle system that is even more noticeable than its other good points is the differential, which is evidently intended to last at least as long as the car, for it has no less than five pinions that run on phosphor bronze bushings and are of the nickel steel that is so extensively used in the machine. The inner bearings of the live shafts are 4 1/16 inches in diameter with ⅝-inch balls. The construction of the axle is of the semi-floating type. The shafts are of ample size for their work, having a diameter of 1 3/16 inches. Conventional practice is followed in the design of the brakes, the emergency brake being an internal expanding ring operated by a lever and the service brake a contracting band operated by a pedal; both are lined with an asbestos material and act on pressed steel drums.

Lightness and strength are combined in the tubular construction of the dropped front axle, while the steering yokes are drop-forgings. The steering knuckles have a diameter of 1⅜ inches. Front wheels run on ball bearings, the inner bearings having ⅝-inch and the outer bearings ½-inch balls. Rack-and-piston steering gear is employed.

Digitized by Google



and this is said to be of a type which practically eliminates back-lash and wabbling of the front wheels on rough roads. The steering wheel column is sharply raked and is fitted with a 16-inch wheel; the pinion end is carried just above the front axle, where the necessary connections can be made with a minimum of apparatus. The front wheels are set at an angle of 3 degrees from the vertical, which brings the center of contact of the tire with the ground directly in line with the produced axis of the steering pivot. The car can be turned within a circle 30 feet in diameter, which is quite short when the length of the wheelbase is considered.

Something of a departure from conventional design is embodied in the frame construction, though the Vulcan people still have adhered to what has been thoroughly tried and found satisfactory in actual service. Instead of the usual channel-section, the pressed steel of the main frames is given a deep inverted U shape. The fact that there are two vertical webs affords enormous stiffness and resistance to vertical stresses. There are three well-braced cross members, one at each end, and an intermediate which serves to support that rear end of the power plant, as already described. The frame rests on semi-elliptic springs in front and three-quarter elliptics in the rear, the latter being 44 inches long and 1¼ inches wide. The front springs are almost flat and the rear springs are scrolled and have thin, tapering ends, all of which has a decidedly beneficial effect on the riding qualities of the car. The spring bolts are of steel, accurately fitted, and means are provided for the lubrication of the bearing surfaces of the spring eyes.

In the case of the "speedster," the wheelbase is 105 inches, while the touring car measures 115 inches from axle to axle and has slightly heavier rear springs. Gasolene tank construction is substantial, the tank being riveted together of heavy steel plates, lead-coated to prevent rust, and soldered at all seams; the ends are concave steel stampings. In the runabout the tank is behind the seat and in the touring car it is under the front seat. In both cases it is high enough to give an ample head of fuel to the carburetter. The gasolene capacity is 14 gallons. In both models the wheels are of kiln-dried hickory with 12 spokes 1¼ inches in diameter and the tires are 32 x 3½ plain white tread clinchers.

The body is of sheet steel laid on a substantial frame of live oak reenforced with drop-forged body irons. The seat is wide and deep, as is quite plain from the illustration, and the upholstering is comfortable and soft. As to the matter of finish, the body is painted a deep olive green, while the fenders, hood, gasolene tank and running gear are finished with two coats of black japan baked on over a metal priming coat which not only prevents rust but causes the japan to adhere to the surface—a matter of no small importance. Five coats are applied to the green body, each being rubbed down before the next is applied. The fact that steel is the body material makes a larger number of coats unnecessary to secure good results. Bright metal parts are finished in bright nickel, while bolt and screw heads and similar parts are finished in black nickel, which will not readily show the effect of the application of a wrench or screwdriver, and at the same time adds appreciably to the appearance of the finish as a whole.

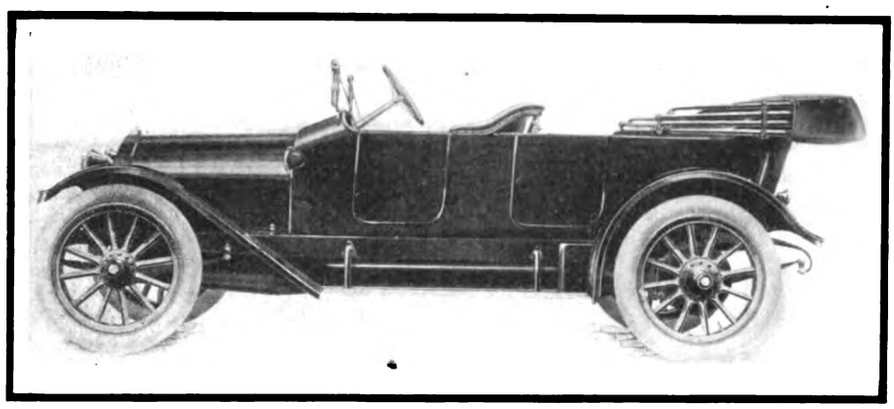
Complete equipment is included in the price of the car, and consists of a one-piece windshield with metal work given what is known as a "hard rubber" finish, mohair top with boot and side curtains, gas headlights with 9-inch lenses and mirror reflectors, Prest-O-Lite tank, oil side and tail lights that are said to be proof against rattling as well as smoking, speedometer, set of tools in brown canvas tool holder with a separate place for each tool, and the usual tire repair outfit, pump and jack.

MANIFOLD AND MAGNETO SIDES OF VULCAN MOTOR SHOWING UNIT CONSTRUCTION

To Avoid Trouble When Using Babbit.

When a bearing is to be babbited it is extremely inadvisable to put into the melting ladle any old chunk of babbit that may be lying around the place, and this for several reasons. Though it may be positively known that the metal is of good quality, the mere fact that it has been melted at least once may be sufficient to condemn it, for at each melting some of the ingredients pass off in the form of vapor, altering more or less the characteristics of those that remain. This is especially true if the metal has been overheated, or has been kept hot for a long time—and information on these points is not likely to be available when the lump of metal is discovered. The old rule to heat babbit until it is just hot enough to brown a soft pine stick is a good one and will prevent overheating; but repeated meltings, even without overheating, result in the spoiling of the metal. The best way to handle such work is to melt up as nearly as can be judged the quantity of metal needed for the job, and to use fresh metal for each new job. The old metal can be kept by itself and used for unimportant jobs, such as fillings, soft hammers and so on.

Putting Saws to Emergency Uses.



It is worth while to know that in case of emergency a butcher's saw makes a very fair hacksaw, especially for fairly soft metal, while a common cross-cut saw with fairly fine teeth can be made to chew through brass after a fashion. Needless to say, the cut will not be a clean one, and the teeth of the saw will be none the better for the experience.

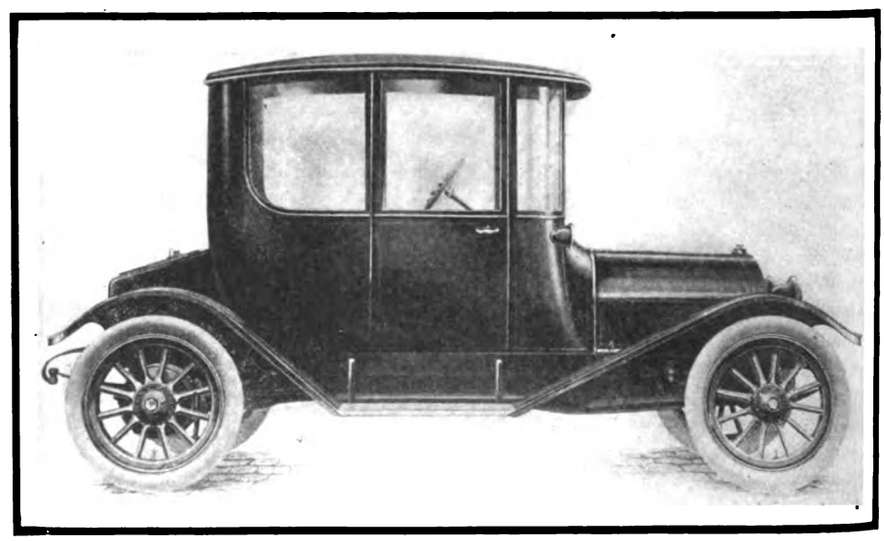
OVERLAND EARMARKS PLAIN IN SINGLE MODEL CHASSIS

Best Points of Older Machines Combined in Latest—Distinctive Overland Body Lines Retained—Coupe Much Improved.

The decision of the Willys-Overland Co., of Toledo, to concentrate its energies upon the production of a single chassis adds not a little to the interest in the machine that is to have such an important bearing upon the destinies of the company, and the information that has become available since a brief description of the car was printed in last week's Motor World serves to confirm the impression that the latest model differs but little from its predecessors. In fact, it embodies practically all of the older Overland features, though it goes without saying that there have been made detail improvements such as might be looked for in any good car under the circumstances. The horsepower of the new motor, which is rated at 35, should be ample for the roadster, touring car or coupe bodies that will be mounted on the single chassis.



MODEL 79 OVERLAND TOURING CAR WHICH LISTS AT $950

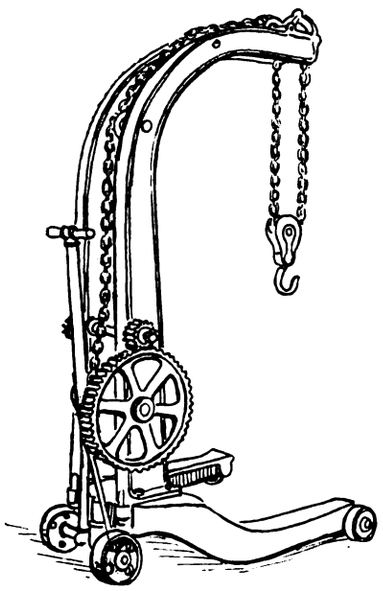
In the matter of body design, the newest touring car—model 79—which has plenty of room for five passengers, is very similar to the older four-passenger torpedo known as model 69-F; the general outlines are practically identical, including the cowled dash, which was not a feature of last year's five-passenger 30-horsepower touring car. Obviously the interior amplifications required for the accommodation of five passengers have been made, but the cleanly designed appearance and lack of excrescences of the older body have been retained. The windshield shows considerable improvement; it is so built into the cowl that it stands firmly without assistance other than that given by a couple of light rods at the rear side, which are unobjectionable and inconspicuous.

In the roadster, too, the lines of the preceding model have been adhered to so closely that even a more than cursory inspection fails to detect much change, except at the rear end, where the sloping deck has been replaced by a horizontal-topped compartment which affords considerably more room for storage than did the smaller box. The addition of four inches to the wheelbase, bringing that measurement up to 114 inches instead of the former 110 inches, has added not a little to the general appearance of the car, and the effect of length and low hanging has been a trifle enhanced by an almost imperceptible difference in the curves and the setting of the mudguards.

Perhaps the most pronounced change is that made in the body of the coupe, which is built on the same chassis as the touring car and the roadster. And it may be said at once that the change is distinctly for the better. The body has been made considerably roomier, as is indicated by the fact that it seats four passengers in place of the three who could find room in the older coupe, and the windows are much larger, the supporting framework having been cut away with good effect. The angular front form has been changed to a curve, the glass front being curved in conformity with the coachwork, and the flare where the walls and the roof met at front and rear has been eliminated. The cowl effect between the hood and the body has been emphasized a little, and altogether the new coupe is better looking by several degrees than the older one.

As for mechanical changes, they are so slight that the increase of bore and stroke from 4 x 4½ inches to 4⅛ x 4½ inches and the substitution of the Splitdorf magneto for the one formerly fitted are by far the most important. The constant level pump lubrication system has been made a little better, and the push-rod guides now are held in their places on the crankcase by forged steel claws, so that their removal is an easy matter. Bronze caps on the tops of the push rods tend to reduce very materially the clicking of the lifters against the valve stems. A change, of some interest as being a reflection of the descending quality of gasolene, is the decrease in the diameter of the intake manifold, the object being to increase the speed of the gas through the piping and so improve carburation. Cooling has been improved a little more than the increased size of the engine has called for by the enlargement and general betterment of the radiator, which has a considerably larger water space than the older cooler.

OVERLAND COUPE MODEL SHOWING CURVED GLASS PANELS



Taking it all in all, it is not possible to say much more than that the latest Overland chassis and its three bodies contain the good points of all the older models, with the addition of the detailed improvements that have been mentioned—and a few that have not because they are of the kind that do not appear to the eye, being in the shape of better material and the like.

REMOVING GARAGE TIME LOSSES WITH A CRANE

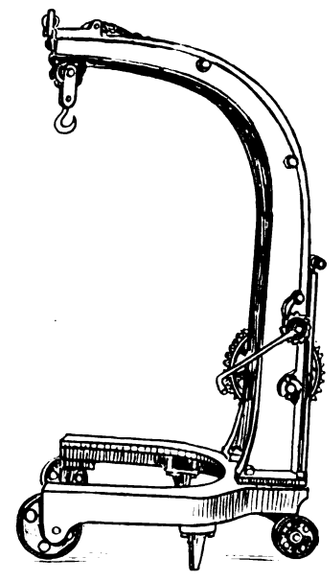
Wasted Minutes That Come From Inability of One Man to Do Heavy Work Alone—One Garageman Who "Timed His Estimate"—Types of Portable Cranes Which Make for Efficiency in Repair Work.

John Quincy Davis was a garage proprietor with a purpose. He was one of those bright-eyed, enthusiastic individuals who believe thoroughly in the modified adage that "everything comes to him who gets out and hustles while he is waiting." He hustled with a definite purpose in mind, however; his other maxim was "Do one thing thoroughly before you attempt another," with "Don't start anything you can't

FRANKLIN PORTABLE CRANE

finish" thrown in for good measure. He lived up to all of them.

His garage was, and is, located in a fairly populous suburban town on one of the main arteries of travel between two large cities, and so a great deal of transient business fell to his lot. Altogether, what with repairing the cars belonging to tourists and repairing and overhauling the cars housed under his roof and quite a few housed under the roofs of other garages, he managed to keep his repair shop pretty busy, though he never would have done it if he had not lived up to the aforementioned adages.



Efficiency—shop efficiency—was his particular bug and he had the bug trained so it would eat out of his hand. In the first place, he believed that if he promised repair or overhaul work would be finished at a certain time it was pretty poor business to offer excuses in lieu of the work. He was not very good at making fake excuses anyway—all the other garage proprietors in town beat him hands down at that game. When work was not finished on time according to schedule, George Washington had nothing on John Quincy Davis. He simply had to tell the truth and, as refreshing as frankness may be on occasion, the owner of the car seldom relished being told that he would have to wait "till to-morrow" for his car because John Quincy Davis's shop equipment was not quite as complete as it might have been and as it should have been. That was years ago, and after making one or two excuses of the kind Davis learned his lesson.

Learning Why Estimates Fell Short.

He had heard that the poor workman invariably blames his tools, and here he was making excuses for the lack of proper tools. He had a big machine lathe and enough power to run it, and a grinder and a shaper and a drill press; also he had plenty of space for work benches and a good assortment of the tools that look funny to the layman and good to the mechanic. All of which was just as it should have been, and he could not understand, quite, where the discrepancy came in—why his estimate of the time required to overhaul a motor, for instance, invariably fell short of the actual time required.

He was in and about the shop most of the time, but he could not sit in a high-chair like the referee in a tennis match and keep tabs on his workmen. He had his office work to do, for one thing, and besides, he was dealer for a line of cars and he never wasted an opportunity to talk car to anyone who seemed interested enough to listen. Hence, he had to be in his little office a good part of the time, talking by word of mouth or through the agency of a typewriter. He had his bookkeeping to do, too. He made a practice of sending carefully itemized statements of all work done and all material used, and he got his bills paid, too. But that, as almost-poet-laureate Kipling says, is another story.

He could not, if he would, be continually at the heels of his employes to see that they did things in the most efficient manner. He preferred to let them work out their own problems, provided they showed the slightest glimmer of originality in their methods, for the proceeding tended to give the men confidence in their own ability and actually taught them to rely upon themselves rather than upon the brain of someone else. Therefore, he kept away from the shop just a little bit more than his other duties made necessary, and he had no hesitation in doing so, for he had chosen his men by a process of elimination and he knew they would not shirk their duties. He

CANTON CRANE CONSTRUCTION

knew, of course, that every man was doing, though the man did not always know that he was being watched.

After Davis had made a couple of excuses for work that should have been finished before it was finished, he decided that there was a flaw in the amber somewhere, and he set about to discover it and to remedy it. Beldame's car had just come in for its annual overhaul, and he proceeded to check up with his estimate the actual time required to finish the job and in this way to discover, if possible, where he had slipped up, if he had slipped up at all. He "stood by" while the car was taken down.

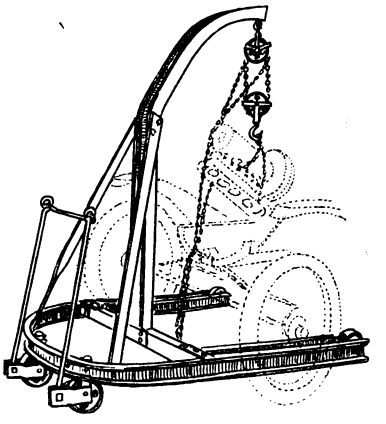
Now, in his shop Davis had two good mechanics. They worked together whenever there was a job big enough to require the services of two men. One of the men worked under the supervision of the other, and at his order left whatever he was doing to fill gasolene tanks and sell oil and

Digitized by Google

make hurry-up repairs on the machines of transients who stopped at the door. Generally such work required comparatively little time, but it could not be kept waiting.

The upper works had been taken off Beldame's car—which means the body and the engine hood and the radiator, etc.—and all the removable bolts and nuts holding the engine and gearset had been removed, and it began to look as if the job would be finished on time, after all, for so far everything was up to schedule. But when it came time to remove the gearset from the chassis, part of the discrepancy became apparent.

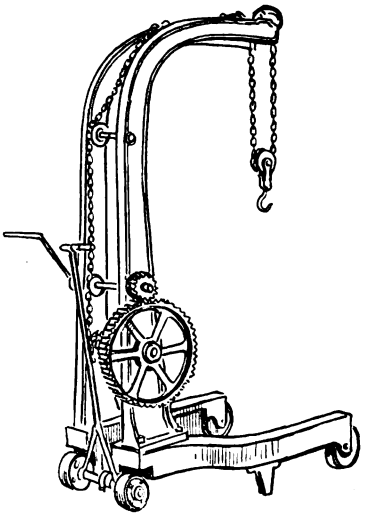
Eighteen Minutes of Enforced Idleness.



It was out of the question for one man to lift the thing out alone, and just as both together were getting at the job a tourist drew up in front of the garage with a noisy flourish of his Klaxon. He wanted "gas" and oil and a rear spring clip tightened, and while the tanks were being filled and the little repair job was done Davis kept his eye on the clock. Ten minutes, fifteen minutes, eighteen minutes before the tourist was sent on his way rejoicing and the gearset could be lifted out of the chassis and set on the work bench and, in the meantime, the one workman left on the job could not do more than twiddle his thumbs and wait for his helper.

It may have just happened that way, and it might not happen that way again in a blue moon, but when it came time to take the cylinders off the engine—honk! honk! at the door and off sped the lieutenant-mechanic to crank five gallons of gasolene into a tourist's tank and swap a fresh Prest-O-Lite tank for an empty one. Another 20 minutes lost on Beldame's overhaul job—though Beldame was not charged with the time, because Davis took "time out" while the man who remained on the job "cussed" in impatience at the delay.

Crane as Eradicator of Time Losses.



Half an hour is 30 minutes, of course, and the two half-hours make a whole big hour, which is equal to about 20 miles on the road in the sunshine. That's about the way the man who owns a car figures it out—"in an hour I could have been at Frog Pond and here I am at the garage." It's mighty dissatisfying, especially if the man has to keep friends waiting.

Here, figured Davis in his mind—and he saw the extra equipment he would need in his mind's eye—was the greatest little chance in the world to increase shop efficiency by substituting machinery for muscle, mechanism for men. So he retired to the innermost recesses of his sanctum sanctorum, which means that he slid in behind his rolltop in the office and pulled out a couple of catalogs from the lower left hand drawer of said desk—he made a practice of keeping all sorts of catalogs in the expectation that they "might come in handy some time"—and turned the pages rapidly until he came to the sections devoted to portable cranes. To the person with a little imagination the rest of the story tells itself.

CAMERON CRANE IN USE

David bought a portable crane of the type that is illustrated herewith, and now his jobs are finished when he says they will be finished. To lift the gearset out of a chassis, the crane is pushed into place, its fingers gripped under the arms—regardless

NILES-BEMENT-POND HOIST

of whether the lieutenant-mechanic is selling "gas" or swapping tanks or yarns—and after a couple of turns on the windlass the whole thing—crane, gearset and all—is pushed over to the work bench, where the gearset is deposited for future attention and the crane is then hooked up to the cylinders or to anything else that formerly had required the combined efforts of both men.

As Davis had at least his full share of common sense—which is more or less obvious from the fact that he used a few up-to-date proverbs for headlights, so to speak—he looked around a bit before he handed over his good cash for a crane, and discovered that there was quite a little variety in the different makes of load-lifters on the market, though for reasons that are obvious there also is a good deal of similarity. The similarity lies in the fact that all the "portables" have arms that extend under the work, and legs, or rather bases on wheels, that extend under it. The one Davis bought was a—well, it really doesn't matter, for he looked over the list and made his choice, which is just what anyone else can do and be pretty sure of getting a good buy. A good example of the principles that are involved in the construction of one of these handy appliances is found in the type built by the Niles-Bement-Pond Co. of New York, which is made in sizes the capacities of which range from 3,000 pounds to 8,000 pounds and will lift from 4 feet 6 inches for the smallest to 11 feet 3 inches for the largest. The body of the crane, the base and the overhanging double arms are of cast iron; the front axle is of cast steel of high tensile strength and a wide band of wrought iron reenforces the overhang. No matter how heavy the load may be, it is easily moved about the shop if there is a decent floor, for the wheels are mounted on roller bearings.

Construction of One Type of Crane.

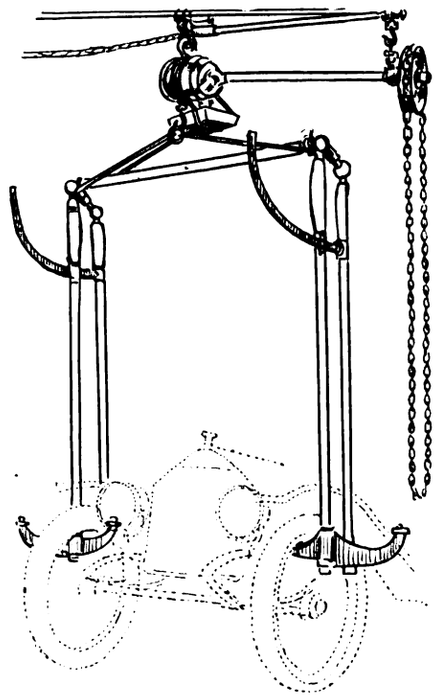
The hoisting gear is simple and effective, consisting of a drum winch turned through a large gear meshing with a very small pinion, the latter being on the shaft of the hand crank, of course. The single chain forms what is called a two-part hoist, which means that the end is made fast while the "bight" is rove through a single block carrying a hook. The combination, while simple, is one that gives tremendous purchase and makes it easy for one man to lift all that the crane should carry.

An exceedingly convenient feature of the crane is that the handle by which the load is hauled acts as a sort of brake lever when it is desired to have the crane stand immovable. That is to say, when the handle is in the usual position for hauling the crane, the wheels will be free to turn, while if the handle is straight up against the column the wheels will be securely locked so that the crane cannot roll around when it ought not to. Or, rather, it would be more correct to say that the truck is locked to the floor, for what really happens is that by a crank arrangement, the weight of the machine is taken off the rear wheels and allowed to rest on two short legs that are plainly visible in the picture.

The method of "putting on the brakes"

Digitized by Google

the apparatus manufactured by the Franklin Portable Crane & Hoist Co., of Franklin, Pa., is different from that of the Niles-Bement-Pond machine, for the "braking" consists in actually resting the weight of the machine on the front wheels, so that moving is out of the question. The axle is cranked, the single bearing being in the throw of the crank so that when the pulling handle is brought into a vertical position the cranked part acts as an eccentric and lowers the machine until the frame rests on the wheel rims, as is just happening in the picture. Roller bearings make for easy rolling on the shop floor. The hoisting gear is similar to that of the preceding machine—in fact, it is a type that is in common use in many kinds of small hoisting devices and is as useful as it is simple. The Franklin hoists will handle from 1 to 3 tons in the various sizes, and the capacities are tested before the machines leave the factory. The machine illustrated is of the low bed type, the frames being dropped to go under low places. The high frame type has high wheels and consequently is easier to move, though it requires a little more space vertically.



Has a Single "Steering" Wheel.

One of the differences between the Canton crane shown in the picture and the other machines illustrated is that there is but one wheel at the "steering" end—though other Canton models are built with two "steering" wheels, too. The single wheel has two bearings, and the usual system of raising and lowering the crane body by means of the pulling handle is employed; the machine is anchored by the feet, which rest on the floor, under the frame. The Canton crane is built with both low and high bed, the low being 6¾ inches high and the high 12 inches high. Steel axles and roller bearings are employed. This machine is built by the Canton Foundry & Machine Co., of Canton, Ohio.

A crane which differs considerably from those already described, though involving the same cardinal principles, is the Cameron, built by the Cameron Enginering Co., of Washington, N. J. As the illustration shows clearly, the construction is comparatively light, channel iron being used for the base instead of castings. It is in the hoisting apparatus, however, that the greatest difference exists, for instead of a winch arrangement attached to the column there is a differential chain hoist, which has the advantage that it can be worked from any point around the crane. This makes it easy for a machinist taking a job out of a lathe, for instance, to hoist the piece with one hand and steady it or slack back his tail center with the other. The Cameron hoist is made in smaller capacities than most others, the minimum being 1,000 pounds—a very handy size for small private garages. Incidentally, the price of a small machine naturally is lower than that of a large one. The crane is furnished either with or without the chain hoist. The largest size has a capacity of two tons.

"Cradle" Lifts Either End of Car.

While it cannot be said to come strictly under the portable crane classification, the Stone device is so nearly related to that tribe and withal is so obviously useful that it is worthy of more than passing mention.

STONE CAR CRANE

The actual lifting tackle is an adaptation of the differential chain hoist and is secured to a beam overhead and operated through a shaft, as shown. The interesting part, however, is the "cradle" which is so arranged that it will lift either end of a car by itself, or the whole car at once, in the latter case the four hooks which form part of the equipment being hooked into the four wheels, the second pair of rods being swung back for the purpose. The Stone hoist serves as a substitute for a pit because it is easy to get under the machine when it is lifted, and it also serve as a turntable, for the top suspension hook is fitted with a swivel which permits turning the load when raised. Altogether, it is a very convenient arrangement.

Davis found that while his portable hoist looked a little more bulky than he expected, when it first arrived, it would go into places where he had not expectetd it to go. This was because the bed not only would go under things, but its sprawling legs would go on either side of many an obstruction that otherwise would have made trouble. And Davis liked his machine, for, to use his own words, "It's some lifter, all right, for it lifted a big load off my mind."

Here's Another Differential Substitute.

It does not seem at all likely that the differential gear, in its present form, will be superseded for some time to come, despite its more or less well known failings and despite the efforts of engineers—and some who are not engineers—to devise satisfactory substitutes. Still, some of the ideas that are called forth by the desire to evolve something better than the "good old differential" are clever, in their way, and one recently devised abroad is a rather striking example.

In this arrangement the rear axle is not divided, but carries the bevel driving gear solidly keyed to it or, if desired, arranged to drive through a clutch on the axle. One of the rear wheels is rigidly fixed on the axle, while the other is loose and is driven through a clutch, of any suitable design. It is in the operation of this clutch that the ingenuity of the inventor has reached its height.

The mechanism controlling the clutch is so connected with the steering gear that when the car is moving straight ahead, or in only a very slight curve, the clutch will be engaged and the wheel will be driven, the same as the fixed wheel at the other end of the axle. Upon turning the steering wheel to make a pronounced turn, however, the clutch is thrown out, allowing the loose wheel to vary its speed with relation to the other, either accelerating, if it is on the outside of the curve, or retarding, if it is on the inside.

It is clear that the suggested substitute for the differential has several advantages over the accepted type—at least, in theory. When driving straight ahead on slippery going, the fact of one wheel getting on a slippery spot will have no effect on the driving power of the other, while with the conventional differential there is little or no power transmitted to the non-slipping wheel until the other has found a hold again. The same principle is involved when, in a fast-moving car, one wheel leaves the road and spins, while the engine momentarily races and no power is transmitted to the wheel remaining on the ground. A car stuck in the mud can pull far better with both wheels locked together than with the differential intervening—a fact which has given rise to numerous differential locks designed to overcome this difficulty. Last, but not least, the new plan permits a considerable reduction of rear axle weight, complication and expense. The idea may be applied to a cyclecar.

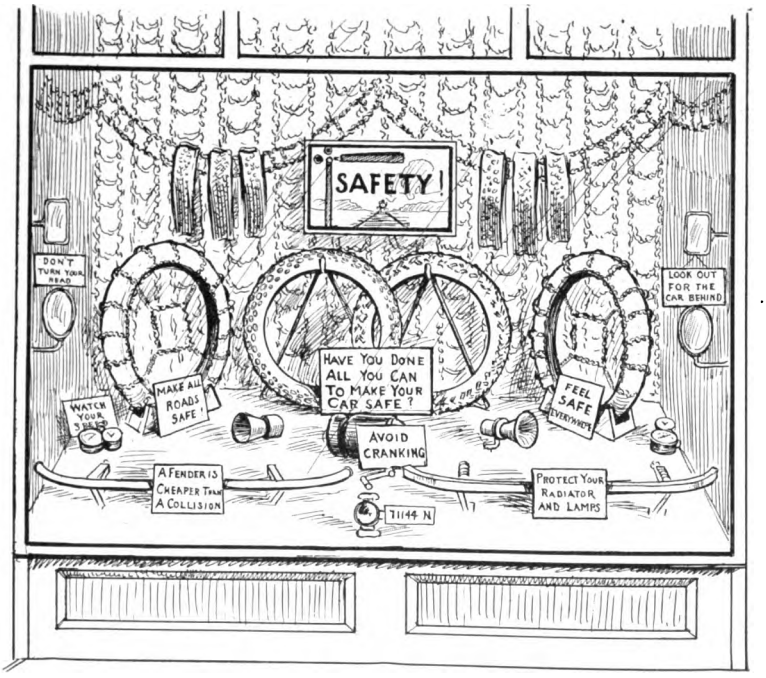
BUILDING WINDOW DISPLAY ON IDEA OF SAFETY

Method by Which Value of Preventive Accessories May Be Doubly Emphasized—One Plan That May Be Followed—Nonskid Chains, Bumpers, Mirrorscopes and Other Devices Used in Making Up Whole.

Building a window display around some one article or accessory is a practice followed with advantage by numerous supply and accessory dealers, and while this is an effective means of window advertising, variations are possible; the "one article" window generally is built around some material object, but it is not impossible to deviate from material things and use them to construct a display around an idea or a quality.



In talking of his car, a salesman is taught to sound its praises by enumerating the good qualities of the manufacturer's product; one car is said to ride easy, another is economical, another is durable, another possesses an element of safety, and so on almost without limit. Although manufacturers build these qualities into their cars, there is also a host of accessory and supply manufacturers who supplement the car builders' efforts with devices to promote safety, easy riding and other conveniences and comforts.

A window arranged around the idea of safety may be built up with little difficulty by any dealer who has window space, and as a suggestion of a line which may be followed, Motor World presents herewith a sketch of what may be done with one size and style of store front. The window contains articles designed to promote safety for both the passengers and the car.

As an eye-catcher, a large card may be placed in a conspicuous position, in this case the center rear wall, bearing the words "Safety" and a railway semaphore arm, the arm itself immediately suggesting the idea desired to be conveyed. Incidentally the lettered cards must be neat and attractive, else much of the value of the display is lost.

Of course, skidding is responsible for many accidents, wherefore non-skid tires and Weed chains may be effectively displayed with cards admonishing the car owner to take no chances against this frequent touring danger; bumpers, as any motorist realizes when the fact is called to his attention, are an efficacious preventive of broken lamps, bent fenders and dented radiators when installed upon a car. In case something breaks when ascending a hill it is not impossible for something to go wrong with the best of cars—a sprag which may be dropped to prevent the car running backward is an article to be appreciated.

When traffic is congested, rear-end collisions and accidents when turning into cross streets, may be avoided by the presence of a mirrorscope, which shows the driver what is coming behind him. These bright little devices may be shown to advantage if so placed that the passerby may look into them, fastened on the front and side of the window, allowing him to glimpse the entire street behind him. Other objects may be introduced into the display, and while one of them alone in a window might cause an observer to realize its necessity or value a whole window built around the idea of safety is many times more effective. In arranging the window, it is not necessary that the illustration, its style or the signs be exactly copied, for much will depend upon the individual taste of the owner and the size and style of the window.

WINDOW THAT CENTERS AROUND THE IDEA OF SAFETY FOR THE CAR OWNER

The Value of Business Courtesy.

"Lack of gratitude always has been a stumbling block to humanity, whereas honest gratitude, felt and expressed, is one of the sure stepping stones to success," said H. D. McCoy, of the Chanslor & Lyon company, Pacific Coast accessory dealers. "It has been truthfully said that the 'hereunto find our check' is about the most wilcome communication a business house can receive, but 'herewith find our order' is a pretty desirable sort of epistle, too.

"We must be sure that in every instance we are profuse enough in thanking customers for their orders and checks, particularly orders. Every once in a while we should lean back in our chairs and think over the little things—important among them—that we impress upon our customers forcefully enough that we do appreciate their orders.

"Acknowledging an order affords a mighty good opportunity (particularly if it is a new account) to assure the customer that the firm is conscientiously interested in him, his business and his welfare. But we must be sincere, or the custom becomes but a dead and unfruitful ceremony. It is a fine chance to bring in a personal touch and deal on a personal basis."

BENSON ADVISES DEALER TO STICK TO SINGLE BUSINESS

Studebaker Sales Manager Warns Against Sidelines and Speculation and Declares Them Fallacy—One Car Better than Several.

"In one of the gatherings of Studebaker dealers during my recent Western trip a man rose to ask a question," says E. R. Benson, sales manager of the Studebaker Corporation, in discussing in that big company's house organ the value of specialization as a dealer's asset. "He wanted to know what course to pursue in cases where rival dealers spread unfounded but damaging reports about various details of the Studebaker cars. He went into detail on one of these reports and, in so doing, exposed the fact that he was ignorant of gasolene motor construction and basic facts regarding the development of power.

"Several well-posted dealers were immediately on their feet, furnishing him with the facts. Then I asked him a question:

"'What is your business?'

"The reply explained the whole difficulty.

"'I am a dealer in agricultural implements,' he said. 'I handle automobiles as a side line.'

Suggested Hiring Salesmen Specialists.

"'Why don't you hire salesmen that know the business to sell automobiles exclusively?' inquired another dealer, plainly disgusted at the turn affairs had taken.

"'These experts cost big money,' answered the implement man.

"'Yes, but the profits are big, too, when someone who understands the business is running the sales,' was the prompt reply. And it was justified.

"This little argument gives an excellent illustration of the cause that underlies the failure of so many automobile dealers to reap the unqualified success which they might otherwise achieve.

"An automobile dealer must be a specialist. If he manages his automobile business, to the exclusion of other enterprises, he is certain to succeed, with normal good sense and market conditions.

"If he is forced to conduct the business by proxy, he should place in charge of it a man whom he can trust to handle it independently. The proxy then becomes, to all intents and purposes, the dealer. The plan is, however, dependent to so large a degree on the caliber of the manager that it is not uniformly successful and profitable.

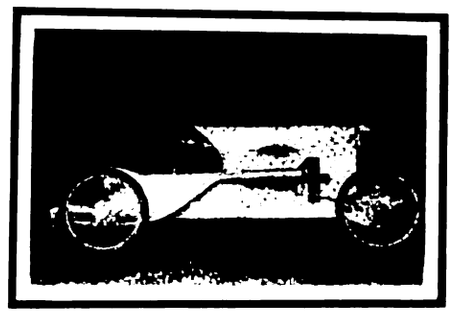
"The dealer who tries to divide his time and effort between the automobile business and some other enterprise is sure to find himself gravitating toward one of the two. The other becomes a sideline, in due time. If the sideline is the automobile business, it is sure to be neglected. If the other business is neglected it becomes unprofitable and, indirectly but surely, injures the man's effectiveness in selling automobiles.

"The financial resources of an automobile dealer form an important factor in his success. Few men are financially able to carry a reserve which will enable them to fill the demands of more than one business. The automobile dealer whose money is tied up in some other business finds himself eventually in a position where he is forced to forego an opportunity to cash in on a large scale. Such an opportunity may not present itself again in several seasons.

"In a long personal acquaintance with dealers all over the country I have been amazed at the number who have from time to time impaired their financial ability by speculations in mines, real estate, orange groves and similar propositions. The automobile dealer should keep an ample reserve in negotiable securities or cash. To spread out his resources is the height of folly. The occasional success of other speculation only serves to call attention to the overwhelming majority of cases in which such speculation leads to financial loss.

"To attain the maximum success, the automobile dealer should carry his specialization still further. Besides abandoning other forms of business and speculation, he should limit his business to one line of cars, selling this to the exclusion of all other cars, regardless of price or class.

"I have known many dealers who have tried to divide their efforts between two or more lines. I have never yet known such a dealer who did not come to regard one of these lines as a success, and the other—or others—as a source of comparative failure. As a result, he pushes one line and makes money. Usually the other one shows a loss when the balance sheet is struck at the end of the year.



Proficiency in One Line Concentration.

"On the other hand, the dealer who centralizes his efforts, without distraction of any sort, on one line of cars, makes no reservations in the form of sales argument he sees fit to employ. He studies this line and becomes proficient in knowledge regarding it. Maintaining relations with but one manufacturer, he secures a standing with that manufacturer far in advance of that accorded the dealer who does not similarly specialize. He finds it easier to secure profitable territorial rights. Provided his choice of a line turns out to be a wise one, and the manufacturer with whom he is allied is financially sound and otherwise stable, the dealer-specialist is bound to go forward with the manufacturer, making each season increasingly profitable and building for himself a reputation which becomes locally very similar to that enjoyed nationally by the corporation whose car he sells.

"It is a mighty asset to any dealer to become known throughout his territory as the dealer for a certain type of successful automobile. The public in such a territory comes to instinctively associate this dealer's name and place of business, with any mention of the manufacturer he represents. A condition like this not only brings to the dealer's store many who might otherwise have gone elsewhere, but it also enables a dealer to reap the full advantage of whatever advertising and other sales help the manufacturer is able to give."

"Gila Monster" Proves to Be Cyclecar.

When those who attended the recent races on the beach at Galveston, Tex., saw "Gila Monster" on the program they naturally expected some big, roaring automobile to make its appearance, and they naturally were surprised when the "monster" turned out to be a very diminutive vehicle

DE WITT'S "GILA MONSTER"

—a cyclecar in fact if not in name. But despite its smallness it did creditable work, winning the 10-mile, Class E, 230-inch event in 10:07.84, under the guidance of George DeWitt, its designer, who is a former Buick racing driver, and established a record of being the first cyclecar to be entered in such a contest in America.

The car, unlike many others of the cyclecar family, uses no belt or chain drive, but receives its motive power through the front wheels, which are carried on spiral springs; the power plant is an 18-horsepower motor, developing this power at 2,800 revolutions to the minute; it is geared at 2½ to 1. DeWitt claims his car can make 85 miles an hour, but it has not yet attained this speed on the road. The tires are 29 x 2¾-inch motorcycle tires and the wheels are wire. DeWitt contemplates entering his production in other races.

FURTHER CONSIDERATION OF ELECTRICITY AND ACETYLENE

Prest-O-Lite Man Claims Ward Leonard Officer Made Unfair Statements —Gives Additional Figures in Lighting Controversy.

To the Editor of Motor World:

I note with considerable interest the statement made by Mr. Leonard Kebler, of the Ward Leonard Electric Co., in your issue of August 7, in contradiction of my recent article which compared electric and acetylene lighting. Mr. Kebler's statement is so highly inaccurate and so thoroughly misleading that the matter should not go before your readers without further discussion.

Mr. Kebler says than an actual test on a stock dynamo, etc., shows a power consumption of about one-fifth of a horsepower. It is one thing to test a dynamo with instruments and run engineering curves with a lead pencil, and it is quite another thing to put that same dynamo in an automobile and test it on the brick speedway. Any time Mr. Kebler, or any other manufacturer of electrical equipment, wants to give the public a demonstration to show that there is no practical difference between laboratory testing and Speedway testing, we shall be more than glad to cooperate. We shall go even further, and furnish all the gasolene and all the necessary electrical and mechanical help, and shall be glad to certify to the result of the test. All we ask in return is a copy of the report of the test, certified to by the manufacturer of the electric lighting equipment. Lead pencil curves are one thing and Speedway curves are quite another thing, and the latter are much more easily understood by the public.

I am sorry that Motor World stated in its part of the article that the user of electricity pays for this convenience in gasolene, and omitted any further items of expense, and also omitted my tabulation of these items of expense. This left Mr. Kebler a chance to say that the expense for gasolene alone would not equal the cost of acetylene lighting. Mr. Kebler, of course, is aware of the fact that the gasolene consumed is only one item of the expense of electric lighting He does not see fit to mention battery expense, light globes, electrical repairs, tire wear due to increased weight, and many other well-known phases of electric lighting expense.

Mr. Kebler is also aware, or should be, that the mileage per gallon obtained on the Indianapolis Speedway, with continuous running, cannot be expected in daily service. The only important part of the Speedway tests was the percentage of difference in mileage shown by disconnecting the electric generator. The car which Mr. Kebler mentions as doing 16½ miles per gallon on the Speedway does 10 or 11 miles per gallon in daily service. Consequently Mr. Kebler's method of figuring such an owner's gasolene bill is wrong, right from the start. This, however, is an easy matter for any automobile owner to figure out without any assistance from Mr. Kebler or myself, if he knows what his annual gasolene bill is and also knows the percentage of power waste.

Mr. Kebler says that Motor World shows a deplorable lack of knowledge in publishing my statement that the discharge rate for two average headlights and one tail light is between nine and 11 amperes. He states that this figure, with 16 candlepower headlight, should be six amperes. Mr. Kebler perhaps forgets that this is a very easy matter for any automobile owner, or for Motor World or any dealer, to find out by turning on the headlights and tail lights and seeing what the ammeter on the dash registers.

It is easy for Mr. Kebler or for myself, or any other electrical engineer, to figure the ampere consumption, but there are other ways for your readers to test this matter which will be much more convincing. A local electrical supply house, which does a large business in automobile light globes, gives me the following figures: 16 candlepower Tungstens take 3 1/3 amperes each; 21-candlepower Tungstens take 4.37 amperes each; a 2-candlepower tail light takes between 1/3 and ½ ampere. Turning on the tail lights and both headlights (16 candlepower) yesterday, on an electrically-lighted car, gave an ammeter reading of slightly over 7 amperes. The same test of a car with 21-candlepower headlights yesterday gave an ammeter reading of between nine and 10 amperes. Check these figures back against my figures and those of the electrical supply house, and then check them back against Mr. Kebler's figures and see which one of us is theorizing.

Mr. Kebler is also well aware of the fact that, while a car may go out equipped with 16-candlepower headlights, the average owner soon puts in larger bulbs. This also is a statement which Motor World, or any reader, can easily verify.

While Mr. Kebler does not deny that charging rates of 14, 16 and 18 amperes are common, he states that 10 ampere charging rate is sufficient. He neglects to remind you or your readers that a large percentage of the dynamo's output is lost in the inefficiency of the storage battery. With a dynamo output of 10 amperes, and the current passing in and out of the storage battery, 7 amperes will not be delivered to the lamps, or even 6 amperes in the average system. This is a matter which is easily verified by Motor World or anyone else who wants to consult any electrical engineer, who is not connected with the manufacture or sale of electric lighting systems.

It is evident that Mr. Kebler has not consulted any of the people who were on the Indiana-Pacific tour, when he intimates that the electric-lighted did not burn their lights in the day time or if they did it with the intention of keeping the battery from being overcharged, they acted in ignorance. Mr. Kebler makes a very grave charge against the factory experts who drove the cars and the electrical experts who gave them attention on their run across the continent. I have taken the trouble to consult several occupants of electrically-lighted cars on the Indiana-Pacific tour, and found that the burning of electric lights in the day time, which was practised by nearly all the electric-lighted cars entered, was done under the advice of expert electrical service men, who found the batteries were being heavily overcharged. I can also name cars which had horn and other connections burned out, and two cars which were on fire. But if Mr. Kebler is correct and these expert service men were ignorant, it might be pertinent to ask Mr. Kebler what amount of electrical knowledge might be expected from an ordinary user of these same outfits under like circumstances.

Mr. Kebler's statement of the life of storage batteries will be highly interesting to automobile manufacturers and dealers especially. I am afraid that our investigation on this subject has been a little more thorough than Mr. Kebler's. To shorten the argument on this point, I shall be glad to furnish Motor World the name and statement of one dealer whose battery expense alone has averaged nearly 5 cents per mile for every mile he has run his car, and the name and statement of another prominent motorist whose expense in 11 months' use was over $70. I shall also be glad to furnish the name of the system, if Mr. Kebler will raise no objection to Motor World printing it.

Mr. Kebler takes one electric system mentioned in the Speedway tests, presumably one on the two light cars tested, states the weight of this system as 130 pounds, and then tries to give the impression that this is typical. Mr. Kebler is well aware of the fact that the two electrical systems on the two heavier cars shown in the Speedway tests weigh considerably more than 130 pounds, but for some reason he forgets to say so. He is also aware of the fact that the addition of weight to a car designed to carry electric lighting equipment is much greater than the weight of the electric system itself. Mr. Kebler is well aware of the

Digitized by Google

ict that one automobile factory, which is ne of the leading exponents of electric ghting and starting, increased the horse-ower of their car over 25 per cent., and ıcreased the weight of their car over 1,000 ounds, and Mr. Kebler knows why.

Take the recent announcement of certain ıedium-priced cars which have this year een redesigned to carry electric equip-ıent, and compare the size of the motor, ze of tires, and other items with the ecifications of the 1913 model. To clear ıe matter up, however, perhaps Mr. Keb-r will be kind enough to come out and ıake a flat-footed denial of the fact that lectrical equipment has been heavily re-ponsible for the increased weight of cars earing this equipment. We shall then be lad to go into the matter more in detail.)nly, before doing so, we want to see Mr. Kebler or some other manufacturer of elec-rical equipment, make a positive statement, nstead of mere insinuations. It is the easi-st thing in the world for any man to make misstatement in one short sentence. I ım sorry that it cannot be corrected in a ıentence equally short, hence the length of his letter.

However, to borrow Mr. Kebler's own anguage, I trust you will give this letter he same prominence that you have given he statements by Mr. Kebler, and let me ıdd that any such discussion cannot help proving valuable to your readers, since it will at least point out a way by which they themselves, without the electrical experi-ence of Mr. Kebler or myself, may ascer-ain the truth.

R. H. COMBS,
The Prest-O-Lite Co.

Motor Truck Club Outing Draws Crowd.

Evidently, the fact that there are those a-plenty who frown dark frowns on "tur-key trotting" made little or no impression on members of the Motor Truck Club of New York City on Tuesday last. For a contest of the sort—in which, however, all the contenders did so well that no decision as to the best couple could be made—formed the chief diversion when the club members and the club members' wives and sweethearts repaired to the Marine and Field Club grounds, on Gravesend Bay, Bensonhurst, for their annual outing. Not all the members showed up to play or to watch the base ball game, which went for six innings, between two "scrub" nines, for there were some who preferred golf or ten-nis or handball, and a very great many took a cooling dip in the waters of the bay. But all were on hand either to see the fun or to take a hand—or a foot—in it when the ladies ran their foot races, and when dinner was served each of the 75 chairs held an occu-pant.

ELGIN IN READINESS FOR TWO DAYS OF ROAD RACING

Course Has Been Manicured Till it Shines and Dangerous Turns Have Been Eliminated—Entrants and Cars They Drive.

Elgin, which is in Illinois, and which is noted for watches and clocks and an 8¼-mile road race course, is about to have an-other speed carnival—the "fourth annual" is the proper caption. Already several of the drivers are on the scene of action, "warm-ing" up and getting used to the new banks and new turns which the road builders have provided by way of making the course safer. The affair, as was the case last year, will be run under the joint management of the Chicago Automobile Club and the Elgin Automobile Road Race Association on Friday, August 29th, and Saturday, August 30th.

Unlike last year's carnival, when five events, three of which were for small cars and two for the higher-powered racing ma-chines, were run, there will be but two con-tests to hold the interest of the specta-tors and both will go for the same distance —approximately 305 miles; and in both the cash prizes will be the same. The cur-tain-raiser will for cars with piston dis-placements of 300 cubic inches or under and will be started at 11 o'clock on the first day of the meet. Besides acquiring the Chi-cago Automobile Club trophy, which is "first time out," so to speak, never having been competed for before, the winner of this 36-lap event will receive $1,750, and if the winner should also happen to have made the fastest lap, he will be still further enriched by $200, Ira M. Cobe, of the Chicago Auto-mobile Club, having donated this sum for the driver who makes the quickest turn of the circuit. Second in will receive $500 and the third man to cross the tape half of that amount.

The Elgin National Trophy, which was won by Ralph De Palma last year, will go to the winner of the larger car event--for cars of piston displacements of under 450 cubic inches—which will be run on the sec-ond day. The cash prize amounts to $1,750. Second and third men will receive money prizes similar in amount to that offered in the smaller car event, and a $200 prize also is offered to the driver who completes the fastest lap; for the Elgin trophy race this lap prize was donated by David Beecroft, also of the Chicago Automobile Club

Since the running of last year's carnival, the surface of the course has been "mani-cured," the turns having been banked and broadened, and it is expected that even greater speed than the winner's average of 70 miles an hour, made in the longest race of last year, is to be expected. One change which is said to have increased the speed possibilities of the course enormously was the elimination of the hairpin bend at Mc-Queen's; by making this sharp turn into a long sweep the length of the circuit has been reduced some 450 yards. As it now stands, the course surveys at 8 miles 2,499 feet, so that each of the races to be run will go for 305 miles 204 feet.

While the entries have not closed as yet, nor will they close until midnight to-mor-row (Friday), up to the present time a baker's dozen of the shining lights in the racing profession have either "signed up" to start or have signified their intention of doing so. Those who are expected to com-pete in either one or the other or both of the events are: Harry Endicott, Nyberg; Gil Anderson, Stutz; Ralph De Palma, Mer-cer; Spencer Wishart, Mercer; Harry Grant, Isotta Fraschini; Joe Dawson, Marmon; Edward Rickenbacher, Mason; "Bill" Chandler, Mason; Ralph Mulford, Mason (300 class); William Haupt, Mason; Theo-dore Pilette, Mercedes; Victory Hemery, Mercedes; Ralph Mulford, Peugeot (450 class); Erwin Bergdoll, Benz.

John De Palma Stars at White Plains.

John De Palma—not Ralph this time—was the bright particular star of the race-meet that was held on the old half-mile dirt track at White Plains, N. Y., on Sat-urday last, and though he gave a pretty good imitation of his brother's method of driving—which means that he won just about as he pleased—he came very far from equaling his brother's time in any of the events; he drove a Mercer car. As was the case at the Brighton Beach meet the Sat-urday previous, Wishart, also in a Mercer, was the runner-up. One accident helped to add excitement. It occurred in the 10-mile free-for all race and put A. W. Marsh and his Stoddard-Dayton out of business for the rest of the day. The summary:

Five miles, class E—Won by John De Palma, Mercer; second, Creerberger, Flan-ders. Time, 7:24.

Five miles, class E—Won by Spencer Wishart, Mercer; second, John De Palma, Mercer. Time, 6:37.

Ten miles, free-for-all, class D—Won by John De Palma, Mercer; second, Henry Hickman, Buick. Time, 13:27⅕.

One mile, time trial—Won by Jean Men-enghetti, Fiat, time, 1:14⅕; second, Spencer Wishart, Mercer, time, 1:16⅗; third, John De Palma, Mercer, time, 1:17⅕.

Ten-mile free-for-all handicap—Won by John De Palma, Mercer (30 seconds); sec-ond, Spencer Wishart (scratch). Time, 13:11.

1,049,883. Change-Speed Gearing for Motor Vehicles. William Turner Lord, Kensington, London, England. Filed June 13, 1912. Serial No. 703,499. (Friction transmission mechanism.) 4 claims.

1,049,887. Carburetter. Elmer E. Marsh, Cincinnati, Ohio, assignor of one-third to Arthur C. Davis and one-third to Victor Gluchowsky, Cincinnati, Ohio. Filed Jan. 2, 1912. Serial No. 669,013. (Carburetter with automatic control of air and fuel.) 4 claims.

1,049,893. Anti-Skidding Device for Tires. Ira Dale Meals, Harrisburg, Pa. Filed Feb. 29, 1912. Serial No. 680,580. (Jointed metal plates curved to fit tire.) 7 claims.

1,049,899. Metal Tire Protector. Joseph Morasky, Forbes, Colo. Filed Mar. 26, 1912. Serial No. 686,280. (Tire cover with spring retaining device.) 2 claims.

1,049,903. Container for Spark Plugs. Christopher Frazine Norton, Merritt, Fla., assignor of one-half to Edgar E. Grimes, Cocoa, Fla. Filed Aug. 1, 1911. Serial No. 641,798. (Tubular case of two spark plugs placed end to end.) 2 claims.

1,049,925. Internal Combustion Engine. John Sauer, New York, N. Y. Filed May 16, 1910. Serial No. 561,668. (Two-cycle three-port engine with adjustable air-valve in crankcase.) 3 claims.

1,049,937. Vehicle Tire. Alfred Steinhauser, Philadelphia, Pa. Filed Mar. 7, 1912. Serial No. 682,283. (Pneumatic tire with internal cushions.) 4 claims.

1,049,946. Combined Automobile Fender and Lamp Support. Richard Tyrell, Missoula, Mont. Filed May 28, 1912. Serial No. 700,253. (Hood covering upper half of wheel, pivoting with it in steering and carrying lamp bracket.) 1 claim.

1,049,959. Accelerator for Internal Combustion Engines. Thomas C. Willett, Adams, Tenn. Filed Oct. 18, 1911. Serial No. 655,316. (Ratchet device with releasing trigger.) 5 claims.

1,050,002. Electric Igniting Device for Explosive Engines. Edward P. Cowles, Sparta, Mich. Filed May 12, 1902. Serial No. 106,947. (Fly-wheel generator with automatic governor for increasing air gap between rotating and stationary parts as speed increases.) 7 claims.

1,050,012. Internal Combustion Engine. Charles E. Duryea, Reading, Pa., assignor to David Clark, Wm. A. La Rue and John H. Fisher, Easton, Pa. Original application filed Oct. 2, 1905, Serial No. 280,974. Divided and this application filed Mar. 22, 1907. Serial No. 363,961. (Rotary cylindrical valve.) 13 claims.

1,050,026. Starter for Combustion Engines. Carl Hunt, Indianapolis, Ind. Filed Jan. 3, 1910. Serial No. 535,963. (Ignition starter with separate fuel supply.) 10 claims.

1,050,049. Driving Gear for Motor Road Vehicles. Giovanni Agnelli, Turin, Italy, assignor, by mesne assignments, to F. I. A. T., Poughkeepsie, N. Y., a Corporation of New York. Filed Jan. 16, 1907. Serial No. 352,630. (Two-speed bevel gear rear axle drive.) 8 claims.

1,050,050. Motor Vehicle Axle. Giovanni Agnelli, Turin, Italy, assignor, by mesne assignments, to F. I. A. T., Poughkeepsie, N. Y., a Corporation of New York. Original application filed Jan. 16, 1907, Serial No. 352,630. Divided and this application filed Dec. 15, 1909. Serial No. 533,149. (Two-speed bevel gear rear axle drive.) 3 claims.

1,050,059. Carburetter. John H. Gould, Plymouth, Ill., assignor to Alfred C. Stewart, Los Angeles, Cal. Filed May 26, 1909. Serial No. 498,523. (Carburetter with gasolene passage through air-valve stem.) 6 claims.

1,050,060. Steering Mechanism. Robert E. Gregg, Indianapolis, Ind., assignor to General Specialty Company, Indianapolis, Ind., a Corporation of Indiana. Filed Jan. 2, 1912. Serial No. 669,078. (Steering axles extended beyond pivots and linked together.) 8 claims.

1,050,061. Coupling Link for Anti-Skid Chain. Edwin S. Holmes, Jr., Washington, D. C., assignor of one-half to Randolph T. Warwick, Washington, D. C. Filed Mar. 11, 1912. Serial No. 682,858. (Cross chains with hooked ends.) 3 claims.

1,050,087. Internal Combustion Engine. Karl Steinbecker, Charlottenburg, Germany, assignor to General Electric Company, a Corporation of New York. Filed Mar. 9, 1912. Serial No. 682,607. (Hydraulic valve gear.) 7 claims.

1,050,108. Lubricating System. Paul Daimler and Albert Hess, Cannstatt, Germany, assignors to The Firm of Daimler Motorengesellschaft, Stuttgart-Unterturkheim, Germany. Filed Apr. 8, 1912. Serial No. 689,317. (Port arrangement in plunger lubricating pumps.) 4 claims.

1,050,128. Vehicle Wheel. Anton Haller, Sioux City, Iowa. Filed Oct. 30, 1911. Serial No. 657,4[illegible]. (Rim with rubber tread, metal sides and internal springs.) 4 claims.

1,050,138. Means for Regulating and Lubricating a Laminated Spring. Maurice Houdaille, Paris, France, assignor to Societe Houdaille & Sabot, Paris, France. Filed July 24, 1911. Serial No. 640,287. (Adjustable wedges for separating spring leaves.) 4 claims.

1,050,146. Curtain for Automobiles. Louis J. Tahrs, Buffalo, N. Y. Filed Feb. 21, 1912. Serial No. 679,046. (Curtain between front and rear seats.) 5 claims.

1,050,162. Magneto Ignition System for Internal Combustion Engines. William F. Nickel, Brooklyn, N. Y. Filed Nov. 23, 1910. Serial No. 593,845. (Winding system designed to concentrate current output from all parts of armature at point of discharge.) 21 claims.

1,050,197. Resilient Wheel for Vehicles. Alois Zimprich, Oberndorf-Purgstall, Austria-Hungary. Filed Apr. 1, 1912. Serial No. 687,665. (Wheel with radial springs between inner and outer rims.) 1 claim.

1,050,200. Auxiliary Air Inlet Device for Internal Combustion Engines. James Madison Aubery, Los Angeles, Cal. Filed Aug. 28, 1911. Serial No. 646,534. (Auxiliary air inlet with ball valve.) 2 claims.

1,050,230. Automobile Heater. Lundy L. Peters, Tiro, Ohio, assignor to Joshua Crouse, Bucyrus, Ohio. Filed Nov. 15, 1911. Serial No. 660,354. (Foot warmer operated by exhaust gas.) 1 claim.

1,050,288. Valve-Operating Mechanism for Motor Vehicles. James W. Packard, Warren, Ohio, assignor, by mesne assignments, to Packard Motor Car Company, Detroit, Mich., a Corporation of Michigan. Original application filed June 29, 1903, Serial No. 163,589. Divided and this application filed Oct. 13, 1905. Serial No. 282,646. (Rocking lever valve mechanism.) 6 claims.

1,050,395. Combined License Bracket for Vehicles. William A. Schleicher, Cleveland, Ohio. Filed June 3, 1912. Serial No. 701,161. (Sliding bracket attached to lamp.) 1 claim.

1,050,418. Electric Ignition Device. James E. Baldwin, East Williston, N. Y., assignor, by mesne assignments, to Fulton Manufacturing Co., Erie, Pa., a Corporation of Pennsylvania. Filed Mar. 10, 1906. Serial No. 305,279. (Eccentric operated ignition system with reversing device for two-cycle gasolene motor.) 8 claims.

1,050,456. Explosive Engine. Eero W. Helin, Jamaica, N. Y., assignor of one-half to William C. Dillman, New York, N. Y. Filed Feb. 8, 1912. Serial No. 676,439. (Crankshaft and cylinders parallel and connection through bevels.) 4 claims.

1,050,461. Make-and-Break Device for Ignition Systems. Theodore Hubert, Roselle, N. J., assignor, by mesne assignments, to American Circular Loom Company, Boston, Mass., a Corporation of Maine. Filed July 6, 1910. Serial No. 570,548. (Magneto circuit-breaker.) 5 claims.

1,050,481. Resilient Wheel. Bernard Marley, Warren Preston Thacker, and Robert Parker Barnard, Nokomis, Ill. Filed May 23, 1912. Serial No. 699,252. (Wheel with crossed curved spring spokes.) 3 claims.

Holds World's Stock Championship

National

Holds World's Record for Fastest 500 Miles in Competition

Once a National Dealer, Always a National Dealer

Electric started and lighted. Not only left side drive, but *access* to both front doors

Five models, $2750 to $3400

Private owners boost sales and profits for *National* dealers

Private owners have boosted the sales and profits of *National* dealers because they received ***honest value*** in their car, consequently, did not hesitate to recommend the *National* to their friends.

Once you join the great *National* Selling Organization, as a *National* dealer you will find that our advertising, *plus* your salesmanship ability, *plus* the recommendation of satisfied private owners, *plus* the ***honest value*** that is to be found in every *National* car, will help you to quick, easy, *profitable* sales. Other *National* dealers find this true—and so will you.

You know from experience that it is only when the private owner gets the honest value in his car, that the dealer who sells it makes a profit. That's why *National* dealers stick with us year in and year out and are prosperous.

No dissatisfied owners to cut down your profits

We claim and can convince the most skeptical that the *National* is the best car to own—that the *National* is the most profitable selling proposition for you as a dealer.

This is a pretty broad claim to make—but after thirteen years of consistent, successful building and selling the *National*, we offer you a car built entirely of the best materials money can buy—containing a most flexible, noiseless motor—the most efficient electric starting and lighting system—a car that is powerful, dependable, easy to operate, convenient and comfortable.

You as a *National* dealer will make a nice profit and *retain* it, because here is a car with "come-backs" reduced to the minimum—a car that keeps the owner boosting instead of dissatisfied—and this simply means that *your profit* remains *profit* and is not eaten up in needless service and shop expense.

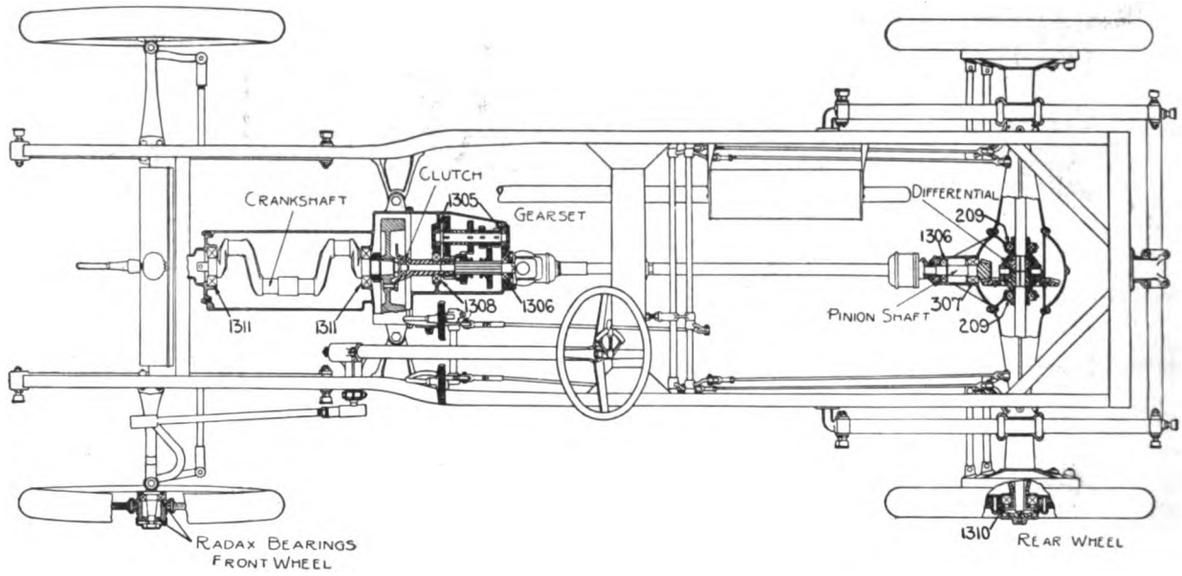
Visit our factory—or write us at once

It will be to your interest to visit our factory at Indianapolis if you can possibly do so. If you are to be a part of the great *National* Selling Organization we would like to meet you face to face.

If not convenient to come here at this time, wire or write us quick, there is a big opportunity waiting for you if you happen to be located in open territory. Our output is steadily increasing; based on a permanent ever-increasing demand from owners.

Come to Indianapolis and visit our factory if possible, if not, write immediately for complete specifications, illustrations of our various models, prices and satisfactory offer to dealers.

Let us hear from you by return mail—your request for information will imply no obligation on your part.



National Motor Vehicle Co., Dept. 90, Indianapolis, Ind.

American Made For American Trade

New Departure

Ball Bearings Throughout, and Why

By the use of New Departure ball bearings throughout the entire chassis, the manufacturer of this car has reduced power losses, repairing and operating costs to a minimum.

New Departure ball bearings eliminate friction. Friction is expensive, wears away the parts, hastens depreciation, and makes frequent repair necessary.

By eliminating friction New Departure ball bearings waste so little of the motor energy that maximum driving power is transmitted to the rear wheels. By eliminating friction there is practically no wearing away of the parts. The life of the entire car is longer and repairs are fewer.

All of these advantages are secured without sacrificing bearing efficiency. New Departure ball bearings will carry the load under all conditions of service equally as well as any bearing made.

Have you seen our interesting brochure on "Friction Elimination"? If not, drop us a card today and it will be forwarded to you by return mail.

Elyria-Dean
TRADE MARK

REXO

PRICE

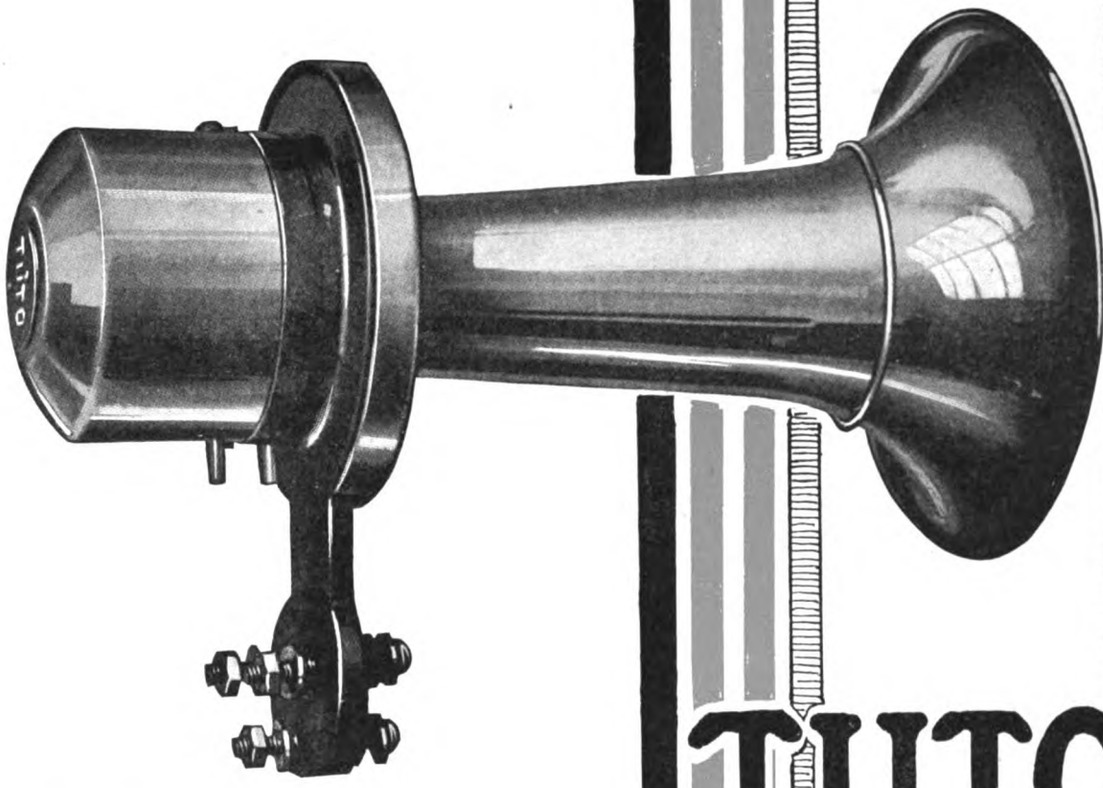
$8

The Rexo is a single tone horn produced in large quantities for the automobile manufacturers—our standard equipment.

The Rexo on your car will give you a signal that satisfies all the requirements of a one note horn. May be used for city and ordinary open country work.

Built on the same sturdy lines as the Tuto and guaranteed.

No Elyria-Dean horns need oiling or cleaning, and only a possible adjustment with a screw driver once a year. Many have not removed the rear cap for three years.



Order through your dealer or address

Elyria-Dean
TRADE MARK

It would be very foolish for the Dean Electric Company with a competent engineering corps to continue to manufacture Hammer driven horns if there were no logical market for them.

The two-tone Tuto will supply your need for a horn which does not shriek but gives a warning to pedestrians, adequate under all conditions, but without annoyance to the occupants of the car.

Too loud a signal becomes vulgar. The low note of the Tuto suffices for ordinary signaling. You may produce the loud note by depressing the same button more deeply.

Permanent guarantee makes it the horn for fall motoring—it will outlast many winters.

Have your dealer order or write.

60 "SIX" KISSELKAR 60 "SIX"

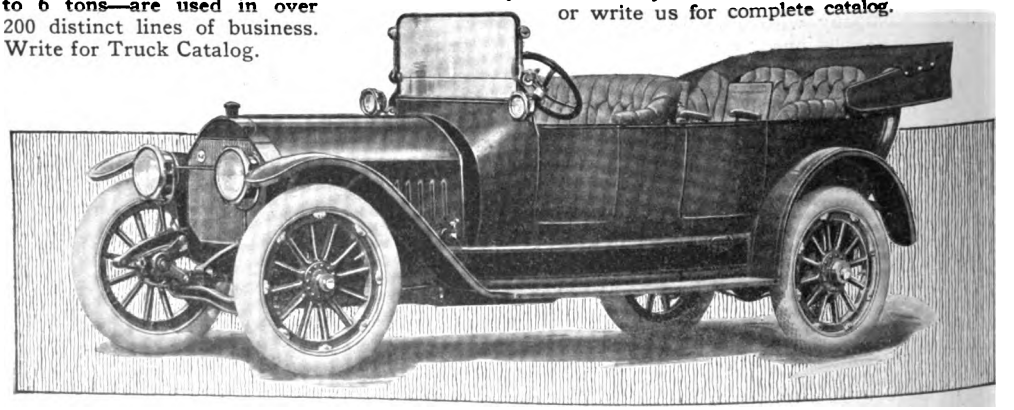
The Big Car that Pioneered Downward Prices Maintains Its Leadership as a Car of Unsurpassed Ability, Elegance and Comfort.

Point for point this powerful, silent, thoroughbred KisselKar 60-"Six" challenges critical comparison. Its symmetry of design, perfect poise and balance, and long, clean, graceful lines appeal irresistibly to your sense of beauty and fitness.

At first sight you feel instinctively that this big KisselKar "Six" is a car that you would be proud to own. Your first road test will disclose the exceptional riding qualities of this "greyhound of the highways." Gliding smoothly along in this superb car of comfort, you realize the utmost limit of motoring delight.

The exceptionally liberal 142-inch wheelbase, the big wheels and over-size tires, shock absorbers and eleven inches of seat upholstery reduce road vibration to the minimum. And the unusually spacious tonneau and deep pitched seats permit you to recline at ease, unaffected by the "lurches" and sidesway incident to ordinary motoring.

The lighting facilities are strikingly original, especially the illuminated instrument board and special lights that sweep the full length of the running boards, and the "bull's-eye" in the tail lamp, the rays of which directly reach the gasoline gauge. The Golde patent "one man" top, Warner speedometer, Klaxon horn and many other features of the highest priced cars are all found in the KisselKar 60-"Six" equipment.



The KisselKar 60-"Six" at $3150 is a wonderful value that easily leads the "big Six" field. Price of the new KisselKar 48-"Six" is $2350; KisselKar 40-"Four," $1850. All KisselKars are fully equipped, and are electric lighted and started. They have left hand drive and center control.

KisselKar Service Contract

The KisselKar is sold under a written guarantee of service to owners—a tangible, definite and specific contract that clearly stipulates the scope of KisselKar Service and provides mechanical care that forestalls trouble and retards depreciation.

KisselKar Trucks—1500 lbs. to 6 tons—are used in over 200 distinct lines of business. Write for Truck Catalog.

These new KisselKar Models are now being shown by our representatives everywhere. See your nearest Dealer for demonstration, or write us for complete catalog.

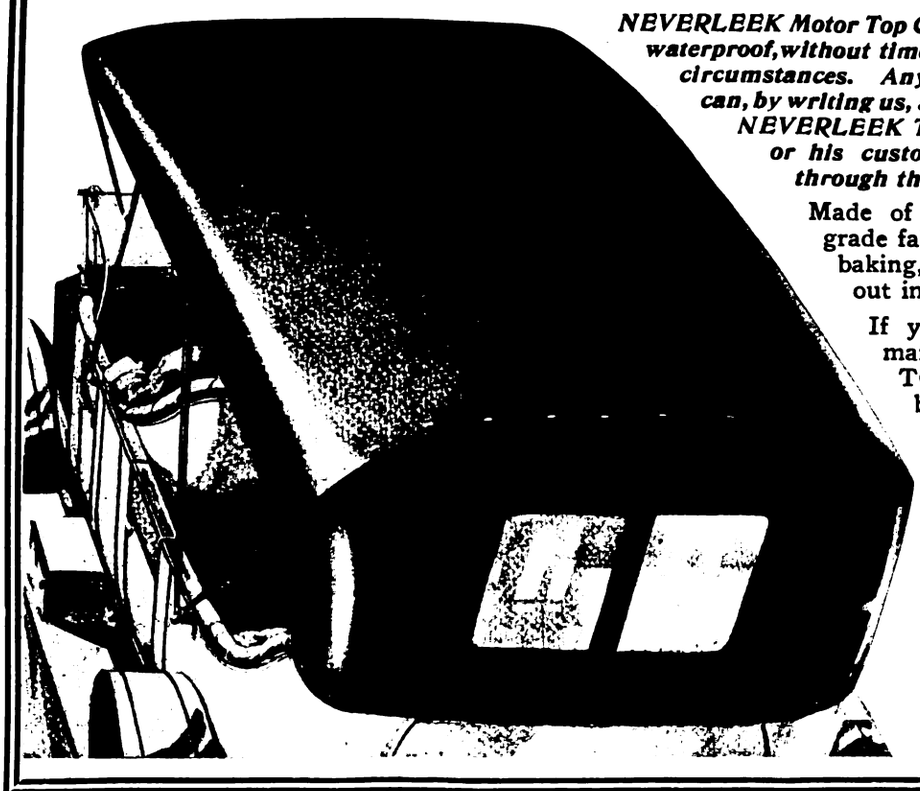
Now Comes the Standardized Top

Here Is the Material that Makes It Possible

Look for pages and half pages in The Saturday Evening Post this fall and winter, advertising NEVERLEEK, the first standardized top covering. Guaranteed without limit—a known, standardized, dependable piece of equipment.

The Automobile Manufacturer can put it on his car with confidence. He can guarantee it because we stand back of him. It adds distinction to the appearance of his car, and adds value. It doesn't shrink—retains its shape—and does not wrinkle.

A NEVERLEEK TOP is an advantage to the Dealer for the same reason. It makes the car easier to sell; it gives a smart appearance; its guarantee is a strong selling argument—there is no danger of a comeback.



TRADE MARK

NEVERLEEK

TOP COVERING

Guaranteed Without Limit

Read This Remarkable Guarantee—The Strongest That Can Be Written:

NEVERLEEK Motor Top Covering is guaranteed absolutely waterproof, without time limit, in any climate, under all circumstances. Any automobile dealer, anywhere, can, by writing us, arrange for the recovering of any NEVERLEEK TOP, without expense to himself or his customer---provided such top leaks through the fabric.

Made of new live rubber and highest grade fabric. Tested for three years by baking, freezing and other abuse, without impairing water-proof qualities.

If you are selling cars, ask your manufacturer for NEVERLEEK TOP EQUIPMENT. If you are buying a car, insist on a NEVERLEEK top. If you have an old top, get it re-covered with NEVERLEEK.

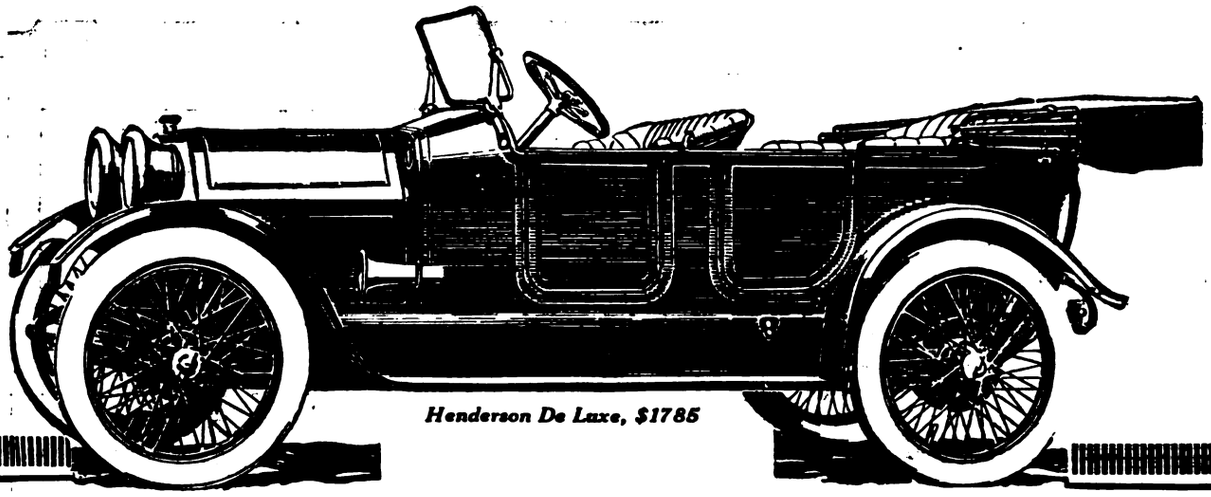
—No, this is not the beginning of a Gouverneur Morris romance.

IT is just Harvey Robinson, the genial dealer in Whirligig cars, happening to meet Miss Bessie Flutter in her 48 h.p. Whirligig trying to take a Sunday spin. The Whirligigs, you know, are fitted with Buzzer & Smashem electric starters, which can be heard two blocks away when they get busy, and which (perhaps for that reason) have become a household word in Robinson's home town.

On this particular Sunday Miss Bessie stopped her car in the shade of a grove to enjoy the view. Perhaps the placid pastoral scene affected the starter also, for when Miss Bessie remounted, pushed her starter lever and stepped on the button, the Sabbath calm was not desecrated by the usual uproar. Miss Bessie could not crank the engine by hand, so she had to wait for a masculine rescuer, who by good fortune was no other than Harvey Robinson himself.

The picture shows Harvey in the act of mentally congratulating the manufacturers of the Whirligig on their selection of a starter. Later he will congratulate himself that he, instead of his competitor across the way, was fortunate enough to happen along at this time.



Just at present he is also framing a resolution to send for Rushmore literature and find why those Rushmore people have the nerve to claim that theirs is the real "press-the-button" starter. He will get it by return mail—and it will deal in scientific facts, not "hot air."

Henderson De Luxe, $1785

How the Largest Dealer-Profits Are Made

By C. P. Henderson

—By offering 1914 cars *NOW!*
—By actually getting *deliveries* on cars they *sell!*
—By not having unsold models of the previous season.
—By getting cars at the height of the selling season NOW.
—By not having to pay interest, insurance, storage, damage on cars crowded onto them in dull season by some makers.
—By means of scientific dealer-cooperation from the factory.
—By factory advertising assistance in copy and *CASH!*
—By selling cars without *chronic* defects that lose sales.

Dealers Who Offer 1914 Cars Now

That is the ideal dealer-manufacturer relationship. I have studied dealer conditions almost from the industry's inception.

Our dealers today can offer immediate delivery of cars embodying features that, on other leading cars, will be seen first at the New York Show, January 1914.

They can offer the use of a new fuel, if the prospect wants it—for Henderson cars are built to be fitted with the new Harroun kerosene-burning carburetor. Wire wheels are optional.

Cowl dash, cowl gasoline tank, left drive, the new center seat control, the famous Stutz rear system—all these and a myraid other striking 1914 and 1915 features win orders *today*.

And we have been delivering since May 20. So our dealers have year-ahead automobiles to offer. Under any other name dealers cannot take profits on such cars until *Spring*.

Don't Sell Old 1913 Models Now

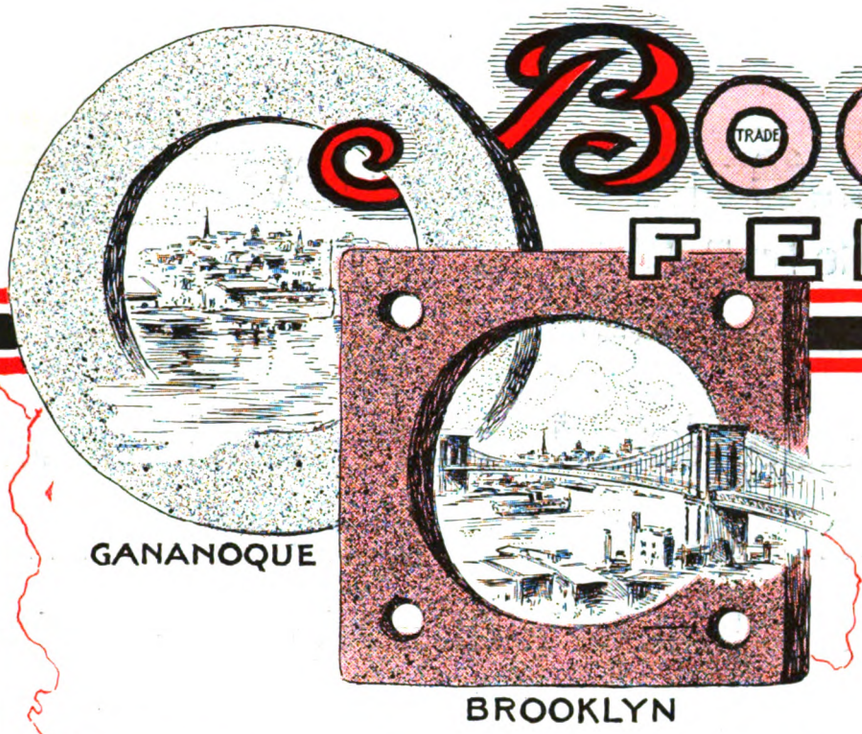
All other moderate-priced car dealers are selling 1913 models today—a year out of date. Buyers know these things. They hold off until 1914 announcements are made. Then they rush in and find they can't get deliveries until Winter.

Some dealers have cars for city sale, none of the price the country buyer wants to pay.

Note the sales possibilities for this line: Light Four $1585, country and city trade; De Luxe Four $1785, city trade and some country business; 6-Cylinder, $2285, city trade; Coupe, on six or four chassis, large city trade.

Have You Such Prospects?

You can probably put your finger today on 20 to 100 prospective purchasers who want just such automobiles—want them NOW. And merely supplying that existant demand is the way largest *dealer-profits* are made.



If you are the type of man we want as the dealer in your territory, you might wire about territory—or come to the factory.

For several years machinery manufacturers in the United States and Canada have used Booth Felt Washers on their products. This business has become so great that it was found advisable to manufacture in the Dominion as well as in the States. In both the American and Canadian factories all grades of washers and gaskets are made but the demand for our all-wool felt washers has grown until it is a very important part of our business.

In the automobile industry the high grade cars were the first to see the advantage of using Booth All-Wool Felt Washers, not because this superior grade of washer became a talking point in the make-up of their cars, but because Booth All-Wool Felt Washers do their work so much better than cheap, shoddy washers and because the working parts they serve are benefitted to such a degree that it is no economy at all to let the slightly greater cost of Booth All-Wool Felt Washers stand in the way of their replacing cheap, inefficient, shoddy washers. Send for samples.

The Hunt Test

Made by R. W. Hunt & Co., Chicago

Materials tested for 3/8" bolt construction:

Castellated nuts and cotters

Nut lock washers 3/16x1/16

Nut lock washers 5/32x1/8

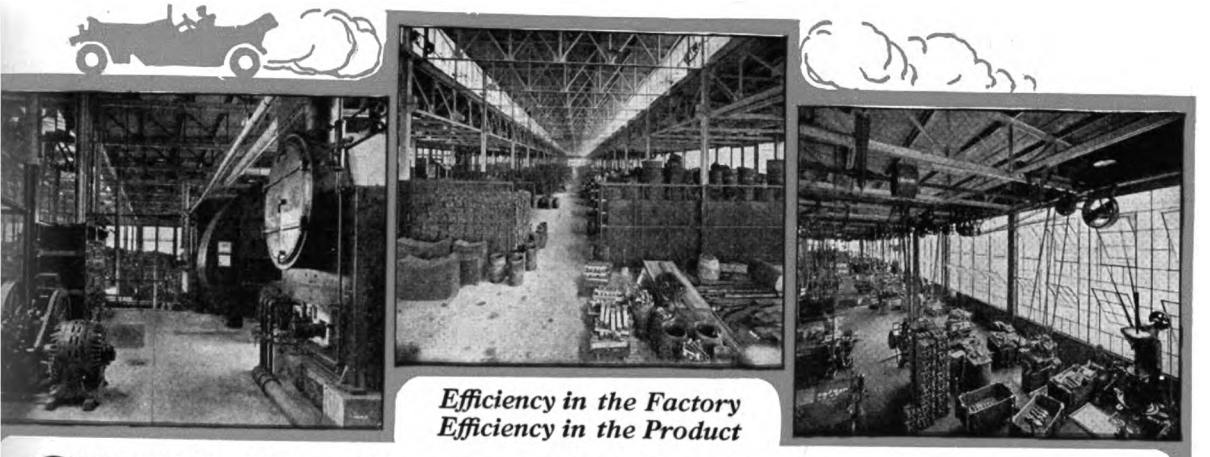
Resulting averages:

3/8—3/16x1/16" showed looseness in 6,765 vibrations.

3/8—5/32x1/8" showed looseness in 87,200 vibrations.

Castellated nut and cotter showed looseness in from 50,000 to 87,000 vibrations.

Conclusion: Light section lock washer decidedly inferior to heavy section lock washer in holding ability and too light for efficient service.



Heavy lock washer superior to castellated nut and cotter in nut holding ability and if produced under manufacturing conditions insuring uniformity of excellence is a better mechanical construction.

Full data of Hunt test was published in Motor World, May first. Copy sent on request.

EISEMANN

Think What the Proven Eisemann Efficiency and Dependability Mean to You, Mr. Dealer and Mr. Manufacturer!

Eleven out of nineteen cars on the severe tour cross country from Indianapolis to the Pacific were Eisemann equipped. Every single equipment absolutely perfect in performance. Not one suggestion of trouble, from the time the start was made to the very end of the trip—through sand and mud, through rivers and alkali plains, through valleys and over high mountains—under the hardest sort of conditions.

Think what the use of such an efficient and dependable system on your car means after it leaves your hands and lands finally in the hands of the customer. Think what a sales asset it is to equip the product you sell with such dependable and efficient ignition.

And besides, this is merely spectacular proof of the facts that have given Eisemann the reputation it enjoys today. For years wise car makers have been using Eisemann ignition with the knowledge that it was making a better product for them and giving them a list of satisfied users. It has been the every day performance of these Eisemann equipments that inspired the eleven entrants in this tour to depend upon Eisemann in the first place. The ultimate performance really is only justification of their judgment.

The most important miles on the dial

One of the most important speeds a car *must* maintain—and must have indicated *exactly* in order to maintain—is the low speed required by city traffic rules which is often as low as 6 miles per hour.

The *only* instrument that indicates these low speeds is the *magnetic type* speedometer.

No other Speedometer shows any sign of life until its whirling parts have enough momentum—never under seven to fourteen miles per hour.

The magnetic Stewart begins to register when the car begins to move. It accurately and unfailingly indicates speed *from zero up*. It is the only speedometer which surely indicates every mile or fraction below fourteen miles—the most important miles on the dial.

This is another reason for the 800,000 Stewart Speedometers in use compared to the 200,000 of all other makes combined.

See that you have a Stewart on *your* car.

Hartford Cone Clutches

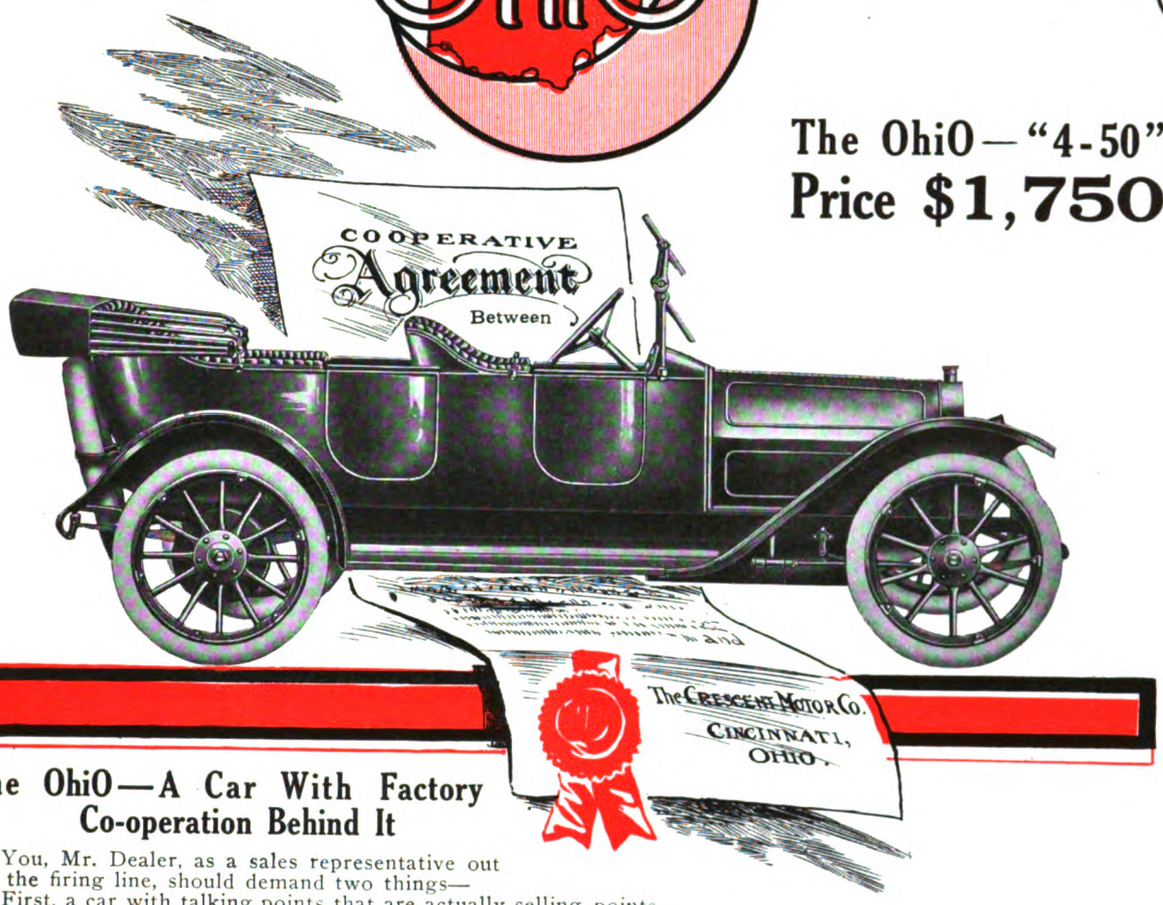
Quality, delivery and price are the three big factors in determining the advisability of one concern's doing business with another—after the all-important engineering features cocnerning efficiency and availability have been settled satisfactorily.

In passing, cone clutches in point of efficiency are the choice of the majority of automobile engineering experts, both for trucks and pleasure cars. Among the various makes of cone clutches, Hartford products dominate.

Standard Hartford Cone Clutch Unit Complete with Universals. This is the Type Clutch We Have Specialized in for Years.

In their relation to the general chassis assembly, Hartford Cone Clutches possess a decided advantage over other makes because of their ready interchange of parts and the ease of assembly and take-down.

In regard to quality—Hartford Cone Clutches go through a series of inspection tests beginning with the rough forgings and on through every stage of their manufacture. These inspection tests are so rigid, and the passable limits so close that an inferior piece of material or an inferior bit of workmanship rejects the unit. Close study and long experience has enabled us to define every possible clutch defect, and the inspection in vogue in our shops is in reality a series of traps which a defective clutch cannot get by.



In regard to delivery and price—approximately the same condition govern each. Material costs vary slightly with the open market. Manufacturing skill is best evidenced in the selection of labor, in machining and in equipment. In the Hartford Shops only the most highly skilled machinists are employed, many of them having been with us for years, making a specialty of clutch work.

We have always made cone clutches and our equipment of special machinery challenges comparison with any. Herein lies the basic reason why we deliver Hartford Cone Clutches strictly according to schedule.

Improved machinery designed especially for a particular purpose reconciles costly skilled labor with commercially practicable quotations on Hartford Cone Clutches,

The OhiO—"4-50" Price $1,750

The OhiO—A Car With Factory Co-operation Behind It

You, Mr. Dealer, as a sales representative out on the firing line, should demand two things—

First, a car with talking points that are actually selling points.

Second, real factory team work.

The OhiO car as a selling proposition is all that Mr. R. E. Northway's experience in the industry, plus an efficient factory, can make it.

Its real value goes back of the paint, deeper than the engine or the transmission; it goes back to the sincerity of the men behind it.

For that reason it stays sold, and its drivers form an unpaid selling force that work for you seven days a week.

Moreover, behind the OhiO is an organization that believes that your success as an OhiO dealer is the foundation of its own permanency.

That's why we back up OhiO dealers with factory-co-operation that actually co-operates—that works with and for you.

First we built the car.

Then we built a real co-operative department to match.

Now we know that both deserve the attention of every keen motor-car merchant, and we can make it mighty interesting for a few such men, provided they respond immediately. Wire now at our expense.

Crescent Motor Company, Cincinnati, Ohio
R. E. NORTHWAY, President

SPECIFICATIONS 1914 CARS

OhiO "4-35" Five Passenger Price $1,275

Motor—4¼ x 4¾
Axles—Full floating on annular bearings.
Transmission — Three speeds and reverse.
Clutch—Multiple disc.
Inside control; right-hand drive
Speedometer—Stewart.
Rims—Demountable.
Tires—34 x 4.
Wheel Base—116 inches.

OhiO "4-50" Five Passenger Price $1,750

Motor—4½ x 5¼.
Axles—Full floating on annular bearings.
Transmission — Three speeds and reverse.
Clutch—Multiple disc.
Center control; left-hand drive.
Speedometer—Stewart.
Rims—Firestone demountable.
Tires—35 x 4½.
Wheel Base—122 inches.

OhiO "6-60" Five Passenger Price $1,985

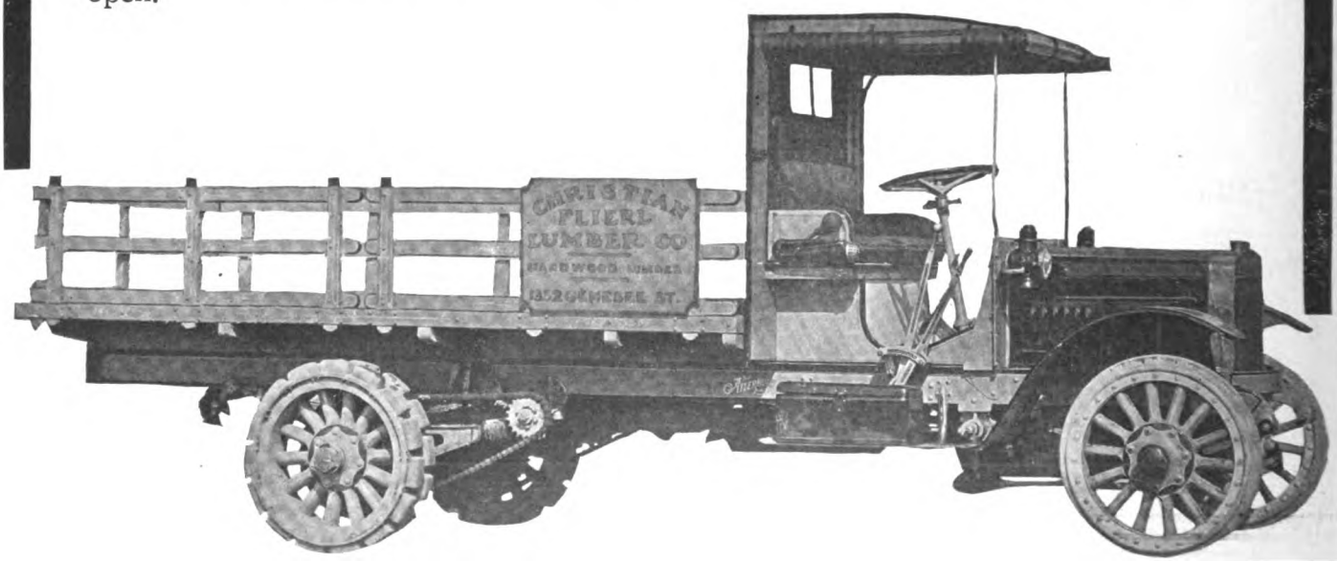
Motor—4 x 6.
Axles—Full floating on annular bearings.
Transmission—Four speeds and reverse, direct on fourth.
Clutch—Multiple disc.
Center control; left-hand drive.
Speedometer—Warner, flush type.
Rims—Firestone demountable.
Tires—35 x 4½.
Wheel Base—122 inches.

OhiO "6-80" Seven Passenger Price $2,485

Motor—4½ x 6.
Axles—Full floating, annular bearings on rear; taper roller on front.
Transmission—Four speeds and reverse, direct on fourth.
Clutch—Multiple disc.
Center control; left-hand drive.
Speedometer—Warner, flush type.
Rims—Firestone demountable.
Tires—36 x 4½.
Wheel Base—138 inches.

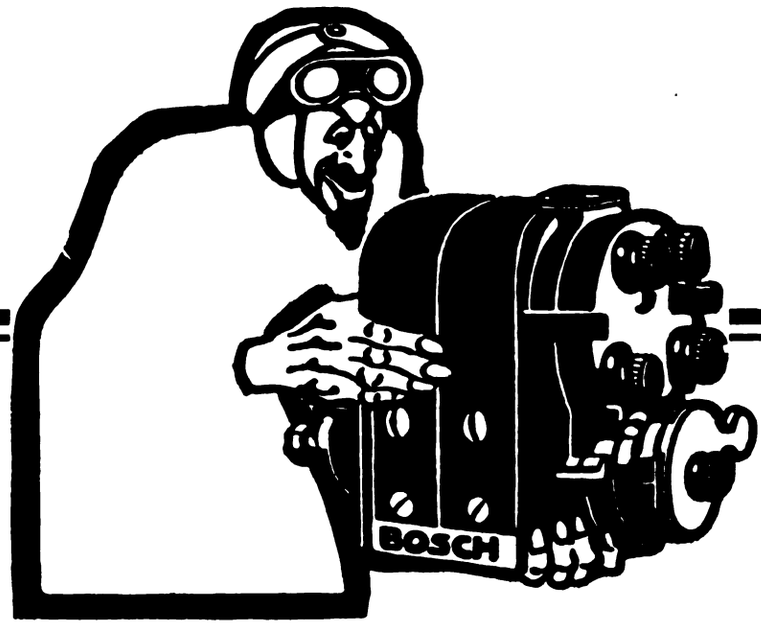
DEALER COOPERATION

Digitized by Google



THE ATTERBURY LINE

Up in front Atterbury Trucks are as nearly perfect as can be. Atterbury motors, in themselves, are efficient and economical, making every bit of fuel used account for work done. The method of motor suspension and hitch-up with the drive mechanism is faultless. Perfection in such details means efficiency.



Truck efficiency without long life, however, defeats the purpose of automatic transportation. A truck must do more than accomplish more work in a day than horses. It must outlast a team of horses because its first cost is greater. This is the reason why the Atterbury Motor Car Co., early in its existence, directed much of its attention and energy to the development of a radius rod construction far in advance of anything of like nature yet produced. The strongest truck construction would never stand up unless the jars and jolts of uneven roadways were compensated by a device to relieve the operating mechanism of road shocks. No matter how well sprung, heavy loads over uneven roadways will rack the strongest truck chassis to pieces unless it be equipped with an efficient radius rod construction.

Atterbury radius rods are the highest development of this all-important, life-giving detail of truck construction, and every dealer, actual or prospective, should give this matter the most serious attention. We solicit your investigation and will welcome correspondence with you regarding terms to dealers and territory now open.

The Atterbury Motor Car Company, Buffalo, N. Y.

More Than 150,000 New Automobiles Will Be Equipped With Stanweld Rims This Coming Season ! ! !

Cars ranging in price from $750 to $7,500.

Cars ranging in weight from 1,000 pounds to 10,000 pounds.

Cars ranging in speed from 20 miles per hour to 90 miles per hour.

Cars ranging in type from the electric runabout to the expensive gasoline limousine.

Cars selling in New York City and Calcutta, India.

Cars that will never leave the boulevards, and cars that will seldom see a paved roadbed.

Cars equipped with solid tires, semi-solid tires, straight-side pneumatic and clincher tires.

Such are the requirements that every Stanweld rim is built to satisfy. And the proof of satisfaction is the present-day demand for them.

Stanweld rims accept either straight-side or clincher tires.

They have both the quick-detachable and demountable features—operating independently.

Stanweld rims have no unnecessary loose parts.

They require no special tools to operate.

They will not rattle, squeak or grind.

They are constructed of finest materials, and built by expert workmen.

They are made by America's pioneer rim-makers.

Stanweld rims are used as standard equipment on many of the best makes of cars.

A little booklet soon will be off the press. It explains the care and operation of Stanweld Rims and contains other information of value to car-owners. Write for a copy. It's free and we'll be glad to send it.

The leading makes of pneumatic tires are guaranteed only when applied to rims bearing one or the other of the accompanying inspection marks. You will find these marks on Stanweld Rims.

"BOWER SAVES POWER"

Through Bower Bearings
With the Least Loss of Power

The real power of any automobile is the net amount available after friction has taken its toll. Bower Roller Bearings, because of their original design, carry the heaviest loads with the slightest loss of power. It is for this reason and also because Bower Roller Bearings never need adjustment, that they are used in so many of America's best known motor cars.

"The Easiest Riding Car In The World"

MARMON

The Marmon "Thirty-Two"

Price, $3,000. Four-cylinder, 32-40 h. p., 120-inch wheel base, body types and equipment to meet every requirement. A rational, logical car for touring and city use. Years of satisfactory service have proved its economy in tires, fuel and upkeep—plus smooth, delightful operation and durability.

The Marmon "Forty-Eight"

Price, $5,000. Six-cylinder, 48-80 h. p., 145-inch wheel base with short turning ability eliminating the old objections to long wheel base. Body types and equipment to meet every requirement. The only big car with small car advantages. Wonderful riding qualities and surpassing power and flexibility. A car developed by years of exacting tests.

What the Dealers Said:

A few weeks ago we announced the Marmon cars for the coming season, and at the same time celebrated the sixty-second anniversary of this firm in the manufacturing business.

A number of dealers wrote us letters of congratulation on the remarkable records of the institution, of its product, and its business methods.

A big, vital message to everyone interested in buying or selling cars is contained in these letters.

Read these expressions. They give you an actual insight into what the Marmon policy means to you.

1. "The writer has told several dealers that when a Marmon car is sold he does not have to go back every week to resell it to the customer, or talk him into believing that he is satisfied with his car. You can ask any person, I believe, in the United States about a Marmon car, whether he is interested in the automobile business or not, and he will tell you that the Marmon is a good car."
2. "I have never yet heard a knock or complaint from our owners or from our competitors in regard to the quality of a Marmon car or the responsibility of Nordyke & Marmon Company."
3. "The quiet elegance and excellence of design and construction of the Marmon cars have helped us to land the orders, and the backing we have received from Nordyke & Marmon Company by way of prompt and generous service has made it possible for us to retain our customers year after year."
4. "If every automobile dealer that you should wish to do business with could know you as we do, you could eliminate the expenses of retaining your salesmen."
5. "We have today approximately 110 Marmon cars and we take care of them with a comparatively small shop force. We can show a letter of recommendation for the Marmon car from almost every one of our owners. In all our dealings with your Company, we wish to state that there has been the utmost fairness, and we do not believe an agent could sign up for a better car or with a better factory."
6. "We are proud of the Marmon account for many reasons. One is because we know it is your policy to build just as good an automobile as is possible to be built irrespective of cost. Another is, invariably when talking to the other dealers or ordinary laymen they will at once concede that it is one of the best machines built."
7. "During the time we have represented you here we do not believe that we have heard one derogatory remark about the Marmon."
8. "We have delivered in this vicinity since we have represented you, almost two hundred Marmons. We are proud to say that not one of these customers has ever quit the Marmon after starting with us. We have not a large sales force working out of our store here. We at the same time feel that every one of these customers is in a way a salesman for us, as we know that there is not one of them that is not willing and trying at all times to further the Marmon interests."
9. "We find that our shop expenses and guarantee work amounts to practically nothing. You will appreciate this when I tell you that we have only two mechanics in our shop to take care of 200 cars."

Consider these points. They have a meaning for you.
Write for the letters and other proofs.
To the Dealer—the Marmon is better to sell because—
To the Buyer—the Marmon is better to own.

The AXLE WITH your CHOICE of the FINEST BEARINGS

For years Sheldon Truck axles have been the undisputed leaders in the field. But we realized that to attain supremacy is one thing; to maintain it is another.

Every Sheldon Axle which leaves our factory is of unvarying perfection.

We are continually striving to improve and perfect wherever it is possible to do so.

In line with this policy we offer to you the choice of the following leading bearings—the best and finest produced in the world:

Standard Taper Roller Bearings	**Fafnir**
Bower Straight Roller Bearings	**S. R. O.**
New Departure	**R. B. F.**
Rhineland	**Schafer**
Hess-Bright	**Norma Roller**
F & S	**R. I. V.**
S. K. F.	

Single row in any type desired.

We leave the manufacture of bearings to the specialist and make the axles as well as infinite care and unlimited experience can make them.

"American" Axles

Combine the Most Efficient Worm Gears Known, with Full Floating Axles of the Highest Grade

THE LANCHESTER-DAIMLER Worm Drive in a Full Floating "American" Axle, creates a unit whose exceptional merit is frankly recognized.

Motor car engineers have not given the Lanchester-Daimler first place among worm gears without sound reasons. They regard it as superior to all others in design, and pronounce it a triumph of manufacturing skill.

That it is—in practice as well as theory—the most efficient type of worm gear known, has been proved by numberless tests.

Since we acquired—nearly two years ago—sole rights as Americn Axle manufacturers to its use, we have demonstrated its perfect adaptability to both gasoline and electric pleasure cars of the finest type.

"American" Lanchester-Daimler Axles, as a part of our regular product, show the same fidelity to the highest manufacturing ideals that is so evident in our Bevel Drive Axles.

They are fitted throughout with the best types of foreign made ball bearings.

Quality---not price—is the sole test of all materials employed in "American" Axles of either type.

Cost Per Sale Is Going To Be Very, Very Small For Haynes Dealers This Year

HAYNES dealers can smile when others complain about the high cost of selling. Cost per sale is cutting pretty deep into the profits of many dealers. That, and the petty repairs and adjustments bring the yearly balance close to the no-profit line.

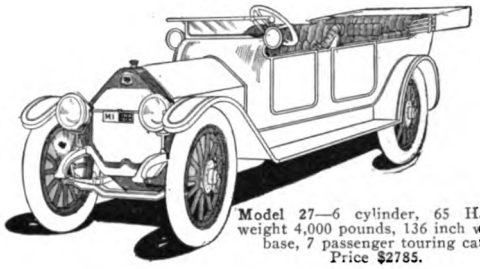
The Electric Gear Shift

is sending crowds of auto buyers to our dealers, each ready to sign his name on the dotted line for a

HAYNES

America's First Car

The electric gear shift is, without doubt, the biggest of all improvements in automobile equipment. Contrast the awkward, noisy yanking of the gear lever with the pushing of a button, the pressing of the clutch pedal, and an instantaneous, noiseless shifting of the gears by electricity.



The Haynes driver never has to take his hands from the wheel or his eyes from the road. Makes driving more simple, safe, easy and enjoyable.

This wonderful electric gear shift, plus everything else in up-to-date automobile equipment is fairly coining money for Haynes dealers.

Model 27—6 cylinder, 65 H. P., weight 4,000 pounds, 136 inch wheel base, 6 or 7 passenger limousine. Price $3850.

Digitized by Google

Model 27—6 cylinder, 65 H. P., weight 4,000 pounds, 136 inch wheel base, 7 passenger touring car. Price $2785.

Every mail brings us a deluge of letters asking for full particulars about the Haynes with the Electric Gear Shift.

Our dealers write us that every day is a rush day—that their salesrooms are the first place that automobile prospects seek. Instead of running their heads off to get orders, sales are coming easy. Many prospects have practically decided upon the Haynes before they see it, desiring only to see the Electric Gear Shift work before ordering.

For the prospect to see the Vulcan Electric Gear Shift put through its paces is a sure order-getter. It works like a charm, with almost no noise, and quick as a wink. If you haven't seen it, don't miss the first chance.

HAYNES SPECIFICATIONS

	A. L. A. M.	Dynamometer.
Horse Power— Models 26 and 27,	43.35	65
Model 28,	28.00	48

Motor—4¼ inch bore, 5½ inch stroke. L-Head Haynes design, cylinders cast in pairs. Enclosed valves.

Cooling—Centrifugal pump and pressed steel fan.

Wheelbase—Model 26, 130 inches; Model 27, 136; Model 28, 118.

Weight—Model 26, 3,800 lbs.; Model 27, 4,000 lbs.; Model 28, 3,400 lbs.

Carburetor—Stromberg.

Ignition—American Simms magneto, with patent pole shoe, producing hot spark at full retard. Perfect synchronism, greater horse power and more perfect running motor.

Lubrication—Splash and gravity feed to main bearings and idle gear; also constant feed to oil basins in lower base.

Control—Left-hand drive, **Vulcan electric gear shift**, dispensing with hand lever and enabling driver to shift gears electrically.

Transmission—Selective type, three speeds forward, one reverse. Timken roller bearings.

Steering Column—Worm and worm gear. Timken bearings.

Clutch—Haynes contracting steel band. Adjustable with single set screw. Applies power gradually.

Rear Axle—Timken full floating on Models 26 and 27, McCue design on 28 with Gurney bearings.

Front Axle—I-beam, single piece, O. H. steel heat treated. 1½ inch spindles of chrome nickel.

Wheels—Artillery type with Funk demountable rims.

Tires—Models 26 and 27, 36 x 4½ inches; Model 28, 34 x 4 inches.

Springs—Front, semi-elliptic, 39½ inches long, 2 inches wide; rear, 48 inches long, 2 inches wide.

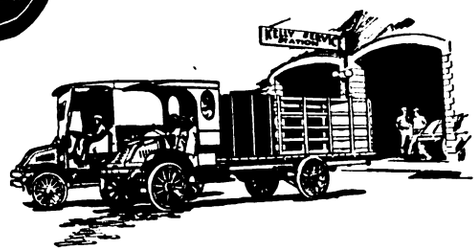
Brakes—Diameter, 15½ external and 15 internal on Models 26 and 27; 12 and 16 on Model 28, both internal.

Finish—Body Indiana dark blue or Pacific Tour gray (optional), with black gear and wheels.

Gasoline Feed—Pressure Feed. Storage tank holds 20 gallons of gasoline, at rear of car where easily filled.

Upholstery—Models 26 and 27 hand buffed leather; Model 28 machine buffed cushions.

Starting and Lighting—Leece-Neville electrical system. A separate unit system embracing a generator for charging battery and motor for cranking engine. 100% efficient under all conditions.



Cowl-board Equipment—Electric lights, sight oil feed, automatic cut-out for lights, dash light, auxiliary air pressure pump with gauge. Models 26 and 27 have rim wind clock and Warner autometer. Model 28, Stewart speedometer.

Other Standard Equipment—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind shield, two large electric headlights, electric side lights, electric tail light, electric starter, generator, 80 ampere hour storage battery, horn, coat and foot rails, tire irons, full tool equipment, one extra demountable rim, Collins curtains. Models 26 and 28 have Truffault-Hartford shock absorbers.

I-Beam, Steering-Arm, Rear Axle Drive-Shaft and Knuckle, bent and twisted by powerful machines to test the toughness of the steel.

There's Safety in Axles that Stand Tests Like This—

—Safety in axles designed to meet the maximum stresses of every-day travel with a *big margin to spare*—built of materials so good that, if accident does bring strains beyond what the axles should bear, they will *stand right up to the last ounce of pressure and the last severe shock*—then *bend* but not break.

WHEN Harry Knight drove his racer head-on into a concrete wall at the Speedway May 30, 1911, to save another man's life, the Timken Front Axle was bent by the intense inpact. But that axle was afterward straightened and is running under a car today.

It is because Timken-Detroit Axle parts are so tough that they *can* be bent, twisted and flattened, cold, *without breaking*, that the man who rides on Timkens *can confidently count on riding safely.*

It requires terrific blows and tons of pressure, in special testing-machines, to bend these big, tough, cold, steel I-beams, steering arms, knuckles and driving shafts.

Tests like this are necessary to *prove* in our factory that the work of the steel-makers, the chemists, engineers and metallurgists was right.

To prove that, while wonderfully tough and strong, Timken-Detroit Axles *are not brittle.*

That the I-beams and spindles will not break under the weight of the loaded car as it drops suddenly into a deep rut or bumps over steel rails. Nor will a steering-arm, or a steering cross-rod snap, and leave the car unmanageable.

Problems in Safety

To get steel that is strong enough, and hard enough to stand the steady stress; and yet so tough that it cannot break under sudden shock, has been no simple problem. And to get it without undue weight has been another problem.

These problems could not be solved through knowledge of the chemistry of steel alone. It meant testing samples of steels from all over the world, observing and recording the effect on these steels of heating them to different temperatures and quenching them in different baths.

Concentrated Study

Out of the multiplicity of analyses, heat-treatments and testings, and out of long experience in every type of car under all conditions of service, has come the best steel for each axle part, and the best formulas for heat-treatment of each part.

Only concentrated devotion to the one problem of axle-building could determine the right steel and the right heat-treatment—just as it has developed the right design, size and relation of the different axle parts.

And Still More Study

Although Timken-Detroit Axles justified themselves from the very beginning of the automobile industry by satisfactory service in motor-cars, pleasure and commercial, the work of study, experiment and investigation has continued through all the years that have followed. It has made, and is making every year, new contributions to the wonderful things accomplished in this Twentieth Century by heat-treatment.

The safety and satisfaction of the man who rides on Timken-Detroit Axles are secure because back of the axle is the great human organization that has worked together for one common object during all the years of motor-car manufacture.

There are no more important parts of your car than the axles and their bearings. Why this is so is told in the Timken Primers, T-5 "On the Anatomy of Automobile Axles," and T-6 "On the Care and Character of Bearings." Sent free postpaid, from either address below.

RCH Complete $900

F. o. b. Detroit

Net Value and Backbone Count

THE R-C-H is not a car sold by one or two special features Abundant power and ample reserve strength; a perfectly balanced and sound chassis; a stunning English body design finished in that fashionable and striking Russian green combine to make the R-C-H *the biggest kind of a seller.*

As for stamina the second R-C-H ever built recently completed a punishing Transcontinental trip. Previous to this it had been driven continuously for two years over every conceivable kind of a western road and trail.

Such a test calls for *backbone.*

Daily we receive letters from every corner of the globe—from owners in 45 civilized countries. Some tell enthusiastically of how little it cost to run an R-C-H; some tell boastfully of R-C-H hill climbing ability while others write to tell how MUCH MORE THEY GOT FOR THEIR MONEY than their neighbors who bought elsewhere.

Again we repeat: R-C-H comfort, service and style sells at $1200 under any other nameplate.

By taking on the R-C-H a live, wideawake dealer can baffle, dominate and overwhelm competition in his territory. Wire us to-day.

R-C-H Reasons:

Left Hand Drive---Center Control---Long Stroke Motor---Big Roomy English Bodies---Stewart Speedometer---Handsome Russian Green Body Finish---Full Set Big Electric Lamps or Prest-O-Lite System---Bosch Magneto---Jiffy Curtains---110-Inch Wheelbase.

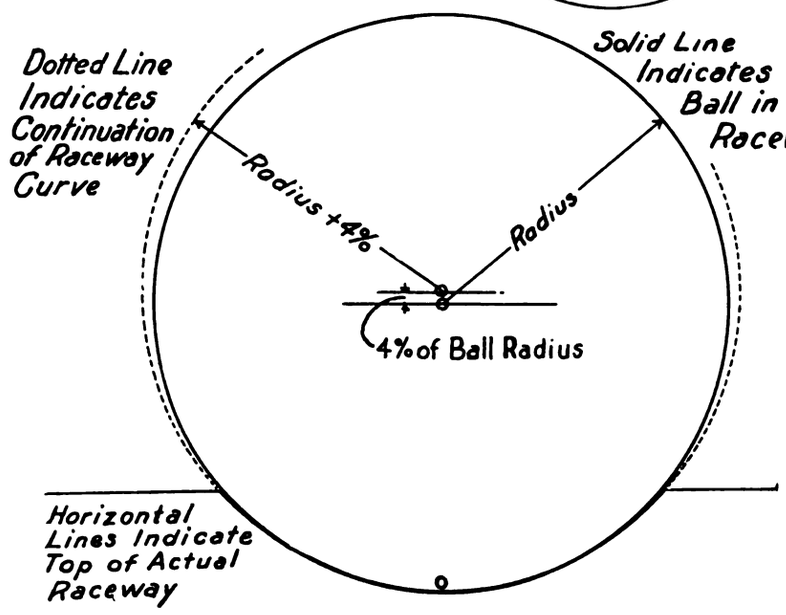
SPRINGFIELD
CONVERTIBLE BODIES

Springfield Convertible Bodies are the embodiment of refinement in the matter of lines, material, finish and ease of adjustment.

The runabout convertible body shown here illustrates one extreme of a line that goes on up to the highest grade limousine, landaulet and town car.

Even this faithful reproduction cannot approximate the beauty and convenience of the equipments as they actually appear. They must be seen to be fully appreciated.

The ease of operation is remarkable; the tops are rapidly raised into position, the doors are opened, the hinged glass swung up into position, the remaining windows are removed from a box in the back of the front seat and buttoned into position, completely enclosing the car in less time than an ordinary top can be erected and the curtains adjusted.



Write for brochure of reproduced photographs.

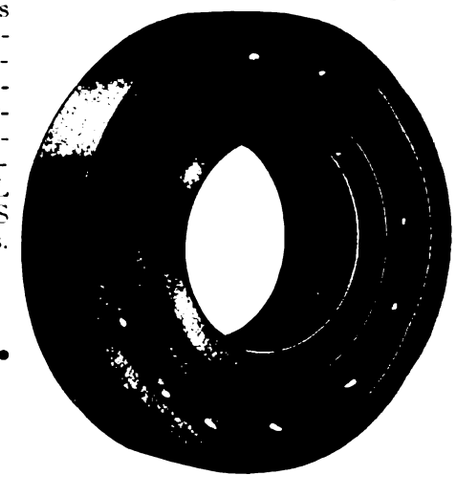
CAPACITY
GURNEY
ENDURANCE



AN examination of this simple diagram will reveal something of the true Inwardness of a Gurney Raceway. The circle represents a ball. The larger curve shows the profile, or contour, of a raceway—extended to make it plainer. It is of 4% greater radius than the ball. It is in contact with the ball circle at the point O, which represents the bottom of raceway. This diagram shows how closely the raceway conforms to the ball.

THIS illustration enables one to appreciate a little better how vital a part are the raceways in a ball bearing. It is apparent how delicate is the forming of the raceways, how slight a divergence from the true race curve will seriously affect the efficiency of the raceway. If, for instance, the race arc instead of being of 4 per cent. greater radius than the ball is, say, of 12 per cent. greater radius, which is about the curvature generally found, the ball and raceway will safely bear only about one-third as much load. Or, worse and equally common, if the race curvature is not a true arc, the efficiency is very greatly impaired.

A glance at the above diagram will make plain how very slight a divergence from the true arc will destroy race efficiency. In the erratic raceway some parts of the surface will bear less than their due share of the load and other parts must bear more. In the true raceway no stresses ever exceed or even approach the elastic limit of the steel and the bearing does its work with ease and safety. In the irregular groove the ridges are easily loaded beyond the limit and accordingly soon break down.

This is the explanation of most ball bearing breakdowns. It also explains why we place so much emphasis on race contour. In the raceway ground and lapped to the truearc, and having this closest permissible approach to the contour of the ball, the balls lie in an easy bed and roll under the heaviest loads with a safety painfully lacking in bearings of ordinary manufacture. It is this exactness and refinement of race make-up that accounts in large measure for the unequaled **Capacity** and **Endurance** that distinguish GURNEY BALL BEARINGS from all others.

THE positive force feed-splash oiling system employed on Ergon Motors is one of the most efficient and simple yet devised. Ergon Motors have oil-tight and dirt-proof crank cases, yet as an added precaution a strainer is provided at the oil pump intake so as to eliminate all possibility of faulty circulation.

The degree of perfection to which Ergon oiling has been developed insures a long lived, clean and sweet running motor at all times. We solicit correspondence and investigation by car and truck manufacturers.

Immediate delivery guaranteed on standard Ergon Motors, of either the independent or unit plant type.

HAZARD MOTOR MANUFACTURING CO.

"Soot-Proof" Spark Plugs Never Balk

Over 2,000,000 Prove it

Not all spark plugs will carbonize. Not all get dirty, grow weak or short-circuit. And not all spark plugs call for frequent replacement. Your customers, Mr. Dealer, want the plug which has all spark-plug advantages and which eliminates all spark-plug faults. Mr. C. A. Mezger—after twelve years spent on spark plug problems—has perfected and patented the Soot Proof Plug. This plug is warranted to clean itself. It never clogs, never leaks, never short-circuits. It lasts for years. It is built with a double chamber and offers at least three times the resistance of any other spark plug made. And it will outlast any other by two or three times over. This has been proven by over two millions in use. One "Soot-Proof" plug will prove this to you. Try it in connection with any other plug and note the results. In a word, "Soot-Proof" Plugs forever wipe out spark plug troubles.

If you are not already handling "Soot-Proof" Plugs, it will pay you to do so. Hundreds of thousands of drivers are using them now and know their worth. Others, who have had trouble with sparking are bound to go to some "Soot-Proof" user for spark plug advice, so the demand for "Soot-Proof" plugs is growing. Get in on the popular demand—it means more and more satisfactory sales for you.

STOP!---SAVE MONEY

$9.00--FORD ENGINE STARTER--$9.00

"It is out of sight," under the hood. All that shows is a small hand lever on dash. You do not have to leave your seat to start your FORD MOTOR when equipped with same.

All that is necessary is to pull the lever. Will POSITIVELY TURN YOUR MOTOR OVER EVERY TIME. With this starter YOU HAVE TWO STARTING DEVICES. YOU DO NOT HAVE TO REMOVE THE CRANK. **IT STAYS ON.**

FOR THE NEXT 60 DAYS TO THOROUGHLY INTRODUCE OUR STARTER WE WILL MAKE THE ABOVE PRICE.

NO MORE BROKEN ARMS. BACK KICKS ARE DANGEROUS.

DIRECT ON RECEIPT OF PRICE.

$9.00---ORDER TODAY---$9.00

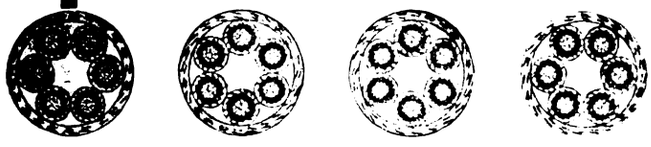
Packard CABLE

The Dealer

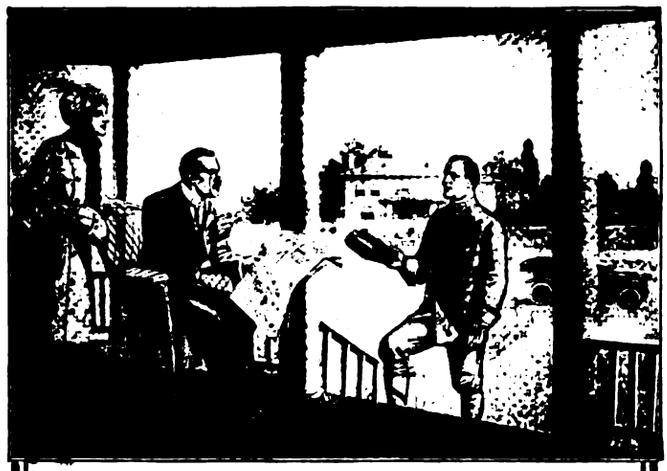
who handles Packard Cable makes satisfied customers and sells them other automobile goods because Packard Cable always makes good.

The two heavy layers of fabric impregnated with a series of flexible enamels, resist heat, oil and water for years.

Thousands of automobiles will have to be rewired this year. Get in a stock of Cable and meet the demand. Write for our liberal proposition to dealers and latest price list.



This Hanger Free



to any dealer or garage man who writes for it on his own stationery. It's a 16 x 20, six color reproduction of the oil painting of the Packard Girl by Liebsher.

Get Weed Tire Chains at Once!

"I know you are a careful driver, but it is best to adopt every device to *prevent* accidents.

"I can't afford to take *any chances.* We have all foolishly depended on rubber alone long enough. It's time to awake to our responsibility. So go at once and buy a complete equipment of *Weed Chains* and never start out without them when the roads or pavements are slippery or greasy."

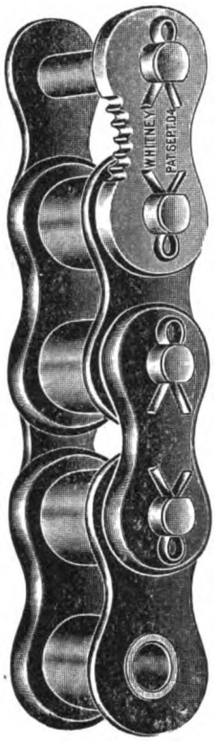
Weed Anti-Skid Chains

Insure Against Anxious Moments

Probably no other device has done so much to raise the factor of automobile safety as WEED CHAINS. They are the proverbial "ounce of prevention" against skidding, the cause of over ninety per cent of all automobile accidents—*Life Insurance* and *Accident Insurance Companies* strongly endorse them and recommend their use. ***Taxicab Companies,*** for their own protection, ***insist*** that their drivers put them on when the streets are wet or slippery.

Increasing Demand

for WEED CHAINS makes them the ***most profitable*** Automobile Accessory handled by Dealers—Quick and Steady Sales—No Dull Seasons—No Dead Stock—Easily Handled—Liberal Profits—Universal Satisfaction.



Attractive, convincing, decorative, lithographed hangers supplied to dealers upon request.

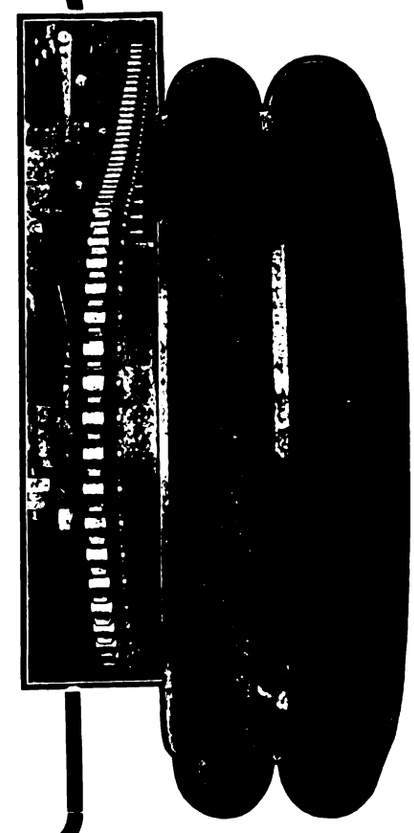
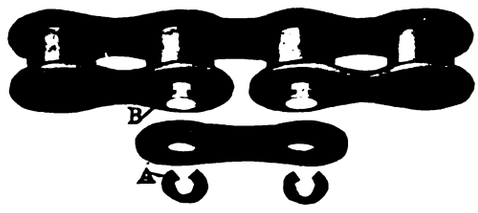
"WHITNEY" Chains

WE call your attention here to "Whitney" Cotter Detachable Chains as the most practical chains ever offered for motor vehicles. They have made a record for themselves which no other Detachable Type has approached.

This Cotter Pin feature is so practical and necessary that it calls for little detailed explanation. The illustrations tell their own story, proving that this form of construction is logical and necessary for chain equipped motor vehicles. This Cotter Detachable Chain can be taken apart at any link and lengthened, shortened or repaired without the use of any special tool, as the Cotter Pin can be removed with pliers, screw driver or any sharp pointed instrument. The use of "Whitney" Cotter Detachable Chains assures the builder, owner and driver of commercial vehicles uninterrupted service on account of the ease of repair.



"Whitney" Chains are made from steel best adapted for the purpose, carefully hardened and calculated to resist the most wear, while in the matters of machining and assembling the utmost care is exercised and thorough inspections and tests characterize each process of manufacture. Their future service, however, depends upon the accuracy of sprockets, care, lubrication, alignment and adjustment, for the best chain in existence cannot withstand the evil influence of improper conditions and give best results.



Write for our illustrated catalog which shows top and side views of each size of all Roller chains manufactured by us.

"Whitney" Chains Are Built for Strains

Dixon's

GRAPHITE TRANSMISSION GREASE NO. 677

Part of the power of your engine is used in overcoming the friction in your transmission and differential. Dixon's No. 677 reduces friction at these points and gives you more power for driving. Why waste gasoline to drive hard-running gears and bearings, when graphite lubrication with Dixon's No. 677 will ease up these parts and convert this "wearing-out power" into driving power? For further information, ask for "Lubricating the Motor," No. 23.

NOTICE

We respectfully call attention to the fact that the Knox Automobile Company is the only other manufacturer licensed to build tractors under the "Martin" patents and other patents owned by Mr. C. H. Martin. These patents, we believe, cover every possible, practical combination of a self-supporting and steerable tractor, with a non-self-supporting trailer. The patents comprise the following:

Hunter.....	670,405	Mar. 19, 1901
Hunter.....	696,143	Mar. 25, 1902
Hunter.....	625,953	May 30, 1899
Thayer.....	678,063	July 9, 1901
Martin.....	1,018,248	Feb. 20, 1912
Hight.....	698,836	Apr. 29, 1902
Liebau.....	655,724	Aug. 14, 1900

and numerous applications are now pending in the United States Patent Office.

This notice is merely in the nature of general information.

THE FEDERATION TRADE PRESS ASSOCIATIONS OF THE UNITED STATES

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

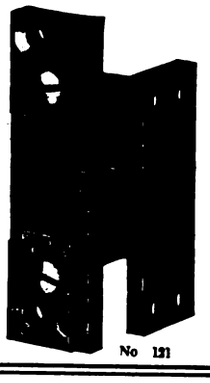
NEW SOSS CONCEALED DOOR HINGE NO. 121



This new hinge requires a pillar only ⅞ inches wide. It is detached by removing two screws as indicated in illustration. The trouble avoided and time gained in hanging doors when using Soss Hinges are important factors.

Soss Concealed Hinges can be installed flush with the outside of the pillar, allowing the steel or aluminum panel to be turned over flush on to the face of the hinge, and fastened down securely in the rabbet provided on the edge of the face to receive it, thus allowing more than ordinary clearance.

The non-corrosive case attached to the pillar section of the hinge, prevents water from reaching the wood of the pillar through the hinge.

Description:

Face of hinge on pillar, ⅞ in. x 3¼ in.
Face of hinge on door, ⅞ in. x 3½ in.
Water-proof case mortises into pillar, ⅞ in. x 1⅝ in. x 1¼ in. deep.
Clearance in opening, 11-16 inches.

No 121

UNITED STATES TIRES

ARE GOOD TIRES

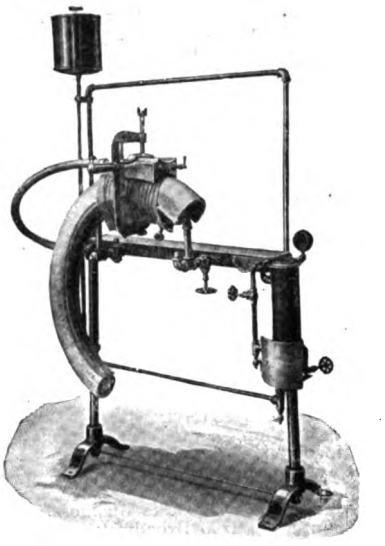
Digitized by Google

Blow-out repairs that outlast the tire

The only way to make **durable** blow-out repairs **economically** is to reinforce the tire with fabric applied to the inside, fill the hole through the tire with Para gum, then apply heat **both** to the inside and outside. This method avoids cutting away and wasting a lot of expensive tread stock, requires a minimum of fabric and makes a repair that is stronger than the tire. Anyone can use it because the work is all straightforward, requiring no special experience. One set of forms fits all sizes of tires. No extra moulds required.

SHALER Steam Vulcanizer

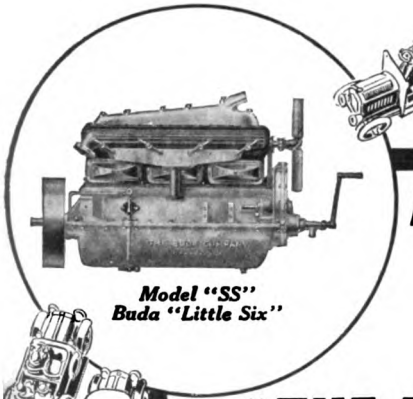
The Shaler is the only steam vulcanizer that permits using the approved wrapped tread method as it is the only one that applies heat to the inside and outside of a tire simultaneously. It makes perfect blow-out repairs.



To make it complete as a garage equipment it is provided with a tube plate 4 x 30 inches that will mend six tubes as quickly as one.

The boiler, a conical copper coil, heated by a powerful gas or gasoline burner, raises steam so quickly that you can profitably heat the Shaler even if you only have a tube puncture to mend.

The essential Shaler feature of a thermostat to hold the temperature at the vulcanizing degree automatically makes it impossible to overheat a tire. Simply light the burner, and steam is raised to the correct pressure and held there indefinitely.



Price of the complete outfit, including all attachments for tube and casing work, $45.

C. A. SHALER CO., 433 Fourth St., Waupun, Wis.

More Buyers Every Day Insist on BUDA MOTOR

"THE PART THAT SELLS THE CAR"

Modern complexity has brought into being the *Specialist*. Each "thing" we make is really a combination of many things, each of which may be a life work.

An Author writes a "book"—really a bundle of manuscript. He's a *Specialist* in ideas—like an *automobile designer*

He turns the "book" over to a "Publisher" (who is a *Specialist* in the business end of book making.)

Can a Publisher "publish" a book by himself? Not without the aid of the Binder, a *specialist.* And neither can the printer print nor the binder bind without the Ink *Specialist*, the Paper *Specialist*, the Glue *Specialist* and all the others, *each doing ONE THING WELL.*

Can a car manufacturer manufacture a car? **NO.** Never could, cannot now, never will. And the tendency of the public is to realize this more and more, and (for the sake of ECONOMY and QUALITY) to insist on the BUDA MOTOR, made by a Successful Specialist. Always look under the hood. It's a good habit.

"Standard"

THERE is no difference of opinion as to the "STANDARD" automobile warning signal.

ASK ANY ONE at all familiar with motor cars and accessories and there will be but one answer: The Klaxon.

THE KLAXON has been adopted by the A. E. C., Alco, Armleder, Autocar, H. H. Babcock, Benz, Borland Electric, Broc Electric, Buffalo Electric Roadster, Century Electric, Charon Chicago Electric, Columbia, Croxton, Davis, F.I.A.T., Havers "Six," King, Kissel, Knickerbocker, Knox, Lancia, Locomobile Lozier, Marmon, Matheson, Maxwell "Six," Mercedes, Metallurgique, Multiplex, National, Nyberg, Oakland, Oldsmobile, Packard, Peerless, Peugeot, Pierce-Arrow, Pope-Hartford "Six" Pratt, Rambler, S. & M. "Six," Schneider, S. G. V., Simplex, Stafford, Staver, Stearns, Sternberg, Stevens-Duryea, Stoddard-Dayton, Touraine, Walker Electric, Ward, White, Winton.

THIS LIST is the unanswerable indication of the Klaxon's standing.

THE car manufacturer who claims the use of "standardized" accessories must of necessity provide the Klaxon—otherwise his claims are meaningless.

Studebaker

THE greatest asset the Studebaker dealer has is the universal public confidence in the quality of the car itself---and in the integrity of its makers.

Studebaker dealers do not have to create this confidence---it has existed without a break ever since the Studebaker name was first placed on a vehicle.

And this public confidence in Studebaker grows greater every day.

Studebaker dealers are a powerful sales-force---selling a standard car that has behind it every resource of the great Studebaker organization --- extending Studebaker car owners a character of service that is as worthy of the Studebaker reputation as is the car itself.

Which Starter Uses Least Current?

At first thought one might imagine that an Electric Starter spinning at 150 R. P. M. would consume more current than the ordinary Electric starter which turns the engine slowly.

But repeated tests show exactly the reverse, and that the spinning Electric Disco, instead of consuming more current actually uses less.

For example, we recently examined the batteries in six Disco-equipped cars, each of which had gone 25,000 miles, and the batteries were apparently good for years to come.

As another instance, two six-cylinder Disco-equipped cars recently driven from Indianapolis to the Pacific Coast, arrived with batteries fully charged and in the best of condition. Throughout the trip, the Electric Disco spun the motor 175 R. P. M. It did not fail once.

The reason the Electric Disco **uses less current** than slow-turning Starters, is that it **starts the car INSTANTLY.** We may use more power **per second** than others, but the time required to start is many seconds **less.**

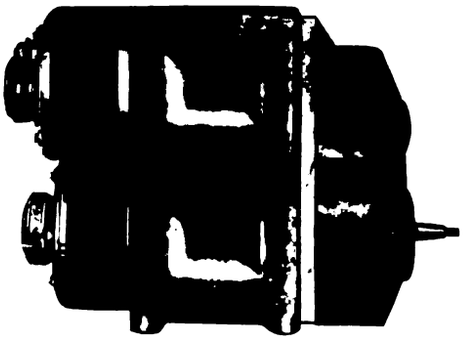
The Limit of Simplicity

This 1914 Model 7E Electric Disco requires but **one** point of attachment to the engine, which eliminates trouble for the owner and materially simplifies installing it.

Note its **double-deck** design. It's as compact as a **motor-generator,** yet gives **all** the efficiency and service of a two-unit Electric Starter. No other Electric Starter combines **all** these good points.

As to voltage, we give you your choice—6 or 12 volts.

Not a Mere Lighting Generator



Other two-unit systems as a rule, are using their ex-lighting generators for lighting and starting. This requires occasional recharging of batteries.

Not so with the Electric Disco. Our Generator is specifically designed to **start** and **light** the car and supply enough current to keep the battery fully charged at all times. **And it DOES it!**

For complete Description and Illustration of the Electric Disco, see our latest Book on Electric Starters. Sent free to any motor car maker, motorist or dealer.

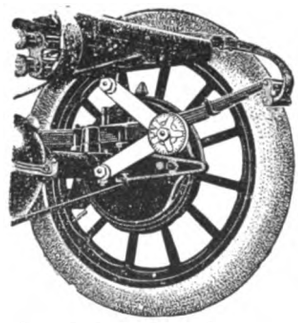
Truffault-Hartford Shock Absorbers on Mercer Cars Assure Safe Riding

The Mercer car is the latest addition to the fast growing big list of cars whose manufacturers now include Truffault-Hartford Shock Absorbers as standard equipment.



The Mercer is a very popular car among motorists—and because of its easy riding qualites has won the title of the "Touring Car de Luxe."

It has been prominently to the front in many great road races—its sensational victories stamping it as a real speed king. Among the Mercer's most sensational performances was the 500 mile Indianapolis Speedway Race, held May 30th, in which the Mercer won second place—its time being bettered by but one car and that one with a cylinder displacement one and a half times that of the Mercer. On August 9th at a matinee meet at Brighton Beach, New York, Mercer cars flashed first by the finish in six races—second in five races and third in two races.

And in all these contests Truffault-Hartford Shock Absorbers helped the Mercer in its great victories—helped by greatly reducing the danger of tire, engine and spring breakage.

Truffault-Hartford
SHOCK ABSORBER
"The Pioneer Shock Absorber"

Truffault-Hartford Shock Absorbers make a good car even better. Their inclusion on the cars you make or sell supplies you with an important sales argument of unquestioned weight. 5 models, $15 to $60.

MONOGRAM HAND CLEANER

¶ We have recently added a Hand Cleaner to our line of

MONOGRAM OILS AND GREASES

¶ It is of MONOGRAM Quality, which speaks for itself.

¶ It is put up in nicely lithographed metal boxes.

¶ It really takes the grease and dirt off the hands and not the skin.

¶ It does not dry up if the cover is kept on the box.

¶ It sells for 10 cents a box

and

¶ It only costs you a very reasonable sum.

¶ Write us for free samples and prices.

Vol. XXXVI New York, U. S. A., Thursday, August 28, 1913 No. 10

CREDITORS TAKE HAND IN AFFAIRS OF KRIT COMPANY

Arrange for Extension of Payments and Will Take Part in Management—Weather Helps Cause Sales to Decrease.

Although the book profits of the Krit Motor Car Co., of Detroit, Mich., for the past year were $145,000, weather conditions in the West, where Krit sales are heaviest, and a general financial stringency, made it necessary for the company's creditors to take a hand in affairs Monday last, 25th inst., for the purpose of adjusting matters in an effort to save the company from more serious trouble.

Despite the fact that an indebtedness of $900,000 was disclosed, the assets are said to be ample to meet all obligations under normal conditions, and 70 per cent. of the creditors have assented to a plan which was offered by a committee consisting of L. M. Hamlin, of the McCord Mfg. Co., H. W. Standart, of the Northern Engineering Works, and John J. Ramsey, of the A. C. Knapp Co. The creditors' agreement stipulates an extension of time as follows:

Ten per cent. to be paid on or before February 1, 1914; 20 per cent. on or before June 1st and 20 per cent. on or before October 1, 1914; 15 per cent. on or before February 1, 1915; 15 per cent by June 1st and 10 per cent. by October 1, 1915, and remaining 10 per cent. on or before February 1, 1916.

Six per cent. notes, dated August 26th, in proportionate amounts, maturing as indicated above, are to be given creditors, provided 80 per cent. sign the agreement. It is expected that the stockholders will surrender 51 per cent. of the stock for the purpose of corporate control, to the Union Trust Co., as a trustee, to vote for the creditors; creditors will take the place of four directors, who will resign.

Walter S. Russell, who is regarded as one of Detroit's best and most conservative business men, and who has been intensely interested in the Krit company, was shown at the creditors' meeting to have advanced cash to the amount of $300,000, which is included in the $900,000 of indebtedness. Russell has gone as far as his means permitted, which left the request for a time extension the only exit from the situation.

Part of the consideration for entering into the agreement is that the indebtedness to Russell shall not participate in payments as before provided, but the time of payment for him shall be postponed until 50 per cent. of the creditors signing the agreement shall have been paid. Then Russell participates, so that ordinary creditors receive full payment before Russell gets 50 per cent. of his.

All bills of two hundred dollars or less are to be paid in 60 days, but it is agreed that in default of payment as set forth, the creditors may terminate the agreement.

The sudden cessation of sales was due to trade conditions and unfavorable weather. The Krit company last fall announced that a "six" would be marketed. Its line otherwise consisted of a single four-cylinder chassis upon which various bodies were mounted. The car sold for $900, and it is planned to continue with the same chassis.

Coreceiver Is Named for Walpole.

Judge Robert O. Harris, of Bridgewater, Mass., was appointed coreceiver for the financially embarrassed Walpole Tire & Rubber Co., of Walpole, Mass., by Judge Dodge in the Federal court in Boston yesterday, 27th inst. He will act with Robert M. Fisher, who was named receiver when the failure of the company's bankers caused financial trouble for the rubber workers three weeks ago. Council for the creditors' protective committee state that at a meeting of creditors and stockholders, held Tuesday, 26th inst., plans for a reorganization were proposed and that the strained feeling which preceded the naming of a coreceiver has given way to a more amicable condition.

LaCROIX ACQUIRES RIGHTS TO MERCEDES IMPORTATION

New York Dealer in Foreign Cars Given Three-Year Contract—Forms New Company and Begins Placing Agents.

The uncertainty which for some time has linked itself with the right to import Mercedes cars into the United States was dispelled late last week when Paul LaCroix, of the Paul LaCroix Automobile Co., of New York City, signed up as importer of Mercedes cars for three years in the United States and its non-contiguous possessions, Canada and Mexico. This places the Mercedes importation once more upon a firm footing, affairs having been somewhat insecure since the Daimler Import Co., of New York City, became finally involved and went into bankruptcy ten months ago.

LaCroix's acquirement of the Mercedes import rights is not a surprise, on the whole, for, as Motor World some time ago made known, he was the temporary successor to the Daimler Import and his relations with the Daimler Motoren Gesellschaft, of Untertuerkheim, Germany, the manufacturing company, have been very satisfactory. LaCroix also produced a greater volume of business than his predecessor had transacted.

The new enterprise also marks the elimination of the name Paul LaCroix from the trade, so far as a corporate name is concerned, he having not only formed a new company to handle the Mercedes business but having changed the name of the Paul LaCroix company to Foreign Automobile Importation Co. The company which will handle the Mercedes business is the Distributing & Importing Co., with a paid in capitalization of $100,000, of which LaCroix himself retains the bulk. The import contract, which he acquired personally, has been transferred to the new corporation.

Because the contract specifies that the

Digitized by Google

Mercedes importer shall not deal in other cars, LaCroix changed the name of his original company in order that no misunderstanding might arise. What was the old LaCroix company, he states, is transacting little business, but will be permitted to exist under its new name. As in the old concern, the officers of the Mercedes importing organization are: President and treasurer, Paul LaCroix; vice-president, H. D. Kibbe; secretary, H. T. Andrews. LaCroix already has begun the placing of agencies and has awarded his Pacific Coast representation to the Rene J. Marx Co., of San Francisco. The Marx company is not a new corporation but has been engaged in the trade for some time.

Prior to his Mercedes connection LaCroix, in the quarters he still occupies at Broadway and West 57th street, New York City, imported various makes of foreign cars but had no regular contract with any particular line.

Cutting Assets Bring $30,000 Bid.

Although the assets of the Cutting Motor Co. at Jackson, Mich., were appraised at $268,653.40, the receiver's sale which was held last week brought a bid of but $30,000, and it is not unlikely that when Judge Sessions of the United States District Court at Grand Rapids, Mich., is asked to-morrow, 29th inst., to confirm the sale opposition will be offered.

The bid was made by W. M. Thompson, of the Jackson City Bank, and his offer includes the shouldering of a real estate mortgage of $15,000 with $250 interest and land contracts to the extent of $9,000 and accrued interest. There also is a mechanic's lien of $4,990. When the property was put up in parcels there was little bidding, the highest offer being made on the auctioning of the property as a whole, and more bids being received.

The Security Trust Co., of Detroit, the receiver for the company, while admitting that the bid is the highest yet made, is unwilling to consider the offer fair to the company's creditors in view of the appraisement at the much higher figure. It is also stated that the Cutting company has asked a bankruptcy trial by jury, setting up an absolute denial of bankruptcy.

Should the bid be accepted, it is anticipated that the plant will be reopened shortly in order to take advantage of the opening selling season. Whether the product would be upon the Cutting lines or a lower-priced model has not been divulged by those who seek to back the enterprise. The appraisal was: Real estate and buildings, $65,000; machinery, equipment and office furniture, $17,022.11; manufacturing stock and parts, $87,475.34; accounts receivable, face value, $99,155.95.

ALCO FORMALLY ABANDONS AUTOMOBILE MANUFACTURE

Long Continued Loss Leads Company to Quit Car and Truck Building —International Offers to Take the Service Business.

Despite the fact that similar rumors have on several previous occasions been flatly denied and that only two weeks ago all knowledge of any impending action of the kind was denied by an officer of the company, the American Locomotive Co., of Providence, R. I., through its board of directors, decided at a meeting held on August 13th to discontinue the manufacture and sale of both its Alco pleasure and commercial vehicles, though no hint of the action was permitted to become public until last week.

Although the formal announcement makes plain that arrangements will be made to furnish repair parts for a period of not less than five years to come and that the company's guarantee will be lived up to in every respect, inquiry of President W H. Marshall elicited no information regarding plans for the disposal of the company's several service stations located in Long Island City, N. Y., Chicago, Boston, Philadelphia and on the Pacific Coast. It is known, however, that the International Motor Co. has made an offer to take over that part of the business, though information as to its kind was not forthcoming from the officers of the company.

Vice-President Fulton of the International company on Wednesday stated to a Motor World man that "We would be very glad to take over that part of the business and we have made a proposition to S. G. Averill to that effect which, he has stated, he will be glad to consider." Averill is an efficiency engineer and is financially connected with the Automobile Department of the Alco.

The reason for the abandonment of the Alco automobile business is not difficult to discern, for it long has been known that it represented a leak in resources of no small amount; it is rumored that not less than $600,000 was dropped last year alone. That the company had turned away from pleasure car production as a serious proposition is indicated by the fact that during the last year some 85 per cent. of its automobile business has been in commercial vehicles.

When rumors of the proposed abandonment of the automobile department became current a year ago, they were more or less hushed up by the entry into the company of two expert efficiency engineers—J. W. De B. Gould and S. G. Averill—who proceeded to study its needs and to suggest remedies. About the same time, Vice-President Leigh Best was placed in charge of the automobile department. Since then a steady improvement in efficiency and prosperity have been reported from those on the inside." In view of this fact and the fact that the automobile department's business during the past year showed a substantial gain over every other year, the decision to abandon it and to dispose of the immense Providence shops is all the more astonishing to those in the trade.

According to conservative estimates, the Providence plant is said to have a real estate value of close to $1,000,000 and the buildings are equipped with modern machinery, tools, jigs, etc., which will bring the total value well above that figure. In Long Island City there is a completely equipped service station only recently acquired that is valued at $250,000; the Chicago branch is said to have cost in the neighborhood of $112,000, and the Pacific Coast station $175,000; buildings occupied in Philadelphia and in Boston are leased at annual rentals of $25,000 and $5,000, respectively, and the New York branch which occupies the whole building at Broadway and West 61st street, is tenanted on a lease which still has 14 years to run. To meet any loss that may occur in the liquidation of the business, a reserve fund amounting to $2,300,000 has been set aside from the accumulated surplus.

The American Locomotive Co. first entered the automobile business in 1905, when it obtained the American rights to the French Berliet car. From Lyons, France, a force of expert mechanics was brought to the United States, and in an addition to the existing plant in Providence the production of American Berliet cars, rechristened Alco, was taken up. Two years later, or in 1907, the production of commercial vehicles was commenced. Although both types of vehicles have always proved more than ordinarily popular with the buying public, sales never have beeen as extensive as was hoped would be the case.

In an attempt to increase sales, Harry S. Houpt was engaged as general sales manager about two and a half years ago. At that time the company had only four agencies. With a liberal advertising appropriation, Houpt began an aggressive campaign which resulted in an increase of some 300 per cent. in sales and the acquisition of 85 agencies. Houpt left the Alco company last March, however, and though he left the automobile department in a better condition than ever before, it was judged inadvisable, in view of previous losses and with a new season coming on, to continue the business longer.

DODGE CAR AN $850 "FOUR"; NOT TO COMPETE WITH FORD

Parts Builders also to Retain Their Large Holdings in Ford Business — Light Thrown on Rumors Concerning Both Interests.

Apparently that Dodge car which has been announced anew by Dodge Bros., of Detroit, Mich., this time to make its appearance on July 1st, 1914, practically simultaneously with the expiration of existing contracts with the Ford Motor Co., is not to be a "six," after all; nor is it to compete directly with the Ford, despite persistent rumorings to that effect; according to the latest information, which comes from authoritative sources, it is to be a four-cylinder machine selling for an amount in the neighborhood of $850.

That the Dodge Bros. will cease to make any more parts for the Ford Motor Co. when existing contracts expire on July 1st, after having furnished Ford parts for 12 years, during which time the annual business between the two companies has been increased from practically nothing to a total of more than $10,000,000 last year, presages no alterations in the organization of either, other than that John F. Dodge probably will resign the vice-presidency of the Ford Co., is reiterated by both Dodge brothers; no change will be made in the organization of Dodge Bros. The Dodge brothers have no present intentions of relinquishing their Ford holdings, which are valued at $25,000,000.

Just how many cars will be produced by Dodge Bros. during the first year has not been definitely determined, nor have the details of the car itself been fixed. It is planned to produce a limited quantity the first year and to increase the supply as the demand increases. That the car will be marketed by Dodge Bros.'s dealers seems certain, for though it has been rumored, and even published as a fact, that it will be sold alongside Ford cars by Ford dealers, any proceeding of the kind seems highly improbable, for the Ford business is quite big enough to require all the energy of Ford dealers, and the Dodge Bros. have plenty of money to hire sales brains and selling ability of their own. At the Ford plant it is said that nothing is known regarding any arrangement of the kind between the two companies.

Although Dodge Bros. have, up to the past year, furnished nearly 70 per cent. of the Ford parts, some 180,000 sets having been turned out last year, the Ford company now is turning these parts out itself with the exception of a limited number of sets of gears still being produced by the Dodges.

Quite naturally, such an increase in production activities at the Ford plant has necessitated additions to the already extensive buildings, and it is these plans that probably have given strength to repeated rumors that the Ford company intended devoting the additional space to the production of wire wheels. A new wing, approximately 1,000 feet long, now is being put up, but that it will not be used for the manufacture of wire wheels is authoritatively stated by Chief Engineer Wills, though he tempers the statement by adding that he does not know whether wire wheels ever will be used.

"As far as wire wheels are concerned," Wills stated to a Motor World man, "I am not in a position to say that we will use them or that we won't use them. Our present position is one of interestedness without any definite plans. We have been investigating and experimenting with wire wheels for a matter of seven years. Every once in a while I take a spurt at it, and we have developed a number of tools for wire swaging and rim making that will enable us to manufacture wire wheels should we ever need them. We are in this position: If we should decide to use wire wheels, we have had sufficient experience through our experimenting so that everything is ready to go ahead should we want them, but we have not bought any parts nor purchased any machines with which to manufacture wire wheels or wire wheel parts. I really do not know what we will do. All there is to it is that if we should decide at any time that we want to have wire wheels, we will be in shape, as far as our ideas are concerned, to go ahead without any further experimenting and testing."

Property already has been acquired for the necessary addition to the Dodge plant and the erection of the first unit, which will be an assembling plant, will be commenced at once; it will stand on Bismarck street, be 900 feet long and furnish more than 20 acres of floor space.

Midland Creditors Offered 20 per Cent.

As was intimated would be the case during the controversy preceding the appointment of J. H. McCullough as trustee of the bankrupt Midland Motor Co., of Moline, Ill., the Midland company now has offered its creditors, through Vice-President Jean A. Page and Treasurer R. E. Deitz, a composition amounting to 20 cents on the dollar. It is stated that the claims will closely approximate $400,000 and that the company's assets, including property at the plant, have been appraised at $119,000. A meeting of creditors will be called to pass upon the acceptability of the composition.

MOLINE COMPANY LICENSED TO BUILD KNIGHT MOTORS

Will Use Sliding Sleeve Valve Motor in One Model — Poppet Valve Model to Be Continued With Few Changes.

Adding one more to the slowly lengthening list of automobile manufacturers who have embraced the Knight sliding sleeve valve motor, the Moline Automobile Co., of East Moline, Ill., has acquired a license to build and to use the Knight motor, and will feature it in one of its 1914 model cars. Though the information is in the nature of a genuine surprise, the move long has been contemplated; the decision to use the Knight motor has not been made over night, so to speak, though nothing of the plans of the company has been permitted to escape.

As yet, the specifications of the motor have not been made public generally, though it is practically assured that it will have four cylinders, for the Moline company is one of those that never has embraced the "six"; during the past it has adhered exclusively to its single four-cylinder chassis, and this, it is understood, will be continued during the 1914 season with nothing more than detail refinements.

With the addition of the Moline company to the roster of American Knight engine users, the list now includes five makes of cars in which the Knight engine is used; they are as follows: Edwards-Knight, Stearns-Knight, Atlas-Knight, Columbia-Knight and the Moline-Knight.

Berry Withdraws from Jeffery Company.

G. N. Berry, who in 1902 entered the employ of the Thomas B. Jeffery Co., of Kenosha, Wis., and who in January last became a stockholder in the company and was elected second vice-president and treasurer, has formally resigned those offices and relinquished his stock in the company. Although his future plans are not yet perfected, it is understood that he is considering offers to act either as manufacturer's agent for a prominent accessories maker or to become identified with some other automobile manufacturer.

Grant Company Plans Expansion.

The Grant Motor Co., which some time ago was formed in Detroit by George B. Salzman and the Grant brothers—George D. and Charles A.—has increased its capitalization from $165,000 to $200,000. The increase in capitalization, it is stated, is to permit the production of nearly double the number of cars originally scheduled.

20% GAIN IN CAR EXPORTS FOR FISCAL YEAR OF 1912

Value of Cars and Parts Shipped in Twelvemonth $33,787,330—Increase of $5,762,198 — Parts, Engines and Tires also Advance.

Automobiles and allied products to the value of $36,925,349 were exported from the United States during the fiscal year ending June 30, as previously stated in Motor World, but a more complete report of the government statisticians reveals the volume purchased by the 12 geographic divisions into which the world is divided for export calculation and also shows the gains and losses as compared with the fiscal year of 1912. Of the $36,925,349, which represents cars, parts, engines and tires, the value of cars and parts shipped abroad and to the non-contiguous American possessions was $33,787,330, a gain of $5,762,198, or 20 per cent. The number of cars was 26,903, an increase of 3,788, which is 16 per cent.

Of the 12 geographic divisions, the United Kingdom and British Oceania permitted themselves to be registered in the loss column in cars and value and Mexico dropped behind by 3 cars, but all the other divisions recorded substantial increases. In actual value Canada was the leader, with an increase of $1,672,906, or 22 per cent., but in percentage of value increase Germany is well to the fore with an advance of 240 per cent., or $542,191. South America made the next largest monetary gain, $1,254,139, which is 66 per cent., and second position in percentage increase belongs to Other Countries which moved upward by 196 per cent., or $893,543.

South America leads in the gain in number of cars purchased, buying 1,209 more than it did in 1912, an increase of 75 per cent. The next highest number gain was made by Asia and Other Oceania, which increased its takings by 1,094, or 96 per cent. In the percentage of number gained, Other Countries is the leader, with an advance of 204 per cent., or 983 cars, and Germany is second with 195 per cent., or 561 cars. The grand total increase for the month of June was: Cars, 125, or 6 per cent.; value, $210,585, or 8 per cent.

The 1913 tire exports were $3,943,220, those of 1912 $2,657,809, and the gain $1,285,411, or 48 per cent. The number of engines exported in 1913 was 11,402, in 1912 6,891, and the gain 4,511, or 65 per cent. The value of engines exported in 1913 was $1,728,596, in 1912 $778,098, and the gain $950,498, or 122 per cent. Parts, for the twelvemonth, gained $1,133,444, an advance of 27 per cent. Cars and parts advanced $5,596,239, or 22 per cent., in the foreign world not including the American possessions. Cars themselves, in number, increased 3,529, or 16 per cent.

The American possessions gained 259, or 19 per cent., in cars exported, and the value of cars and parts advanced by $165,959, or 7 per cent. The figures in detail are shown by the subjoined table.

* Does not include engines and tires. † Not separately stated prior to July 1, 1912.

IMPORTATION OF CARS IN TWELVEMONTH LESS BY 18%

America's Purchases Abroad Fall Away by $374,801—United Kingdom and Other Countries Heaviest Losers—But Two Gain.

The importation of automobiles into the United States during the fiscal year ending June 30 decreased by $374,801, or 18 per cent., as compared with the fiscal year of 1912; also, the number of cars fell away by 215, or 22 per cent. Parts decreased $40,317, or 13 per cent., and cars and parts by $415,118, or 17 per cent.

The heaviest monetary losses were those of the United Kingdom—$215,679, or 50 per cent.—and other Countries—$47,110, or 17 per cent. These two divisions, also, recorded the heaviest losses in number of cars, the United Kingdom dropping behind by 110 cars, or 58 per cent., and Other Countries by 29 cars, or 23 per cent. But two gains were shown; Germany increased the value of its shipments by $1,855, or 7 per cent., and Italy by $6,376, or 3 per cent. The figures in detail are as follows:

	Twelve Months Ending June 30—			
	1912		1913	
	Number.	Values.	Number.	Values.
France	401	$964,635	357	$844,392
Germany	116	259,313	99	261,168
Italy	131	199,555	116	205,931
United Kingdom	188	434,611	78	218,932
Other Countries	127	276,067	98	228,957
Total cars	963	$2,134,181	748	$1,759,380
Parts (except tires)	...	304,144	...	263,827
Total cars and parts	963	$2,438,325	748	$2,023,207

The Week's Incorporations

CONVENIENT AND SIMPLE ARRANGEMENT OF THE STEWART MOTOR CORPORATION'S FACTORY IN BUFFALO, THE CAPACITY OF WHICH HAS BEEN DOUBLED WITHIN THE PAST TWO WEEKS

Louisville, Ky.—Monarch Auto Co., under Kentucky laws; authorized capital, $10,000.

Raleigh, N. C.—Alta Motor Car Co., under North Carolina laws; authorized capital, $10,000.

Los Angeles, Cal.—National Cushion Inner Tire Co., under California laws; authorized capital, $100,000.

Philadelphia, Pa.—S. & T. Auto Co., under Pennsylvania laws; authorized capital, $25,000; to deal in automobiles.

Springfield, Mass.—Baxter-Chesebro Co., under Massachusetts laws; authorized capital, $10,000; to deal in motor cars.

Wilmington, Del.—The Muier Co., under Delaware laws; authorized capital, $100,000; to manufacture and deal in motor cars.

Pass Christian, Miss.—Union Auto Co., under Mississippi laws; authorized capital, $5,000. Corporators—J. L. Jones, J. B. Williams and others.

Spokane, Wash.—Auburn Auto Co., under Washington laws; authorized capital, $10,000. Corporators—D. V. Woods, J. W. Fisher, L. V. Gray.

Everett, Wash.—Standard Gas Engine & Auto Repair Co., under Washington laws; authorized capital, $5,000. Corporators—Jacob Anthes, Adolph Bosshard.

Portland, Ore.—Motor Appliance Mfg. Co., under Oregon laws; authorized capital, $50,000. Corporators—Chester A. Groat, George G. Chute, John T. Akern.

Louisville, Ky.—Reid Auto Co., under Kentucky laws; authorized capital, $5,000; to sell and rent automobiles. Corporators—A. E. Reid, Alta Reid, W. G. Clapp.

Chicago, Ill.—Henderson Motor Co., under Illinois laws; authorized capital, $1,000; to deal in cars and accessories. Corporators—Frank L. Childs, H. C. Peterson, D. V. Harlan.

Lafayette, Ind.—Lafayette Taxi Co., under Indiana laws; authorized capital, $10,000; to operate a taxicab and transfer service. Corporators—C. T. Bartel, F. C. Newman, L. L. Lefler.

Guilford, Me.—Tire Buyers, Inc., under New York laws; authorized capital, $600,000; to deal in automobile tires. Representative—Mortimer F. Levy, 47 West 34th street, New York City.

Indianapolis, Ind.—Peterson-Keyes Auto Co., under Indiana laws; authorized capital, $10,000; to deal in cars and trucks. Corporators—William B. Peterson, Paul H. Keyes, A. A. Peterson.

Rochester, N. Y.—Rochester Motors Co., Inc., under New York laws; authorized capital, $300,000. Corporators—George F. Davison, E. A. Grenelle, Albert H. Stearns, 229 Meigs street, Rochester.

New York, N. Y.—Fordham Auto Van Co., Inc., under New York laws; authorized capital, $5,000. Corporators—John Forbes, Catherine Kelly, Louis Bissinger, all of 232 East 101st street, New York City.

New York, N. Y.—Liverani-Lombardi Motor Co., Inc., under New York laws; authorized capital, $20,000; to manufacture hydro-carbon motors. Corporators—Arthur H. Marr, Francesco Lombardi, Joseph Liverani, 321 West 47th street, New York City.

New York, N. Y.—George H. Kusel & Co., Inc., under New York laws; authorized capital, $1,000; to conduct an automobile business. Corporators—George H. Kusel, 1360 Boston road; Adolph Har-

Digitized by Google

nischfeger, 661 Jefferson place; Patrick O'Keefel, 141 Cherry street, all of New York City.

Minor Business Troubles.

The Kissel Service Station, at 215 West Monroe street, Bloomington, Ill., has been closed by the sheriff and two cars attached as chattels; the cause of the move was the failure of Frank Leavenworth, the manager, to pay $70 back rent.

The Alborak Auto Co., of New York City, has filed a notice of dissolution with the Secretary of State; it was incorporated October 25, 1905, with a capital of $3,000. Fredereick R. Welch was president and John G. James secretary.

La Buire Import Co., of 1974 Broadway, New York City, a dealer in supplies, has filed a petition in bankruptcy; it states that its liabilities are $4,131 and its assets $3,246, consisting of: Accounts, $2,982; office furniture, $100; stock, $66; cash, $98. The business was started in March, 1907, and was incorporated September 14, 1908, at $5,000. George H. Key is president.

An involuntary petition in bankruptcy has been filed against A. A. Stevens & Co., of 1234 South Wabash avenue, Chicago, a maker of automobile tops and awnings; the petitioner is the Santa Rosa Vallejo Tanning Co., of Santa Rosa, Cal., which claims the company's assets are about $6,000 and its liabilities in excess of $10,000. The petitioner has a claim of $1,247.98.

Following the attachment by the sheriff of the property of the Oakland Sales Co., of East Orange, N. J., a week ago, a receiver has been appointed for the company; Raymond E. Smith, cashier of the Roseville Trust Co., of Newark, N. J., and head of the Oakland Sales Co., caused the embarrassment by disappearing after the funds of the trust company had been found short. The Goodyear Tire & Rubber Co. and the Standard Oil Co. also have commenced bankruptcy proceedings against Smith as an individual.

Edward K. Nicholson, of Bridgeport, Conn., has instituted foreclosure proceedings on a note against the Bridgeport Vehicle Co. and the Blue Ribbon Auto & Carriage Co. He claims that January 1, 1909, Dolisca F. Terry loaned the vehicle company $2,000 on a demand note and that in July of the same year James W. Horton loaned the same company $3,000 on a similar piece of paper. After other moves in the case, the paper and a mortgage came into Nicholson's possession. He alleges that in January of this year the vehicle company attempted to, or did, transfer its property to the Bellamore Armored Car Co., which went into bankruptcy in the following month.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

E. F. Warren has been appointed chief draftsman in Plant No. 10 of the Studebaker Corporation.

Chester C. Boynton, former sales manager for A. R. Mosler & Co., has resigned to accept a position as sales manager of the Greek-American Sponge Co., of Chicago. Boynton is located in New York City.

E. N. Sanders, formerly manager of the Moon Motor Car Co. of Illinois, has been made manager of sales west of the Rocky mountains; Sanders is one of the veterans of the trade, having originally been allied with the bicycle business.

W. E. Wardlaw, manager of the New York branch of the Schoen-Jackson Co., has tendered his resignation to take effect September 1; after a month's vacation in Canada he will associate himself with a new carburetter company, the name of which has not been disclosed.

E. E. Hand, formerly connected with the Abbott-Detroit and Thomas companies, has been made a district manager for the new J. I. Handley Co., of Indianapolis; he is not new to his territory, which includes Cleveland, Pittsburgh, Buffalo, Philadelphia, Baltimore and Washington.

Charles Fisher, formerly manager of the Chicago branch of the Universal Motor Truck Co. and later a district manager, has been appointed a district manager for the Mogul Motor Truck Co., of Chicago; he has all territory east of Chicago and while the factory is in Chicago his headquarters are in New York City.

Robert R. Ramey has been appointed southern district manager for the Lozier Motor Co. and will immediately take up his headquarters in New Orleans; Ramey began his connection with the Lozier company in Philadelphia in 1906, and for the last three years was sales manager of the General Motor Car Co., which handles Loziers in Philadelphia.

Correja Distributers to Build Own Car.

Following its arrangement to handle exclusively the entire factory output of Vandewater & Co., of Elizabeth, N. J., which produces Correja cars, the Thomas Howard Co., of 319 Atlantic avenue, Brooklyn, N. Y., is preparing to go into the production of a light roadster of its own and which will bear its own name; a factory in Detroit already has been obtained and it is planned to have the first of the cars on the market by September 10th. The new Howard roadster is to be a "near" cyclecar, which is to say it will be very light, have a wheelbase of 100 inches and standard tread.

Motive power will be furnished by a four-cylinder water-cooled motor and transmitted through a three-speed selectively controlled gearset and shaft; wire wheels will be standard. Although the list price of the car is to be $450, it will be fully euippped and likely will have an electric gear-shifting apparatus manufactured under Hollister patents which have been acquired for the purpose. Incidentally, it is proposed to market the cars under a rather unusual method, whereby purchasers will be afforded the opportunity of making "time" payments, though the dealer will receive his full profit at the time the sales contract is signed.

Amplex Receiver to Continue Operation.

Until the parts on hand are all used up, at least, the works of the Amplex Motor Car Co., of Mishawaka, Ind., which two weeks ago were placed in the hands of M. W. Mix as receiver, will continue to be operated; Judge Funk granted the receiver's petition to continue operation and incur expense. It is expected that a fair amount will be realized from the disposal of completed parts.

Factory Site for Oregon Company.

As a site for its projected factory buildings, the Beaver State Motor Co., which proposes to build cars near Portland, Ore., has purchased a five-acre tract of land in the suburb of Gresham. The erection of a building measuring 60 x 300 feet and to cost approximately $25,000 will be commenced immediately.

Recent Losses by Fire.

Urichsville, Ohio—Barr Bros., garage destroyed. Loss, $18,000.

Quincy, Ill.—Shackleford Garage, damaged. Loss not stated.

Cranston, R. I.—Henry C. Angell, Princess street, garage damaged. Loss not stated.

St. Louis, Mo.—Coyne Automobile Co., 902 Cass avenue, building destroyed. Loss, $40,000.

St. Paul, Minn.—G. E. Michael, White Garage, and M. J. Osborne, dealer, 3d street and College avenue, building and four cars damaged. Loss, $23,000.

Changes of Capitalization.

Columbus, Ohio—John W. Brown Mfg. Co., from $490,000 to $640,000.

Digitized by Google

In the RETAIL WORLD

David Thomas, of Lewistown, Pa., is about to build a garage.

R. G. Cowham has purchased a site in La Mesa, Cal., and will erect a garage.

Raymond McIntyre and Frank Scheetz, of Sellersville, Pa., plan to open a garage.

C. W. Guth is having a garage erected in Wescoesville, Pa. He will stock Buicks.

W. F. Parrish, of Palmetto, Fla., is having a garage erected on East Myrtle street.

George E. King is erecting a garage in Atchison, Kan. The site is on Main street.

F. G. Goodman, of 8515 Lorain street, Cleveland, Ohio, proposes to build a garage.

The Dupee Hardware & Auto Co., of Aberdeen, S. D., has erected a new building.

J. H. Cardwell has opened a garage in Madera, Cal. He also will handle Buick cars.

A new garage is being erected in Camden, Me., for F. W. Hill; it will stand on High street.

A garage will be erected in Lincoln, Neb., at 221 9th street, for Nicholas Ress; it will cost $10,000.

John A. Hamilton, of Columbia, S. C., has opened a garage; it is located at 1216 Main street.

The S. W. Crawford Auto Co. has opened a garage in De Soto, Mo. It is located on Easton street.

The Camden Motor Co. has entered the trade in that Arkansas town; it will conduct an agency.

Rivers & Petrie have purchased the Reek Garage in Marshall, Mich. It is located on West Main street.

Fred C. Schneider, of New Brunswick, N. J., has been granted authority to erect a garage on French street.

S. M. Stone, formerly manager of the Chicago Marathon branch, has set up as a dealer; he has the King line.

Judson C. Rives, of Los Angeles, has secured permission to erect a garage at 12th street and Westchester place.

Horace Farish, of Morrilton, Ark., is erecting a garage; he will open up as a garageman and accessory dealer.

H. W. Matthews, of Lincoln, Neb., plans to build a garage on 10th street; it will represent an expenditure of $12,000.

Edgar Vernon, of Atlanta, Ga., plans to open a garage and accessory store; he has secured a location on Harris street.

The Bloomington (Ill.) Garage, Supply & Storage Co. has opened for business; it is located at Douglas and Prairie streets.

Epley & Weert have opened a garage and repair-shop in Grand Rapids, Mich. It is located at the rear of the Waverly Hotel.

The Cartercar Iowa Co., of Des Moines, Ia., has been granted authority to build a garage on Locust street; it will cost $10,000.

The Culbertson-Grote-Rankin Co., of Spokane, Wash., has purchased a garage on Knox avenue; it will enlarge it and locate there.

R. C. Manning, proprietor of the Motor Shop in Trenton, N. J., has become a car dealer; he will handle Overlands after January 1.

Gregory Garage is the style of a new structure being erected in Englewood, N. J., on Grand avenue; the estimated cost is $15,000.

The Bronx Gas & Electric Co., of New York City, plans to build a garage at Walker and Frisbie avenues; the estimated cost is $3,000.

Frank J. Martin is erecting a garage and repair-shop in Greenfield, Mass., on Davis street; he will style the business the Martin Machine Co.

The Dorris-Crawford Co. has entered the trade in Chicago, at 1621 Michigan avenue; it will handle Dorris cars and trucks and Selden trucks.

Harry W. Snyder, of Cincinnati, Ohio, has leased for nine years the Peerless Garage; it is located on Woodburn avenue, south of Myrtle avenue.

Plans have been prepared for a garage to be erected in Utica, N. Y., for George Fullmer; it will stand on Genesee street and will cost $6,500.

The Universal Auto Sales Co. has opened salesrooms in New York City at 1700 Broadway; the company will specialize in used cars and trucks.

C. L. Brown, of Birmingham, Ala., has taken possession of new quarters at 219 South 20th street; he stocks Stevens-Duryea cars and Chase trucks.

B. G. Holmes and George Ress, of Redlands, Cal., have leased the Mission Garage to George M. Bartlett, formerly of Detroit; it is locatetd on Vine street.

D. D. Freese, of Gardner, Mass., has leased the garage of A. Rosenberg, on North Main street; he will add additional equipment and operate the garage.

Z. P. Eagleston and A. B. Shanks are preparing to open a garage and repair-shop in Smithville, Tex., on 2nd street; it will be styled Smithville Auto & Machine Co.

The Independent Auto Co., of 11th and Mulberry streets, Des Moines, Iowa, has been taken over by M. Gerhart; the company is Locomobile and Moline dealer.

Charles C. Case has purchased the Nolan Auto Co., of Rochester, N. Y. The style will be changed to Case Auto Co. The company handles Studebaker and Rambler cars.

The Schenectady (N. Y.) Cadillac Co. has taken possession of a new garage at 422 Smith street; it has a frontage of 40 feet and is 133 feet deep. B. W. Peebles is manager.

Holland & Co. have opened a garage in Lead, Col., at 114 East Main street; Holland formerly was connected with the Black Hills Garage in Deadwood, in the same State.

Vaccaro & Fargo, of Modesto, Cal., have sold their interest in the Modesto Garage to A. W. Bereaux, formerly of San Francisco; they, however, will continue as Regal dealers.

The Ennis-Klink Oil Co. has been formed in Milwaukee, Wis., with a capital of $7,000 by Eugene Klink, Joseph Ennis and A. A. Shead; it will deal in oils, greases and motor fuels.

G. and E. Tisch, constituting the firm of Tisch Bros., in Grand Rapids, Mich., have entered the tire trade; they will stock the Federal line. Their store is located on Davidson avenue.

E. R. Gardener, formerly of Davenport, Ia., has purchased a controlling interest in the Western Auto Co., of Denver; he has removed to that city and will take an active part in the business.

J. D. Perry Lewis, a pioneer salesman in the trade in St. Louis, Mo., has become a dealer; he has secured the Marion agency and will open salesrooms at Walton and Washington avenues.

Frank G. Bell, of Hollon & Bell, under-

Digitized by Google

takers, has purchased the garage of the Syracuse Storage Battery Co., in Syracuse, N. Y., at 118-20 South State street; it will be operated by Bell's son, Paul H.

The National Motor Car Co., of Chicago, has changed its name to Divine Motor Car Co. The personnel remains the same and the company will continue to stock Garfords; F. C. Divine is president.

W. A. Wicks, of Seattle, Wash., has taken possession of a new concrete salesroom and garage at 12th avenue and East Union street; the showroom has a frontage of 60 feet on 12th avenue and 40 feet on East Union street. Wicks is a Franklin dealer.

A. B. Larmour, of Plainfield, N. J., has taken possession of new quarters at 119 Madison street; he now styles his garage and repair business the Central Garage. He formerly was located at 180 East Front street.

H. S. Neer has opened a garage and repair-shop, 50 x 200 feet, in Birmingham, Ala., at 109 South 20th street; he formerly resided in Dayton, Ohio, and went to Birmingham in July of this year to become connected with the Huster-Overland Co.

E. H. Kammerer has purchased from Charles Perrault the Coeur d'Alene Garage, in Coeur d'Alene, Idaho; Perrault, who retains his bicycle agency and repair-shop, has taken a new location across the street. With the garage goes the Ford agency. Kammerer formerly resided in Spirit Lake, in the same State.

Frederick C. Hamerson, of Grand Rapids, Mich., has sold his interest in the Mitchell Auto Agency & Garage, at 210 Ionia avenue, to his partner, John Vlasbloom; the latter will continue the business. Haumerson will return to the repair department of the Mitchell-Lewis Motor Co., in Racine, Wis., where he formerly was employed.

John D. von der Leith, for five years connected with the Splitdorf Electrical Co., Newark, N. J., has entered the trade for himself; he has formed the Reliable Auto Specialty Co., with headquarters at 306 Mott avenue, New York City, and will handle accessories, specializing in ignition devices and materials. He plans to tour the country in a car, demonstrating the lines he handles.

The Cooperative Auto Co. has been formed in Norwich, Conn., with a capitalization of $50,000, $10,000 paid in; the officers are: President, M. H. Donahue, of Baltic, Conn.; vice-president, R. J. Jodoin, of Baltic; secretary and treasurer, P. A. Quinn; manager, John A. Allen. Besides these the incorporators include John Quinn and John H. Brown. The company will operate a garage with car and truck agencies.

CHAMBER EFFECTS CUTS IN MOTOR CAR FREIGHT RATES

Reduction of from 5 to 16 per Cent. in Transcontinental Tariffs—New Arrangement Scheduled in Southern Classification.

Freight rate reductions ranging from 5 to 16 per cent. on transcontinental shipments of automobiles have been secured by the Automobile Chamber of Commerce on carload shipments ranging from 11,000 to 22,000 pounds and, likewise, reductions have been secured on commercial vehicles from the pleasure car rating, the reduction being according to a fixed differential.

In securing these rates the Chamber asked certain concessions and the result was a compromise. On delivery wagons, trucks or chassis and extra parts, finished or unfinished, but not including extra windshields, lamps, searchlights, headlights, speedometers, cyclometers and horns, in minimum carload weights of 12,000 pounds for 36- and 40-foot cars and 14,000 for 50-foot cars, the chamber asked: Group A, $2.65; B, $2.60; C, $2.52; D-J, $2.45. The railroads granted rates for the four classes of $2.80, $2.70, $2.60 and $2.50, but did not include delivery wagons with enclosed tops and made the weights: 36- and 40-foot cars, 12,500 pounds; 50-foot cars, 15,000 pounds. The original rates were: $3.30, $3.20, $3.10 and $3.

The present classification, which reads "Automobiles, passenger and freight," has been amended to include fire-fighting apparatus, hearses and tractors. The reductions, taking Detroit to San Francisco as an example, are:

Weight. Lbs.	36 ft. or 40 ft. Car. Present Charge.	36 ft. or 40 ft. Car. New Charge.	50 ft. Car. Present Charge.	50 ft. Car. New Charge.
10,000	$310.00	$310.00	$372.00	$372.00
10,484	325.00	325.00	372.00	372.00
10,486	325.07	325.00	372.00	372.00
11,000	341.00	325.00	372.00	372.00
12,000	372.00	325.00	372.00	372.00
12,500	387.50	325.00	387.50	387.50
12,582	390.04	327.13	390.04	390.00
13,000	403.00	338.00	403.00	390.00
14,000	434.00	364.00	434.00	390.00
15,000	465.00	390.00	465.00	390.00
16,000	496.00	416.00	496.00	416.00
18,000	558.00	468.00	558.00	468.00
20,000	620.00	520.00	620.00	520.00

In the Southern Classification new rates have been established which will make freight rates one class lower than at present on carloads of chassis or open-bodied trucks. Other changes are:

A lower charge for 11,000 pounds in 36-foot cars than now charged on 10,000 pounds; a lower charge for 13,750 pounds in 40-foot cars than now charged on 12,500 pounds; a lower charge for 19,800 pounds in 50-foot cars than now charged on 18,000 pounds, and the privilege of shipping engine or gear parts and wheel rims or channels in carload lots of either passenger or freight machines as part of the carload instead of being subject to additional less carload charges.

Seitz Becomes Detroit Wyandotte.

The Seitz Automobile & Transmission Co., of Wyandotte, Mich., which in January of this year purchased much of the machinery of the Grabowsky Power Wagon Co. at the receiver's sale, has been reorganized with $500,000 capital under the style Detroit Wyandotte Motor Co. and now is actively engaged in the production of commercial vehicles which bear strong resemblance to the old Grabowsky trucks. Frank Marx, a Wyandotte brewer, is president of the new company, and associated with him are J. C. Kern, who is secretary-treasurer; G. A. Horner, formerly with the Grand Rapids Motor Truck Co., and later in charge of the Grabowsky plant for the receivers, is general manager. The truck, which differs from the Grabowsky in that it has a stationary power plant instead of a removable one and that it has the radiator behind the engine, has been named the Horner.

Reorganization Planned for Muncie Gear.

If the efforts of a loyal group of creditors and stockholders prove successful, it is not unlikely that the Muncie Gear Works, of Muncie, Ind., which three weeks ago was placed in the hands of a receiver, will be reorganized and that the business will be carried on as heretofore under the old management. It is stated that the plan of the organization calls for an issue of 5 per cent. preferred stock, retirable at given intervals, to liquidate the $275,000 indebtedness of the firm. It is thought that this plan will appeal much more strongly to the creditors than will the alternative of getting approximately 10 cents on the dollar, which, it is pointed out by officials of the company, is all that would result from a forced sale.

Great Western's Creditors to Meet.

Creditors of the Great Western Automobile Co., of Peru, Ind., have called a meeting for the purpose of arranging an extension of time for the automobile company which, it is stated, has been placed in financial straits because of a lack of orders during the last few months. About 130 cars are on hand which, if sold, will furnish the required funds.

The Simplex Specialties Co. has been organized in Detroit with John B. Teford in charge. He will have an office in a garage at 703 Woodward avenue and will handle the Green top lifter and other accessories.

POSSIBILITIES OF PORTABLE GARAGES.

Whether or not the cyclecar ever "comes in" in the sense that the automobile and the motorcycle may be said to have "come in," the increasing number of really small cars suggests anew the advantages that lie in the portable garage, to which comparatively little attention has been paid. It is pointed out by those who would popularize little vehicles either in or nearly in the cyclecar class, that they may be "housed under a tarpaulin in one's backyard." That is not good advice, for though some one or other is credited with having stolen a red-hot stove, the fact remains that it is the little things that are most easily filched, and the size and weight of such small cars stands as a permanent and decidedly strong inducement to the light-fingered—or,rather, light-handed—gentry to make off with them.

It is here that the first possibility of the portable garage makes itself manifest, for at the expense of a small initial outlay any car, whether it is small or large, can be put beyond the reach of all ordinary thieves; and furthermore, the old saying to the effect that out of sight is out of mind still obtains. It is true that one so minded might be able to get into one of these light metal shelters with a can-opener, but it would have to be a pretty big can-opener and burglars, as a rule, don't carry such evidences of domestic simplicity about with them, though in time they may add these tools to their "kits."

The advantages of the private garage have been too often pointed out to require reiteration—elimination of garaging fees; safety from unauthorized meddlers, or riders; convenience; reduction of fire risk, and a host of others that are far too numerous to mention. Ordinarily, the mere term "private garage" indicates a certain affluence, wide spaces and rolling lawns with a gem of architecture hiding among luxurious trees; its cost is looked at askance by the average individual whose income is anything under $5,000 a year; it is almost, if not quite, beyond his means. Not so the small portable garage, however. As a shelter it is every bit as good as any masonry edifice founded on rock. And, needless to point out, its cost is a trifling fraction of the cost of the other; it can be put up almost by anyone, and once up it will stay put up until the owner changes his residence, when it can be packed up and carted away with the furniture. It is just a little bit surprising that greater attention is not paid to its possibilities, not alone by the car owner but by the dealer as well, for the fact of its existence and its availability might well be used as a lever in turning sales, especially to those who buy moderate priced cars.

DANGER IN CURVED GLASS WINDOWS.

It is essential, in building enclosed cars to meet with the approval of present-day purchasers, that there should be as much clear glass and as little to obstruct the view as possible, especially in the front. It also is important, though in a different way, that such a vehicle should be of attractive appearance, for even a good car, if it is not good to look at, will be hard to sell. No doubt these reasons are responsible for the fact that a number of cars, more particularly electrics, are built with fronts of curved glass. True, the curved glass front affords a splendid view and in many respects is pleasing to the eye; but there is another aspect of the case that requires at least as careful consideration as such matters as unobstructed vision and handsome appearance.

The fact is that, while curved glass does not actually obstruct the view, it has an effect that is even more objectionable, for, acting as a sort of lens, it is likely to distort objects, destroy proportions and optically falsify distances. It is not possible to make allowances for such effects, for they vary with every variation of the observer's position, and no one likes to look out and see passing objects take on forms that more or less resemble those produced by a Coney Island curved mirror, the principle of which, incidentally, is embodied in the curved glass front of the automobile.

While it is quite true that glass is more or less transparent, it is only necessary to give it a curved form, or even merely to set it at an angle, to discover that it has optical qualities which, while of incalculable value in making possible the construction of lenses of all sorts, are decidedly out of place in a window that has no reason for existence other than to form a barrier to the weather but not to the vision of passengers.

PREVENTING CARELESSNESS BY ADHERING TO A SYSTEM

Member of Ford Organization Urges that Employes Be Guarded from Temptation—Slackness in Manager Imitated by the Force.

"If employes are allowed to handle business transactions in a careless manner, that carelessness may grow into practices that are questionable," says N. A. Hawkins in the Ford Sales Bulletin.

"Unless employers protect their honest employes against those who might be dishonest if they dared, and protect all of their employes against the temptation to be dishonest, they are not treating themselves or their employes fairly. All employes should be compelled to work close enough to a system to keep them out of unnecessary temptation. Unless this is done, you can expect that some of them will learn bad tricks.

"About the best plan to prevent losses of loyalty, losses of ambition, losses of character, losses that arise from a suspicious and disorganized force of employes, is to compel every one of them to record their transactions. To be successful—to avoid carelessness, you must have a clear and well-defined system and follow it to the letter—and see to it that all of your employes do likewise—thus operating your entire business to its maximum efficiency and with little likelihood of loss through any other than legitimate ways.

"Employes will imitate the faults of their employer quicker than they will imitate his virtues. If the manager is slack—the employes will be even more slack.

"Carelessness is catching.

"Questionable practices are contagious.

"This is the record of many a failure."

Couldn't Enter Race; Wants $100,000.

How many jeers is $100,000 worth? Ask Ferd L. Adams, who was entered to drive a Smada (Adams backwards) car in the last Indianapolis Speedway race, for Adams has commenced suit for that amount because of his inability to start in the 500-mile grind. Hs asks that sum from the Automatic Motor & Engineering Co., of 15 South Michigan avenue, Chicago. Adams claims he engaged the company in February to build a special 90-horsepower racing car for him, to be delivered May 1. May 10, he states, the car was not completed and he tried to get another mount but failed. His picture was printed in the programs and he had paid $100 entry money, but he was unable to find any kind of a car in which to start. Because of this he says he was ridiculed by his friends and suffered great mental anguish for which he wants the Chicago company to furnish balm.

Hub Odometer Added by Stewart.

To its extensive line of speed and mileage indicating and recording devices, the Stewart-Warner Speedometer Corporation of Chicago, Ill., just has added another that is designed primarily to afford the operators of commercial vehicles and electrics, which ordinarily are not equipped with the usual type of speedometer, a permanent record of the mileage traveled by the vehicle to which it is attached; as the accompanying illustration shows, it is a hub odometer, though the picture does not show the insides of the device which, of course, is its most important part. As accuracy is

STEWART HUB ODOMETER

essential in any device of the kind, the drive in the new instrument is through steel pinions with worm and spiral gears, and all the parts are heat treated, hardened and ground to make them practically wear-proof. To prevent the dials "jogging" around miles that have not been run by the wheels, an ingenious adaption of the Geneva stop is used and this positively locks the indicating figures, except at the instant they register; those not registering remain locked. Another excellent feature of design is that the instrument is absolutely springless; furthermore, there are neither pawls nor ratchets.

Yosemite Park Opened to Automobiles.

After a long squabble, the Interior Department of the Federal government at length has thrown open a part of the Yosemite National Park to automobiles, though motorcycles still are barred out. Motorists may enter only over the Coulterville and Big Oak Flat roads, and as a means of regulating the speed of vehicles checking stations have been established. For the round trip through the park a fee of $5 is made.

PIERCE-ARROW PRODUCES 2-TON WORM DRIVEN TRUCK

Design of Big Truck Closely Followed in Latest Model—Improved Suspension and Automatic Governor for Motor.

Something akin to a real surprise has been "sprung" by the Pierce-Arrow Motor Car Co., of Buffalo, N. Y., in the announcement just made that a 2-ton worm-driven truck has been developed and will be ready for delivery early in September. While it is a matter of much difficulty—in fact, a practical impossibility—to design a machine from the ground up, complete an experimental model and keep it on the road for a considerable time, as the Pierce-Arrow people have done with the new truck, without more or less spreading of an inkling of what is going on, there has been little general idea that there was a medium-weight worm-driven truck coming from the Buffalo factory.

In view of the highly satisfactory service that has been obtained from the Pierce-Arrow 5-ton truck, which, as is well known, was among the first American commercial vehicles to adopt worm drive, it is not without substantial reason that the same principles of construction and practically the same lines have been adapted to the needs of the smaller car. In fact, the latest comer may be termed a smaller edition of the big machine without stretching the truth to any appreciable extent. At the same time, the opportunity has been seized to incorporate a few improvements that experience has indicated as desirable, as well as a few constructional changes due to the difference in the sizes of the machines.

A case in point is that of the motor and gearset suspension. In the big truck the motor is hung from three points, one in front and two in the rear, from cross-members of the main framing; in the 2-ton truck, however, the motor, though retaining the three-point suspension idea, is hung differently. The motor and the gearset are rigidly bolted to a rigid steel subframe, and this, in turn, is mounted on three points on the main frame. The result is that the motor itself is perhaps somewhat less exposed to localized stresses, and the protection from twisting is complete.

As for the engine itself, it is, as might be expected, a thorough Pierce-Arrow motor. It has four cylinders, cast in pairs, of the T-head type, and, with a bore and stroke of 4 inches and 5½ inches, respectively, has a rating of 25.6 horsepower, though its actual capacity is 30 horsepower at 1,000 revolutions per minute. An automatic governor holds the engine speed down to a maximum of 1,050 revolutions per minute, which, with standard gearing, corresponds to a road speed of 16 miles an hour. All the valve mechanism is made by exactly the same processes and on the same lines as in the motor of the 5-ton truck.

While it is usually taken as a matter of course that a truck maker will be a little extra careful in the designing of his lubrication system, the Pierce-Arrow company has gone even further than the stereotyped "might be expected" in the new motor. The rotary pump that circulates the oil is directly coupled to one of the camshafts, and is of unusually large size and takes oil, in the usual manner, from a well in the bottom of the crankcase. Oil is delivered under pressure from the main tube lead to the three crankshaft bearings, whence the oil passes, through holes drilled in the crankshaft, to the connecting-rod big-end bearings. The spray of oil splashed by the connecting-rods and crankshaft is relied upon to lubricate the camshaft, piston pins and cylinder walls; the surplus, of course, falls to the bottom of the crankcase and finds its way to the well to be strained and recirculated.

With the exception of two tubes, one of which leads to the pressure gauge and relief valve on the dash and the other of which is the return pipe, all the oil passages are inside the crankcase, so that if a leak should develop the dripping oil will merely fall into the well, and will not be lost or spread in a messy smear over the engine. There are but four outside oil-pipe joints. A float-operated gauge indicates the level of the oil in the well.

Gas is supplied to the motor by a regular Pierce-Arrow automatic carburetter, slightly modified to meet the requirements of this particular machine; throttle control is through a foot accelerator. For the sake of simplicity, but a single ignition system has been installed, and particular pains have been taken to render this as reliable as an ignition system can be made. The time of ignition is fixed. The Bosch magneto sends its current to the spark plugs through wires clipped in fiber blocks and run through the air, away from contact with possible grounds. Special sockets over the pistons are provided for the spark plugs. Water is forced through the vertical tube radiator by a centrifugal gear-driven pump of large capacity.

The clutch is a large, leather-faced cone and the gearset provides three speeds which are selectively controlled through a lever placed at the right side of the car. The gears are designed to propel the car at 4, 8 and 16 miles an hour, respectively, for the first, second and third speeds, the highest being a direct drive and the maximum speed controlled, as already has been stated, by an automatic governor. The reverse speed is 3½ miles an hour. The propeller shaft which bridges the gap between the gearset and the rear axle is fitted with two universal joints, one at each end.

The rear axle follows closely the lines of the rear axle of the 5-ton machine, and is of the floating type with the overhung worm enclosed in a tight and particularly rigid steel casing. The live shafts, of course, carry no weight load, serving merely to transmit power to the wheels; they are extremely heavy, so that the margin of safety is more than ample for all requirements. As in the larger machine, the springs are not depended upon to transmit drive to the body; two radius rods are provided for the purpose, and they run forward at right angles to the axle and terminate at heavy brackets riveted to the main frames.

Adhering to the theory, which has been well demonstrated in practice by the big trucks, that a flexible frame has peculiar advantages for motor truck work, the frame of the 2-ton machine has been constructed so that it is free to give more or less when the truck is running over uneven ground, so avoiding not a little strain on the fastenings. It goes without saying that the entire design is laid out to harmonize with this flexibility of frame, and that the material used is adapted to the work; special steels, heat treated, provide the requisite qualities. The springs are all semi-elliptics, of unusual length, and the rear springs, inasmuch as they transmit no driving power, are shackled at both ends. As in the big car, the front axle is a one-piece forging and the steering gear is of the worm-and-nut type, of very heavy construction. The steering wheel is at the right side.

All the wheels are of wood, all are 36 inches in diameter and all are shod with 4-inch solid tires, there being two tires on each rear wheel, however, as against one on each front wheel. The tires are on S. A. E. standard demountable rims. The standard wheelbase is 150 inches, and the tread is standard—56 inches.

The braking system consists of the usual two units—service and emergency brakes. The service brake, operated by a pedal, consists of a band and drum mounted immediately in the rear of the gearcase; the emergency brake, with the customary lever control, includes a pair of internal expanding shoes working in drums on the rear wheels.

Bearings throughout the truck are either ball or roller, with the exception of the engine bearings, and the lubrication problem has been simplified by eliminating grease cups and the like and employing self-lubricating bearings where it is possi-

Digitized by Google

ble to do so. All bearing surfaces are made large and are fitted with particular care, so that there will be a good working fit from the beginning and the least possible loss of service due to the "bedding down" process.

The gasolene tank, which feeds fuel to the carburetter by gravity, has a capacity of 15 gallons. The water capacity of the car is 8 gallons and the oil capacity 1 gallon. The radiator is of the tubular type, with vertical tubes, and is of particularly substantial construction, a point that is of much importance in truck work, where a flimsy radiator is sure to give trouble early, make the life of the driver miserable and reduce the efficiency of the truck, even if it is not damaged through the loss of water and the consequent overheating of the engine.

The over-all length of the chassis is 18 feet 6 inches and the extreme width 5 feet 6 inches. The body, in its standard form, is 10 feet 6 inches long and 6 feet wide, and its upper surface stands 3 feet 6 inches from the ground. The top of the frame is 30 inches from the ground; these measurements are taken without load on the machine. The frame is 34 inches wide. The load capacity of the truck is given as 5,200 pounds, this figure including the weight of the body. In other words, 1,200 pounds is the weight allowed for the body if the full paying load of 2 tons is to be carried; if the body is lighter the load may be correspondingly heavier, but if the body exceeds 1,200 pounds the excess must be deducted from the paying load. The price of the chassis, in the lead, is $3,000 f. o. b. Buffalo.

Martin Tractor Enters Massachusetts.

Virtually to take the place of the Martin Tractor Co., of Indiana, which was formed about a year ago with $350,000 capitalization, there has been formed in Springfield, Mass., a new company of the same name and with the same capitalization, of which Harry C. Fisk of the Fisk Rubber Co. is president; C. H. Martin is vice-president; E. O. Sutton, also of the Fisk Rubber Co., is treasurer, and C. E. Beckwith is secretary. The incorporation of the company marks the entry of S. E. Eveland, of Philadelphia, into its affairs, Eveland being one of the largest stockholders and bringing with him a number of valuable patents. Coincident with the formation of the company, which holds all rights to produce tractors under the Martin and Hunter patents other than those held under license by the Knox Automobile Co., of Springfield, Mass., a letter warning against infringement has been sent out. The patents listed in the letter, which it is pointed out "is not a specific allegation that you are infringing these patents but is merely in the nature of general information for the trade," are as follows: Hunter, 670,405, March 19, 1901; Hunter, 696,143, March 25, 1902; Hunter, 625,953, May 30, 1899; Thayer, 678,063, July 9, 1901; Martin, 1,018,248, February 20, 1912; Hight, 698,836, April 29, 1902; Lieban, 655,724, August 14, 1900.

To Produce "Double" of Bedelia Cyclecar.

To produce a cyclecar that will be the "spitting image" of the French Bedelia car, a company to be styled Davis Cyclecar Co. now is in process of formation in Detroit. The company is named for William Norris Davis, formerly with the Murphy Potter company, and will be capitalized at $500,000. It is planned to turn out between 3,000 and 5,000 cars during the coming year. The car will have 93 inches wheelbase, 36-inch tread and its seats will be tandem arranged, a la Bedelia. Power will be furnished by a special Spacke motor and transmitted through a three-speed gearset; wire wheels will be used and the car will weigh less than 600 pounds; it will sell for $395.

Another Cyclecar Company for Detroit.

The Princess Cyclecar Co., which has been incorporated under Michigan laws with $200,000 capital by Isaac N. White, H. H. Dawson and C. J. Thornewill, is the latest addition to the increasing number of companies that expect to produce light vehicles. An office has been opened in the Dime Savings Bank building in Detroit and negotiations for a factory have been opened. Also interested in the company, which will produce a true cyclecar to sell for $375, are J. A. Martin, formerly of the Oakland Motor Car Co.; E. H. Vincent, formerly with the Packard, Hudson and Regal companies, and H. L. Blydenburgh, formerly with the Buick company.

Reeves Negotiating for Mais Plant.

Headed by M. O. Reeves, who is head of the Reeves Pulley Co., of Columbus, Ind., and the Reeves Octoauto Co., a group of Columbus business men is understood to be conducting negotiations for a controlling interest in the Mais Motor Truck Co., which in July, 1912, was placed in the hands of a receiver. If Reeves's plans materialize, it is his purpose to move both the plant and the business to Columbus, Ind. The names of Reeves's associates have not been made public.

Wager to Produce Worm-Drive Truck.

For the purpose of manufacturing and marketing a 1½-ton worm-driven commercial vehicle, which already is so far advanced that it has reached the testing stage, the Aetna Motor Truck Co. is being formed in Detroit, Mich., by J. G. Wager, formerly owner and operator of the Trebert Gas Engine Co., of Rochester, N. Y. The truck, which is to sell for about $2,000, is to have a Hazard four-cylinder motor, Ross steering gear, Sheldon axles, Brown worm gear and a Brown-Lipe gearset.

Detroit Body not to Have Distributer.

Despite statements to the effect that the Detroit Body Co., of Detroit, successor to the Detroit Carriage Co., has arranged to have its entire product marketed by an independent distributer, it is stated by President H. W. Paten the company has no such intention and that it will continue as heretofore its own distributer; the man whom rumor had named as the marketer of the body company's products is Theodore F. Millington, formerly with the General Motors Co. and an organizer of the Edward J. Budd Mfg. Co., of Detroit.

More Trucks Coming from Indianapolis.

The Kugel Auto Co., of Indianapolis, Ind., which heretofore has conducted a machine shop and paint works, is preparing to commence the production of commercial vehicles of its own and has arranged to take up the manufacture of a vehicle styled Auglaize, which previously has been produced in limited quantities in New Bremen, Ohio. For the purpose, a new building 80 x 175 feet will be erected. The truck will be renamed Kugel.

Gain of $1,400,000 in Pope Sales.

Although the Pope Mfg. Co., of Hartford, Conn., has not yet completed its annual statement, the fiscal year which terminated July 31 is understood to have yielded a gain of $1,400,000 in gross sales; of this $500,000 came from the bicycle and motorcycle end of the business and the remainder from automobiles.

Indian Sues Utica Man for Bill.

The Indian Refining Co. recently filed suit in the Supreme Court for New York county against F. S. Worden, of Utica, N. Y. It is claimed that he was supplied with goods to the value of $51.75 between November 22, 1912, and February 1, 1913, and has failed to pay for them.

White's Boston Branch in New Home.

The Boston branch of The White Co., of Cleveland, Ohio, has taken possession of new salesrooms and a service station at 930 Commonwealth avenue; formerly it was located at 320 Newberry street; J. S. Hathaway is manager.

In order to be in closer touch with the automobile industry, the Pettingill Machine Co., of Amesbury, Mass., which manufactures bodies, has opened a branch at 603 Boylston street, Boston. It is in charge of D. M. Roney.

"My Best Sale and Why I Regard It as My Best"

Getting a Physician's Order After He Had Emphatically Turned Down the Salesman and Said He Would Buy Another Make—Courtesy to a Late Evening Caller Which Resulted in a Sale by a Man Not a Salesman.

By C. C. HALL, Danville, Ill.

The hardest sale I ever made was the sale of a 1913 model five-passenger touring car. The purchaser was an influential doctor who was known to be wealthy; he was a critic and a genius, and a man generally credited with the ability properly to judge an automobile.

He already had a car, though it was a rather decrepit one, and it was his habit to drive to his office every morning, leaving the car unattended at the intersection of two very busy streets in the downtown section of the city, where all day a continuous stream of people passed. It was this habit of his of leaving the car in such a prominent place, coupled with his own prominence, that influenced me to exert myself to the utmost to make the sale, for its advertising value to me would be considerably greater than the profit in mere dollars and cents on the sale of the car.

I had approached him several times on the subject of a 1912 car, but he did not warm up to it. In fact, he turned me down rather hard and I commenced to get discouraged. He pointed out that, while he wanted a car, he had practically determined to purchase a much higher priced one than the make I was selling. He had even gone to the length of getting photographs and specifications of the car he proposed to buy and things looked rather black for me. I remember the last time I called on him he did all, or near all, the talking. He would have made a wonderful salesman. I think if I had been in the market for a car he could have sold me the one he himself was going to purchase, or said he was going to purchase; he had all its fine points down pat, and the way he pointed them out to me made me wish for a chance to get away and terminate the interview.

There probably is not a salesman within the automobile, truck or accessory trade who does not treasure in his memory a sale which to him gave satisfaction when he got the signature at the bottom of the contract. If you have ever made such a sale write it and mail it before September 1. Your name will not be used if you so request. For the best four Motor World offers awards of $30, $20, $15 and $10.

At last he intimated that I might go and that, as far as he was concerned, it could serve no useful purpose for me to call again. All of which I reported to my employer, who also was inclined to think that further visits to the doctor would be a waste of time. But I had other views on the subject; I had determined to sell the man my car, and I calmly "sat tight" until the 1913 catalogs came through from the factory. When I got them I studied them until I knew them by heart; I got every detail of improvement in my mind's eye and also at the tip of my tongue.

Then I called on the doctor again and, though I was carrying the previous disappointment as a heavy load he never knew it, for I kept my feelings well concealed. Four times I missed him, but on the fifth trip, made in the evening, I found him in his office and alone; it was fifteen minutes to nine.

His greeting was not calculated to induce enthusiasm. "Good evening," he said; "I suppose you want to talk automobile, but I haven't time."

"No, doctor, and yes," I replied. "I was only going to offer you an opportunity to save from $1,000 to $2,000, and it won't take 10 minutes to do it if you will only give me a chance to talk. I know you have made a lot of money in your life, but I don't think you ever made that amount in such a short time."

This seemed to anchor in the gentleman good and strong. He was interested immediately, and that gave me the opening for which I was looking. I sprung the 1913 specifications and described the car, its quality, power and beauty, and before I had gotten very far along I knew I had him.

To make a long story short, inside of an hour I had his signature to the order blank and his check for $100 in my pocket. Nor was that all. Not only did I sell him a car, but I sold him slip covers for it, a bumper, a trouble lamp and two extra tires, and when I left—in the doctor's old car—we were friends; I was smoking one of his cigars. The old car, which we took in trade, was put through our shop and sold at a profit a little later. All of which goes to show that persistence coupled with a sales campaign generally can be relied upon bring in the business.

By WM. J. HASTINGS, Cleveland, Ohio.

One evening last summer I was taking inventory of stock, when about 9 o'clock I was ready to go home, a stranger stepped into the stock room.

My first impulse was to tell him to "beat it!" as I was tired out and in no mood to listen to a hard luck story, as I surely though would be the case. But I changed my mind and said, "Good evening." He replied likewise, and asked if I could show him something about an electric car.

After displaying one of our cars, he called his wife and two children, who had been standing at the back of the garage, to come and look it over; they liked it very well and asked some questions, which I answered to the best of my ability, although I was not on the sales force and could have asked him to call in the morning or told him we would have one of the salesmen call and see him.

However, I got them interested and took them for a ride, although it was after 10 o'clock, and set them down at the hotel where they were to stay, for they had come in late from the country and had left their machine at a nearby garage for the night.

Next morning the M. D., as I afterward learned he was, came in and looked over the machine in daylight to see if it confirmed his opinion of the night before; it did so, and before he left the office I had his order for the car and a charging plant which I had recommended.

Within a week I had delivered the car and plant to his home town, some 60 miles away, and come back with the money. He now very often comes in to get advice and information, and is very much pleased.

STUDY OTHER MEN'S METHODS

Keeping Posted on the Whole Trade a Secret of Success in Every Business—"Doctor" Tells How Business Illness May Be Avoided.

"One of the secrets of good business is to keep both yourself and your employes posted on what other people in your line in different parts of the country are doing. I have no use for the 'shut-in'; I refer to the dealer who resolutely closes his eyes to the advancements and improvements made by others in the same line of business, and keeps on doing this the same old way; no change, no improvement." Thus spake a man who has made a big success and has had manifold opportunities of seeing how other people did things or left them undone.

Has "Pulled Up" Many Sick Enterprises.

The man was in a sense an "efficiency expert," though he did not call himself by that title. He was simply known as the competent officer of a very successful trust company. In his career he has administered estates, closed out businesses, acted as receiver, and in many cases has been engaged at a very substantial figure to put "weak" and "consumptive" business on its feet.

He was thinking particularly of those businesses which might be called unhealthy. Continuing, he said: "If I were a dealer or a manufacturer, I would send trusted employes out to find out how successful concerns in my line in other localities did things. What automobile manufacturer could fail, for example, to learn something of value from a study of Ford methods and shop practice? Let him take a week or two visiting other shops; in most cases he would be welcomed. The right sort of manufacturers have few secrets; they are glad to be able to contribute information and ideas that tend toward the stability and upbuilding of the industry. Time and again we have been called in to handle affairs where there would never have been any need for our services if those in charge had availed themselves of the wide-open opportunities for learning better ways.

Garner Ideas from Successful Concerns.

"As a dealer I would be sure to get inspiration and ideas from the methods and plans worked out by notably successful New York concerns like Carl H. Page & Co., Elliott-Ranney, Colt-Stratton, or any of the successful, big dealers in cities like Philadelphia, St. Louis, Chicago, Cleveland, Detroit, or Los Angeles. Two or three times a year is not too often to chase ideas—it would be better to go six or a dozen times and come back with plans and ideas worth while and put them into practice, than to be stingy about it. Suppose I had three men and let them go different months one at a time for two or three days, then when they came back and we adopted some of the ideas they had learned, wouldn't they think it was bully? Wouldn't the next one be keen to be thought a closer and more practical observer? Wouldn't it increase the interest of every one of them in the business? Wouldn't it help the whole business?

"With such a plan followed out, it would be impossible to keep in a rut; ideas, ideas, then analysis, comparison, judgment and action. No chance for stagnancy or gloom to exist in such an atmosphere."

QUICK TURNOVER OF STOCK AS A MEANS OF AVOIDING LOSSES

The best merchants are those who keep their stocks cleanest, freshest and up-to-the-minute. It is profitable sometimes to sell slow-moving goods at cost in order to put the money into something that will move quicker at a profit. Quick turn-overs are one of the secrets of money-making merchandise.

Listen! This does not mean cutting prices on regular goods that are up-to-date. It means turning goods into money rather than have them hang on indefinitely and be compelled eventually to take less.

When the straw hat season is on, a $3 hat commands $3. There is no argument. But when the season is waning the wise merchant cuts prices to the bone—gives the public a bargain, gets back the cash he had invested and is ready to take advantage of the cash discount on the fall goods.

Many an automobile dealer has money tied up in products that might better be sold at once without a profit. The idea is to keep things moving. Especially is this true as far as supplies are concerned. Certain materials deteriorate with age. Keep your eye on these—and make them move fast. The money is always mightier than these goods.

GARAGE ADVANTAGES THAT LIE IN WISE USE OF ROAD SIGNS

A tour made recently through central New York shows that garages in general are not living up to the opportunities open to them by the judicious use of road signs. If a man wants gasolene and oil he is likely to go to the garage that advertises; he doesn't simply look for the sign "garage," but looks for "Jones on Main street." Where good roads abound there is an unlimited amount of touring done, and the dealer in the smaller towns has only himself to blame if he does not reap a decided benefit from this condition.

When to Talk and When to Keep Still.

There's a time to keep still in salesmanship as well as a time to speak. Let the buyer talk. Give him a chance and he will tell you many reasons why he should buy your goods. Of course, he does not intend to; but let him talk, and keep your ears open and your brain busy.

CIRCULARIZING THE PROSPECT

Methods Employed by Dealer Who Effectively Hammers Home His Selling Points—Letters and Literature That Make Prospect Think.

"We advertise regularly in our local paper—a little weekly that goes to all the farmers in our neighborhood, but we do not stop there," said a live sub-dealer who has built up a strong demand for a medium-priced car in a comparatively limited territory. "Once a week we send every prospect something that will add to his stock of practical knowledge about our cars. Every piece of lilterature that the factory sends us is immediately put to good use, and at regular intervals of three weeks we shoot out a multigraphed letter properly filled in with the prospect's name and address. This sort of work, coupled with persistent personal effort backed by a good car, is responsible for the success we enjoy. I have come to the conclusion that the first element in a good automobile business is a good car; the second is good personal salesmanship; the third is regular and systematic cultivation of the territory by use of letters and good printed matter.

Many Subjects Covered by Letters.

"Our letters cover a variety of subjects. The first one is right to the point about our car. The second letter takes up some features of our car that we think particularly adapt it to the roads of our section. The third letter is accompanied by a booklet explaining and describing still other features of the car, and winding up with a list of recent purchasers in the community. We vary this plan from time to time as we see a change necessary, and add letters written personally to cover points brought out in the salesman's reports. If you can only get a prospect thinking that you are really familiar with his needs, the battle is half won: It is a contsant study with us, and we are always on the alert to learn any other methods that have been successfully employed by others."

WHY SELLING POINTS NEVER NEED BE THOUGHT WORN OUT

Did it ever occur to you that sometimes "familiarity breeds contempt" for the very points that have helped you close sales before? The fact that you have used a certain argument for a long time is no reason for discarding it. That very point may prove the most potent in the world for the present customer. Do not disregard any detail that contributes to the real strength of your proposition, no matter how many times you have used it or how threadbare it may seem to you. Remember, the man you are trying to sell may never have heard it before, and it is just as vital to him as to anyone you ever used it on.

This brings up the fact that there is such a being as the hundred-point salesman. The hundred-point salesman knows that 95 per cent. is just 5 per cent. short of delivering the goods—and that 105 is exactly 5 per cent. too good. Or, to put it another way, if the fruit is six feet two inches away from you, a six-foot pole is just two inches short of getting the fruit. One of the small details, so familiar as to seem almost worthless, might just make up the necessary two inches. Think it over.

DISPLAYING WARES SO THEY WILL HELP SELL THEMSELVES

Accessory dealers who keep such goods as pliers, small tools, and so forth locked away in cupboards, out of sight and out of mind, would do well to study the merchandising methods of most of the large hardware and department stores.

You enter one of these modern stores in search of a single article perhaps worth 30 or 40 cents. While peering over the neatly arranged baskets or boxes containing the various lines of tools, you are amazed at the number of things you really need that are staring you in the face. There's a triangular file and a half-round, and a rat-tail (you always intended buying them, but you always forgot till you actually needed them); and there are those cutting pliers and the small pocket pincers that you have wished for a thousand times. Before you get out you see several articles (all marked with the prices in plain figures) that you want and you buy them. Your purchases aggregate a couple of dollars—just five times what you planned to spend. What did it? No salesman spoke to you. You just saw the goods there, noted the reasonable prices, remembered you wanted them, concluded you might better buy now, while you are thinking about the matter, rather than later.

Why "Five and Ten" Sales Are Large.

This is the secret of the big sales made by the five-and-ten-cent stores. It is the secret of the big sales made by many prominent accessory dealers. It is an idea that works and can be made to work for every dealer in supplies and accessories who chooses to adopt it. People who run automobiles are not different from other people; they are the same people who are large customers of the stores in other lines, and the same methods will work with them.

Dirty Floors and Their Influence.

That caked grease and dirt that covers the floor of some garages may seem like a little thing, hardly worth bothering about; as a matter of fact, it is a serious proposition. It not only annoys customers, but it eats into the soul of the repairmen and is often responsible for sloppy work. Experience is a good teacher. Suppose you try the effect of clean, greaseless floors. Note the effect on your men and then on your customers.

BACKBONE—REMEDY THAT ASSURES A SILVER LINING

Pessimistic Dealers and Salesmen Are Referred by Studebaker Corporation to Bill McQuigg — Won Success on Cripple's Bed.

"I have just finished a long session with one of our dealers who felt that the world didn't need him any longer. He felt dirty and grimy and disgruntled. His patience was at an end, and the future looked to him like an empty gasolene tank," says the Studebaker News.

"He has changed all my plans. Instead of talking to you about another of the laws of salesmanship, I am going to talk to you about Backbone. I can't help it, for I know that the men of backbone are the chaps that are doing the world's work. They all had faith. They all believed in themselves, in their work, in the need of the world for that which they offered. They all had backbone.

Salesman Should Not Be a Jellyfish.

"The jellyfish has no backbone, no direction or desire—it is only a quivering, slippery mass. We can't afford to be jellyfishes. Successful salesmanship is largely a matter of courage—without it you might as well quit business. Courage to believe in a bigger and better success than you have ever won—courage to go after it—courage to stay with it—courage to get it.

"Let me tell you the story of Bill McQuigg as told to me by my good friend Ray Clark Rose, formerly star reporter on Chicago newspapers and now a wealthy land owner in California. The man who can lose hope and courage after knowing what Bill McQuigg did—well, he can be little more than a poor excuse for a man.

Began to Live Where Others Would Die.

"Listen! If you think your cake is dough, go see McQuigg, and he'll show you! Bill McQuigg says he doubts if he ever had any backbone until he got his broken, some 13 years ago. From that day to this he has been dead, practically, from his waist down, but he declares that he really began to live at the moment when you and I, Brother Salesman, might have felt justified in giving up and dying. Most chaps do who get their backs broken across the middle.

"But Bill! Say, don't get too close to his bed (planted right in the center of his printing shop) or he may give you a playful poke in the ribs that will remind you of Jim Jeffries in his palmy days, in spite of the fact that there is a suspicious flatness, relieved by two pitifully narrow ridges where two big, powerful legs would bulge up the coverings if the Bill of 13 years ago were lying there, for he was as hard as nails in those devil-may-care gold mining days in the West.

"The most wonderful part of it all is that Bill's optimism is so huge, so virile and brawny, that, after facing him for five minutes, you are inclined rather to envy him, and to wonder if it wouldn't be worth while for you to go back and get your back broken, too, just to make a man of you.

What He Did After Misfortune Came.

"Here is a list of the things that this man has done since he became dead from his navel down:

"Earned the money to buy a farm for his father and mother.

"Earned the money to buy valuable real estate in Chicago.

"Established a successful job printing business, including purchase of building site, erection of building and complete equipment of a modern printing plant.

"Educated himself in natural philosophy and kindred subjects.

"Made himself an expert in business analysis.

"Developed a glorious cheerfulness that has conquered pain that is constant (nearly) and a deathly sickness that clutches him at intervals; for you must remember all normal functions have ceased from the waist down.

"When you enter Bill's shop, above the noise of the presses you will hear him shout, 'Hello, old man!' if you are a friend (you are sure to be if you have met him), or there will be a broad, appreciative smile for you if you are a stranger.

Cheerful Even in Great Adversity.

"Bill lies there propped up by a mass of pillows, with proofs and 'copy' all about him on the bed, a movable telephone at his elbow and an invalid's table, with a typewriter fastened to it, in front of him. Directly in front of him, on the opposite side of the room, are heaped up ridges of paper stock as colorful as mountain sunset. Bill sometimes call them his mountain peaks of unliberated thought, and he may tell you of the fairies of fancy that come stealing through the paper passes sometimes during the long nights that he spends alone there at 865 Galt Court, in the heart of the Italian quarter of Chicago, for Bill never leaves the shop from one year's end to another.

"I suppose you will insist upon knowing how the accident happened to Bill. It really doesn't matter, but he was sinking a shaft in a little gold prospect in Arizona. He bent forward to light his cigarette at the moment a bit of quartz slipped from the side of the shaft above him. It tapped him lightly in the small of the back, but in a flash Bill changed from a reckless, hardy adventurer to a despairing, pain-wracked and helpless cripple.

"The story of the agonizing waiting for the coming of his partner, of the weeks with little or no medical care in a mining camp, of months of suffering and delirium in a hospital, of the years of mind fog and bodily weakness almost fatal, and of the final triumph of will over weakness, hope over despair, is the story that Bill never tells—unless you are down and out and need it.

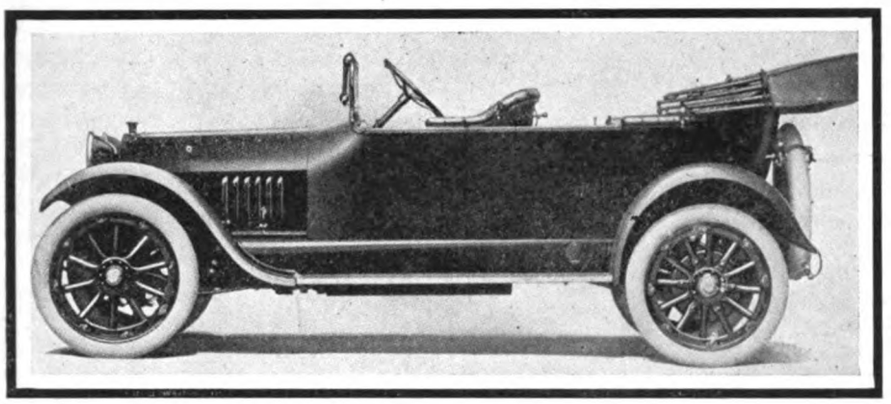
"However, Bill is no hero, he will tell you. He refuses to be lionized. In passing back and forth through the valley of the shadow of death for his soul's sake he has come to believe that power comes through service for the chap who can't pay the price (save gratitude) but who needs the help. And those who see this man and talk to him go away with a sense of shame at their petty complaints, and a high resolve to 'sin no more'—for the present, at least.

"See Bill; Then Get Back on the Job."

"That is why I say to you, Brother Salesman and Dealer, if you think that you are down and out, if you think the world's against you and the 'jig is up,' if, in fact, you have reached that stage where you are afraid that the automobile business will be sucked up under some heavenly vacuum cleaner, pawn your shirt, or steal one to pawn, if necessary, and make a little pilgrimage to William H. McQuigg, Man and Gentleman, and then get 'back on the job' and make the sparks fly upward, sir!"

Steam Vulcanizer of Unusual Construction.

Portable vulcanizers usually are operated without steam, despite the well-known advantages of the steam method, because of the bulk of the generating apparatus. There has been placed on the market, however, a car vulcanizer that is a complete little steam plant, though it can readily be carried under the seat and its weight is but three pounds.



The Positive vulcanizer, as the device is called, is made by the Positive Tire Vulcanizer Co., of Davenport, Iowa, and it consists of but a single casting having two compartments, one for water and the other for gasolene. The device is applied to the tire, which may be in place on the wheel and need not be deflated, by chains and thumbscrews, and the gasolene ignited. The water compartment, being between the flame and the rubber, prevents overheating, and a sheet steel hood serves as a safeguard against the flame above the casting. Cuts up to 2½ inches long can be vulcanized at one setting, and longer cuts by resetting the device.

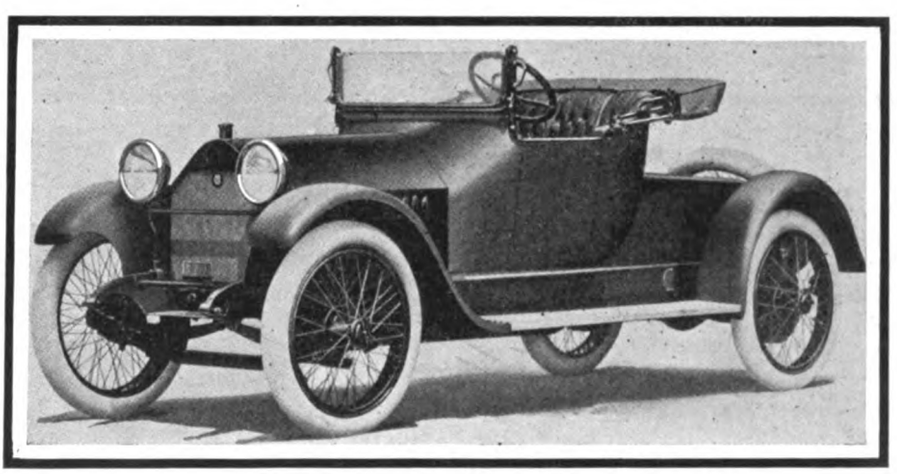
EFT STEER AND ELECTRIC STARTER FOR CHALMERS

"Six" Otherwise Brought up to Date with Larger Motor and Longer Wheelbase—$225 Lopped off Touring Car Price.

Not content with any half-way measures in bringing its newer series "six" right up to the latest in design and construction, the Chalmers Motor Co., of Detroit, Mich., has virtually redesigned the car and in the redesigning has built into it a number of features that never before have appeared under the Chalmers nameplate. Perhaps the most important of all the changes that have been made is embraced in the adoption of the Entz electric lighting and engine starting system in place of the highly perfected compressed air system that has been used in the past, and this, coupled with an alteration in the size of the motor, the shifting of the steering gear and control levers to the left and center, respectively, a longer wheelbase, more resilient springs and several less important mechanical changes makes plain that the new car is quite a little different from its predecessor.

LATEST CHALMERS TOURING CAR, WHICH HAS ELECTRIC STARTER

Most important of all, however, is the fact that a material reduction in price has been made despite the many improvements. Instead of listing at $2,400, the three-, four- and five-passenger open cars now sell for $2,175—a reduction of no less than $225; instead of $2,600, the six-passenger touring car now lists at $2,275; and $100 has been lopped off the price of the seven-passenger limousine, which heretofore sold for $3,700. A slight increase has been made in the price of the coupe model, however, the new list price being $2,850 instead of $2,700.



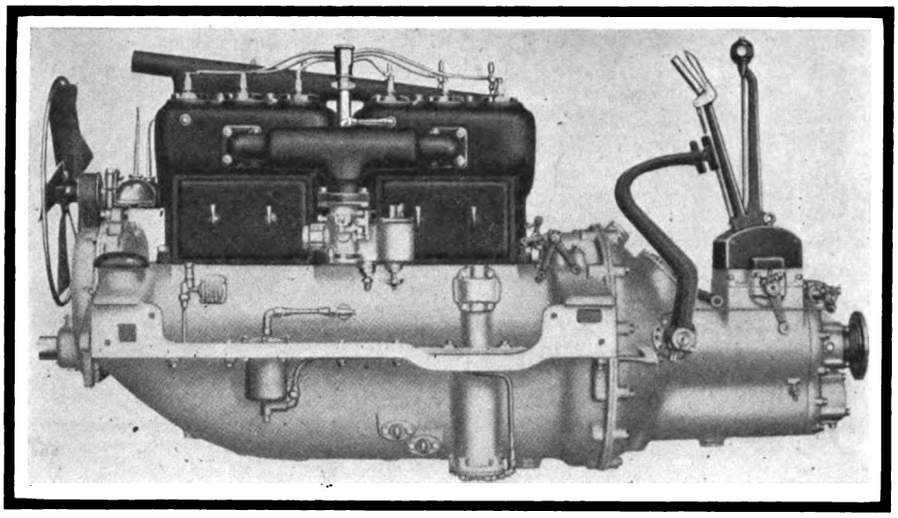
In altering the dimensions of the motor cylinders, Chalmers engineers have sought to reduce vibration to the minimum and at the same time obtain proportions conducive to the greatest possible power output. To this end the bore has been reduced from 4¼ to 4 inches and the stroke increased from 5¼ to 5½ inches. The increase in size coupled with better design in the proportion of the combustion chambers and alterations in the valve timing and in the manifold design permit the generation of considerably more power than was obtainable with the old dimensions; at 1,000 feet piston speed, 50 horsepower is developed easily, and at higher speeds the maximum power drawn can be increased to as much as 70 horsepower.

As heretofore, the six cylinders are cast in blocks of three and the valves, which are formed of nickel and tungsten steel, are located on opposite sides, thus providing for adequate sweeping out of the residual charge after combustion; valve stems, guides and springs are enclosed quite as a matter of course. To provide more efficient lubrication, an alteration has been made, the main bearings now being fed under pressure together with the timing gears; oil sumps are provided to collect the used oil, which is twice strained before it it is again sent on its rounds of lubrication.

In the carburation system, an important change has been made in the adoption of a completely water-jacketed intake manifold, the clean design of which is clearly shown by the accompanying illustration. As usual, the carburetter, too, is water-jacketed and, in addition, a hot air inlet has been adopted. The carburetter is a Rayfield with dash adjustment. Ignition is by Bosch high-tension magneto operating through a single set of plugs and cooling is carried on by pump-circulated water.

In formally adopting the Entz electrtic starting system in place of the compressed air system that has been used in the past simplicity has been the guiding star. Instead of the multiplicity of air pipes and valves, there is now a compact combined electric motor and generator permanently geared to the engine by means of a "silent" chain, the necessary wiring and a storage battery which also serves to furnish illumination.

The Entz system differs from others in that it is minus the usual "cut-out" to disconnect the generator and gasolene engine when the speed of the latter drops. Hence, it is not possible to stall the new Chalmers engine for, as the starting motor always is connected, it takes up its functions automatically immediately the speed of the engine falls below a predetermined limit. In starting it is merely necessary to close one dash switch, which makes the connection between the battery and the starting motor; thereafter the switch is not touched until it is desired to stop the motor. When, after starting the gasolene motor, its speed increases, the electric motor automatically becomes a generator and replaces in the battery the current drawn for starting and lighting.



WIRE-WHEELED CHALMERS ROADSTER, SHOWING DOMED FENDER

Back of the engine, in the transmission elements, not a great amount of change has been made; as heretofore, the clutch and gearset are a unit with the motor, though the clutch remains of the multiple disk type, provision now has been made for

Digitized by Google

its lubrication from the engine base. The gearset is of the selective type and provides four speeds forward and reverse; one excellent feature of design is that there is a positive lock provided for locking the gear shift lever in the neutral position. The location of this lever in the center of the footboard instead of at the right side is brand new in Chalmers construction, of course, and marks the conversion of one more prominent manufacture to left-side steering.

From the gearset, the drive is carried to the rear wheels through the orthodox shaft and two universal joints; the rear axle is of the full-floating type and is encased in a pressed steel housing with a liberal handhole for adjustment. Timken roller bearings are used in both the rear hubs and the differential mechanism. The front axle remains a single-piece drop-forging in I-beam section, with the wheels mounted on Timken roller bearings. Both sets of brakes are carefully equalized and operate on rear wheel drums; the service set is contracting and operates on 16⅜ x 2¼ inch drums and the emergency set is internal expanding, the drums being approximately the same size.

CHALMERS UNIT POWER PLANT, SHOWING WATER-JACKETED INTAKE

Though the springs remain of the same type as heretofore—semi-elliptic in front and three-quarter elliptic in rear — they have been made more resilient by the addition of main leaves of Vanadium steel. In the rear suspension an important change has been made in the method of mounting the springs, which now are hung beneath the axle; the body therefore is lower than heretofore and it follows that stability has been increased. Obviously no alteration has been made in tread, which remains standard—56 inches. The wheelbase has been lengthened, however, and now measures 132 inches instead of 130 inches. No change has been made in tire or rim equipment, all four wheels being shod with 36 x 4½-inch tires carried on Continental demountable rims.

In external appearance, there can be no doubt that the car has been materially improved, which fact is made plain by the accompanying illustration. Instead of the straight fenders that have been used in the past, domed fenders of the type that steadily is growing in popularity, are used, and they have been so designed that they fit the wheels snugly. Running boards are absolutely clear and even windshield struts have been eliminated, thus giving a seldom-equaled appearance of "cleanness." The windshield, by the way, is rigidly built in place and, as an indication of its strength, despite the elimination of stay rods, it is pointed out that it may be used as a convenient handle to assist passengers in entering or leaving the front seats. Another feature that bids fair to increase in popularity is that the usual side lamps have been eliminated and in their place there are double head lamps with 24-candlepower bulbs for touring and smaller ones for town service. Spare tires are carried at the rear of the body, as is the 24-gallon gasolene tank, and regular equipment includes a clever luggage carrier mounted integral with the body just aft the engine hood.

Equipment is about the same as has been included in the price heretofore, except that an electric horn, an inspection lamp and a Corbin lock have been added; the remainder is as follows: Mohair top with Collins side curtains and dust envelope; windshield; Warner speedometer, Entz electric lighting and engine starting system; tire carriers; gasolene gauge; license brackets, and the usual complement of tools, spare parts, and so forth. At the option of the purchaser, five wire wheels will be substituted for the wooden wheels at an increase in price of $80; or a casing and tube with tire cover and a four-cylinder Kellogg tire inflator will be added for an extra consideration of $75.

Increasing the Efficiency of Dividers.

In shop work it becomes necessary in some kinds of work to use a pair of dividers on a shaft or the like, working from the lathe center in the end. As such a center usually affords no accurate guide for the point of the dividers, the best thing to do is to provide one of the points with a brass ball, such as are sold for making ball checks. By drilling a hole in the ball and reaming it to about the same taper as the divider point, so that the point will enter and hold without shaking, the tool can be conveniently and accurately used from a lathe center of almost any size, as long as the tapered sides of the center are smooth and true.

Value of Proper Size Screwdrivers.

It is entirely possible to grind or file down a big screwdriver to fit a small screw, and it is a thing that often is done. But nevertheless it is a very slipshod way of doing things, and those who do it are sure to discover that fact when it comes to using the tool for a screw of the size it was designed to handle. It does not require many sizes of screwdrivers to fit all the screws on a car, and the cost even of a good screwdriver is by no means a serious matter. So there is no good excuse for not having in the tool kit a screwdriver suitable for each screw, without the necessity for doing any "stretching" of the tools.

Ammeters that Serve as Tell-Tales.

Where electric lighting and engine starting systems are equipped with ammeters, it should be remembered that the meter serves not only as an indication that the generator is charging the battery or that the lamps are burning, but it makes plain as well just how many lamps are lighted. Thus, for instance, if two head lamps draw five amperes, one lamp will draw only 2½ amperes, and though it may be difficult to judge whether one or both lamps are lighted from the amount of radiance, the meter serves as an infallible tell-tale.

To Render Easier Cleaning of Hands.

To those who object to the old method of thoroughly greasing their hands in order to make subsequent cleaning easy after an overhauling job, for instance, it is recommended that a solution composed of four parts of alcohol, three part of glycerine and three parts of water be used instead. This should be well rubbed in and the hands permitted to dry before work is commenced.

AVOIDING SELLING PROSPECT "SPECIAL STUFF"

Reilly Advises a New Dealer Not to Be Anxious to Book Orders That Differ From Stock and Regular Equipment—Says Practice Entails Undesirable Delay—Favors Stock Sale and a Quick Delivery.

Reilly had eaten a very late Labor Day breakfast and, like all good men who labor for a living, was taking a day off, and as a starter on this day of rest had found a sunny spot on the front porch where the morning sun was just warm enough to take the tang out of the September air; the coat sweater he wore when he emerged from the house had been discarded, and with his feet on the rail, his sole occupation was watching the smoke clouds which a bare stir of the air wafted unbroken from his cigar.

He was intently engaged in seeing how high he could persuade the thin pillar of blue to rise vertically from the end of the cigar before an atmospheric movement carried it out of the perpendicular, when his business was interrupted by the appearance of a car which rolled leisurely down the street; in it were two men and two women, and as Reilly recognized the driver as Craig, a fellow dealer from a town some 70 miles away, Craig spotted Reilly and the salutations were simultaneous.

HIS BUSINESS WAS INTERRUPTED BY A CAR WHICH ROLLED DOWN THE STREET

"Hello, loafer!" shouted Craig.

Dealer and Prospect on Holiday Trip.

"The same—and many of them," returned Reilly, as he went to the curb.

Craig introduced the remainder of the passengers as his wife and Mr. and Mrs. Trever, and explained that they had made a sunrise start and were going to a little nearby lake for a shore dinner.

"Get out and stretch your legs; you've got lots of time—it's only about an hour to the lake," suggested Reilly.

They debated, the women made and changed their minds several times, which they had a perfect right to do, and the compromise finally effected resulted in Craig climbing out and joining Reilly on the front porch while Trever took the wheel, the two women got into the tonneau and this majority of the party set out to ramble around and see the town for half an hour.

"Who's Trever? I don't seem to be able to place him," puzzled Reilly, who had an idea he ought to know everybody within a radius of a hundred miles or so.

"He's an insurance man; he——"

"That's why I don't know him; I dodge 'em," interrupted Reilly.

"He's one of my prospects," continued Craig. "Or, rather, he's going to be an owner; I had a son-of-a-gun of a time getting him signed up, but I did it. But I had to fight the factory to get the order accepted; they don't seem to be anxious to sell a man anything but a regular stock model—color, equipment and everything else."

Landing Orders by Changing Details.

"Do you turn in many special orders?"

"Quite a few," replied Craig. "If a man doesn't like the stock model and I can sell him by giving him a different color or something different in equipment, I do it every time. I think it's good business, don't you?"

"Well," and Reilly hesitated a moment in thought, "I don't believe I do; I don't believe very much in special orders.

"From the factory point of view, it isn't good; it makes overhead and increases the manufacturing expense," explained Reilly. "Production has been concentrated on making a stock model, and every deviation from the prearranged plan means an added expense. Generally this falls on the factory and not on the dealer—that is, provided the special work isn't very much."

"Is that so?"

"Yes, and I don't believe it's very good for the dealer's business?" continued Reilly. "If you can get a man to take a stock model you can make a quicker delivery, as a general rule, and it doesn't give the public an idea that it can get any change it wants made when it buys a car from you."

"But supposing they insist upon having special stuff?"

"Lots of prospects have an idea they want special stuff," asserted Reilly, "but it's nothing but an idea, generally.

Emphasize Advantage of Stock Model.

"You ought to frown on such stuff and explain to the prospect the advantages of taking a regular car. Also, if you take an order for a special car, even if it's nothing more than a different colored upholstery, you are not going to be able to make as quick a delivery as you could otherwise."

"Why not?"

"Well, the principal reason is that your order has to come all the way through the factory and you have to wait until that particular body can be finished, whereas if you take a stock model you may be able to get one within a very short time. In fact, you may have a stock model on your floor.

"A dealer's business is to sell to the pub-

Digitized by Google

lic the goods he has, not to sell them something he hasn't got and therefore must get after the order is taken. I used to have some trouble that way, but I finally made up my mind that I would put every ounce of ability I had into selling the man what I wanted him to take and not let him be the better salesman and persuade me to sell him something I didn't want to let him have. It can be done, as you will learn if you make up your mind."

"It doesn't seem a bad plan," commented Craig. "Of course, you know I haven't been in this business as long as you have; its only about a year now."

Extra Car in Salesroom Good Plan.

"You'll find it not a bad plan, too, Craig, to keep an extra car in the salesroom; of course, it ties up your money, but if you can afford it you will find that very often it will swing a sale. If a man wants a car and you have one, it is good business to sell him the one you have, and when a man gets to the point where he really wants a car, the sooner he can get it the better for you; therefore, the special order isn't such a good thing as it may seem at first sight.

"My salesman put over a good sale a few weeks ago in which this same question was involved. He was trying to sell a touring car to a family that lives next door to a family that has a touring car. The man who has the first touring car had had it quite a while and the service it had given was one of the salesman's good arguments. If you are familiar with our line you know that some of our present line of touring cars are black and some a dark blue. Well, the first owner's car was blue and the prospect and his wife insisted that they wanted a blue one, too.

Changing Desire for Blue to Black.

"It so happened that the series was running out and the new cars wouldn't be along for several weeks, and there is quite a lot of good touring weather left yet; in fact, autumn is one of the best touring seasons. Also, and what is more to the point, we had a black touring car in the salesroom but had no blue one and couldn't get one very soon.

"The salesman looked the ground over, detected a trace of social rivalry between the two families and decided to make a clever play to the woman. He said he noticed they had painted their house the same color as the first owner's house, and that since they seemed to like the same things the first owner did, it would be a very nice thing for them to have the same colored car as their neighbor. Had they fallen in with him, we would have been stuck with that special order, but his estimate of the woman was correct.

"As soon as the matter was presented in that light, blue began to lose its charm for her; it wasn't nearly as pretty as she thought it was. She began to hedge on the blue proposition, and the salesman became more enthusiastic about their having a car just like their neighbor's. The more he enthused the less she wanted blue, and she finally came out flat-footed and declared she wouldn't have blue. Having gotten that far, the salesman suggested black and said that personally he preferred a black car.

Sold Black Car Because he Had it.

"He also told them he could give them a black car the same afternoon if they liked that color, and since it was a nice day he didn't have much trouble persuading them as to the joy of taking advantage of the

"THE SPECIAL ORDER ISN'T SUCH A GOOD THING AS IT SEEMS," SAID REILLY

fine weather. He delivered the car that afternoon and got the money."

"That's good work."

"The good work part lies in the fact that he sold them the car we had and not the car they wanted," added Reilly. "Lot's of people bob up with an idea they want something different from what we have to give them.

Prospect's "Special" Desire a Notion.

"If we had things the way they want them, most of them would want them the way we have them now; a great deal of it is just notion. But if you can find out the real reason why a man thinks he wants something different from stock, you are in a position to show him why he will be just as well satisfied with what you have to offer. And after he gets the car he never knows the difference, provided you take care of him and see that he gets good service.

"I had one prospect who insisted that he had to have the tool box built into the car somewhere so it wouldn't show. He declared he had to have a clear running board. Our tool box is on the running board, and I must admit to you that a clear running board is a mighty pretty thing; but despite that fact, it is a knotty little engineering problem to dispose of to good advantage, and we haven't been able to find a satisfactory solution.

"If that prospect had had his way, I would have had the tool box built into some darned place which the experience of our engineers has shown to be not so all-around desirable as the running board, and in the end the owner probably wouldn't have been satisfied. Not only that, but it would have taken some time to get the order through, and all that time the man would have been without his car. I like to sell and deliver as quick as I can. I had some session with him, and finally I asked him if he thought the S—— and the T—— cars looked any better than ours, and I asked him why.

What Craig Did with "Special Order."

"He said they certainly did, because they had a clear running board. Then I showed him their latest catalogs, with fine, big tool boxes on the running boards."

"What did he say then?"

"He said, 'Oh, h——! Bring out your contract.'"

Just then Trever buzzed the horn in front of the house and Craig left. Later in the day they passed again on the return trip. Craig stopped again, ostensibly to ask Reilly something, but what he said in the three minutes he spent on the Reilly premises was, "S-s-s-s-sh-h! I sold him the demonstrator and have canned the special order."

Tag Colors Offended Esthetic Taste.

When Mrs. Thomas Settle, of Asheville, N. C., wife of the Republican State leader, found that the maroon and white colors of the new State license tags did not harmonize as she thought they should with her car's black body, she adopted what she considered a perfectly legitimate course and had the maroon letters made white, leaving the background white; when a policeman halted her she protested that the specified colors were totally out of harmony with the body of her car, but the officer told her she would have to explain her ideas of harmony to the judge.

May Extradite Former Chicago Supplyman.

Application has been made to the Federal government for the extradition from England of Albert V. Webb, who, until May 31, 1913, was in charge of the American Auto Supply Co., of Chicago; it is alleged that May 31 Webb decamped with $3,600 of the company's funds.

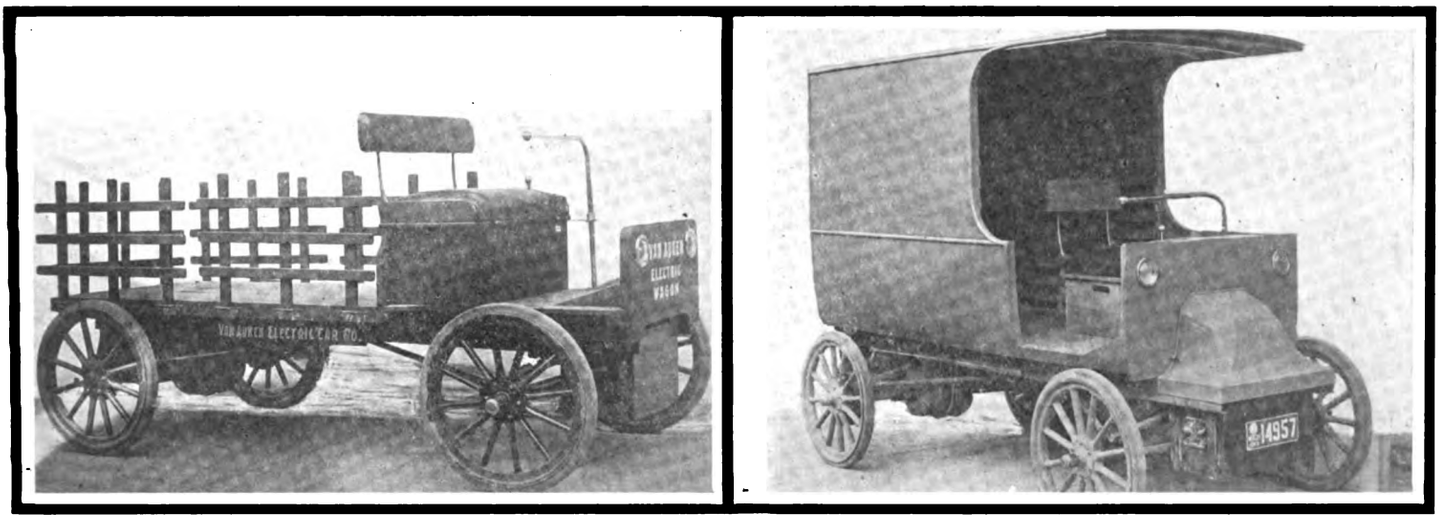
$1,000 ELECTRIC WAGON DEVELOPED BY VAN AUKEN

Extreme Simplicity Makes Machine Almost Foolproof—Batttery Divided and Hung in Unusual Locations—Shaft Drive.

There is and there always will be a demand for automobiles, of both commercial and pleasure types, that are of a better quality for the price, or of lower price for the quality, or both, than others on the market, and it goes without saying that such demand furnishes the inspiration for the remarkable development that has taken place in the cars that sell for moderate and low prices. Among the more recent evidences of the quickening effect of a lively prospective market is the organization, which took place some three months ago, of the Van Auken Electric Car Co., of Connersville, Ind., with Charles M. Van Auken, who has conducted no little special work for the Ford company, as its moving spirit and president; Guilford C. Babcock as vice-president and treasurer and Clarence C. Millard, formerly with the Connersville Carriage Co., as secretary. Van Auken has designed a light electric delivery wagon that is priced at $1,000—a figure difficult to place on a well-built electric—and it embodies several features that go a long way toward making the car a good "buy."

The carrying capacity of the new Van Auken light wagon is 750 pounds and the weight of the vehicle itself is 1,625 pounds; the speed is held down to an economical maximum of 12 miles an hour, and it is stated that under normal running conditions the distance that can be covered on a single charge of the battery is from 40 to 50 miles. The battery is a 16-cell Exide Hycap, carried in two trays of 8 cells each, and the method of carrying the battery is one of the peculiarities of the machine. Departing from conventional practice, the trays are suspended one at each end of the car—half the battery in front of the front axle and half of it back of the rear axle. The two sections are exactly alike and interchangeable, and the terminals are so arranged that a mistake in connecting up is impossible. Obviously the whole battery is readily accessible for examination or flushing, and the time required for making an entire change of battery is given as but five minutes. The trays are light enough to be easily handled.

An important advantage of a small electric vehicle is the low cost of current. The Van Auken company states that the cost of charging the battery in the delivery wagon is from 40 to 60 cents, according to local charges for current, which vary greatly. For work under the pressure of unusual volume of business an extra battery can be charging while the car is on the road and a change quickly made when the service battery is discharged, thus keeping the machine running continuously, if necessary.



A strong appeal is made with regard to simplicity. The drive is through propeller shaft with two universal joints and bevel gears to the live rear axle, and an intermediate gearing gives the requisite speed reduction. Including such things as spring eyes, universal joints, steering connections, etc., there are but 32 wearing surfaces in the car, so that with proper design—which it is not difficult to take for granted in this case—the friction losses should be slight and the deterioration through wear at a minimum.

The dimensions of the machine have been kept down to avoid a size out of accord with the work in view. The wheelbase is 80 inches and the tread 51 inches; the wheels, 28 inches in diameter, are shod with 2-inch Firestone solid tires. In the case of the covered model the body has 70 cubic feet of loading space, and it will be noticed that the seat for the driver extends but half-way across the car, making an unusual amount of room for long packages and also providing an easy way for the driver to enter the body.

The length of the car from dash to rear end is 96 inches and from the back of the driver's seat to the rear end, 56 inches. The width of the loading space is 41 inches, and of the driver's seat 21 inches. The height from the floor to the top is 53 inches and from the top of the floor to the ground 30 inches.

The control of the car is exceedingly simple, even for an electric. The steering gear is of the lever type, which is thoroughly satisfactory for a light, moderate-speed machine, and the power control is effected through a controller of the rotary type, so designed that there is no arcing between the contacts. The controller contacts are so laid out that the entire battery is conneced in series with the motor at all speeds, and is of the continuous torque kind, which does away with the disagreeable—if nothing worse—jerking when passing from one speed to another which is so noticeable in many of the old-fashioned commercial vehicle controllers.

In its essentials the open model is exactly like the enclosed type, but the seat is carried clear across the car and the little hood that serves to put a sort of finish on the car with the top is absent. The equipment of the car is sufficient for such a simple machine and includes, in addition to the few tools needed ,a volt meter, an ammeter, an odometer, electric lights and an alectric horn.

PREVENTING DETERIORATION IN IDLE STORAGE CELLS

Expert Lays Down Rules for Proper Treatment—Small Charges at Regular Intervals Essential—Use of Hydrometer.

To those who are familiar with the vagaries of storage batteries, it is an axiom that if they are to be kept in the best of condition they must be used continually, barring which they must at least be charged at regular intervals unless other means are taken to preserve them from the deterioration bred of inactivity. All of which, and more, ably is set forth by the Willard Storage Battery Co., of Cleveland, O., in calling attention to the care that is necessary in "laying up" batteries during the winter months, or any other time, when they are not in use.

The first requisite, according to the Willard company than which few companies have had greater experience, is a hydrometer; it is an inexpensive instrument that may be purchased from any dealer in battery supplies or from almost any druggist If it is purchased from a druggist, however, care must be taken to specify the purpose for which it is to be used.

The second consideration pertains to the storing of the car, assuming of course, that it is equipped with a complete electric lighting system, including a dynamo. The owner should arrange so that the engine can be run for a couple of hours at least every two weeks. Contrary to expectation, it is not necessary to run the engine for a long time, for the good and sufficient reason that, as no current is drawn from the battery, little will be required to bring it up to proper condition. However, the engine should be run until the solution in the battery tests out at 1.280 degrees specific gravity, according to the hydrometer reading. If this is done regularly, about once every two weeks, it will be necessary to run the engine only about an hour each time. Where a hydrometer is not obtainable, it is advisable to run the engine from two to three hours as a measure of precaution. In either case the engine should be run at a speed corresponding to a car speed of approximately 20 miles an hour.

In cases where it is impossible to run the engine, or where the car is equipped with only the battery and has no dynamo and direct current is available, it is a comparatively simple matter to give the battery a "soaking" charge once every two weeks by merely attaching it to the electric light mains through a suitable bank of lamps, of course, the number of lamps depending upon the size and capacity of the battery. Where only alternating current is available, a small rectifier such as may be purchased in the open market—there are several brands of them—is all that is required. A charge over night, or for about 12 hours, will be sufficient to maintain the battery in a healthy condition.

Whenever a battery is to be charged, the solution always should be examined first to make sure that it completely covers the plates. If it has receded slightly, due to evaporation, only distilled water should be added, bringing the solution up to normal level. Determination of the level of the solution may be made by removing the vent plugs and inspecting the plates.

In cases where none of these methods are available, the battery should be removed from the car and stored with a competent battery man for care, or should be left in the hands of a garage man who is versed in the proper care of batteries. Stipulation should be made, however, that the battery must be charged regularly every two weeks, if it is to be found in good condition when wanted for service.

Such methods, of course, are the simplest and, if adhered to as outlined by the Willard company, should result in the battery coming out of its long period of inactivity not harmed but actually bettered for the rest. Care must be taken, however, to store batteries in a dry place, preferably where the temperature does not fall below 40 degrees Fahr.

When a Car Is Not a Bath House.

An automobile is not a bath house. Any one ought to know that, but it took the police of Rockaway Beach, which is on Long Island, to make it plain. Residents of that more or less popular seaside summer resort complained to the police that motorists were in the habit of driving their cars near to the beach at the ends of residential streets, where they retired behind side curtains and emerged in bathing suits. So a squad of officers was sent to warn those who might attempt the proceeding, and a good many wet and dry motorists went without their expected dips.

Desert Annual Show for State Fair.

Instead of holding an annual automobile show each spring, the Dallas (Tex.) Automobile Dealers' Association plans to make its display at the Texas State Fair, which it held at Dallas each fall, and for that purpose has erected an Automobile Building containing 41,600 square feet of floor space; the building has been accepted by the State Fair directors. It will afford accommodation for 225 cars. It cost $12,000, and $2,500 will be spent in decorating it appropriately.

UNWISE POLICY FOR SMALL DEALER TO STOCK HEAVILY

Money Turned Over Quickly and Frequently Yields Greater Return—Illustration of How One Sum May Yield Best Profit.

That the small dealer should avoid tying up too much capital in a large stock of one article is realized by many tradesmen, but there are those who will permit a suave and unscrupulous salesman to load them with an unreasonably large order; many small businesses come to grief because of this failing when the goods do not move quickly.

How the unexpected skid occurs on the business roadway is made plain by a wholesaler of small articles, who said: "More small business ventures come to grief because their owners overstock on merchandise that does not sell quickly than for any other reason. Let me show why small merchants, as well as large, should buy often and in small lots. Take a slow-selling article that wholesales, for example, at $9 a dozen, or 75 cents each. Suppose that buying this article singly means that it costs 78 cents. The 36 cents saved on the dozen purchase looks fine at the time of buying, and often swings a sale. Suppose, however, that it takes six months to sell the 12 articles at a profit of 25 per cent. This means that the $9 spent earns $3.25 in six months. Suppose, on the other hand, that one article had been bought at 78 cents, had been sold at the same profit, and the remaining $8.25 had been put into more active merchandise. It is not unusual in this business to turn stock over four times in six months on certain goods. This $8.22 in stock, turned four times with a 25 per cent. profit, would mean that the merchant would take in about $42 on the dozen purchase."

Dream of Fatal Accident Came True.

After dreaming one night last week that he had been killed in an automobile accident, George Knitteberger, a chauffeur, of New Rochelle, N. Y., sustained fatal injuries the following morning, and died in a hospital to which he was removed. When Knitteberger appeared at the garage where he was employed he told of his dream of the night before and then startetd out with three other men to test a chassis. He was driving on the street car tracks and, seeing a car approaching in the opposite direction, attempted to turn out, but the steering gear stuck and the chassis hit the street car head on. Frank Phelico, one of Knitteberger's companions on the ride, also was killed.

HOW CAN THE MANUFACTURER HELP THE DEALER?

Prompt Attention to Complaints of Man Who Retails Cars Advocated by Metropolitan Distributer—Tells of a Dealer Whose Complaint of Defective Clutches Brought Answer, "It Can't Be So."

"He gives twice who gives quickly," was said by someone in some such form or other, and while the man who said it probably never dreamed of such a thing as the automobile industry, the proverb is applicable to more than one phase of the business; service that is prompt is admittedly a strong bond between the dealer and the car owner, but there is yet another relation which can stand fully as much cementing as that of the dealer to the owner, and it is the relation of the manufacturer to the dealer.

Few Dealers Who Have Not Complained.

The exact number of dealers in the United States is more or less a matter of estimate, but of the thousands there probably are few who have not at some time —perhaps now—been emphatic in their expression of opinion regarding the manufacturer they represented, and from the dealer's standpoint they were assuredly right in the complaint they had to make; all of which affords opportunity for the question, "What can the manufacturer do to make more congenial and firm the relation which exists between the man who builds the cars and the man who sells them at retail?"

Although many dealers, often in moments of confidence, talk over "the factory," framing an answer to the question is not easy; when a Motor World man asked it of C. H. Larsen, who is the head of the Cutting-Larsen Co., Oldsmobile distributer in New York City, Larsen said that he could say little that emanated from his own personal experience with the manufacturer whom he represents, for, said Larsen, "I have represented them 12 years, seven of which I have been a dealer in New York, and I never have had any cause for complaint.

"It is true, though," he added, "that so far as conditions generally are concerned, I do hear a great deal about what goes on in the trade and about the relations of other dealers and their manufacturers," and when what Larsen said is summed up it is best expressed in "prompt service by the manufacturer to the dealer, promptness in getting behind him and helping him out when things go wrong with the cars and promptness in admitting that perhaps the dealer may be right in his complaint and that the complaint may be worthy of an immediate investigation and remedy."

Some manufacturers—not all of them, by any means—assume the contrary attitude toward their dealers, and it is not unlikely that in many instances the attitude is unintentional; possibly the manufacturer does not realize the harm that comes from his conduct of affairs and the good that might come from a different spirit in the operation of the company.

"I can cite a specific instance," said Larsen. "I know one dealer who went to his manufacturer and told him that there was trouble with the clutches in nearly half the cars in the last consignment he had received. This dealer is located here in New York City, and I think you will concede that a dealer who is distributing in such a populous territory is entitled to as much consideration as anyone else. This dealer insisted that there was something wrong with the clutches.

Manufacturer Said It Couldn't Be So.

"The manufacturer said he didn't see how it could be so. 'Look here! See the satisfaction we're getting!' he said, and proceeded to show letters from men in El Paso, Tex., or Rockford, Ill., in which they said the cars were fine, the best they had ever handled. The letters, in all likelihood, were written by some man who had taken the car out of the freight house and driven it home and then sat down to write about what a fine piece of work it was. He didn't wait six weeks, or even two weeks, to see how it ran, but handed out the compliment right away before he had a chance to know for certain whether the car would travel five miles without a breakdown.

"When the New York dealer still persisted that he had had all the trouble he said he had, the manufacturer called in his engineer and asked him what he thought about the dealer's complaints. The engineer said it couldn't be so, couldn't possibly have happened any way he could figure it out. The dealer didn't get any satisfaction, and went back to his place of business a very disgruntled man.

"There he was; the clutches were going wrong, he could not deny it; he was in duty bound to stand back of the car, so far as the owner was concerned, and still the manufacturer insisted thaere couldn't be anything wrong and that the cars were giving great satisfaction. The more the dealer thought of it the more unkind became his feelings toward the manufacturer, and now —I don't say what caused his move—he has taken on another car.

Investigation When "Kicks" Piled Up.

"But it wasn't long before other dealers began to complain about the clutches. When the kicks began to stack up on the manufacturer's desk he could not help but be convinced that perhaps the New York dealer was right in his complaints. An investigation was started, the engineer was forced to admit that, despite the fact that it 'couldn't be so,' it was so and engineers were hurried out onto the road to right that trouble. All of this was very fine when things finally began to move, but in the meantime this particular dealer had been sailing very rough seas; all because the manufacturer was unwilling to act promptly and to investigate the dealer's complaint.

"On the other hand, there is another manufacturer who incorporated in one series of cars a mechanical wrinkle that had been copied from the rear axles of certain foreign cars. It was supposed that the new feature would work out well and give great satisfaction, but the cars hadn't been out long before one of the dealers said the axles wouldn't stand up to their expectations. Before the trouble had time to spread and before the dealer had time to become disgusted with the treatment accorded him, an investigation was set in motion immediately. The engineers found that the dealer was right and a remedy was forthcoming. The axles were replaced in every instance, and the company stood back of the car to the last axle. Not a dealer had a chance to go back from the factory and accumulate a grouch.

In the same category and more or less related to it is the handling of the parts replacement problem. Manufacturers' guarantees cover the replacement of defective parts but it not infrequently happens that a dealer is encountered who laments the length of time that is required in the adjudication of parts claims, during which time the dealer must bear the brunt of the owner's dissatisfaction.

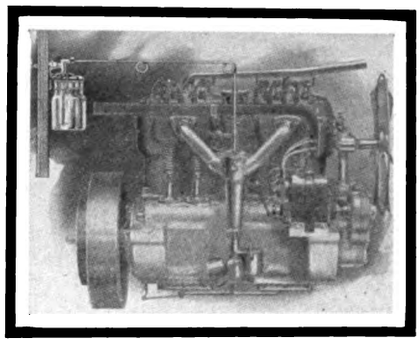
INAUGURATES SERVICE FOR OWNERS OF KLAXON HORNS

Road Men Sent Out by Lovell-McConnell to Test and Adjust Car Owners' Signaling Devices — Experiment is Satisfactory.

Inaugurating what is more or less of an innovation in the matter of service to the user of an accessory in that it is free and unrequested, the Lovell-McConnell Mfg. Co., of Newark, N. J., maker of Klaxon horns, has developed and is operating a department for the inspection and adjustment of Klaxon horns that are in use by motorists. While the work is as yet hardly beyond the experimental stage, it is stated that results have been excellent and well in excess of the company's expectations.

The service plan consists, thus far, in the employment of two young men of college education and mechanical training who are sent out on the road; a feature of the service is that the road men are of a class which is above a "tip" and are capable of unquestionable deportment. The two youths have been working in the metropolitan district, and their procedure is to enter, for instance, a village, secure a list of the motorists who have Klaxon horns, visit the car owner, explain their mission and adjust and lubricate the horn or remedy any difficulty which the owner may have experienced. Being specialists in this work, they are able to give greater satisfaction than is obtainable from the average garageman or supplyman.



Having completed their call, they present to the car owner a card with two or three questions which he is requested to answer in a "yes" or "no" manner and mail to the factory. Thus far, however, owners have exceeded the mere affirmatives in expressing their gratification at the innovation.

For Clearing Out Carbon Deposits.

To be able to clean the carbon out of the motor in a few minutes at most any old time, with no more trouble than is involved in turning a little valve and letting the motor run, is a convenience that most anyone who has had any experience in the running of a car can appreciate, and it is a convenience that is made possible by the use of a device styled the "Ad-a-man-tor," made by the Hendricks Ad-a-man-tor Co., of Grand Rapids, Mich.

Both in principle and in construction the device is simplicity itself, consisting of a small glass reservoir clamped to the dashboard of the car, under the hood, and piped to the intake manifold. Communication between the reservoir and the manifold can be controlled by a valve on the dashboard. There are three ways in which the "ad-a-man-tor" can be used. By putting kerosene in the container and allowing a little to be drawn into the hot cylinders just before the motor is stopped at night, the oil will loosen the carbon during the night, and when the motor is started in the morning the oil, carbon and all will be blown out with the exhaust. By filling the container with high-test gasolene, or a mixture of gasolene and ether, the device can be used as an efficient primer; and for those who prefer to make use of steam for loosening carbon deposits water can be employed and drawn in with the charges and ejected with the exhaust—and the carbon.

A special clamp makes it an easy matter to attach and detach different containers, so that after the morning or evening cleaning operation has been completed the kerosene or water container can be removed and the jar of priming liquid snapped into place, the whole operation requiring only a few seconds.

AD-A-MAN-TOR CARBON REMOVER

"Boost Indiana" Tourists Get Laudation.

Just to "top off" the affair, so to speak, and fittingly bring to a close the most successful tour which the Indianapolis Automobile Dealers' Association has yet staged, an informal dinner and reception was tendered those who took part in the recent cross-continental tour at the Claypool Hotel, which is in Indianapolis, on Friday evening last, August 22nd; the tourists were the guests of the Indianapolis Board of Trade, the Indianapolis Chamber of Commerce, the Hoosier Motor Club and the Indianapolis Automobile Trade Association, which bodies combined to welcome their homecoming. The gathering was addressed by Governor Ralston, who praised the work done by the manufacturers' association in gaining recognition for the Hoosier State, and Senator William White thanked the tourists on behalf of the smaller cities of the State. Stereopticon views and moving pictures of the reception of the tourists at places along the route were thrown upon the screen, and W. S. Gilbreath, who was one of the tourists, related anecdotes in connection with each picture.

Price List Makes Big Book.

Even in this day of complete and convenient catalogs, the big price list that has been issued by the Union Hardware & Metal Co., of Los Angeles, Cal., which just has added automobile accessories, is one that deserves a good deal more than a casual glance. Not that it is an example of printers' art, but because it is of such wide scope, is so well arranged and is so thoroughly indexed that for those who want a catalog to use as a catalog it is a fine piece of work. For rapid reference, the index is letter-indexed in the margin. The paper is thin and of good quality, little space is wasted in margins, the corners are round and the whole is bound in a patent binder which permits the addition of extra leaves from time to time. The catalog covers not only automobile accessories and supplies, but a general line of hardware and carriage goods. Altogether the list contains, 972 pages, 9¾ inches wide.

Firestone's Little Brown Catalog.

Despite the fact that a pneumatic tire does not suggest much in the way of catalog possibilities, the Firestone Tire & Rubber Co., of Akron, Ohio, has made a decidedly artistic job of its latest price list —to say nothing of the primary reason for the existence of the little brown book with the embossed cover. Various types of pneumatics are clearly and well illustrated, and they are described concisely and effectively. It goes without saying that the Firestone quick detachable, demountable rims come in for a fair share of attention, as well do the Firestone non-skid treads.

Propose Open-Air Garage in Grant Park.

Another scheme has been broached as a solution of Chicago's "loop" parking problem, the municipal authorities having turned down the idea of a subway garage and having forbidden cars to be parked in the Grant Park section of Michigan avenue. The Electric Vehicle Manufacturers' Association has suggested to the South Park Commission that an open-air garage be opened in Grant Park east of the Illinois Central tracks.

Claim Policeman is Garage Owner, too.

Running a garage and being a policeman at the same time is, it seems, not permissable in Chicago, where Sergeant John B. Lacey has been charged with being the owner and operator of the Chicago Auto Livery Co., of 35th street and Grand boulevard; the business is in the name of one La Mont, but current report has it that Lacey is the real owner.

KNOX MODELS CONTINUED PRACTICALLY UNCHANGED

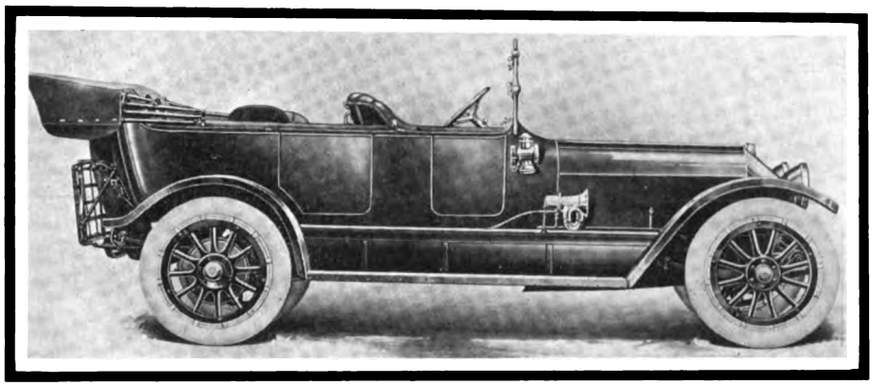
Berdon Electric Lighting and Starting System on All Machines—Few Alterations in Mechanical Features.

Adhering tenaciously—and with good reason—not only to the general principles that have been features of its cars for several years, but to the very details of the designs that marked the chassis of the preceding season, the Knox Automobile Co., of Springfield, Mass., is building its cars without mechanical changes, very sensibly declining to alter designs that they know to be good until there appears a well-defined possibility of making changes for the better. But while no changes have been made, there has been at least one important addition, for the equipment of each of the four chassis models has been finished off by the installation of the Berdon lighting and starting system. This outfit, one of the cardinal features of which is a dynamo that has compound wound permanent magnets and is self-regulating through its inherent electrical characteristics, is peculiarly adapted to the Knox construction, as the unit is conveniently mounted on one of the engine legs and drives through a shaft and a pinion meshing with a spur gear on the flywheel.

While mechanical changes are conspicuous by their absence, with the exception noted, the body designs have been touched up here and there and the "little six," model 46, with a 46-horsepower motor, has been fitted with a stream-line body of the so-called "Prince Henry" type, in which the stream-line effect is carried from the radiator clear back to the rear panel of the body. An unusual item of regular equipment is a locking device in the form of a substantial bar which can be padlocked to the floor with one end hooked to the clutch pedal and the other to the gearshifting lever, effectually preventing the use of the machine.

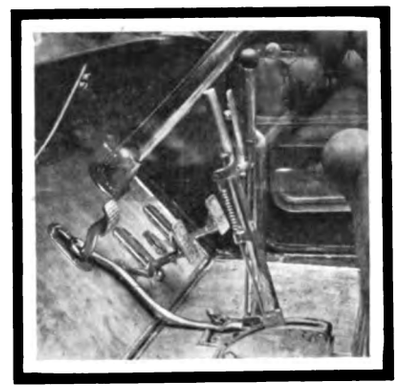
As before, the line of chassis shown consists of four machines—two "fours" and two "sixes." The "fours" are alike, except that the model 44 has a wheelbase of 122 inches, while model 45 is 4 inches longer. In each case the motor is of 40 horsepower. Of the "sixes," model 46 has a 46-horsepower motor and a wheelbase of 134 inches, while model 66, though standing on a wheelbase of the same length, has a motor of 60 horsepower. Upon each chassis is mounted a variety of roadster, touring and closed bodies.

Apart from such dimensions as are compatible with variations in horsepower and in the number of cylinders, the Knox chasses are very much alike, the same ideas being carried out in all of them. Chief among the things to which the Knox people "point with pride"—and justifiable pride at that—is the motor, with its overhead valves and detachable cylinder heads in which the valves are seated without the intervention of cages. In the four-cylinder models the cylinders are cast individually, while in the "sixes" they are in pairs. The "snap and ginger" of the motors is attributed largely to the directness of the gas flow through the head valves and to the symmetrical combustion chamber form that they make possible.



The cylinder dimensions of the two "fours" are, of course, the same; the bore is 5 inches and the stroke 5½ inches. The 46-horsepower "little six" has a bore of 4⅜ inches and a stroke of 5½ inches, while the 60-horsepower "big six" duplicates the dimensions of the "four" and has cylinders of 5 x 5½ inches bore and stroke, respectively. Incidentally, the ratings given the motors are "formula ratings," which take into account only the bore, so that the actual developed horsepower is considerably in excess of the catalog figures.

Throughout the Knox line the unit power plant idea is employed. The details, however, are peculiar to this machine. The gearcase, which is of very modest dimensions considering the fact that it contains gears providing three speeds, is connected to the crankcase by means of a pair of hollow aluminum alloy arms which extend on either side of, though they do not enclose, the flywheel. These connecting arms carry the two lugs which form the rear supports for the unit power plant, the third point—the three-point principle is employed—is at the front of the crankcase, of course.



Direct pressure feed of oil to all bearings is the prominent feature of the lubrication system, which is of the pump type. Oil is forced by a plunger pump to the main bearings, through holes drilled in the crankshaft to the crankpins, and thence through conduits running along the connecting rods to the wristpins. The excess oil forced out of the bearings is sprayed and thrown upon the cylinder walls. Direct feeds are provided for the camshaft bearings. The pressure can be varied by means of a by-pass adjustable from the dash, and a gauge on the cowl-board indicates the pressure at all times. In addition to being effective in keeping a film of oil on all bearing surfaces, this system is said to be extremely economical in the use of lubricant, a gallon serving for from 600 to 800 miles, according to the size of the motor.

In all models the selective gear shifting lever is placed in the center, though the option of right or left steer is given in all chassis except model 44, the smallest of the line, which has right-hand steer. Drive from the motor to the gearset is through the Knox three-plate clutch with cork inserts. The gearset is notable chiefly for its compact design, which permits the use of extremely short and stiff shafts, and because it is put together without the use of a single nut, bolt or pin inside the gearcase. The gearset has been used, with few changes, for five seasons.

The rear axle, which is driven by means of the customary propeller shaft and bevel gears, is of the full-floating type. The live shafts are forged with notched driving disks integral. In the four-cylinder models the axle casing is of pressed steel with tubular

KNOX "LITTLE SIX," MOUNTING "PRINCE HENRY" STREAMLINE BODY

KNOX LOCKING DEVICE

Digitized by Google

steel ends welded to it by the oxyacetylene process, while in the "sixes" the axle is made up with a cast steel central housing to which tubular steel arms are bolted by means of flanges inside the central housing. Truss-rods are fitted under both rear axles. All the axle and wheel bearings are imported ball bearings. Differential and bevel drive are mounted as a unit on a cast steel frame and can be removed without being taken apart. The front axle is the usual I-beam steel forging, and the steering knuckles are fitted with roller bearings.

The conventional arrangement is employed in the braking system; that is to say, the service brake is operated by a pedal and the emergency brake by a lever, both being on the rear wheels. A single drum on each wheel serves for the frictional surface for the expanding rings which constitute the emergency brake and the contracting bands used for service applications. Adjustment of either brake is easily and quickly effected.

Springs are elliptics in front and three-quarter elliptics in the rear; frames are of cold pressed steel, of channel section, and are "kicked up" in the rear and narrowed in front. Wheels are of wood. The tires on the smaller "four" are 36 x 4½ and on the larger four 37 x 5. On the "little six" the tires are 38 x 5 and on the "big six" 38 x 5½. On all models demountable rims are standard equipment. In all cases the tread is 56 inches.

Equipment includes, in addition to the lighting and starting system now installed as regular equipment for the first time, top with boot and side curtains, windshield, power pump, shock absorbers, spare demountable rim, tire carriers, horn, tools and the usual small things. The closed models have, in addition, interior lamps and switches, interior mirror and driver's mirror, toilet and card cases, flower vase, ventilators, racks and the usual rails.

Menace that Lies in Oily Waste.

As innocent as old, oily waste may appear to the uninitiated, it nevertheless constitutes a constant menace. Unless it is safely housed in a metal container it may cause a conflagration by spontaneous combusion. The container does not render it less likely to "go up"; it merely lessens the danger of the fire spreading.

To Make Cores for Soft Castings.

Cores for castings of babbit, lead or other soft metals are easily moulded from a mixture of glue and salt stirred together into a thick paste and shaped as desired. After the casting has hardened, the core can be melted out with hot water with no difficulty, leaving the cored parts clean and true.

PULLMAN REVISES PRICES AND ADDS LIGHT "SIX"

Electric Gearshift, Four Speeds and Left Steer Features of Latest Model — Electric Lighting and Starting Standard.

Three models which already have made their mark as Pullman products, together with a new model which is a light six-cylinder car, constitute the latest series of cars turned out by the Pullman Motor Car Co., of York, Pa. Of the three older models two are "fours" and one, the largest, a "six"; the prices of the "fours" have been cut, but a slight increase has been made in the case of the big "six." The two "fours" have motors of 36 horsepower and 44 horsepower, respectively, while the big car is rated at 66 horsepower; the smallest machine has a three-speed gearset and the other two four speeds each.

The latest model, the light "six," which will be called model 6-46, has a motor of 46 horsepower, as the name indicates. A notable feature of the car is the incorporation with the four-speed gearset of the Vulcan electric gearshift, and still another important feature is the Westinghouse electric starting and lighting system, with separate motor for starting and generator for recharging the storage battery. The propeller shaft forms a straight line with the rest of the transmission system when the car is normally loaded, giving the universal joints the lightest possible service. The rear axle is a Timken product, as is also the front axle. The steering wheel is on the left side and the gear-shifting lever in the center.

The wheelbase is long—130 inches—and the tread standard. Wire wheels are regular equipment, and are fitted with 36 x 4 tires. The body is of the touring type, for five passengers, and has Turkish upholstery, wide doors and is up to date in every respect. The finish is blue, with silver-finished radiator. The car is priced at $2,400 with regular equipment, which includes top, Collins curtains, speedometer, electric horn, windshield and other accessories that go to make the modern car complete and ready for the road.

A number of changes have been made in the three models that are continued from the previous series, and most of them are common to all the cars. The backs of the bodies have been given a graceful curve instead of being made straight; the cowl board, upon which the instruments are mounted, has been lowered and the windshield, which now is of the built-in type, made higher. In the "big six" there is a foot scraper on the running board, a ba[g]rack in the top, a cocoa mat in the tonneau, a new special tool equipment and a powe[r] tire pump. In all models the gasoline tank, under the front seat, can be removed by taking out four screws. A four-gallon emergency reserve tank, inside the main tank, is controlled by a four-way cock which also serves as a gasolene lock. The piston construction has been so improved that it is said to tbe impossible to get an excess of oil above the pistons, the result being smokeless running. The level of the oil in the crankcase is accurately adjustable and there is a sight feed on the dashboard.

The equipment includes such new features as the Collins side curtains, adjustable combination tail light and license carrier, tonneau lamps on the "big six," improved lamps, and so on. While the Vulcan electric gearshift is regularly fitted only to the "light six," it will be applied to any of the other machines at an advance in price of $250. Wire wheels, which are regular equipment on the "light six," cost $50, $60 and $75 extra on the small and large "fours" and the "big six," respectively. In the case of the "big six," an option is given of Brewster green or blue, with black hood and fenders and wheels finished in natural wood. Other models are finished in blue.

Changes have been made in prices all along the line. The smaller "four," the former price of which was $1,675, now sells for $1,575, without electric starting and lighting, or $1,775 with the Westinghouse system. The larger "four" has been reduced from $2,150 to $1,975, while the price of the "big six" has been increased and now is $2,850. The light "six" costs $2,400.

When Use of Pliers Becomes Abuse.

A small pair of cutting pliers is extremely useful in its place; but its business is not cutting stuff that is so heavy that the cutters scarcely can be forced through. Overworking the pliers soon destroys them, and yet this very thing is constantly being done. Cutting pliers should not be used on material that they will not go through with reasonable ease, except in the case of the heavy tools, which will stand all the strength a man can exert on them.

One Good Way to Remove Insulation.

Removing insulation from electrical conductors made up of fine strands of wire is a matter of some difficulty, especially to the inexperienced "hand," if none of the strands are to be severed. It is very easily done, however, if the insulation is set on fire and allowed to burn off to the desired point. The wires will not be injured, and if there is any tendency toward brittleness the heating will remove it and leave the metal soft and pliable.

›RE OUTFIT, LESS PRICE FOR LATEST REO MODELS

:ctric Lighting and Starting Sys- em Installed and $220 Lopped off Cost — No Important Mechanical Changes.

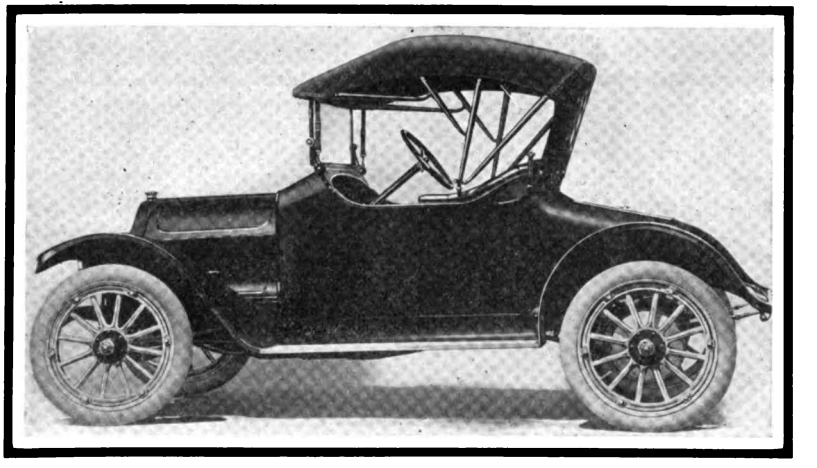
ı bringing out what is styled the "fall es" of the 30-horsepower Reo car, the › Motor Car Co., of Lansing, Mich., has .e two things that are notable and appar- ly incompatible. The car has been im- ter design and quality even than that which it was necessary to pay extra for previously. The windshield now supplied is of the rain vision, ventilating type.

The body has been entirely redesigned and is somewhat lower hung than before and, moreover, is of even better appearance, as might be expected. The touring car has been given a cowl over the dash, and under the edge of the cowl is the instrument board, in which the electric plant instruments, speedometer and so on are set with their dials flush with the polished surface of the wood.

The mechanical changes have been few,

REO FIVE-PASSENGER TOURING CAR, WHICH SELLS FOR $1,175

'ed by the addition of a good deal of pment and a number of detail changes, the price has been reduced $220; the hine now costs $1,175 complete. At the e time the main features of the car re- ı unchanged. Except for minor al- :ions, the power plant, the entire trans- ion system and the other parts remain ıey were.



›nspicuous among the new things that been added to the equipment of the is the electric starting and lighting :m that has been built into the single sis that is used for both touring car roadster. Formerly a lighting system installed, the source of current being a :ry; but the new system includes a gen- ›r—in fact, a complete, self-contained ing and lighting plant. And while in er models it was necessary to pay an . $100 for top with side curtains, wind- d, speedometer, etc., the cars of the lat- eries have these necessities as part of standard outfit, to say nothing of an demountable rim and an electric horn. e searchlights are fitted with a dim- attachment which makes them unob- ›nable for urban driving—and also s to keep the car out of reach of the arm of the law, wherever it interests in such things. The tire carrier is of v pattern and serves also to support ail light and license bracket. All the ment that goes with the car is of bet- the chief among them being in the change-speed gearing, which has been made more smooth-running and quiet than before. The tires still are 34 x 4 inches and the wheelbase remains at 112 inches and the tread is, of course, the standard 56 inches.

Though the motor is rated at 30 horsepower, it is claimed that its four cylinders of 4 inches bore and 4½ inches stroke will work up to a considerably higher power. The cylinders are cast in pairs. The valves are particularly well taken care of in the matter of cooling, the exhaust valves being directly in the path of the incoming water as it is pumped from the radiator. Another valuable feature that is embodied in the latest Reo, as it was in the previous model, is the main bearing adjustment. All three of the crankshaft bearings can be adjusted from the outside, it being unnecessary to go through the usual process of taking down the lower half of the crankcase. Half an hour is said to be sufficient time in which to make the main bearing adjustments.

From the motor power is transmitted through a multiple disk clutch, which has an automatic disengaging device preventing the dragging of the disks. The change-speed gearing provides three forward speeds and is controlled by a central lever with a "cane" handle—a feature that has been worked out to the limit of convenience in the Reo. The handle has a very short swing in four directions, and the manipulation of the gears is simple and easy in the extreme. Both brakes are operated by pedals. As before, the steering wheel is on the left side.

Quiet running is one of the features of the Reo, and the use of steel cables instead of rods has had not a little to do with bringing about this desirable state of affairs. The cables, of course, do not rattle, and are amply strong for braking purposes. The clean appearance of the car and the simplicity of the actual work of controlling it are enhanced not a little by the fact that no emergency brake lever is employed. Both brakes are pedal operated, and the hands have only the steering, motor control and gear-changing to attend to.

While the Reo finish was very considerably improved in the previous models, it has been still further bettered in the present "edition"; and though an attractive exterior does not by any means make a good interior, it is only fitting that one should match the other.

REO ROADSTER, SHOWING LINES OF NEWLY DESIGNED BODY

HERE'S McINTYRE'S IMP; IT'S A REAL CYCLECAR

Has no Axles, no Gears, and the Engine Starts from the Seat — Air-Cooled Motor of 10 Horsepower and Belt Drive.

Almost without intimation of its intention to do so, the W. H. McIntyre Co., of Auburn, Ind., which has been engaged in the manufacture of vehicles of various kinds for well-nigh half a century, has taken up the production of "sure enough" cyclecars and has brought out a machine which it has christened "Imp" and which embodies a number of features that have been well tested in cyclecars of foreign construction.

A glance at the accompanying illustration will show that the car carries two passengers seated tandem, that the drive is through very long belts and that, as is usual, the wheels are of wire. Under the hood, which, incidentally, is almost as much cowl as hood, is a two-cylinder motor, air-cooled, with the cylinders set at 45 degrees, rated at 10 horsepower at 1,500 revolutions per minute. The motor is set close to the open front of the hood with its shaft fore-and-aft and a deflector turns part of the air current on the back of the engine to facilitate cooling.

IMP CYCLECAR, WHICH HAS FRICTION DRIVE AND NO AXLES

Also under the hood is the friction change-speed gear, which is of small size because of the small size and high speed of the engine. The control lever is pivoted to the cowl and is close to the steering wheel. The countershaft of the friction gear carries the two small pulleys for the V-section belts, which are exceedingly long and which constitute one of the features for which claims are made. Long belts are said to form an exceedingly smooth drive, to eliminate danger of overloading the friction disks and to wear well—in fact, the makers state that a single set of belts should give a service of about 10,000 miles. The rear wheel pulleys are 20 inches in diameter and are utilized also as brake drums, V-shaped blocks of hard wood forming the friction shoes.

An unusual form of construction is embodied in the spring suspension. The machine has no axles, properly speaking, but the stubs upon which the wheels turn are carried on the ends of two pairs of transverse springs. The two springs of each pair are placed one above the other and the forgings carrying the stub axles are bolted to the ends. This construction has several arguments in its favor. It is light and simple, and gives extremely easy riding. There is no unsprung weight except that of the wheels. The resilient springs are said to be capable of withstanding shocks that might well spring axles of the rigid type. The frame of the car is underslung from the springs, and though the center of gravity is so low that it is said to be possible to tip the car to an angle of 45 degrees, with passengers on board, without upsetting it, there is a road clearance of eight inches.

The steering gear is the acme of simplicity. The wheel, 14 inches in diameter, tops a shaft which extends, unbroken, to the forward spring; on its end it carries a pulley on which is wound a steel cable, the ends of which are attached to the steering knuckles, which are connected across by the usual drag link. A spring device prevents slackness in the cable. The arrangement is said to be nearly irreversible and to work very well indeed.

The wire wheels, which are made with tangent spokes, are 28 inches in diameter and are fitted with 2½-inch standard clincher tires, front and rear wheels and tires being of the same size. The wheels run on ball bearings—in fact, ball bearings of the radial type are used throughout the car. A good idea is the fitting of a mechanical motor starter, consisting of a cable w... when pulled, acts on the crankshaft ... "turns the motor over"; a clutch ... when the motor starts and a spri... winds the cable after a pull. The s... works from the seat.

The wheelbase of the car is 10... and the tread 36 inhces. The maxi... speed is given as 50 miles an hour, ... is claimed that the machine is capable ... covering from 50 to 70 miles on a gall... gasolene. The tandem seats are deep ... well upholstered, and the edges als... cushioned. In the rear of the body th... is a tool box that is of ample size for ... purpose, and also a space in which a l... luggage may be stored. The machi... weighs 450 pounds and the price is $5... complete with lamps and horn.

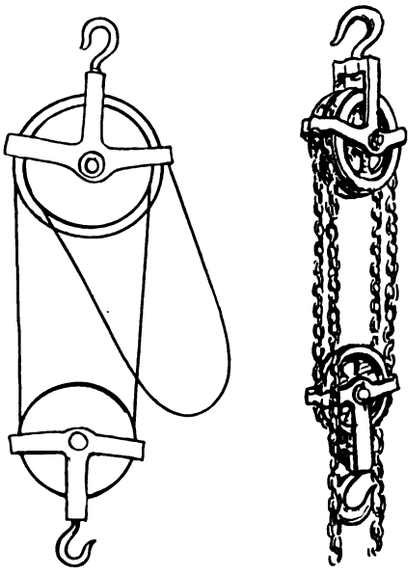
Repairs Six Tubes in 20 Minutes.

A strong appeal is made to the business instinct of the garage proprietor by the ... of steam vulcanizers brought out by the Simplex Steam Vulcanizer Co., of Omaha, Neb. The point made by the manufacturers is that where there is plenty of work to ... done the Simplex vulcanizer will do it quickly because in the No. 6 model, for instance, no less than six tubes can be repaired every 20 minutes, so that a man can be kept busy as long as there is anything to be done. A single tube size ... inches long can be repaired at one setting. Attachments for all sorts of casing repairs as well as retreading, complete the equipment. Other models are made for less extensive requirements, the smallest being No. 1, which is intended particularly for the private owner, and will make small casing repairs and mend tube holes up to 3½ inches. In all models there is a sheet of water between the fire and the work and burning is thus guarded against. Even the smallest outfit has a pressure gauge.

Grease that May Cause Growls.

Transmission gears require lubrication—must have it, in fact—as nearly every one knows; but not every one knows that too much grease is likely to make the gears almost as noisy as too little. It is poor practice to fill transmission cases to the brim in an attempt to silence the gears; the better way is to fill the case about half-way up the gears—unless the manufacturer recommends some other limit.

Nail Clip as Insulation Stripper.



One motorist who does all his own "tinkering" and is quite proud of the fact has evolved an unusual method of stripping the insulation from the ends of wire. Instead of using a knife, which endangers the wire, he uses an old nail clip.

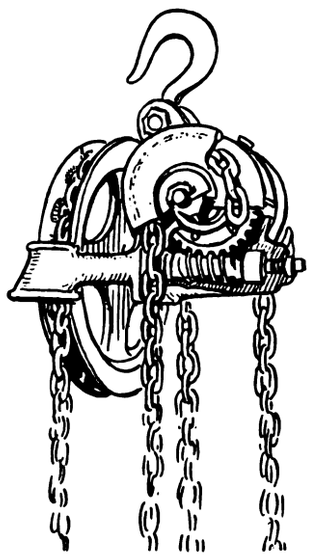
HOISTING BURDENS THAT HOLD DOWN PROFITS

Part That Differential Hoist May Play in Saving Labor in the Garage or Repair Shop Where Heavy Lifting Is Required—Types of Mechanisms Designed to Aid One Man in Doing Work of Many.

If the repair-shop of John Quincy Davis had been differently laid out, or if it had been bigger, or if the character of the general run of work had been something else besides what it was, it is possible that the single portable crane installed to decrease internal resistance to the flow of profits would not have been sufficient to lift all the losses that were susceptible of being hoisted by such means. But it happened that Davis's hoisting work was of an intermittent character, the shop was not so large that the apparatus was likely to be required in two places at once, and there were no jobs, except once in the proverbial blue moon, that the portable crane described in various forms last week in Motor World could not handle in a perfectly satisfactory manner.

DIFFERENTIAL PRINCIPLE AND PRACTICE

Over on the other side of the town, however, Llewellyn Lloyd, a Welshman, whose expression and manner perpetually hovered on the verge of good humor but never got any further, had a larger establishment and one that was very differently laid out. Davis did all his work on the ground floor. Lloyd's ground floor area was somewhat restricted, so he installed his machine tools on the second floor and rigged up an apparatus that was a cross between an elevator and a dumb-waiter for getting heavy stuff from one floor to another. On the ground floor he used a portable crane similar to Davis's for moving stuff from cars to the elevator and back. Upstairs, however, things were pretty closely spaced and, despite the small size of the portable crane, it could not have been moved around without interfering with fixtures and running a good deal of risk getting mixed up with belts and so forth. So Lloyd installed two chain hoists, one running on a trolley over the long bench where motors were deposited for overhauling, having one end close to the little elevator, and the other hoist over the big lathe—the only machine in the shop that took in work too heavy for a man to handle.



FORD PLANETARY REDUCTION

Bench Hoist Cared for Most of Work.

Heavy things were lifted off the elevator by the bench hoist and dropped on any part of the bench or else on a little truck, upon which they were wheeled anywhere in the shop they might be wanted. Anything that did not either stay on the bench until reduced to small units or else go to the big lathe usually was small and easily handled. The exceptions occurred so seldom that the extra time needed to handle them did not count for much in the long run. So Lloyd's two chain hoists covered his shop very efficiently, all things considered.

There had been a time, however, when the men had had to "horse" everything around, and life was just one temporary hoisting rig after another. The worst of it was getting the motors upstairs for overhauling. Lloyd started by chopping a hole in the floor and rigging a chain hoist over it; but, good though the chain hoist is in its proper place, it is far too slow for making frequent lifts from one floor to another, and the miniature elevator with its little electric motor followed; then the chain hoist was rigged over the bench and another, of lighter construction, hung over the lathe.

HARRINGTON SCREW HOIST

Let it not be thought for one moment that Lloyd simply went out and bought a couple of chain hoists—just like that! He looked through the advertising columns of a few technical journals and speedily came to the conclusion that picking out a chain hoist was going to be just about as hard as picking out a wife—a job in which Llewellyn had not been wholly successful. In fact, there was a tradition in the trade that before his marriage Lloyd had been a young fellow of extreme geniality, and that afterwards—but that's something else again and has nothing to do with the hoists. What really counts just now is that Lloyd sent for whole flocks of catalogs and before he sent in his first order knew pretty well how all the leading styles of hoists were constructed and had formed his own opinion as to their respective merits.

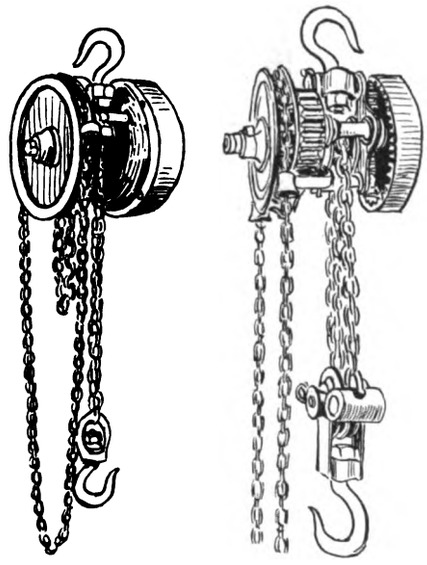
Though Lloyd was not familiar with the

Digitized by Google

many geared hoists on the market until he began to investigate with a view to buying one, he knew well enough what a differential hoist was; for the differential hoist is the simplest, the most widely used and the cheapest kind, and for light work, or for occasional use on moderately heavy work, is very satisfactory. There are few manufacturers of chain hoists who do not include a differential in their lists, but such is the simplicity of the device that there is but little opportunity for variation in construction.

Operating Principle of the Hoist.

The accompanying diagrammatic illustraiton shows the principle of operation of the differential hoist, which is a little difficult to work out from the picture of an actual hoist. There are three principal parts —the double sheave at the top with suspension hook, the single sheave at the bottom with the load-carrying hook, and the endless chain connecting them. One of the grooves in the double sheave is a little larger, in the matter of diameter, than the other, the usual difference being one "pocket," a pocket corresponding to a sprocket tooth. The chain is endless, and part of it hangs loose for pulling and hauling. Starting from the loose portion, the chain passes over the larger of the upper sheaves, runs down and around the lower sheave and up and around the smaller sheave of the pair, from which it runs back to join the part hanging from the larger sheave.



Different-Sized Wheels Give Leverage.

The hoist is operated by pulling on the loose part of the chain; pulling on the chain hanging from the larger sheave serves to lower. When the pulling part of the chain is hauled upon the double sheave is turned and the chain from which the load hook hangs is drawn up on one side and let down on the other; but as one sheave is of greater diameter than the other it will take up (or let down, as the case may be) faster than the other, as both turn together. It is this differential feature that gives the hoist its name and its leverage.

In practice the difference in the two diameters is so slight that the leverage of the larger over the smaller is not sufficient to overcome the friction of the bearings and chains, and so a load will remain stationary at any point without special means for holding it, such as brakes. Differential hoists are made to hoist up to 3 tons—rarely more. Other types usually are built to lift up to 10 tons, and in some cases up to 20 tons and even more, and these figures convey a fair idea of the comparative efficiencies of the differentials and the more complex and also more efficient kinds.

An example of a well-made differential hoist is that manufactured by Edwin Harrington Son & Co., Philadelphia, and is shown in one of the accompanying illustrations. The smallest size will lift a maximum of 500 pounds, and to move this load requires a pull of 72 pounds on the hand chain. A 1,000-pound hoist requires 122 pounds to move full load, and a 1-ton hoist calls for 216 pounds.

Where greater efficiency is required in a small hoist, or where it is desired to lift a considerable weight by hand, various systems of external and internal spur gearing are employed, as well as worm gearing. The Harrington company makes a worm hoist—or, as they call it, a "screw" hoist —that is not only a good hoist, but is a

SPIEDEL AND ROUND TYPES

good example of its class. A chain wheel of relatively large diameter is mounted on a shaft upon which is formed a worm; an endless chain running over the wheel is operated by hand and constitutes the means of applying power. A worm gear meshes with the worm, as the illustration shows plainly, and is fixed to the center of a shaft upon which two small chain wheels are carried, one on either side of the worm gear.

Lifting and Pulling Weights Compared.

Two chains, one running over each of the small chain wheels, are attached to the lifting hook, the idea being to balance the weight and pressure on either side of the worm gear and to afford plenty of chain strength; each chain is capable of sustaining more than the full rated capacity of the hoist. An idea of the relative efficiencies of the differential and the worm hoists—both of the same make—may be gained from the fact that the 500 pound differential takes a pull of 72 pounds, as already has been stated, while the worm type of the same capacity takes a 20-pound pull for full load. With a worm hoist a heavy man can raise 3 tons, for the pull required is but 163 pounds; a differential hoist for the same weight calls for a pull of 557 pounds, which is rather too much for anything but a professional fat man. Other manufacturers turn out screw hoists, and good ones, but for the most part they are built on the same principles and differ little in their essential features from the one illustrated.

Utilizing the Planetary Gearset.

The worm and gear system of power transmission is not the only one that is common to both automobiles and hoisting devices. The "old reliable" planetary gear has found a mighty useful job in a hoist, and the Ford Chain Block & Mfg. Co. is one of the concerns that put it there. The gears look just about the same in a hoist as they do in the automobile gearset, leaving out of consideration the extra pinions and the brake bands and drums of the car gears, and they are almost—not quite—as tricky for the uninitiated to follow in their operation. In the picture the Ford hoist gears are shown uncovered. The large wheel is operated by the hand chain and drives through the intermediate planetary gearing, which gives a large ratio of reduction, the wheel carrying the hoisting chain. The hoisting chain wheels are directly under the hook. The load is held by a ratchet device. The Tribloc hoist, as the Ford people call it, is made in sizes from half a ton up to the extraordinary capacity of 40 tons. The half-ton size requires a 62-pound pull and the 1-ton 82 pounds.

Hoists That Use Plain Spur Gearing.

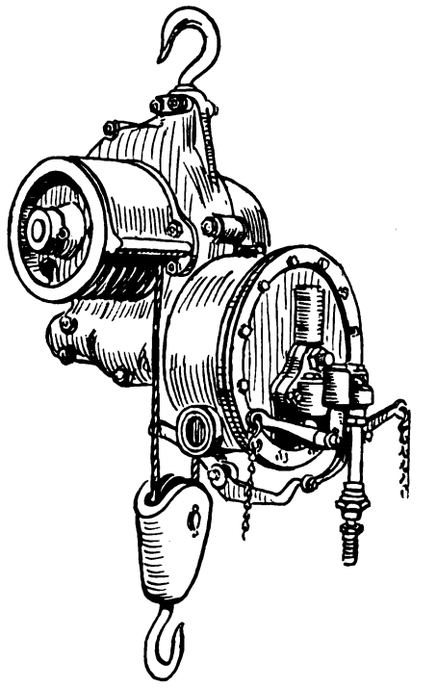
Ordinary spur gearing is employed as a means of reduction in a number of hoists, including one made by D. Round & Son, Cleveland, Ohio. The hand-chain sheave and a casing containing the gearing are mounted on opposite sides of the smaller sheave over which the lifting chain runs; this sheave is mounted on a sleeve turning on the steel shaft which runs through from the hand-chain sheave to the first pinion of the gearset, and which, of course, transmits power to the latter through the gears, which are enclosed in a tight casing and well protected from dirt and thoroughly lubricated. These spur-geared Round hoists are made in various sizes from 500 pounds capacity upward, and are said to have an efficiency of 80 per cent. The brake mechanism, the function of which is to hold the load stationary, is of the friction-and-ratchet type. While it prevents the running down of the load under its own weight, it does not interfere in any way with hoisting

Digitized by Google

or with the lowering of the load by pulling on the "down" chain.

It is a tedious job to hoist a comparatively light weight with a tackle of considerable capacity, because the gearing necessarily is so low that the motion is exceedingly deliberate. Yet there are many cases where the same hoist must be used for both light and heavy work. Recognizing this, J. G. Speidel, of Reading, Pa., has devised a clever and yet extremely simple method of obtaining two speeds from his hoist, which, by the way, is of that type in which the gearing is divided and enclosed in two casings, one on either side of the central load-chain sheave; the hand-chain sheave of course is mounted with one of the gear-cases. The two-speed device is almost ridiculously simple.

How Speed of Hoist May Be Varied.



Ordinarily the hoisting chain is double—that is to say, one end is passed over the hoisting sheave and the other end is fixed to the frame of the hoist, while a pulley carrying the load hook is carried in the "bight." For heavy loads the hoist is operated in the ordinary way, with the chain running freely through the hook pulley. For higher speed the chain is made fast to the hook pulley by an ingenious clip, and the hoisting is done direct through one strand of the chain, the other merely dangling loose. This just doubles the speed and, of course, halves the lifting power. When the load is lowered to the height at which the chain was clipped to increase the speed, the clip automatically disengages and the hoist resumes operation in its normal condition, with full power and slow speed. The Speidel hoists are made in a very wide range of capacities, the smallest lifting half a ton and the largest a weight equal to that of a dozen big cars.

Hand Power Generally Sufficient.

There are mighty few shops where anything more than hand power is required for hoisting purposes—especially in view of the fact that hand-operated hoists are made for loads as heavy as 40 tons; but occasionally there are special cases where the greater speed of a power hoist may be of considerable value. Just as an example of the clever designing that is done in this particular part of the mechanical field, one of the accompanying illustrations shows an air-motor hoist built by the Ingersoll-Rand Co., of New York and styled the Imperial hoist.

The motive power of the Imperial air hoist consists of a little air engine mounted with the gearing overhead, the whole forming a compact unit. The engine has three radial cylinders which revolve about the single crank, and there are no separate valves, there being ports cut in the crank. The crank is of large diameter, not only to permit the port construction but also to provide a large bearing area. The reduction gearing is of the worm type, and owing to the irreversible nature of the worm no brake is necessary, the worm holding the load suspended at any point. All the working parts are enclosed in tight casings and are flooded with oil.

The lifting hook is hung from a steel cable winding on a drum; control of the motor is effected by two chain pulls, one of which opens the air throttle while the other, of course, closes it. The Imperial hoist is made for loads of from half a ton to

IMPERIAL AIR LIFT

five tons, there being two sizes of motors, one developing two horsepower and the other 3½ horsepower. Of course, it is necessary to have a supply of compressed air, which must be carried to the hoisting motor through a flexible hose.

Power Hoists and Many Other Types.

These are by no means all the hoists, and are not even all the really good hoists, that Lewellyn Lloyd studied and pored over before he made his choice. It would take a good deal more than a whole number of Motor World to touch upon all of them. But enough is plenty, as Mawruss said to Abe, and there are few that differ much from the types described—that is, small hoists such as are suitable for use in repair shops and garages. Power hoists form a large group of their own, which is subdivided according to the source of energy, and there also are various kinds of trolley hoists, truck hoists and so forth and so on. Lloyd found what he wanted without going through the whole list, and he was so well satisfied with his chocie that it did not even occur to him to wish he had looked up some of the others before buying.

"Artful Dodger" Flourishes in Russia.

The "artful dodger" in business is not confined to America, as is indicated in a consular report from Odessa, Russia, which advises foreign capitalists to become familiar with Russian business law before entering the domain of the Czar of all the Russias; fraudulent bankruptcies are common, it is stated, and methods of avoiding financial responsibility are numerous and easy.

"The dishonest trader works on a 5 per cent. profit for a few years," says the consul, "thereby getting the bulk of his special line of trade into his hands, and then goes bankrupt, eventually paying about 20 cents on the dollar. Sometimes a firm can escape liability for its debts by changing its name. The newly-named firm, which may be the same as the original firm in everything except name, cannot be sued for the liabilities of the former. There is no remedy, unless it can be proved that the change has been made for fraudulent purposes, proof of which is probably very difficult to obtain, and even if obtainable the suitor must overcome endless legal stratagems and devices, with the probability that, when a verdict is at last obtained, the defendant may declare himself bankrupt and leave the plaintiff to pay his own costs. New legislation approved by the Council of Ministers is being introduced to remedy this state of affairs."

Startling Building Proposed for Denver.

If plans which now are brewing ever come to anything, the City of Denver, which is in Colorado, will have one of the most peculiar looking buildings in the world and it will be put to a use that is absolutely unique—no other word describes it. It is proposed to build a reinforced concrete structure some 200 feet in height, up which visiting motorists may drive their cars to an extensive platform at the top, where a commanding view of the city will be obtainable. No! The cars will not be driven right up the sides. They will be driven around a spiral driveway leading to the top. It is not stated whether the roadway will be wide enough to permit those whose cars balk at the incline to turn around and come down again.

To Hold Small Machine Screws.

One very good way of holding small screws that require to be put in places that are almost inaccessible is to push the screw through a piece of rather stiff paper. Another way is to hold the screw with a loop of soft wire around its head.

1,050,571. Clutch Controller. Irvine M. Smith, Tillamook, Ore. Filed Mar. 7, 1911. Serial No. 612,768. (Dashpot for clutch control.) 1 claim.

1,050,581. Tire. Benjamin Walter, Livermore, Pa. Filed Apr. 17, 1912. Serial No. 691,292. (Tire with cellular inner tube.) 1 claim.

1,050,624. Wheel Rim. George A. Distelhorst, Leshara, Neb., assignor of one-third to John A. Swanson, Omaha, Neb. Filed Nov. 13, 1911. Serial No. 660,016. (Detachable rim and fastenings.) 1 claim.

1,050,625. Internal Combustion Engine. Henry A. Dortch, Hayti, Mo. Filed Dec. 27, 1910. Serial No. 599,328. (Double-acting engine with piston valve.) 1 claim.

1,050,674. Tire for Vehicle Wheels. Alonzo C. Mather, Chicago, Ill. Filed Feb. 1, 1909. Serial No. 475,397. (Sectional tire with sections supported by radial coiled springs.) 1 claim.

1,050,686. Brake Mechanism for Automobiles. Robert S. Pelton, Monticello, N. Y. Filed Jan. 4, 1912. Serial No. 669,315. (Means for operating either one of a pair of brakes independently.) 2 claims.

1,050,727. Anti-Skidding Tire Armor. Daniel Fasold, Keswick, Iowa. Filed Oct. 6, 1910. Serial No. 585,694. (Tire armor of U-shaped connected sections.) 2 claims.

1,050,739. Starter for Explosive Engines. Robert C. Hull, Philadelphia, Pa. Filed Aug. 26, 1912. Serial No. 716,992. (Electric starter with irregular torque, maximum torque occurring at points of maximum resistance to turning effort.) 16 claims.

1,050,761. Driving Mechanism for Automobiles. Absalom F. Clark, Philadelphia, Pa., assignor to Simon Freidberger, Philadelphia, Pa. Filed May 4, 1912. Serial No. 695,169. (Spring-supported electric motor with shaft drive.) 6 claims.

1,050,779. Internal Combustion Engine. William F. Miller, Newton, Mass. Filed July 19, 1905. Serial No. 270,357. (Two-cycle motor with fuel injection system.) 16 claims.

1,050,790. Tire Tread. Fred McRea Bawden, Toronto, Ontario, Canada. Filed Jan. 13, 1912. Serial No. 671,082. (Tire tread with V-shaped ribs.) 3 claims.

1,050,799. Igniter for Gas Engines. Stephen F. Briggs, Milwaukee, Wis., assignor to Briggs & Stratton Company, Milwaukee, Wis., a Corporation of Wisconsin. Filed Mar. 28, 1910. Serial No. 552,013. (Primary circuit controlled by magnetic switches.) 13 claims.

1,050,810. Motor Vehicle. Edward P. Cowles, Warren, Ohio, assignor, by mesne assignments, to Packard Motor Car Company, Detroit, Mich., a Corporation of Michigan. Filed Sept. 6, 1901. Serial No. 74,497. (Steering pivots within enlarged hub.) 8 claims.

1,050,811. Lubricating System. Paul Daimler, Cannstatt, Germany, assignor to The Firm of Daimler Motorengesellschaft, Unterturkheim-Stuttgart, Germany. Filed Sept. 5, 1912. Serial No. 718,665. (Oil pump with differential cylinder and piston, and piston valves.) 3 claims.

1,050,826. Clutch Pedal and Throttle Control for Automobiles. Milton T. Hancock, Jr., Los Angeles, Cal. Filed Aug. 4, 1911. Serial No. 642,369. (Throttle control connected to clutch pedal.) 7 claims.

1,050,853. Spring Wheel. Joseph Sanders, Washington, D. C. Original application filed Mar. 6, 1912. Serial No. 681,883. Divided and this application filed July 3, 1912. Serial No. 707,602. (Wheel with bunched strands of spring wire under tread.) 7 claims.

1,050,853. Wheel. Harlow Orville Shockley, Darlington, Wis. Filed May 14, 1912. Serial No. 697,326. (Wheel with pneumatic cushion surrounding hub.) 1 claim.

1,050,886. Vehicle Tire. Anson B. Wetherell, Pittsburgh, Pa. Filed Feb. 23, 1910. Serial No. 545,404. (Self-inflating pneumatic tire.) 2 claims.

1,050,888. Variable Speed Transmission Mechanism. John G. White, Newberry, Fla. Filed May 22, 1912. Serial No. 699,030. (Change-speed gear having a driving pinion meshing with concentric rings of teeth formed on the face of a disk.) 4 claims.

1,050,950. Resilient Wheel. Ernest E. Julien, Watseka, Ill., assignor of two-thirds to Zedok P. Watkins and James H. Stone, Watseka, Ill. Filed Nov. 15, 1911. Serial No. 660,329. (Wheel with spring-and-plunger spokes.) 1 claim.

1,050,986. Bearing Adjusting Means for Axles. Emil A. Nelson, Detroit, Mich., assignor to Hupp Motor Car Company, Detroit, Mich., a Corporation of Michigan. Filed Mar. 1, 1912. Serial No. 680,983. (Means for adjusting bearings of live rear axles.) 5 claims.

1,050,988. Transmission Gearing. Nils Nilson, Leonard Nilson and Harold Nilson, Wayzata, Minn. Filed May 29, 1911. Serial No. 630,225. (Combination of friction disks and gears.) 8 claims.

1,051,025. Incased Universal Joint and Casing Thereof. Clarence W. Spicer, Plainfield, N. J. Filed Sept. 12, 1906. Serial No. 334,222. (Universal joint with automatically adjusted hemispherical dust cap.) 11 claims.

1,051,030. Automobile Fender. Wilson E. Symons, Chicago, Ill. Filed May 15, 1911. Serial No. 627,256. (Movable fender controlled from seat.) 22 claims.

1,051,053. Vehicle Wheel. Charles Altman, Wilber, Neb. Filed Feb. 27, 1912. Serial No. 680,234. (Wheel with spring-and-plunger spokes.) 1 claim.

1,051,055. Power Transmission Gearing. Vincent G. Apple, Dayton, Ohio. Filed June 15, 1911. Serial No. 633,235. (Variable speed gear for starting and lighting motor-generator.) 10 claims.

1,051,079. Demountable Rim and Tire Fastener for Wheels. Charles F. Burkhart, New York, N. Y., assignor to Walter J. Reiman, Buffalo, N. Y. Filed Apr. 10, 1912. Serial No. 689,722. (Demountable rim operated by rack-and-pinion.) 3 claims.

1,051,090. Air Pump for Inflating Automobile Tires. John Desmond, Chicago, Ill., assignor, by mesne assignments, to William S. Potwin, Chicago, Ill. Filed Jan. 20, 1909. Serial No. 473,323. (Air pump operated by shaft projecting through hub of starting crank.) 5 claims.

1,051,117. Tire. Fred W. Karches, St. Louis, Mo., assignor to Fidel Ganahl Lumber Company, St. Louis, Mo., a Corporation of Missouri. Filed June 14, 1912. Serial No. 703,684. (Tire with rubber cushions and spring-supported sectional tread.) 9 claims.

1,051,122. Means for Supplying Explosive Mixture to Explosive Engines. Stephen S. Krayer, St. Louis, Mo. Filed Nov. 18, 1911. Serial No. 661,000. (Double carburetter arrangement with automatic control.) 2 claims.

1,051,130. Exhaust Muffler. Charles F. Lattime and George W. Lattime, Newburyport, Mass. Filed Oct. 23, 1912. Serial No. 727,472. (Water-cooled concentric-shell muffler.) 6 claims.

1,051,132. Elastic Wheel. Jules Leonard, Parc-St.-Maur, France. Filed Feb. 7, 1911. Serial No. 607,208. (Wheel with rubber cushion between inner and outer rims.) 1 claim.

1,051,178. Elastic Wheel. Thomas Whitehead, Blackpool, England. Filed Dec. 12, 1911. Serial No. 665,323. (Wheel with coil spring spokes.) 4 claims.

1,051,236. Automobile Wheel. Albert Johnston, Grat Falls, Mont. Filed Aug. 16, 1912. Serial No. 715,478. (Wheel with compressed air chamber in hub and plunger-and-cylinder spokes.) 4 claims.

1,051,255. Change-Speed Gearing. Lars August Peterson, Stockholm, Sweden. Filed Mey 27, 1912. Serial No. 700,114. (Pinion meshing with gears of a stepped cone.) 8 claims.

1,051,276. Resilient Wheel. James Seadler, Sacramento, Cal. Filed Oct. 14, 1912. Serial No. 725,632. (Wheel with springs between inner and outer rims.) 3 claims.

1,051,281. Automobile Transmission Mechanism. Samuel L. Slaughter, Richmond, Mo. Filed Feb. 16, 1912. Serial No. 677,927. (Friction gear with independent drive to each rear wheel.) 5 claims.

1,051,288. Shock Absorber. Paul Szydlowski, Boston, Mass. Filed June 5, 1912. Serial No. 701,915. (Hydraulic shock absorber.) 14 claims.

1,051,289. Internal Combustion Engine. Walter K. Thomas, New York, N. Y., assignor to himself as trustee. Filed Dec. 8, 1911. Serial No. 664,660. (Four-cycle motor with cylinder ports and rotary valve.) 18 claims.

1,051,290. Valveless Rotary Combustion Engine. Maurice Tips, Brussels, Belgium. Filed July 20, 1912. Serial No. 710,687. (Two-cycle revolving cylinder motor.) 3 claims.

1,051,305. Shock Absorber. William H. Bell, New York, N. Y., assignor to Oswald J. Karsch, New York, N. Y. Filed Apr. 10, 1912. Serial No. 689,812. (Shock absorber of the auxiliary spring type.) 6 claims.

1,051,307. Vehicle Tire. Herman L. Biener, New York, N. Y., assignor, by direct and mesne assignments, to Auto Sectional Leather Tire Company, New York, N. Y., a Corporation of New York. Filed Nov. 24. 1911. Serial No. 662,098. (Spring wheel with spiral springs between inner and outer rims.) 3 claims.

1,051,352. Dirigible Headlight for Vehicles. Wallace R. Petty., Price, Utah. Filed Apr. 5, 1912. Serial No. 688,800. (Headlights moving with steering gear.) 1 claim.

1,051,369. Charge-Mixing Device for Gas Engines. Forrest A. Heath, Jersey City, N. J., assignor, by mesne assignments, to Homo Company of America, Philadelphia, Pa., a Corporation of Delaware. Filed Sept. 20, 1909. Serial No. 518,509. (Mixer with revolving fan in gas passage.) 1 claim.

1,051,373. Inductor Generator for Ignition Purposes. John L. Milton, Chicago, Ill. Filed June 17, 1907. Serial No. 379,485. (Magneto with stationary winding and cross-shaped inductor.) 12 claims.

1,051,579. Automatic Fender and Brake for Automobiles. Albert D. Barth, Philadelphia, Pa. Filed July 27, 1911. Serial No. 640,896. (Fender operating automatically and connected with brake and clutch control.) 3 claims.

1,051,388. Cut-off Shade for Headlights. Maurice F. Castleman, Berryville, Va. Filed Mar. 7, 1912. Serial No. 682,179. (Adjustable shield for upper part of headlight.) 5 claims.

1,051,403. Auxiliary Tension Device for Shock Absorbers. Howard R. Harrison, Detroit, Mich. Filed July 5, 1912. Serial No. 707,660. (Compound coil springs between main springs of a car.) 4 claims.

1,051,425. Ignition System. Charles Thomas Mason, Sumter, S. C. Filed Apr. 22, 1912. Serial No. 692,474. (Ignition system with magnetic control of breaker.) 2 claims.

1,051,431. Resilient Wheel. William J. Mettler, De Kalb, Ill. Filed Apr. 8, 1912. Serial No. 689,248. (Disk wheel with spring tire.) 2 claims.

1,051,440. Carburetter. Alexander Ostler, Newark, N. J., assignor to Hydro-Carbon Machine Company, a Corporation of New Jersey. Filed Dec. 20, 1907. Serial No. 407,292. (Floatless, automatic carburetter.) 5 claims.

1,051,457. Vehicle Wheel. Bert Halaster Seevers, Akron, Ohio. Filed Aug. 2, 1912. Serial No. 712,987. (Hollow sectional tire with rubber tread and internal springs.) 1 claim.

Holds World's Stock Championship

National

Holds World's Record for Fastest 500 Miles in Competition

Once a National Dealer, Always a National Dealer

Electric started and lighted; not only left side drive, but *access* to both front doors

Five models, $2750 to $3400

Less "missionary work" and quicker profits—if you handle the *National*

Wherever motorists foregather and discuss motor cars—you will invariably hear the *National* mentioned, and always mentioned *favorably*.

The *National* has run a consistent, persistent race for leadership in quality since it built its first car 13 years ago, and remains today in the lead.

No car today has received more mouth-to-mouth advertising than the *National*.

This means much to you as a dealer. Your time is worth money and in selling a car the less time you devote to "missionary work"—to educating the prospect and telling him about the merits of the car you are offering him—the bigger will be your profits. This is just as true in selling automobiles as it is in the grocery, drug, hardware or shoe business.

The American people know about the *National*—they *appreciate* the merit of the *National*—they have *confidence* in the *National* car and the *National* Factory Organization that builds it.

No apologies to make—no competition to fear

If you are handling a competitive car—you know from actual observation that the "missionary work" has been done in advance for the *National* Dealer—that the *National* dealer has no apologies to make or competition to fear.

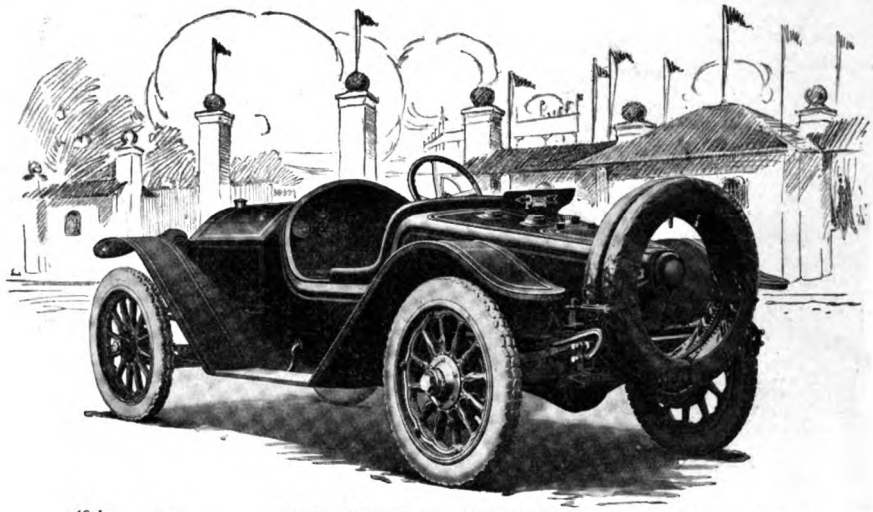
As a salesman you know that if the prospect "knows about" your car—if he is favorably impressed in *advance*—if he has confidence in your car and the factory organization behind it—before you even start you have the battle more than half won.

This favorable impression on the part of the public toward the *National* has enabled *National* dealers to "cash in" on it time and time again. And *National* dealers enjoy a year-round business.

Increased output gives you a big opportunity

Our business is to make the best car money, brains and skill can produce. The *National* today is as near motor car perfection as it is possible to obtain—it is powerful, absolutely dependable, first class in every way—easy to operate, convenient, comfortable, luxuriously furnished—it has a most efficient electric starting and lighting system—it is truly a $5000 car selling for $2750 to $3400, minus the $5000 price tag.

Your business is to *sell* motor cars *at a profit*. Some dealers overlook those three *important* words—"at a profit"—and it makes a big difference in the balance to their credit at the bank, at the close of the season.



If we can't prove to you that *you* can *sell* the *National* *at a profit*, you won't care to join the great *National* Sales Organization and we won't urge you to do it.

So the burden of the proof is on us—wire or write us at once—come to Indianapolis if you can, go through our factory—let us submit the *proof*—then decide for yourself.

Now is the time—get in touch with us *immediately*.

National Motor Vehicle Co., Dept. 90, Indianapolis, Ind.

40 horse power PATHFINDER CRUISER *120 inch wheelbase*

Harmony of design marks the PATHFINDER a car of quality

¶ Real money has been spent to make the Pathfinder a quality car. Only materials that are standard with manufacturers who have a reputation for producing the best are used. Yet the Pathfinder is not classed as an "assembled car" because every part is made especially for us, according to our own design patents, and has no duplicate in any other car.

¶ Harmonized construction, or the scientific blending of

—quality materials *—quality workmanship*
—quality design *—quality finish and appearance*

such as you find in the Pathfinder car means years of enjoyment and pride of ownership as well as economy in the long run. Some cars combine one or two of these factors but the Pathfinder has them all.

¶ Do not be deceived into buying a motor car on the strength of some accessory or novelty that has nothing to do with the operation of the car itself.

¶ To be sure you want a reliable electric self-starter—the Pathfinder starter is 100 percent. efficient—and you want electric lights, an electric horn, demountable rims—and you want the instrument board within easy reach of your hand. But these necessities are not *fundamental.*

¶ To thoroughly familiarize yourself with the advantages of Pathfinder construction get a copy of our "101 Reasons." This, and other Pathfinder literature, will tell you why Pathfinder cars make friends in their old age—explains why Pathfinder cars will run quietly in their fifth year of active service due to renewable bearings and perfect weight distribution. Get a copy of the *"101 Reasons"* today without fail. Your name on the margin of this page will do.

THE MOTOR CAR MFG. CO.

1138 Division Street Indianapolis, U. S. A.

Write your name on the margin and get **1914** Pathfinder literature

A Continued Story
Chapter 3

No. 4
in our next

Well, what the—
Let's think!

I've cranked that confounded, fool car for the last half hour and she won't start.

What have I forgotten ?

To prime the engine ?
Tickle the carbureter ?
Open petcocks ?
Shut off the air ?
Spark switch turned on ?
Gas turned on ?
Gasoline all gone ?

Ges! I've got to get her going some way. I'll try her some more—Lord! how my back aches.

American Made For American Trade

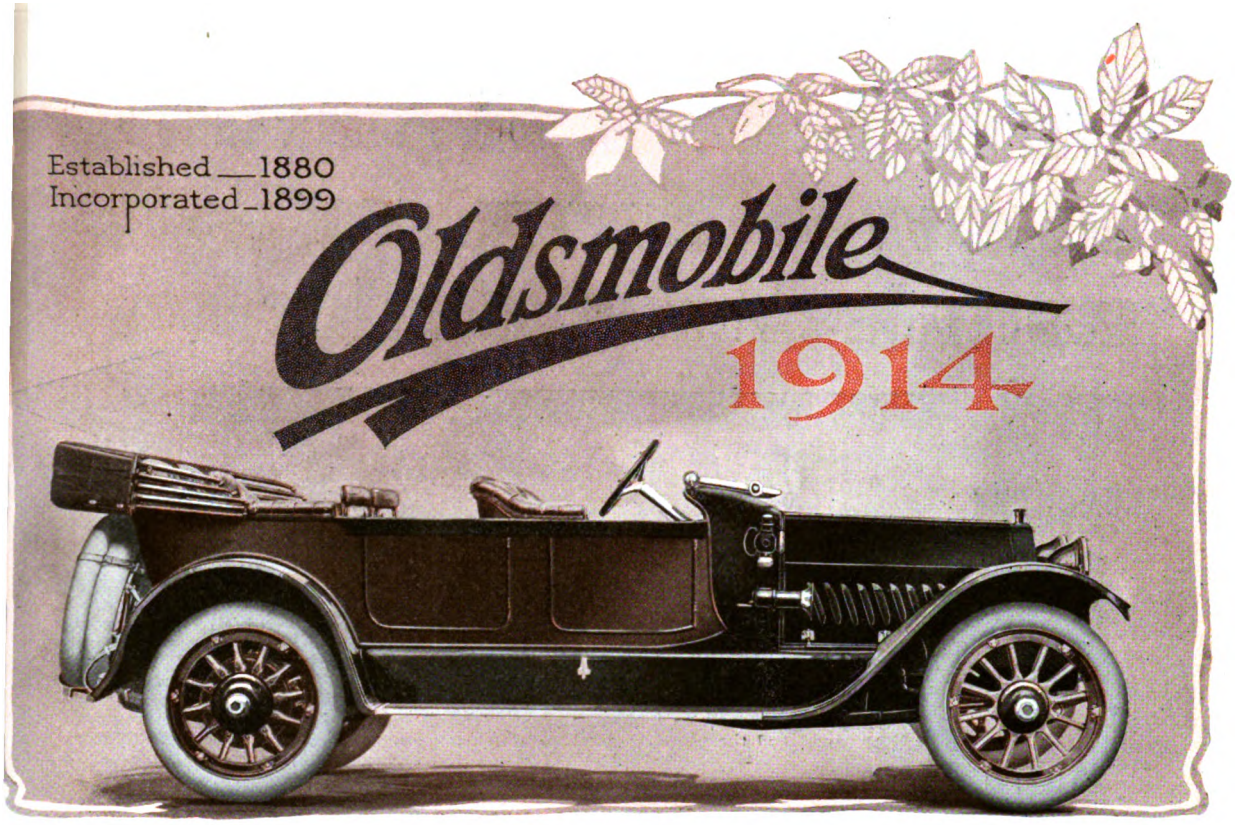
New Departure

Ball Bearings Throughout, and Why

By the use of New Departure ball bearings throughout the entire chassis, the manufacturer of this car has reduced power losses, repairing and operating costs to a minimum.

New Departure ball bearings eliminate friction. Friction is expensive, wears away the parts, hastens depreciation, and makes frequent repair necessary.

By eliminating friction New Departure ball bearings waste so little of the motor energy that maximum driving power is transmitted to the rear wheels. By eliminating friction there is practically no wearing away of the parts. The life of the entire car is longer and repairs are fewer.



All of these advantages are secured without sacrificing bearing efficiency. New Departure ball bearings will carry the load under all conditions of service equally as well as any bearing made.

Have you seen our interesting brochure on "Friction Elimination"? If not, drop us a card today and it will be forwarded to you by return mail.

The New Departure Mfg. Co., Bristol, Conn.

This Is the 1914 Oldsmobile That So Many Dealers Have Been Clamoring For

The Greatest Six-Cylinder Car Ever Produced

OUR entire sales organization, engineering department and factory managers not only endorse the statement that this is the greatest six-cylinder car ever produced, but insist upon advertising it as such—there is no other expression which so adequately and truthfully describes the new 1914 Oldsmobile Model 54.

We have never before in our sixteen years of automobile manufacturing made so strong a statement. Our policy has ever been, and will continue to be, a truthful adherence to facts, and when we commit ourselves we believe we can prove by demonstration or comparison that we have not underestimated the position occupied by Model 54 among sixes.

From the purchaser's viewpoint this 1914 Oldsmobile contains every feature of refinement, stability, luxury and power that can be found in cars of greater price.

From the dealer's angle it has back of all these features a reputation as solid and as old as the industry itself.

It is fair to state that there is not another six-cylinder car in America any better or wider known than the Oldsmobile.

It is not necessary to introduce the Oldsmobile. Olds Motor Works was founded in 1880, and after 34 years of successful manufacturing we celebrate anniversaries not introductions.

You, who are familiar with motor car values, compare the 1914 Oldsmobile with higher priced cars and see for yourself if there is any reason why we should not be classed with the highest priced. Compare with cars of cheaper make and try to find an argument for not adding just a few dollars more in order to secure an Oldsmobile.

Dealers interested in six-cylinder cars have displayed a keener interest in the 1914 Oldsmobile than in any other model ever produced by the Olds Motor Works, and have unanimously pronounced it a supreme achievement among sixes.

The complete equipment on the Model 54 is the finest that money can buy.

Four or Five-Passenger Phaeton touring body type $2975
Seven-Passenger Touring Body, $175 extra
Limousine 4300

Wire Wheels—Oldsmobile Trunks and extra tires at additional cost

To reliable dealers we have an interesting and profitable message

Three letters of startling import to every car manufacturer, dealer and user

1 —from G. A. Hendricks to W. H. Tripp

Grand Rapids, Mich., August 1, 1913.

Mr. W. H. TRIPP,
Western Advertising Manager, The Motor World,
1001 Ford Building, Detroit, Mich.

Dear Billy:—

Through a mutual friend, I just learned of your connection with The Motor World.

I am enclosing description of a device of mine—read it over. It seems to be so good that no one will believe it, therefore I want you to come and see it personally the next time you are in Grand Rapids.

My first experience driving an automobile was with a Hupmobile purchased in 1909. I drove it three or four thousand miles and about every six or seven hundred miles, it was necessary to have the carbon removed and the valves ground, which started me to thinking there must be some way of eliminating this very serious and expensive difficulty and the device shown in the circular is the result.

The original device and experiments were all on this Hupp machine, and from the spring of 1910 to the present time, this machine has been driven approximately an additional 39,000 miles with no attention whatever to the valves and with maximum power at all times.

In February, 1912, I purchased a Rambler Cross Country and immediately attached an Ad-a-Man-Tor to it. This car has now run about 15,000 miles with no attention to the valves and it appears the car will run indefinitely without grinding the valves.

If you know what a statement of this kind means, you doubt can find some excuse for the fellow who doubts the statement— ssibly you will doubt it yourself and that's the reason I am suggesting hat you see it personally.

Yours very truly,
(Signed) G. A. HENDRICKS.

2 Mr. Tripp's Reply

Detroit, Mich.,
August 4, 1913.

To HENDRICKS,
Grand Rapids, Mich.

Dear Mr. Hendricks:—

Will be in Grand Rapids on Tuesday and glad to have you tell me all about your invention. Looking forward to seeing you, I am,

Very truly yours,
(Signed) W. H. TRIPP, Western Advertising Manager.

3 Another letter from Mr. Tripp

Detroit, Mich., August 14th, 1913.

Dear Mr. Hendricks:—

I am sending our Mr. Maxton R. Davies down to see and talk with you in reference to the Ad-a-man-tor. Mr. Davies drives a car and is thoroughly familiar with automobile engines and will be glad to look over your device in detail and get the facts about it for our paper.

With kind regards, Yours very truly,
(Signed) W. H. TRIPP, Western Advertising Manager.

39,000 miles *without touching* or *grinding valves* and the device that made this record possible

A Sworn Statement

State of Michigan, County of Kent, } s. s.

This is to certify that the Hupmobile referred to in attached letters has traveled approximately 39,000 miles without attention to valves other than the Ad-a-man-tor cleaning; also that the Rambler Cross Country equipped with Ad-a-man-tor engine cleaner has traveled approximately 15,000 miles without any attention whatever to valves, and that both machines are still running perfectly.

(Signed) G. A. HENDRICKS.

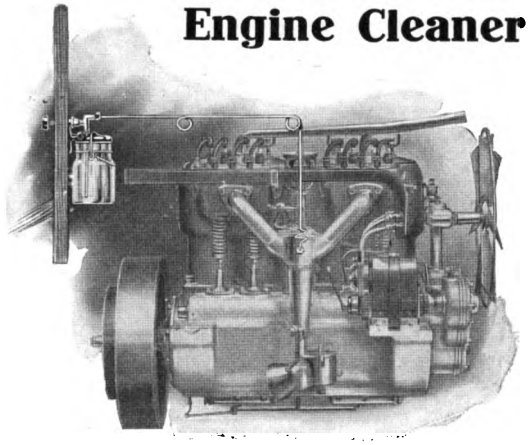
I am employed as mechanician for G. A. Hendricks, and know the above statement to be true and correct. (Signed) SCOTT HUSO.

I am the sales agent for the Thos. B. Jefferys Co., and sold the Cross Country Rambler to G. A. Hendricks, and know above statement to be true and correct.

(Signed) B. F. KENYON.

Personally appeared before me, G. A. Hendricks, Scott Huso, and B. F. Kenyon, known to me, and who signed the above statements and who severally made oath that the same were true and correct.

Grand Rapids, Kent County, Michigan, August 19th, 1913..



(Signed) PALMER A. JONES, Notary Public, Kent County, Michigan.

[Official Seal. My commission expires Dec. 20, 1915.

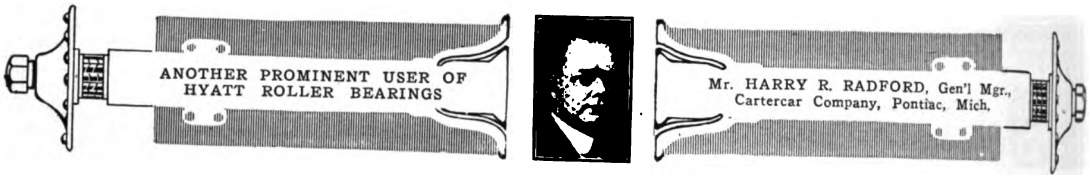
The Ad-a-man-tor

Engine Cleaner

A simple practical, usable engine cleaner that gives ar ring results. Keeps valves and cylinders free from carbon. Does away with any need for grinding valves. The affidavit above shows how it works and why it should be on every car.

A Word to Manufacturers

This is all that shows on dash



An Ad-a-man-tor on every car you make will save you thousands of dollars in service expense; will add to the efficiency of every engine; will add reputation and value to your car. Most engine troubles are due to carbon. The Ad-a-man-tor CLEANS OUT THE CARBON and saves the trouble. We sell it on ten days or three months trial—satisfaction or your money back.

Write AT ONCE for sample and further details.

Think what this material means for priming alone! What a help to self-starters in winter!

G. A. HENDRICKS, Grand Rapids, Mich.

HYATT QUIET BEARINGS

THE enormous strains and stresses set up in the reciprocating parts of a motor car traveling at even a moderate speed over ordinary roads impose a severe duty upon the bearings of the transmission and axles.

In a solid roller or ball bearing this duty is in the nature of a "dead shock" or load that causes undue wear and noise and has to be absorbed by the surrounding mechanism.

The Flexible feature of the Hyatt Roller Bearing cushions the shock, absorbs vibration and relieves the shafts and gears of excessive strain.

The durability of the Hyatt Roller Bearings is further increased by rigidly testing the high grade alloy steels used in them. These tests are so thorough and comprehensive that the possibility of any weakness or defect in the bearing is reduced to a minimum.

Sell Spark Plugs That Give Real Service

BOSCH PLUGS, in addition to being perfectly constructed, in addition to being made from the finest of materials obtainable, have 6 special and exclusive features which make them the superior spark plug—Just the plug your customers want.

$1.00 Each
is the selling price. Shipped from nearby distributors, thus reducing shipping costs.

1 Crescent Electrodes minimize electrical resistance affording the maximum spark, therefore maximum power at all speeds and easy starting always assured.

2 Undue wear of electrodes prevented, consequently long life is certain.

3 Insulation, Steatite, unaffected by intense heat, carbon or oil, and unbreakable by vibration or accident.

4 Design permits massive and absolutely gas-tight construction—no power loss at any pressure.

5 BOSCH PLUGS are "excessively" durable; they last as long and serve as well as you expect a "Bosch" product will.

6 BOSCH PLUGS are as good as Bosch Magnetos.

Write for "Locating the Spark Plug"
It's educational and will be sent you free

The Foreign Trend

The builders of motor cars abroad are constantly introducing new ideas, new body designs, new equipment and new methods of construction.

There are wire wheels and worm drive now. And other things are promised.

But some things there, as here, are standard.

One is The Jones Speedometer.

Seven years ago The Jones became Europe's most popular speedometer.

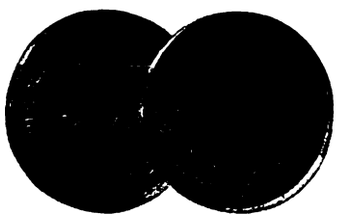
It won the Royal Automobile Club's gold medal for all around superiority in a test that covered 2,000 miles and lasted 30 days.

It was placed on the cars of the King of England, the Emperor of Germany, the Czar of Russia, the King of Italy, the King of Spain, and the Kings of Siam, Norway, Sweden, Denmark and Belgium. The President of Switzerland and the President of France, and hundreds of other notables used it.

It is used by these rulers and thousands of others on the best cars today.

No other speedometer ever gained such prestige or was ever so widely sold abroad. No other sells there today like the Jones. The love of new things—the foreign trend—doesn't dislodge the Jones.

It is regarded as the Standard Instrument because of its accuracy. And nobody ever thinks of displacing it. The makers of thousands of American cars are factory-equipping their product this year with the New Jones Speedometer.



They expect their cars to be used the year 'round and they know the Jones isn't affected by temperature. The Jones is the Universal Speedometer. Makers and owners are finding this out. It is accurate, *always*. The simplest in principle. And the longest-lived.

It's the product of Jos. W. Jones, the inventor of the speedometer as used on motor cars. Nothing else will ever serve like the Jones Speedometer.

Let us send you the man who knows it in detail and can give you the fullest information in regard to placing it on your car.

THE JONES SPEEDOMETER

Broadway at 76th Street NEW YORK CITY

This is the Gold Medal presented to The Jones Speedometer by the Royal Automobile Club of Great Britain and Ireland. Eleven different instruments competed in the test—foreign and American makes. The Jones made the only perfect score on seven points of superiority. And the Jones is the only speedometer that has ever won this medal.

Chalmers–1914

The New "Six"

$2175

Fully Equipped f. o. b. Detroit

The Master Motor of Them All

What other makers are still striving for we give you in the New Chalmers "Six."

To the best features of the costliest cars we have added these crowning triumphs:

Silence at all speeds; silence that lasts.

Many cars that are quiet at ten miles an hour, kick up a lot of noise at thirty. Watch the speedometer of the New Chalmers "Six";—30—40—50 miles an hour and not a murmur from our big oval cams or enclosed valves.

The silence of the Chalmers "Six" means more than the mere luxury of quiet. It tells you that your motor is working with the perfection of a watch—without the slightest wear. And this silence continues for years.

Sustained power; even after years of use.

This motor, like the trained athlete, grows better by action. Its Tungsten steel valves are not affected by the cylinder heat. So there's no warping—no leaking—no power wasted. Think of the years of extra service this master motor will give you.

No vibration; comfort and long life.

The smoothness of the "Six" saves wear on the car as well as on the passengers. The interval between the explosions of any "four" makes a gap in the power stream. It produces a vibration that hammers constantly at the life of the car. There's no escape from it. The explosions of the "Six" give an unbroken stream of power. This gives smoothness and economy that no "four" can equal. It adds years to the life of the car.

Extreme flexibility, without intricate gearing.

You'll find you can do nearly everything on "high." It does away with gear shifting almost entirely. With this "Six" any supplementary gear mechanism would be useless. The motor itself gives a suppleness of power unknown even in costlier cars.

A Non-Stallable Motor.

This motor will never go dead in the crowded city traffic. The electric starter won't let it.

Even if the driver should cut off the gas accidentally, the electric starter, always on duty, keeps the motor running—won't let it stop.

This is the greatest feature of safety and convenience put on a car in the last five years.

These features mean far more than the luxury they bring. They mean no wear—no waste of power—no depreciation. A car that lacks them may cost you less to buy—but it will cost you more to keep.

When once you know the years of extra service these features add, you'll wonder how we give them at the price, $2175.

Go ride in this car—at our dealer's. Let it tell its own story in deeds. It can neither over-rate its virtues nor hide its defects. It must tell the truth—nothing else.

Let us send you literature explaining why the New Chalmers "Six" is the master motor of them all. Write today.

Chalmers Motor Company, Detroit

Salient Features of the New Chalmers "Six"

Six-cylinder motor, T-head type 4"x5½"—40-65 h.p. All moving parts enclosed.

Bosch Magneto.

Electric starter—Entz System, built in Chalmers shops.

Non-stallable motor.

Full electric lights—Our powerful headlights also contain auxiliary lamps of moderate power for city driving.

132-inch wheel base.

Molded oval fenders.

Gasoline tank and tire carrier on rear—clean running boards.

Left drive and center control—enter from either side.

36x4½-inch tires and Continental demountable rims.

Four forward speed transmission.

Underslung rear springs; main leaf of vanadium steel.

Tapered bonnet and stream line, bell backed body.

Chalmers patented doors—unusually wide.

Full equipment — including Chalmers silk mohair top, quick acting storm curtains, Warner speedometer, one extra demountable rim, electric horn, pump, tools, etc.

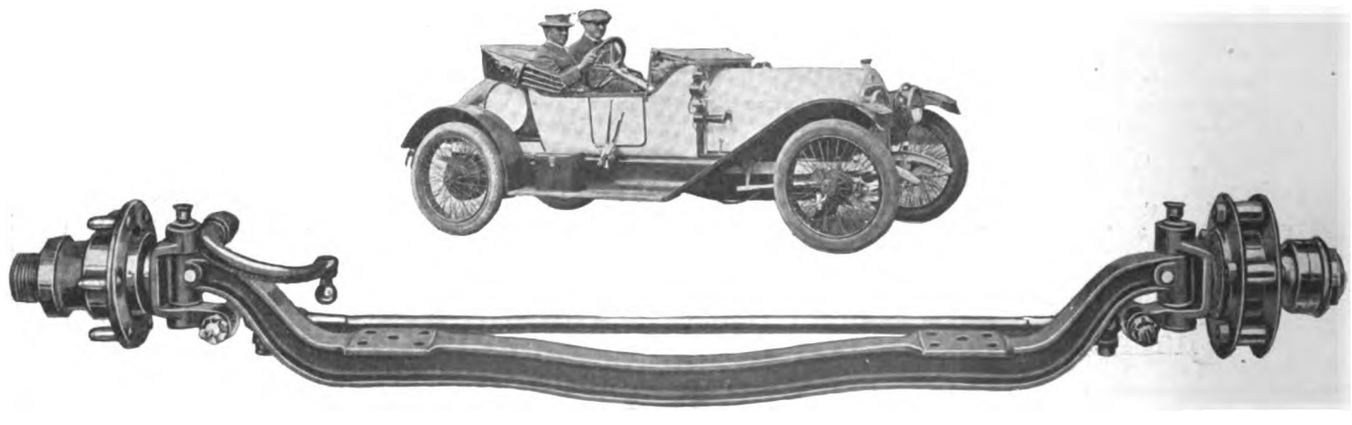
One of the first things you will be asked about wire wheels is "How do they compare with wooden wheels?"

The strength of wire wheels to resist side thrust is fifteen times as great as the side thrust strength of wooden wheels.

ADD these qualities together and you have a sum of essential benefits far in advance of wooden wheel construction but secondary to the wonderful tire economy of wire wheels.

In all our advertising we have been comparing wire wheels and wooden wheels, bringing out the benefits and advantages of wire wheels which years of use have demonstrated to be unquestionable. Our statements as to wire wheel strength, riding qualities and tire economy are founded upon the results of tests. At first our statements were founded upon tests conducted by engineers, tests capable of exact

McCUE



results. The results were checked by close observation of wire wheel performance in every day usage—track racing, road racing, hill climbing, endurance runs, commercial work on taxi cabs, touring, city and town car usage, in fact every kind of test of practical motor car use.

The sum and substance of wire wheel superiority is stated in three words—better car service.

The "better car service" that wire wheels give is found in three essentials:

1. Greater strength and lighter weight—a factor engineers appreciate.

The McCue Company

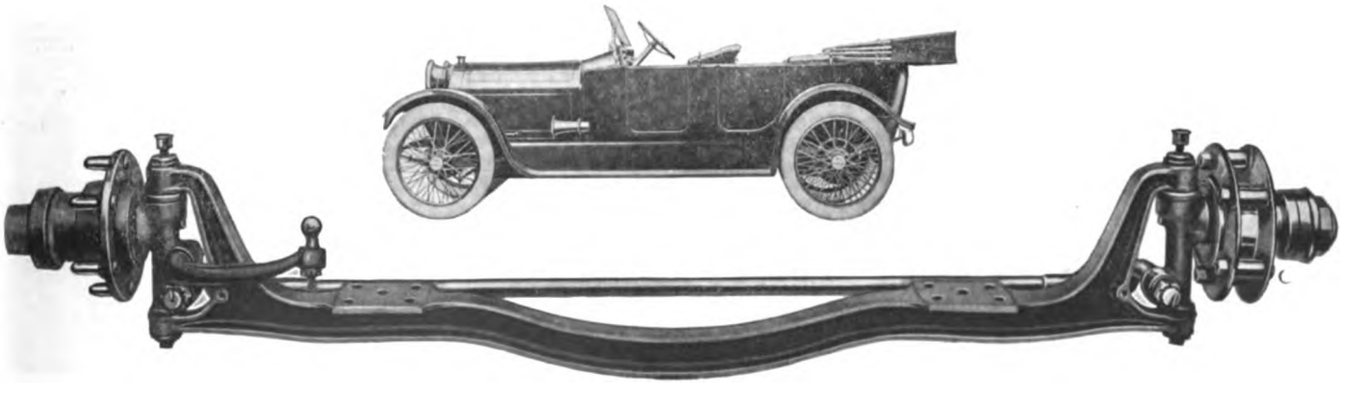
Digitized by Google

While a wire wheel weighs the same as a demountable rim its carrying strength is five times as great.

The superb riding qualities of wire wheels are due to their light rims and laced spoke construction.

2. Better riding qualities—a feature that gradually makes itself indispensable to owners.
3. Tire economy—at least 50% more than with wooden wheels—an advantage which dominates everything else in giving car owners the service they have the right to expect in the cars they buy.

Tire economy this is the first and greatest element in "better car service." Tire economy is the first and greatest reason why manufacturers should equip their cars with wire wheels. Tire economy is the first and greatest benefit car owners are seeking.



WIRE WHEELS & AXLES

Every dealer should demand wire wheels on the cars they sell on the basis of giving their customer "better car service."

McCue Wire Wheels use the Standard (S) Spokes made for us by the Standard Company of Torrington, Conn.

We are the only concern making wire wheels in America equipped to produce wire wheels in quantities to meet the demand. Our outfit is 1000 wire wheels per day.

Hartford Cone Clutches

IN each Hartford Cone Clutch Assembly then there is a universal joint which provides the necessary flexibility for the main shaft.

The Hartford method of building universal joints is, in itself, worthy of close scrutiny because poor construction of a perfectly designed universal or good construction of a poorly designed universal will cause never-ending clutch trouble.

Standard Hartford Cone Clutch Unit Complete With Universals. This is the Type Clutch We Have Specialized in for Years.

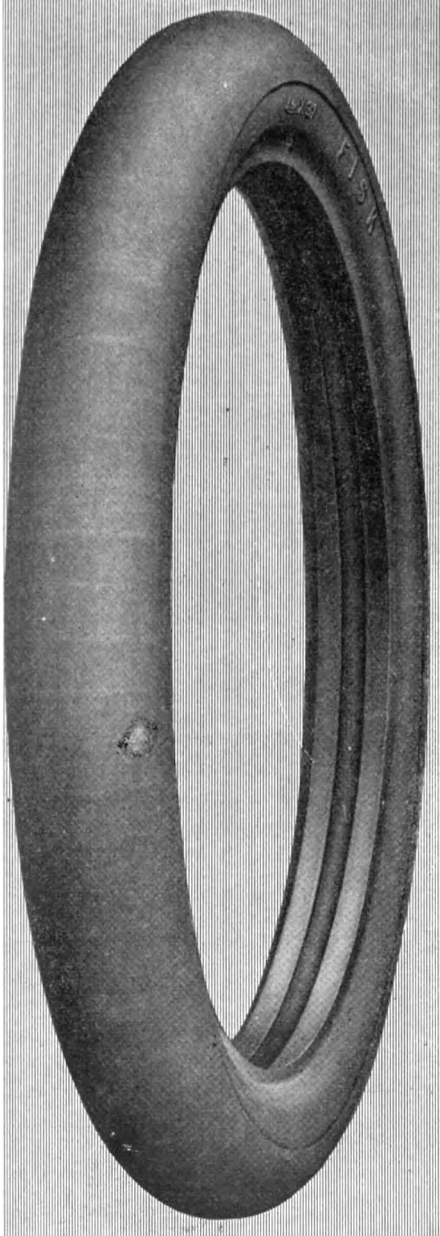
The bearing portions of Hartford Universals are machined to .00025 of one inch. A quarter-thousandth of an inch is the limit to which the male and female members of the Hartford Universals must come so that the greatest possible amount of play between the two members is .0005 of an inch.

With this slight amount of play wear is almost unknown because there is no chance for its development, yet all the flexibility is there. Such a close joint means absolute silence in Hartford Universal Joints.

Another thing—all of which goes to show the consistency of Hartford construction—the cone hubs are faced and recessed, the leather face is turned and the soft steel cone faced all in one operation so that there will not be the slightest variation and so that all will be absolutely concentric.

Standard Universal Joint Assembly With Leather Dust and Grease Proof Covering.

In order to do away with the slightest irregularity due to vice-like pressure, during the turning operation the part is held in the machine by the grip of magnetic chucks.



The accuracy of the cone friction surface, due to absolute concentricity with its shaft bearing, calls for the close quarter-thousandth limit of the universal joint, the flexible connection between the clutch proper and the drive shaft which it actuates.

HEAVY CAR TYPE FISK TIRES

Straight Side Tire

No Transaction is Complete Until Our Customer is Satisfied

WE accept our full responsibility with every transaction. If you sell our tires, we must earn your confidence and good will. It is not enough that we supply mileage; you are entitled to our personal interest in your tire business and all that pertains to it. Our one aim is to sustain the reputation we have established as the ***Squarest Dealing Company, makers of the Honestly-Built, Service-Giving Tire.***

We are the largest exclusively Pneumatic Tire builders in the world. We are probably the most rapidly growing company in the industry. Our 1912 business was double that of the year previous. To date for 1913 we have increased our 1912 sales by 100 per cent and must continue to add to our building facilities in order to meet the demand for Fisk Tires. Our growth is due to the QUALITY of Heavy Car Type Fisk Tires and the CONFIDENCE which we inspire.

The Fisk Branches

are the most complete tire service stations in the United States.

Each is a miniature factory prepared to serve consumers direct and to co-operate with dealers everywhere that they may assure to their customers the advantage of real FISK SERVICE.

Each department of these Branches is in charge of an expert. The knowledge that these men possess is freely given at all times to tire users and has repeatedly been successful in solving tire problems.

Lancia

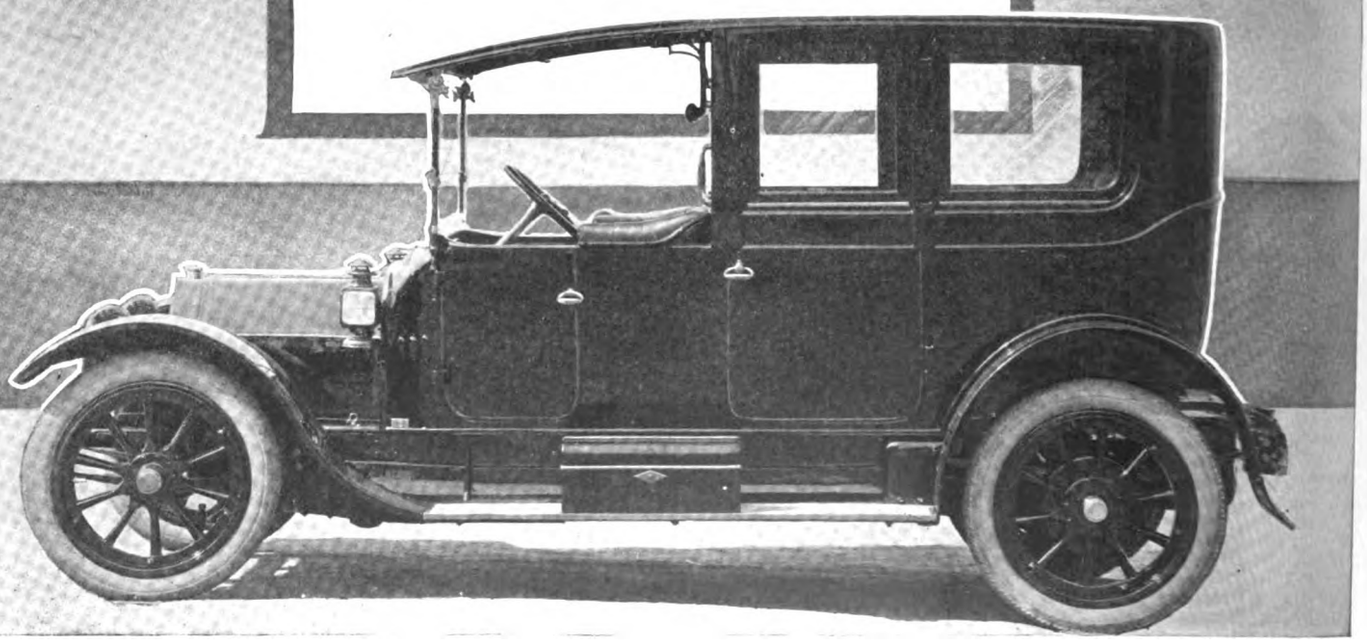
AMERICA'S FAVORITE FOREIGN CAR SOLD AT AMERICAN PRICES

Lancia cars, made in Europe, offer the American buyer every European point of superiority in material, engineering features, workmanship, design and finish—and it is conceded that car building methods which obtain on "the other side" are years in advance of American methods.

And American Dealers can sell Lancia cars at American prices.

DEALERS WANTED

You, Mr. Dealer, know that limited quantity production insures the ***personal attention*** of every man engaged in the building. Lancia production is typically European because it is limited. Here are no American cut and dried operations that produce quantity at the heavy expense of quality.



Lancia dealers use these arguments as the basis for selling arguments.

Car wise buyers who want European automobiles are quick to grasp and act upon them.

There is some choice territory awaiting dealers who are looking for that ***different and better car.*** Are you such a dealer?

Kelly - Springfield

Automobile Tires

There are two basic elements that put mileage into a tire. One is a perfect rubber composition. The other is painstaking hand workmanship. A number of well known tires, we believe, are made of long wearing rubber composition. But no well known tire except the Kelly-Springfield is made by hand.

Kelly-Springfield Tire Company

"Soot-Proof" Spark Plugs Never Balk

Over 2,000,000 Prove it

Not all spark plugs will carbonize. Not all get dirty, grow weak or short-circuit. And not all spark plugs call for frequent replacement. Your customers, Mr. Dealer, want the plug which has all spark-plug advantages and which eliminates all spark-plug faults. Mr. C. A. Mezger—after twelve years spent on spark plug problems—has perfected and patented the Soot Proof Plug. This plug is warranted to clean itself. It never clogs, never leaks, never short-circuits. It lasts for years. It is built with a double chamber and offers at least three times the resistance of any other spark plug made. And it will outlast any other by two or three times over. This has been proven by over two millions in use. One "Soot-Proof" plug will prove this to you. Try it in connection with any other plug and note the results. In a word, "Soot-Proof" Plugs forever wipe out spark plug troubles.

If you are not already handling "Soot-Proof" Plugs, it will pay you to do so. Hundreds of thousands of drivers are using them now and know their worth. Others, who have had trouble with sparking are bound to go to some "Soot-Proof" user for spark plug advice, so the demand for "Soot-Proof" plugs is growing. Get in on the popular demand—it means more and more satisfactory sales for you.

What is a REAL Tire Protector?

One that does not chafe the tires.

What is the cause of chafing?
Loose fitting protectors, due usually to stretching.

Can stretching be prevented?
No—leather, and even fabric, is bound to stretch.

Can it be overcome?
Yes—by pulling the protectors tight by means of stiff springs which take up the stretch automatically.

Are such protectors made?
Yes—the spring attachment is a patented feature of the oldest and most successful make of protectors—

Woodworth Treads.

Dealers! Write for particulars of our selling proposition and demonstrating outfit.

THE FEDERATION OF TRADE PRESS ASSOCIATIONS OF THE UNITED STATES

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

Dixon's Graphite
Transmission Grease No. 677

Here is a grease for transmissions and differentials that is always just right. Changes in temperature don't affect its "body" materially. It flows with the gears without any drag, yet it won't run off when the gears stop. The fine graphite flakes unite with the gear and bearing surfaces, forming a durable veneer. And you have graphite-on-graphite contact instead of grinding, wearing metal-on-metal contact. "Lubricating the Motor," No. 23, explains.

Swinehart Non-Skid Tires

The one type that makes skidding impossible. Both the initial cost and the repair expense of chains and inevitable wear and tear on the fabric of the casing are avoided, representing more than 30% of total tire costs. Swinehart (Keaton) depression type has four times the wearing surface of any other non-skid, and its traction and non-skid properties last until the tire is worn out. Safe and economical.

INTERLOCKS
Double Your Mileage and Stop Tire Trouble

Interlocks are complete inner tires—not inner shoes—placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They insure safety—make new tires give twice the usual mileage, and add 1000 to 5000 miles to old ones. Don't affect resiliency. Make your tires blow-out proof.

NEW SOSS CONCEALED DOOR HINGE NO. 121

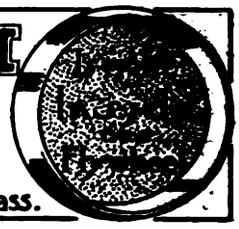
This new hinge requires a pillar only ⅞ inches wide. It is detached by removing two screws as indicated in illustration. The trouble avoided and time gained in hanging doors when using Soss Hinges are important factors.

Soss Concealed Hinges can be install'ed flush with the outside of the pillar, allowing the steel or aluminum panel to be turned over flush on to the face of the hinge, and fastened down securely in the rabbet provided on the edge of the face to receive it, thus allowing more than ordinary clearance.

The non-corrosive case attached to the pillar section of the hinge, prevents water from reaching the wood of the pillar through the hinge.

Description:

Face of hinge on pillar, ⅞ in. x 3¼ in.
Face of hinge on door, ⅞ in. x 2½ in.
Water-proof case mortises into pillar, ⅞ in. x 1⅝ in. x 1¼ in. deep.
Clearance in opening, 11-16 inches.



No 121

UNITED STATES TIRES
ARE GOOD TIRES

Digitized by Google

Saved!

Weed Tire Chains enable you to safely make sharp turns and quick stops when a momentary loss of control means loss of life.

The above picture illustrates one of the numerous situations in which you may be placed during bad road weather — when suddenly someone appears directly in your path and in a fraction of a second you must make a sharp turn and apply the brakes. It is then you require a firm unfailing grip on the road which can only be obtained by equipping ***all*** tires with

Weed Anti-Skid Chains

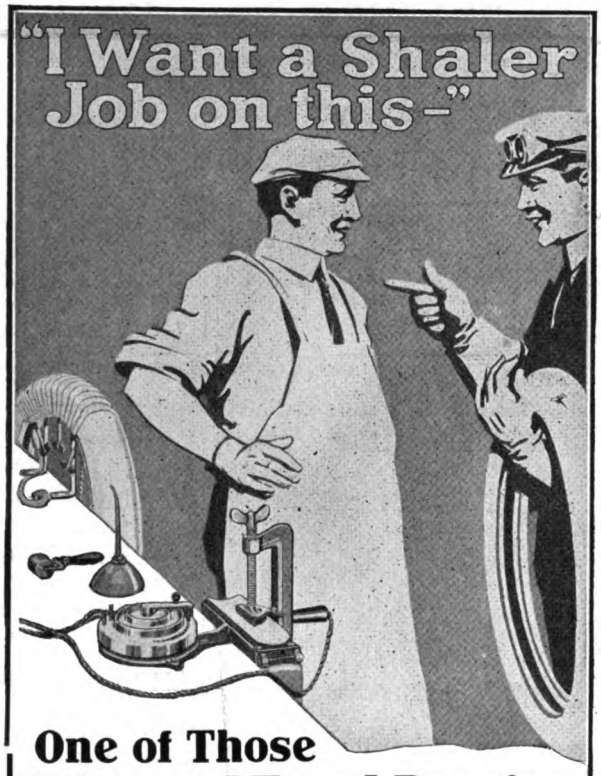
The Only Device that Absolutely Prevents Skidding

The memory of one accident deters future enjoyment in the use of a car. Why run the risk of such accidents and why forfeit the pleasures of motoring ***forever after, when safety can surely be yours by equipping all four tires with WEED CHAINS?***

WEED CHAINS cannot injure tires because "they creep." Easily put on in a jiffy without the use of a jack or other tools. Directions packed with every pair.

Universally Used

WEED CHAINS are generally regarded as the most profitable accessory for the automobile Dealer — Extensively Advertised — Easily Handled — Quick Sellers — No Dead Stock — No Dull Seasons — Liberal Profits — Satisfaction Guaranteed.



Attractive, Decorative, Convincing Hangers regularly supplied to Dealers upon request

DOMINION CHAIN CO., Limited, 137 McGill St., Montreal, Can.

One of Those Wrapped Tread Repairs That Outlast the Tire

The wrapped tread blow-out repair is the best for the motorist because it is stronger than any other and does not make an unsightly section on the tire.

It is the best type of repair for you to make because it is simple, and requires only about half as much material as the old sectional method. Anybody in your garage can make good wrapped tread repairs without a lot of experience, and **you can guarantee the job.**

SHALER Vulcanizers

are the only vulcanizers that use the wrapped tread method successfully because

1. They are the only vulcanizers that heat the tire from the inside and outside simultaneously.

2. They are the only vulcanizers which have a temperature control that is automatic.

Shaler Vulcanizers heat with steam or electricity. One of their biggest advantages is that you can start with a small equipment and increase it to keep up with your requirements. Shaler Vulcanizers will do every practicable kind of tire repairing.

Garage Managers:

Don't fail to write at once for a complimentary copy of the Shaler book, "Common Sense About Tire Repairs." It tells what you want to know about tire repairing and how to start a vulcanizing department. A postal will bring it by return mail.

You will never again complain of "Short Mileage" if you use Diamond {No Clinch} Tires made of Vitalized Rubber

Cross section, Diamond Safety Tread Tire

All types of Diamond Tires are made of Vitalized Rubber—a new process discovered by our chemists which toughens pure rubber so that it will give you the greatest mileage—stand the friction of the road and the pull of the engine—adapt itself from one end of the thermometer to the other—from high speed to low—and under all these conditions you, at the wheel, are riding with mind-comfort and free from possible tire worries.

Additional Diamond advantages

Perfect 3-Point Rim Contact, that holds the rim with a vise-like grip—No-Pinch Safety Flap, for inner tube protection, insuring a worth-while saving in inner tube expense—and, if you wish, the now famous Diamond Safety (Squeegee) Tread.

Be a Diamond Dealer
If you are not a Diamond Dealer, now is the time to get in line. There is a Diamond branch near you—get in touch today.

So this time buy Diamond Vitalized Rubber Tires—you can get them to fit your rims from

MOTOR WORLD

A Trade Paper Giving the World's Motor News

Vol. XXXVI
No. 11

New York, September 4, 1913

Ten cents a copy
Two dollars a year

This Is Another Gray & Davis Year

It begins with the largest order for starters ever placed—50,000 Gray & Davis Systems purchased by one of America's leading automobile manufacturers.

THE insistent demand from motorists for the Gray & Davis Starting-Lighting System, has just led to the biggest order of its kind ever placed. One manufacturer alone, to insure the reliability of his starter, has ordered 50,000 of our systems for use on his 1914 cars.

In addition, 31 other automobile manufacturers use the Gray & Davis Starter, Dynamo, or both in combination.

Marked reliability and efficiency have given the Gray & Davis Starting-Lighting System the leadership in its field. And our reputation has reached beyond the United States. Our business has become international, embracing Gray & Davis branches and service stations in France, England and Germany.

It is this popularity which has led to our need of the largest factory of its kind in the world. You will want in your starter the satisfaction and security given by the great organization back of the Gray & Davis System.

New Automatic Shock Absorber Adjusts Itself to Every Road Condition

Every kind of road makes a different demand upon a car. Generally speaking roads group themselves into three general degrees of ridability — the good — the moderately rough — the very bad.

And recognizing the fact that each kind of road demands a distinctly different degree of spring control—to insure normal spring action at all times—Mr. E. V. Hartford, after a prolonged period of study and experiment — designed the New Automatic Three Degree Friction Absorber — which automatically adjusts itself to varying changes in road conditions and provides the proper tensional control for each.

The New Automatic Shock Absorber is shown in the illustration—its operation is simple and automatic—yet sure and unfailing.

When traveling over good roads—the center arm "C" as indicated, is the only arm of the absorber that works. This is the first or "good road" control — eliminating the slight but noticeable spring oscillation caused by the ordinary road inequalities. Under these conditions arms "D" and "C" remain stationery. When a rougher road or bad cross-walk is met with the arm "C"—by means of arm "P"—which is an integral part of arm "C"—picks up and calls into operation arm "D" on the back side of "C"—doubling the amount of controlling friction. This is the second control. When the very bad type of road is being travelled or crossings particularly severe, arm "E" is also brought into immediate play—imparting the maximum tensional friction of the absorber and supplying a third control designed to overcome the most violent spring rebound.

Reduced upkeep cost—increased comfort and longer tire wear — vastly greater all-round car satisfaction—follow the installation of the

Firestone

Faith and Reason —Both Big Factors in the Choice of Firestone Tires.

FIRESTONE enthusiasts are of two kinds—the man who knows reasons and the man who accepts results. Both have confidence in the steadiness and sturdiness demonstrated over and over again on track and tour.

One man knows the value in the thickness of tread, its extra "give" and "life," the sharp edges, abrupt angles, deep hollows in the "non-skid" lettering.

He realizes that the Firestone in-built mileage which carries men to victory in the race will be his to command on every road.

But—the other man simply depends on the experience of his friends, added to Firestone racing laurels, and he stands pat on the Firestone showing of Most Miles Per Dollar.

Firestone pneumatic tires are guaranteed when filled with air at the recommended pressure and attached to rims bearing either one or both of these inspection stamps. When filled with any substitute for air or attached to any other rims than those specified, our guarantee is withdrawn.

Table of Sizes of Standard Ergon Models:

Model C ---- Bore 3 3-4, Stroke 4 1-2
Model CX---- Bore 4, Stroke 4 1-2
Model D ---- Bore 4 3-8, Stroke 6

(Note: In Model D Timing Gears are replaced by Renold Silent Chain Drive.)

Upon order we can make prompt delivery of any Ergon Standard Motor either as independent or as unit power plant arrangement.

Provision has been made in the crank case of each Ergon Motor designed for pleasure car practice to house any of the standard electric starting-lighting systems.

Ergon Long Stroke Motors have shown a remarkable degree of efficiency in truck practice. We cannot urge too strongly the investigation of Ergon Motors for commercial purposes.

Engineers are always welcomed at our plant. Send for preliminary information and blue prints.

NEW PRESIDENT AND A NEW MOTOR FOR PALMER-SINGER

Singer, Sr., and Knapp "Swap" Presidency and Vice-Presidency—Line to Include Magic Motor with Crescent Sliding Valves.

Reports which have been in circulation for some time, that as a result of the investment of new capital, a reorganization or semi-reorganization of the Palmer & Singer Mfg. Co., of Long Island City, N. Y., would be brought about, were partially confirmed late last week, when Charles A. Singer, Sr., president of the company, and Clyde D. Knapp, first vice-president, exchanged places.

President Knapp, it is stated, was elected to represent certain Standard Oil interests which control the Motor & Gear Improvement Co., of New York, which, in turn, controls the rights to the Magic motor in this country. Knapp is also president of the Aristos Co., of New York, which is closely related to the Motor & Gear company.

Other than the changes in the offices of president and first vice-president, the officials of the Palmer & Singer company remain unchanged. Charles A. Singer, Jr., is still second vice-president, G. Stanley Heft treasurer, S. P. Woodard secretary and H. R. Callison assistant treasurer.

While official announcement has not been made, dealers have been so informed, and it therefore is no secret that Knapp's elevation to the Palmer & Singer presidency will be followed by the production of a Palmer-Singer car which will utilize the Magic motor, which in tests has given a remarkably good account of itself. It will be the first American car to employ the German engine and, because of the fact, it is bound to command attention. The newcomer, however, will not interfere with the manufacture of the Palmer-Singer poppet valve models.

The Magic motor is not unlike the Knight-Davidson motor in construction, the principal difference being that whereas both employ sliding crescent valves in place of the usual poppet valves, those of the Magic motor come in contact with the pistons and those of the Knight-Davidson do not. The valves in the Magic motor are actuated by camshafts and small bell cranks operating in slotted grooves, thus providing for positive timing. The motor is otherwise distinctive by reason of the use of separate cylinder heads on a four-cylinder block casting.

Fisher Forms a Canadian Company.

Frank E. Fisher, who resigned the management of the Studebaker Corporation's Canadian factory several months since, has organized the Fisher Motor Co., with an authorized capital of $150,000, which has acquired the former Tudhope Motor Co. plant in Orilla, Ont., which has been shut down for several months. It is the intention to continue the manufacture of cars at Orilla until January 1st, when the industry will be transferred to Walkerville, Ont., opposite Detroit. Fisher is the president of the company which bears his name. Among his associates are C. F. Geraghty and F. W. Vollans.

Would Forbid Flag as Trademark.

Representative Murray, of Massachusetts, has introduced a bill into Congress which seeks to prohibit the use of the national flag as a trademark or other commercial symbol and which would limit its use to military and patriotic organizations. There already exists a law forbidding the placing of advertising matter of any sort on the flag.

Campbell Assumes Colby Presidency.

John Campbell, of Rockwell, Iowa, has been elected president of the Colby Motor Co., of Mason City, Iowa. His son, John L., already was treasurer of the company and a brother, Joseph C., a member of the board of directors.

MITCHELL-LEWIS REINS PLACED IN McLAREN'S HANDS

Former Tire Man Is Made President and Official Make-up Otherwise Altered—Bankers Lessen Their Control of Affairs.

After having been directed and otherwise managed by an executive committee representing Chicago and New York bankers, since they refinanced the company in the fall of 1911, the Mitchell-Lewis Motor Co., of Racine, Wis., has been, in a measure, restored to its stockholders. At any rate, the executive committee management has been eliminated and H. L. McLaren has been elected president and general manager, to succeed Joseph Winterbotham, Jr., who was appointed the bankers' representative in 1911 and who later formally assumed the presidency when William Mitchell Lewis relinquished that office.

The new head of the company was at one time identified with the United States Tire Co., but for the last year or so has been vice-president of the Racine Rubber Co.

The Mitchell-Lewis charter, which was amended when the bankers assumed control, was re-amended last week, in order to eliminate executive committee control, and permit of the new order of things, which carried with it not only a new president but practically an entire slate of new officers.

John W. Bate, factory manager of the Mitchell-Lewis company since Mitchell cars first were built, has been elected first vice-president and will continue to serve as factory manager. The other officers are: William T. Lewis, second vice-president; F. L. Mitchell, treasurer; H. E. Redman, secretary; O. C. Friend, general sales manager; G. W. Morgan, purchasing agent; M. J. Gillen, general counsel

According to the official announcement, "the bankers and all the stockholders are not only of one accord as to this change but are loyally supporting it for five years."

FIXES DATE FOR ALLOTTING SHOW SPACE; ISSUES RULES

Chamber Whipping Details of National Exhibitions into Shape—Pleasure Cars Explicitly Defined—Other Regulations.

October 2nd has been set as the date for the first allotment of space at both the New York and Chicago shows. The allotment, which covers all applications received up to noon of September 27, will be made at the New York office of the Automobile Chamber of Commerce and, as heretofore, members of the Chamber will be served first and thereafter other applicants will draw for choice of positions. This, of course, does not apply to members of the Motor & Accessory Manufacturers, Inc., for whom, as usual, a block of space has been set aside and who will make their own apportitonment. Priority will be given to those who have exhibited at the largest number of shows held under the auspices of the Chamber of Commerce or its predecessors, the National Association of Automobile Manufacturers and the Automobile Board of Trade. In the event of conflict, the order of drawing will be decided by lot.

The application blanks, rules and space diagrams for both shows made their appearance this week. They disclose that the Chamber of Commerce has officially adopted the resolution affecting exhibitors at unsanctioned shows which was enforced by its predecessors, the line of demarkation or disqualification, however, being placed at unsanctioned shows held after July 18, 1913; this new date has the effect of restoring to good standing all of those who may previously have been disqualified.

As is already well known, both the New York and Chicago exhibitions will consist exclusively of pleasure vehicles, which restriction is made even more explicit by being defined as "passenger cars designed for private use," which means that 'buses and similar conveyances for public utility purposes will not be admitted. No exhibitor other than a manufacturer of complete automobiles will be permitted to show a body mounted on a complete chassis, although bodies may be shown mounted upon stands or trestles.

All exhibitors are prohibited from displaying "apparatus which has painted thereon any advertising matter, trade mark or name, whether the same be painted upon the apparatus direct or upon separate plates."

Manufacturers are also forbidden to display goods in operation if "such goods are noisy or objectionable to surrounding exhibitors." Also special permission will be required for the display of any mechanically operated or illuminated exhibit, which likewise is the case with printed matter or souvenirs.

Special permission also must be obtained for the display of horns, bells, whistles and alarms of all kinds and no permission will be granted except on the undertaking of the exhibitors that reeds shall be removed, or such other alterations made as to render impossible production of sound by the instrument; it is specifically provided that disconnection of wiring will not be considered sufficient.

Except those provided by the management, no "Sold" or other placards and no pictures of factories, stores, cars or other subjects will be permitted to be displayed.

The admission fee will be 50 cents, except on Wednesday, when it will be doubled. Previously there were two so-called "dollar days." So-called trade tickets, which will be issued in the form of special invitations, will be sold in lots of not less than 50, but their cost will be 50 cents each. Bona fide automobile dealers who prove their identity will, as heretofore, be furnished with an agents' admission badge. Attendants also will be admitted by badge and for the first time there will be a special form of badge for the use of female attendants.

Uniformity of decoration and equipment, of course, will prevail, the price per square foot, including equipment, ranging from $1.50 to $1.10 at Grand Central Palace, New York, and $1.25 to 75 cents at the Coliseum and Armory in Chicago. The sub-letting of space is prohibited.

For the first time, Chicago practice will prevail in New York and the Grand Central Palace show be inaugurated at two o'clock in the afternoon instead of eight P. M., as hitherto has been the rule. Thereafter the doors will open at 10 A. M. each day and close at 10.30 P. M.

Lops $5 off Price of Newtone.

Having increased the output of Newtone horns to more than 2,700 a week, the Automobile Supply & Mfg. Co., of Brooklyn, has reduced the price of the horn to $15, a cut of $5. During the year 1911 the average weekly production of Newtone horns was 350, in 1912 it was increased to 900, and during the first six months of the present year to 2,765, two enlargements of the plant permitting the increase. A further increase of facilities, it is expected, will enlarge the factory to 5,000 Newtones weekly. In addition, the Brooklyn company continues to produce bulb horns on a surprising scale. For the present year, it places its production at 400,000 of such horns.

COUZENS THROWS LIGHT ON RUMORS OF FORD AFFAIR

Makes Plain Company's Intentions as to Wire Wheels—Denies Connection with Dodge Car—Commends Motor World's News.

While it is no secret that the Ford Mo Co., of Detroit, is making some use of wi wheels, published reports that it had adop ed them, much less being engaged in the erection of a plant for their production were denied late last week by none other than James Couzens, vice-president and treasurer of the Ford company, whose right to speak by the book is not to be challenged.

"There is absolutely no foundation in the rumor that we are going to use all wire wheels next year," he said in reply to Motor World's direct question. "Neither is there any truth in the report that we are building a plant to make them. We may use wire wheels after the first of the year or when we get around to it, but we are not going to adopt them in entirety and we are not going to manufacture those we do use. The story to that effect published in one of Motor World's contemporaries is absolutely without foundation."

Couzens also thoroughly punctured the entertaining report that the Ford company is or would be in some way interested in the Dodge car, which is to be produced by Dodge Bros., of Detroit, who are Ford stockholders and who for years have manufactured certain Ford parts. On the face of things, as Motor World stated last week, the story that Ford would be interested in the making or marketing of the Dodge car was highly improbable, a view which is even more emphatically expressed by Couzens.

"We know nothing about the car that Dodge Bros. are to build, have no connection with it, financially or otherwise, and have no idea when it is to be exhibited or the price at which it is to be sold," said Couzens. "There is nothing in such reports."

Commending as "good business" Motor World's policy of confirming news before printing it, Couzens remarked a state of mind that exists in many high places in the trade.

"We believe the publishing business has been injured greatly," he said, "by the fact that much of what is printed is unreliable. Being on the inside of so many things I fear almost to believe anything I see in the papers, or, if inclined to believe any of it, only after it has been greatly discounted."

L. J. G. COMPANY ABANDONS WHITE PLAINS; GOES WEST

Grossman Hopes to Find More Profitable Manufacturing Territory—Success that Failed to Come in Suburb of New York.

After having tried it for several years, George J. Grossman, president of the G. J. G. Motor Co., has become convinced that there are better places than White Plains, N. Y., for the manufacture of motor cars. Accordingly, he has leased his plant in that village to a publishing firm and is seeking a new location for his motor company in the West.

White Plains is practically a residential suburb of New York, and when Grossman first established himself there he erected what was known as the Mammoth Garage, a term which aptly fitted the structure. It was then one of the largest one-floor garages in the country, containing 21,600 square feet. The building, a fireproof, concrete, postless structure, is 80 x 270 feet and is splendidly appointed, having two separate heating plants and its own electric lighting and power outfit.

It was generally understood that Grossman built the place largely for the benefit of his two sons, but as a garage it proved unprofitable and Grossman, therefore, gradually drifted into the manufacture of complete cars. He called his productions the Cruiser, Pirate and G. J. G., but they failed to become real factors in the business, and of late he has devoted himself chiefly to the production of chassis, with which he specially sought the patronage of carriage builders. His venture in that direction likewise failed to prosper, and it has been a matter of speculation how much longer he would continue to pour money into the enterprise. As stated, he now is convinced that the West holds more prospect of success, but just where he will locate has not yet been settled.

Grossman, himself a man of means, at one time held the Cadillac agency for New York City, but about five years since relinquished it, and thereby permitted another snug fortune to escape him.

Seeking to Revive Lansden Business.

Due to the efforts of H. L. Davisson, trustee in bankruptcy, the property of the Lansden Co., which several months since was removed from Newark, N. J., to Allentown, Pa., is being shipped back to Newark, where it will be reinstalled in the same factory it previously occupied and the work of producing Lansden electric vehicles will be recommenced. John B. Wickery, the former sales manager of the Lansden Co., is acting as manager for the trustee and the work of reestablishing the Lansden business will be conducted under his direction. It is stated that the company has orders on hand sufficient to justify the move and that with proper handling the claims of all creditors can be satisfied.

Commer Truck Makers Sue for $49,000.

Commercial Cars, Ltd., of Luton, Eng., manufacturer of Commer trucks, this week filed a complaint in the United States District Court for the Southern District of New York against Clarence F. Wyckoff and Ernest S. Partrtidge, demanding $49,704.54; this sum is claimed on bills of exchange made by the Commer company between October 31, 1911, and February 9, 1912, and accepted and endorsed, it is claimed, by Wyckoff and Partridge, who were members of Wyckoff, Church & Partridge, the Commer distributers in America before they went into bankruptcy. The claim is made up of 28 separate causes of action, and contains 169 clauses. The claims range from small amounts up to sums slightly in excess of $2,000.

Grossman Adds "Manufacturing" to Name.

That its corporate name may more clearly designate its vocation, the Emil Grossman Co., of New York City, manufacturer of "Red Head" spark plugs and other accessories, has made application to the Supreme Court for New York county for permission to change its name to Emil Grossman Mfg. Co. The move entails but little change in the company, its personnel and capitalization remaining the same; as the name now stands, the company states, it might mean jobber, selling organization or manufacturer.

Cutting Indorsers Can't Get Release.

W. W. Clark and F. L. Holmes, of Jackson, Mich., as indorsers of notes of the bankrupt Cutting Motor Car Co. in that city, have failed in their efforts to have released nine attachments which are pending on the property of the company. Clark applied for an order of discontinuance, but Judge Cheslet last week denied the request. He held that the attachments were in proper form and amply sustained by proof.

Making More Room for Hazard Motors.

The Hazard Motor Mfg. Co. is erecting a 60 x 130-foot addition to its plant in Rochester, N. Y. The enlargement will permit the output of the Hazard company's motors to be increased to approximately 5,000 a year. At present, several departments are operating 20 hours per day to keep pace with the demand.

MONOGRAM OPENS CAMPAIGN AGAINST OIL SUBSTITUTERS

Hales International "League" into Court and Demands $10,000 Damages—Weed Also Pursues Bidwell's "Organization."

As the opening move in a campaign against the substitution of other oils for the Monogram brand, the New York Lubricating Oil Co. filed suit this week in the Supreme Court for New York county against the International Automobile League, of Buffalo, for $10,000 damages and an injunction restraining the "League" from sending out other oils under a Monogram mark. Service was secured on Alfred C. Bidwell, the president of the "League," at 270 Division street, Buffalo, N. Y.

The specific instance upon which the charge of substitution is based is the alleged shipment by the "League" to J. Mosby West, of Richmond, Va., of a barrel of oil which was marked "Monogram Medium," both on the barrel and on the shipping tag attached. The oil was shipped to Mosby, was located by the Monogram company and shipped to New York City, where it is held as evidence. That substitution of other oils for Monogram has been made by other offenders is the contention of the lubricating company. The Monogram company brands its mark onto the head of the barrel and in the case of bottles and tins a different but distinctive mark is used. In its complaint the Monogram company goes into a lengthy recital of the nomenclature of the company and the length of time and amount of money which have been spent in building up a reputation for its product, and it is averred that the name Monogram has become allied in the public mind with a high grade of lubricating oil.

While the "League" did not duplicate the Monogram style and mark, but merely painted the name upon the barrel, it is charged that the defendant organization "applied a brand containing the word Monogram in a manner similar to that in which the plaintiff has been and is accustomed to brand the plaintiff's barrels, in such manner as to deceive the public into the belief that the oils so branded and offered for sale by the defendant were in fact the oils manufactured and vended by the plaintiff."

As regards the motive in the substitution, it is claimed that "the sole object of the defendant in such use of the word Monogram is to deceive the public and the customers of the plaintiff into the belief that they were purchasing plaintiff's goods when actually they were the goods of the defend-

Digitized by Google

ant." Allegations of unfair competiiton and fraudulent methods of merchandising are made in the papers. No statement as to the quality of the oil shipped is made and the matter of price is not touched upon, but those who are familiar with the "League" are aware of the fact that "members" are supposed to get "standard" articles at cut prices.

Aside from the Monogram suit and the recent financial internal trouble which beset the "League" and Bidwell, he is also being pursued by the Weed Chain Tire Grip Co., which January 13th last secured against him a decree restraining him from infringing the Parsons patent, No. 723,299, and directing that an accounting be taken to ascertain the damages due the Weed company. The present trouble is due to the accounting.

To conduct these proceedings it is necessary for the "League's" books to be examined, and for that purpose Bidwell and his bookkeeper were subpoenaed into court in Buffalo last week. But Bidwell sent his lawyer and failed to appear. His excuse was that he had furnished heavy financial backing for an Elks' ball game which was being played that day and could not forsake the ball tossers for the accounting.

Accepting the excuse, the accounting proceeded—for a short time—and an effort was made to garner information from the bookkeeper, but what the Weed representative learned from the books and the bookkeeper did not require many sheets of paper to record. The examination was adjourned to September 24.

In a dicker over a prospective settlement without an accounting, a Weed lawyer said, "Well, let's see; you've got 60,000 members——"

"No, no!" interrupted the "League's" attorney. "That's what we advertise; we haven't got as many as that."

Michigan Plant Not Sold to Gerber.

Spreadeagle reports that the Edw. F. Gerber Co., of Pittsburgh, had purchased the plant of the bankrupt Michigan Motor Car Co., in Kalamazoo, are repudiated by the receiver, the Detroit Trust Co., which denies that the Gerber company is even negotiating for the property. The Gerber people handled Michigan cars and buggies on a large scale and it is understood that their notes for advance payments to a large amount were among the many discounted by the bankrupt in its effort to kept afloat.

The Westinghouse Air Spring Co., of Pittsburgh, Pa., which manufactures the shock absorbers developed by George Westinghouse, has added $500,000 to its capital stock. The increase is from $2,000,000 to $2,500,000.

DRAFTS FOR FAULTY CARS NOT BINDING ON DEALERS

Nation, of Oklahoma City, Wins Out in Suit Over Cars He Had Accepted —Puts Them in Storehouse and Then Has Them Attached.

That a dealer is not obliged to pay for cars which are found not up to specifications even though the dealer has unloaded them and signed the drafts which accompanied the bills of lading, is the gist of a decision rendered last week by the United States District Court in Oklahoma City, Okla., in a controversy involving the Michigan Buggy Co., of Kalamazoo, Mich., the Kalamazoo Savings Bank and the National Motor Car Co., of Oklahoma City, a dealership house of which W. E. Nation is the head.

National contracted October 5, 1911, for three Michigan cars to be shipped at once on notes of 30, 60 and 90 days; the cars were shipped December 18, 1911, with bills of lading for the terms specified in the notes. Upon the arrival of the cars Nation refused them because of the terms and also because he was not permitted to examine them before accepting them. He states, however, that he was persuaded by a representative of the Michigan company to sign the drafts and take the cars, and that after he got them upon his salesroom floor he found them not according to the contract.

He immediately placed the cars in storage, subject to the order of the Michigan company, and let the drafts go to protest, whereupon the Kalamazoo Savings Bank brought suit, claiming to have been the innocent purchaser of the drafts. Nation's answer was that there was conspiracy between the bank and the Michigan company to commit fraud by making Nation pay for cars not up to order. The court dismissed the case and denied a new trial.

Nation then attached the cars as the property of the Michigan company on the Nation claim for the original deposit and damages. The Michigan company has indicated its intention of contesting the matter further, and Nation states that he has no intention of relinquishing the advantage thus far gained.

Grand Rapids Truck Brings $17,050.

At the receiver's sale of the property of the Grand Rapids (Mich.) Motor Truck Co. last week, the physical assets were purchased for $17,050 by Frank T. Hulswit, a former official of the company, who also assumed the mortgage on the real estate. It is possible that Hulswit will undertake the formation of a new company, although it is not unlikely that negotiations for consolidation with the Michigan Hearse & Carriage Co., which fell through when the truck company's financial condition became apparent, will be renewed on new lines.

Eveland Manager Killed in Wreck.

Howard F. Martin, general manager of the Eveland Engineering Co., of Philadelphia, Pa., and his wife were killed Tuesday morning, 2nd inst., in a wreck on the New York, New Haven & Hartford Railroad near New Haven, Conn., when one train crashed into the rear end of the train ahead which had been stopped. A score were killed and many injured.

Martin was 45 years old and originally lived in Bridgeport, Conn., but had resided in Pennsylvania for 20 years; he was general sales manager of the Pennsylvania Steel Co. for many years, recently taking a position with the Eveland company in Bryn Mawr, his residence, both he and Mrs. Martin were active in church work and Martin was a member of the Art Club and the Manufacturers' Club in Philadelphia.

He left August 8th on a vacation with Mrs. Martin and Mr. and Mrs. Samuel S. Eveland; they toured Connecticut, and which the Martins went to Maine, where they were returning at the time of the wreck.

The Eveland company originally brought out the Vulcan electric gear shift and which is now the U. S. L. electric lighting and starting system.

Shanks Parts from Kelly Truck.

Quite unexpectedly, Charles B. Shanks who last year became general sales manager of the Kelly-Springfield Motor Truck Co., of Springfield, Ohio, has severed his connection with the company, his action being the result of a dispute over a five-year contract entered into in September, 1912.

At that time E. S. Kelly was president of the company. Later, or within ten days of the time the contract was made with Shanks, control passed, via purchase, to the American Light & Traction Co. of New York. At the same time the name of the company was changed from the Kelly Motor Truck Co. to the Kelly-Springfield Motor Truck Co.

Shanks's contract apparently was taken over by the new company as salary and commissions were paid under its terms without protest. Subsequently the new company announced that it repudiated the contract, but Shanks refused to waive claim, with the result that a situation developed which caused a parting of the ways. Shanks has announced no plans for the immediate future.

The Week's Incorporations

Iowa City, Iowa—Johnson County Motor Racing Co. Corporators—O. H. Carpenter and others.

Rosendale, Mo.—Wright Auto Co., under Missouri laws; to operate a garage and deal in motor cars.

Rutherford, N. J.—Sam Dressler, Inc., under New Jersey laws; authorized capital, $50,000; to buy and sell motor cars.

Seattle, Wash.—R. W. Abbott Motor Car Co., under Washington laws; authorized capital, $5,000. Corporators—R. W. Abbott and E. A. Manion.

Thompsonville, Conn.—Blissland Leather Co., under Connecticut laws; authorized capital, $25,000; to produce automobile top and upholstery leathers.

Seattle, Wash.—Automobile Accessories Co., under Washington laws; authorized capital, $25,000. Corporators—O. D. Colvin, J. C. Burlock and others.

Chicago, Ill.—Ogren Motor Car Co., under Illinois laws; authorized capital, $25,000. Corporators—George H. Wilkins, Carl E. Duval, Fred H. Johns.

Kansas City, Mo.—Thorp-Allen Motor Co., under Missouri laws; authorized capital, $10,000. Corporators—Wm. R. Thorp, H. B. Thorp, H. L. Allen.

East Palestine, Ohio—National Tire & Rubber Co., under Ohio laws; authorized capital, $150,000. Corporators—C. J. Davis, R. F. Taggart, William Smith.

Farmington, Mo.—St. Francois Motor Co., under Missouri laws; authorized capital, $4,000. Corporators—Martin L. Clardy, Jr., R. P. Lang, Carlisle E. Rozier.

Wilmington, Ohio — Wilmington Auto Co., under Ohio laws; authorized capital, $10,000. Corporators—Carl S. Bangham, Frank L. Gallup, M. H. Hoskins.

Cleveland, Ohio—Rauch & Lang Electric Car Co., under Ohio laws; authorized capital, $10,000. Corporators—William H. Marlatt, C. F. L. Weiber, Jr.; E. J. Stahl.

Seattle, Wash. — Northwestern Automobile Mfg. Co., under Washington laws; authorized capital, $2,750. Corporators—Frank W. Bishop, Clarence G. Vail and others.

Oklahoma City, Okla.—Hupmobile Sales Agency, under Oklahoma laws; authorized capital, $5,000. Corporators—W. H. Say, L. S. Liggett, Harry Pole, all of Oklahoma City.

Sheboygan, Wis.—Town of Herman Auto Transit Co., under Wisconsin laws; authorized capital, $8,000. Corporators—William Grosshuech, August Frome, Jr., W. F. Buscher.

Los Angeles, Cal.—Machinery & Motor Exchange, under California laws; authorized capital, $10,00. Corporators—C. E. Shaul, T. E. Smith, M. Wantoch, A. Schaffer, R. J. Gardner.

Cairo, Ill.—Angier Automobile Service Co., under Illinois laws; authorized capital, $200; to operate an automobile taxicab service. Corporators—W. E. Angier, Mrs. P. M. Angier, D. C. Morrison.

Coffeyville, Kan.—Isham Garage Co., under Kansas laws; authorized capital, $5,000; to operate a garage. Corporators—E. H. Hess, George N. Upham, Sarah H. Hess, Charles D. Welch, Guy Bayless.

Los Angeles, Cal.—International Automobile League of California; under California laws; authorized capital, $200,000. Corporators—H. E. Rudd, L. E. Hepburn, M. M. Driscoll, S. H. Tuck, J. A. Stone.

Chicago, Ill.—Auto Hoist Co., under Illinois laws; authorized capital, $50,000; to handle automobiles, accessories, patents and inventions. Corporators—W. S. Stewart, L. E. Long, William P. MacCracken, Jr.

Chicago, Ill.—Orphans' Automobile Day Association, under Illinois laws; to conduct automobile outings for poor and orphan children. Corporators—George B. Foster, Homer E. Mesz, Burt B. Parker.

Glencoe, Ill.—Glencoe Garage & Livery Co., under Illinois laws; authorized capital, $5,000; to conduct a garage and general livery business. Corporators—Thomas W. Whitson, Isaac S. Brill, Isaac B. Lipson.

Muskogee, Okla.—Muskogee Vehicle & Machinery Co., under Oklahoma laws; authorized capital, $10,000; to deal in general power machinery and vehicles. Corporators—R. A. Lester, N. Lester, Walter Van Allen.

Toledo, Ohio—Toledo Cooperative Garage Co., under Ohio laws; authorized capital, $10,000; to operate a garage. Corporators—Harry L. Stebbins, Metha L. Stebbins, John Felkes, D. D. Felkes, Herbert Felkes.

Louisville, Ky.—Helical Shock Absorber Co., under Kentucky laws; authorized capital, $120,000; debt limit, $1,000; to manufacture a shock absorber. Corporators—George C. Knnapel, M. C. Fullenlove, C. C. Hieatt.

St. Louis, Mo.—Anslem-Ganahl Motor Car Co., under Missouri laws; authorized capital, $5,000; to buy and sell motor cars, parts and accessories. Corporators—Roy W. Anselm, Leo F. Ganahl, Richard and J. Ganahl.

Kenosha, Wis.—R. J. Murray Mfg. Co., under Wisconsin laws; authorized capital, $10,000; to conduct a general metal manufacturing and repairing business. Corporators—Raymond J. Murray, John B. Butcher and others.

New York, N. Y.—H. C. Well Perfect Motor Co., under New York laws; authorized capital, $25,000; to manufacture and deal in motor cars. Corporators—H. C. Well, M. M. Well, F. B. Knowlton, all of New York City.

Columbus, Ohio—Central Auto Vehicle Co., under Ohio laws; authorized capital, $10,000; to deal in automobiles. Corporators—John K. Kennedy, S. A. Webb, Clarence M. Addison, Wilbur E. Benoy, Allie V. McLaughlin.

Pittsburgh, Pa.—Chester Rubber Tire & Tube Co., under Delaware laws; authorized capital, $250,000; to manufacture, sell and deal in tires and tubes. Corporators—Morgan Howells, Ephriam Lyon, C. E. Jarvin, all of Pittsburgh.

St. Louis, Mo.—Palmer-Meyer Motor Co., under Missouri laws; authorized capital, $100,000; to manufacture motor cars and accessories and equip a repair shop. Corporators—Charles W. Palmer, Frederick C. Meyer, Ferdinand A. Meier.

New York, N. Y.—S. & K. Tire Co., under New York laws; authorized capital, $10,000. Corporators—James J. Coomber, 358 West 15th street, New York City; Herman Senner and Bernard J. Kaplan, both of 115 West 30th street, New York City.

New York, N. Y.—Frederick Smith Auto Sales Co., Inc., under New York laws; to sell cars and supplies. Corporators—Alanson P. White, East Orange, N. J.; A. H. White, Passaic, N. J.; Harry Wolkof, 583 Bedford avenue, Brooklyn, N. Y.

Brooklyn, N. Y.—Ohlsson Spring Tire Co., under New York laws; authorized cap-

ital, $30,000; to manufacture and sell motors and accessories. Corporators—Charles J. Ohlsson, Joseph Maddocks, Peter J. Butterly, 46 Berkeley place, Brooklyn.

Utica, N. Y.—H. W. Skinner Motor Car Co., Inc., under New York laws; authorized capital, $5,000. Corporators—Harry W. Skinner, New Hartford, N. Y.; Edmund C. Richards, 12 Miller street, Utica; David G. Comstock, 479 Prospect place, Brooklyn, N. Y.

Indianapolis, Ind.—United Supply & Accessories Co., under Indiana laws; authorized capital, $10,000; to deal in automobiles, aeroplanes and other vehicles. Corporators—E. Beveridge Dill, Ernest L. McCloy, Edward C. Ilg, Charles E. Rochat, Geo. L. Kempf.

New York, N. Y.—Jesco Equipment Co., Inc., under New York laws; authorized capital $12,000. Corporators—Frank D. Boulanger, 323 Canal street, New York City; Alfred Ware, 200 Hudson street, New York City; George W. Wacker, 60 Ely place, East Orange, N. J.

Brooklyn, N. Y.—South Brooklyn Garage, Inc., under New York laws; authorized capital, $5,000. Corporators—Hal C. Washburn, 256 16th street, Brooklyn; Chas. Bestelmann, 1720 Webster avenue, New York City; August W. Rath, 405 Fairmount avenue, Jersey City, N. J.

Recent Losses by Fire.

Lincoln, Ill.—Wasson Co., garage damaged. Loss, $5,000.

Natchez, Miss.—Natchez Auto & Supply Co., garage and three cars destroyed. Loss, $12,000.

Highland Mills, N. Y.—Thompson Garage, Frank H. James, proprietor; destroyed. Loss not stated.

Long Island City, N. Y.—Edwards Motor Car Co., Borden avenue; warehouse destroyed. Loss, $15,000.

Philadelphia, Pa.—Joseph Kane & Co., 1244 North Hutchinson street; garage destroyed. Loss not stated.

Cedar Rapids, Ia.—Barton Motor Car Co., 606-8 2d avenue; garage and fifteen cars damaged. Loss, $25,000.

Jamaica, N. Y.—Frank Baerlein, Newton road and Jamaica avenue; garage damaged and thirteen cars destroyed. Loss, $25,000.

Changes in Capitalization.

Detroit, Mich.—Grant Motor Co., from $165,000 to $200,000.

Detroit, Mich.—Detroit Auto Exchange, from $8,000 to $10,000.

St. Joseph, Mo.—Holliday Motor Car Co., from $10,000 to $15,000.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

H. E. Doty has been appointed manager of the Haynes branch in Chicago. He succeeds Webb Jay, resigned.

Harry M. Newman has been promoted to the post of manager of the Moon Motor Car branch in Chicago, of which he became sales manager in March last. Previously he was identified with the Washington (Pa.) Automobile Co., which handled Moon cars in that part of the Keystone State.

Charles R. Culver, sales manager of the Knox Automobile Co., of Springfield, Mass., with which he has been identified almost from its inception, has resigned that connection to become sales manager of the Stoddard Motor Car Co., of Springfield; the latter handles the Pierce-Arrow car and the Selden truck.

C. A. Hamilton has been elected president of the Racine Mfg. Co., the body building concern located in the Wisconsin city of that name. He succeeds Frank K. Bull, who retired in order to devote himself wholly to the J. I. Case T. M. Co., of which he is the head. Previously Hamilton was vice-president of the Lavigne Gear Co., of Racine, and at one time he was associated with the Wisconsin Engine Co.

Frank E. Smith, former general manager of the Maxwell-Briscoe Newcastle Co., has been elected vice-president of the American Motors Co., of Indianapolis; he will have special direction of factory production. He succeeds P. S. Menasco, who has gone to the Pacific Coast to assume charge of the American interests in that part of the country. Smith is one of the best known automobile men in Indiana and acquired a high reputation during the four years he was in charge of the Maxwell-Briscoe Newcastle property. When it became involved in the failure of the United States Motor Co., Smith was appointed receiver and added to his repute by earning a handsome profit, while all others of the United States Motor group netted a loss.

Wants Balance Due on Two Garfords.

Claiming that John Stanley Frazer, of Frazer & Burchenal, contractors at 1 Madison avenue, New York City, failed to meet notes for $7,500 given as part payment on two 6-ton Garford trucks, the R. & L. Co., Garford dealer in the metropolitan district, filed suit this week in the Supreme Court for New York county against Frazer. It is claimed that Frazer paid $3,000 when he got the trucks, June 5, 1913, and arranged to pay the balance of $8,000 in 16 monthly notes of $500 each, but that he paid only the one due July 31.

Minor Business Troubles.

Proceedings in bankruptcy have been instituted against the Standard Vulcanizing & Tire Co., of Nashville, Tenn. The petitioners are Paul Moore, Rocky City Tin & Copper Works, Chester Motor Car Co., John W. Chester and J. Melvincove.

Because the Michigan Buggy Co., which failed, owed the Sandusky (O.) Auto Parts & Motor Truck Co. $150,000, the latter has been placed in the hands of receivers at the request of stockholders; William M. Harsh, one of the receivers, will superintend the mechanical end of production, and the other, Daniel S. Storms, will manage business affairs. Despite the fact that $300,000 will be needed to pull the parts company through, it is believed this can be done as the Michigan account proves of any material value.

Theodore A. Kaplan, who was manager and proprietor of the Kaplan Auto Supply Co., which opened up in February, 1912, in Newark, N. J., and which later went into bankruptcy, has been ordered by the court to explain what became of $3,000 worth of stock which is alleged to have disappeared during the three months prior to the failure. Last February an inventory showed assets of $4,160 and liabilities of $6,2[illegible], while at the time of the bankruptcy the assets had dwindled to less than $3,[illegible] and the liabilities exceeded $7,000.

The Tobin Whichway Signal Co., of New York City, which set out to manufacture a tail lamp signal which indicated the driver's intention to turn to the right or left or stop, was the object of a petition in bankruptcy filed last week in the Federal court in New York City; the petitioners and claims are Stanley & Patterson, Inc., $713; U. T. Hungerford Brass & Copper Co., $73; H. W. McCandless & Co., $104. It is charged that the company committed an act of insolvency when it permitted Horseless Age to secure a judgment for $496. The liabilities are said to be $13,000 and the assets $2,[illegible]. The company incorporated in May, 1[illegible], with $50,000 capital and John W. Tobin as president and treasurer.

H. S. Firestone, president of the Firestone Tire & Rubber Co., returned from abroad last week. He had been absent six months, which were spent chiefly in the pursuit of pleasure in company with his family.

In the RETAIL WORLD

A. L. Crowthers & Son, of Coshocton, Ohio, are about to erect a garage and machine-shop.

The King Bros. Machine Co., of Spring City, Tenn., is about to open a repair-shop in Harriman, in the same State.

The Highland Garage, of Louisville, Ky., is erecting a fireproof machine-shop; the garage is located at 1064 Bardstown road.

Edward L. Bellman has opened a garage in Fort Atkinson, Wis. It will be operated in connection with the Hotel Lawton.

Prewitt & Howell, hardware dealers in Mt. Sterling, Ky., have entered the commercial car trade; they have the I. H. C. agency.

F. E. Tessinger, formerly of Chatsworth, Ill., has opened a garage in Melvin, in the same State; he has leased a portion of the I. O. O. F. building.

Wallace L. Wilcox & Co., of Providence, R. I., have taken possession of a new salesrooms at 320 Broad street; the concern handles Franklins.

Henry and Earl Billings are about to open a supply and accessory store in Milwaukee, Wis. They have leased a building at 181 4th street.

James E. and Leslie E. Newell have formed the Kissel Motor Car Co. in St. Louis, Mo., and have located at 5802 Delmar boulevard; they will handle the Kissel line.

John F. Reus, a dealer, has purchased the First Church of Christ, Scientist, in Baltimore, Md., and will remodel it into a garage; it is located on Mount Royal avenue and has a frontage of 90 feet.

F. W. Van Sant, for several years a car and accessory salesman in Minneapolis, has branched out for himself; he has the Minnesota agency for the Sandbo starter and is located at 100 Corn Exchange.

J. H. Yonkers, of Toledo, Ohio, formerly with the Cornelius-Hohly Auto Sales Co., has branched out for himself; he has secured the agency for the Mayer carburetter and will locate at 133 Erie street.

Porte R. Wheeler and P. J. Wood have entered the trade in Peoria, Ill., under the style Wheeler & Wood; they have secured the Norwalk agency and have opened salesrooms at 105 South Jefferson street.

F. H. Satterlee and R. E. Fosness, who operate in Minneapolis, Minn., under the style Satterlee & Fosness, have opened a new garage at 215 6th avenue; they handle Pope-Hartford cars and Quaker tires.

L. W. Fraser, formerly Canadian factory representative of the Hupp Motor Car Co., has entered the trade as a dealer; he has the Hupmobile representation in Western Ontario with headquarters in Windsor.

The Buick Automobile Co., of Seattle, Wash., has leased for five years a building which is being erected at Harvard avenue and Pike street; it will be ready for occupancy December 1. A. S. Eldridge is manager.

William Stellway, proprietor of the Metropolitan Garage, at 57th and Chestnut streets, Philadelphia, Pa., has secured plans for a one-story garage, 140 x 180 feet; he will build on 33d street above Jefferson street.

F. B. Rohtert, of Nashville, Tenn., has purchased the plant of the Roemer-Worrick Foundry & Machine Co., in Bowling Green, Ky. He will add to the equipment and will enlarge the machine-shop to care for automobile work.

The Hearsey-Willis Co., of Indianapolis, is about to take possession of a new three-story building at 339 North Capitol avenue; the company, which is now located at 117 West Market street. is Indiana distributer of Hupmobiles.

The Ohio-Buick Co. has been formed in Cleveland, Ohio, to take over the business of the Buick branch in that city; G. G. Peckham, formerly of the Peckham Motor Car Co., of Dayton, Ohio, is president and general manager.

S. T. Hutchinson, owner of the Badger Garage, in Lake Geneva, Wis., has taken over the Lake Shore Garage, formerly owned by O. E. Romare, and will operate both; Romare will open a garage in Williams Bay, in the same State.

The Garber-Buick Co., of Saginaw, Mich., has been renamed Garber-Collins-Buick Co. The addition of the name of Collins followed the entry of John S. Collins, formerly manager of the Buick Motor Co., of Buffalo, N. Y., into the company.

W. H. Sill, for fifteen years with the Minneapolis Lumber Co., and O. G. Scheig, have formed the Used Motor Trux Co., in Minneapolis, Minn., and have located at 220 3rd street south; besides dealing in used trucks the company will store and rent commercial cars.

P. O. Oswald, formerly of Hanlontown, Iowa, and B. S. Bergie, formerly of Joice, Iowa, have taken over Nelson & Son's garage in Forest City, in the same State; the new comers will handle Reo and Chalmers cars, Bergie having been a Reo dealer before the transaction.

M. H. Davis, who recently resigned from the La Crosse Implement Co., of Minneapolis, because of ill health, has decided to reenter business; he will form the La Crosse Auto Co. and will handle Imperial cars. Davis was connected with the implement company for thirty years.

The Safety Starter Co. has been formed in Des Moines, Iowa, by J. W. Hunter, manager of The Road Maker, and Donald Hunter, formerly editor of the Spencer (Iowa) Herald; the company will act as Iowa distributer of the Sandbo mechanical engine starter, designed for use on Ford cars.

The Lebanon (Tenn.) Motor Car Co. has been sold by H. C. Foutch to ex-Mayor J. T. Odun; Kieffer Odun, the buyer's son, will manage the business. Foutch did not sell his stock of cars, however, and will maintain a livery service in a garage on Depot street, formerly occupied by the E. E. Adams Motor Car Co.

The Standard Harness Co., of Milwaukee, Wis., which several years ago engaged in the tire and supply business to compensate for a waning harness trade, has changed its name to Standard-Racine Rubber Co. It is a distributer of the Racine Rubber Co.'s products. John Jirachek and John C. Zeman are the principal owners.

Milton A. Kent, owner of the first garage in Kenosha, Wis., has sold his business to Charles E. Turnock, of that city; the business includes the Rambler agency. Until January 1, Kent, who is chairman of the road committee of the Kenosha Automobile Club, will devote himself to good roads, $100,000 having been appropriated for Kenosha county.

Connell & McKone, dealers. the Boston Batavia Rubber Co. and the Schebler Car-

Digitized by Google

buretter Co. are about to take possession of a new three-story brick building which is being erected in Boston, Mass., on Massachusetts avenue, near Boylston street; Connell & McKone, who handle Overland cars, will have the entire ground floor, with a 30-foot front and a depth of 92 feet.

F. A. Tuschen has sold the Boulevard Garage, at 266-70 27th street, Milwaukee, Wis., to W. H. Kreuger, who will operate it; Tuschen, who also owns a garage in Watertown, Wis., has engaged in the manufacture of accessories. With A. G. Scheuerell, of Sun Prairie, Wis., he has purchased the properties of the defunct Yale Motor Equipment Co., of Oostburg, in the same State.

Smith Bros., of Los Angeles, Cal., for several years located at 742 South Olive street, have taken possession of a new building at 1616 South Figueroa street; they handle Peerless cars and trucks and Ohio electrics. C. R. Teaboldt will have charge of pleasure car sales, W. F. Wood, formerly with H. O. Harrison, will manage the truck department, and Guy Pierce will supervise the electric division of the business.

The Probey-Haynes Motor Car Co. has entered the trade in Washington, D. C., with headquarters at 1230 Wisconsin avenue northwest; it will handle Haynes cars. T. Oliver Probey, president of the company, has been engaged in the trade for some time and was chairman of the last Washington Automobile Show Committee; W. D. Arrison is associated with Probey in the new business as sales manager. The company will incorporate for $10,000.

The Payne Motor Co. has been formed in Des Moines, Ia., to act as Central Iowa distributer of Paige and Lozier cars; it was formed by Dr. C. W. Payne, formerly of Boone, Ia., and who formed and has operated the Boone Auto Co., which now becomes a sub-dealer under the Payne company. R. O. Gresham, formerly sales manager for the Warren Motor Car Co., of Detroit, will act as Payne's sales manager. The company has secured a location at 1012-14 West Locust street.

Fred Larson and William Struble, comprising the implement firm of Larson & Struble, and C. C. Sheakley, W. J. Kennedy and Matthew Kennedy, comprising the department store company of Sheakley & Kennedy Bros., all of New Hampton, Ia., have combined in a new company; the new organization will handle both implements and automobiles. Another similar business recently organized in New Hampton is the New Hampton Motor & Implement Co., with a capitalization of $40,000; the incorporators are: W. G. Shaffer, W. N. Wesp, C. W. Schnurr, A. H. Shaffer and T. K. Young.

ELECTRICS ASSUME GREATER PLACE IN ELECTRICAL SHOW

Electric Vehicle Association Takes Hand in Management — Model Garage and Repair Shop to be Featured.

That the New York electrical show, which this year will occupy Grand Central Palace from October 15th to 25th, will be more than ever an electrical vehicle show is indicated not only by the fact that Electrical Exposition and Motor Show has been selected as the official designation of the enterprise, but by the fact that a committee of the New York Electrical Vehicle Association has been appointed to take charge of the automobile section. The committee is composed of E. W. Curtis of the General Vehicle Co., J. H. Cafferty of the General Motor Truck Co., Nathaniel Pratt of the Baker Vehicle Co., S. W. Menefee of the Anderson Electric Car Co., C. Y. Kensworthy of the Rauch & Lang Carriage Co., Charles A. Ward of Ward Motor Vehicle Co., W. R. Chandler of the Holt-Chandler Co., W. C. Poertner of the Poertner Motor Car Co., J. M. Barrett of the Automatic Transportation Co., Harvey Robinson of the New York Edison Co., and H. C. Fling of the New York Electric Vehicle Association.

In addition to the display of electric vehicles, the show will include several exhibits of an instructive nature, chief of which will be a model garage for the storage and maintenance of electrics. The garage will be erected on the third floor and will be conducted in conjunction with the automobile track.

The structure will be equipped exactly as a city garage should be equipped. An electric display sign and a danger sign will be erected in front and vacuum cleaners, polishing motors, electric tire pumps and patented car washing devices will be maintained within. Visitors at the show will have an opportunity to see all of these up-to-date contrivances in action, for the garage will be the storeroom for exhibitors' cars used for demonstration purposes on the automobile track. An effort is being made to have each company detail a corps of men for demonstration work; but the Electric Vehicle Association itself has arranged to have a special staff of demonstrators on the floor.

Connected with the garage will be a model repair shop and a model battery room. The shop will be equipped with an exhibition of lathes, presses, drills and all sorts of electrical appliances for use in automobile repair work, supplied by the United States Electric Co. The battery room will be furnished with complete sets of batteries loaned by the Philadelphia Storage Battery Co., the Electrical Storage Battery Co., the Gould Storage Battery Co. and the Edison Storage Battery Co.

Aside from the space occupied by the garage and a special parking space for exhibitors' cars, most of the third floor of Grand Central Palace will be occupied by the automobile demonstration track. The course will cover 100 yards in the shape of an oval, surrounded by heavy guard rails.

Demonstrations will be conductetd on the track, and sometime during show week a gymkana will be held in which pleasure cars will participate.

White Plains Dealer Killed in Wreck.

William Gidley, a tire dealer at 22 South Arlington avenue, White Plains, N. Y., was almost instantly killed Tuesday, 2nd inst., when the car in which he and John Pye, a chauffeur, were riding left the roadway, collided with an iron electric light pole and capsized in New York City at Broadway and West 215th street; the two men had been to New York to purchase tires and Prest-O-Lite tanks, and the collision is said by some to have been due to the fact that the men were disputing for the possession of the steering wheel while traveling 40 miles an hour and by others to the inexperience of the driver. Gidley was pinned under the car and he was dead when released. Pye is in a critical condition.

Dealer Forms $250,000 Corporation.

The Motor Car Distributors Co. is the title of a $250,000 corporation which has been formed in Los Angeles, Cal., chiefly through the efforts of Fred W. Beau de Zart, who has been handling the Krebs truck in that part of the countrty. Associated with him are A. C. Labric, J. T. Bunn and Dr. C. W. Fish, all of whom are prominent in Los Angeles. The new company will not only handle the Krebs truck but also the Motokart in the territory west of the Rockies; it likewise has practically completed negotiations for the agency of two lines of pleasure cars.

Wiping "Columbia" off the Slate.

The Columbia factory in Hartford, which is one of the possessions of the Maxwell Motor Co., has been shut down and it is stated will shortly be offered for sale, which means, of course, that the Columbia car, one of the earliest and best known in the field, will be known no more. When, several months since, Motor World exclusively stated that this end was in view, it created a considerable furore in Hartford, where more or less vigorous and lengthy denials were published.

CHANGE FOR THE SAKE OF CHANGE.

Whether car makers, or any considerable number of them, are now making changes for the mere sake of change is a pretty question. Few, if any, of them would plead guilty to the impeachment but, despite the fact, there are not a few of those identified with the industry who vigorously maintain that such is the case.

Instead of developing or perfecting productive effort which really earns the profits, many engineers are accused of flattering their fancies by devoting themselves too seriously to the task of making changes for the sake of change, often on the eve of or in the midst of the productive season.

To cite an instance of change without good reason, a lamp maker points to one of his patrons who delayed placing his order until 30 days before the lamps actually were required. It was impossible to make the dies in such a short space of time, and the effort to do so caused such a rush that there was no time to permit of road tests of the lamps As a result, trouble was experienced and buyers of cars to which the lamps were applied were quick to complain. To every complainant the lamp manufacturer promptly sent a set of new lamps of his standard pattern and invariably the satisfaction they afforded was expressed in letters of thanks, abundantly proving that the standard article is not only satisfactory to the car purchaser but that he was not influenced by the specially designed article.

The lesson of these lamps is an example of not only wasted effort but wasted money. There was no public demand for a special design and the standard article was of such a satisfactory nature that departing from it served no useful purpose. The demand rose solely in the mind of the engineer and could spring only from a striving for style or individuality, or whatever else change for the sake of change may be termed. Too often such striving means a reckless disregard of the enormous overhead cost which it entails, the real extent of which is not immediately appreciated, as the bad effects are not experienced until production is found to have been delayed, bringing with it costly unhappiness.

Thus the dealer who may have ordered and expected to sell 100 cars, and laid his plans and expenses accordingly, actually receives but 40 or 50 cars. The money lost can never be regained and the loss falls all along the line, even the accessory manufacturer not escaping the bad effects.

There are indications that in many instances change for the sake of change is adroitly masked by the term "refinement of detail," and that enormous losses have grown therefrom. But whether or no indications err, the subject is one that merits the most thoughtful consideration.

At this stage, it would seem that "Hold fast to that which is good" is a proverb which should be tacked up for the daily scrutiny of engineers, fickle and otherwise, who are prone to be swayed by passing breezes or to gild the lily in the belief that it is improved thereby.

SALTING THE STANDARD OIL STORIES.

Whenever it is desired to attract notice, one sure way is to shout or print the name Standard Oil. That corporation has committed its full share of commercial offenses but the number of sins committed in its name or by use of its name is beyond reckoning. It has been used both to boost and to embarrass men and movements, commercial and otherwise, and the fact is so well known to observant and well informed persons that the mere linking of Standard Oil with any enterprise causes them to smile and reach for the salt celler.

This is true of the yarn bearing the heading "Standard Oil May Enter Automobile Industry," which during the past week has been going the rounds of the daily press and which recites that Standard Oil interests are planning to acquire and merge "three of the largest automobile factories in this country" and to sell their popular priced productions "without agents and with little advertising."

It isn't the first time that Standard Oil has been reported to be making ready to "enter the automobile industry" and the reports would pass as amusing if they were not swallowed whole by even some fairly intelligent men in the industry itself. Undoubtedly Standard Oil stockholders, like other men of means, have invested in automobile shares, but their investments are purely personal. The business of the Standard Oil Co. is the production of oil and it is just as likely to enter the automobile industry as the automobile industry is likely to engage in the production of oil—no more, no less.

APPALLING TRAGEDY CAUSED BY NASHVILLE PICKANINNY

Four Meet Death When Race Driver Tries to Avoid Hitting Lad Who Strayed Onto Track—Sudden End to 25-Mile Event.

Those who saw the Labor Day automobile races that were run on a one-mile dirt track in Nashville, Tenn., are not likely to forget them for some time to come, for the piece de resistance of the meet—a 25-mile free-for-all event—resulted in one of the saddest and most spectacular accidents that has occurred in some time in connection with automobile racing. No fewer than four persons, all of them participants in the race, were killed and three others were badly maimed, and all because of a little negro boy who eluded the vigilance of the guards and wandered out onto the track in front of the flying cars. Strangely enough, the cause of the accident escaped unhurt.

The accident which piled three cars together a mass of tangled wreckage and sent another through the fence, occurred in the backstretch of the track directly in view of the crowded grandstand. A local racing driver named Cylde Donovan was leading at the time of the accident in a Studebaker, and in an effort to avoid hitting the little colored boy swerved his car so quickly that one of his axles gave way under the strain and precipitated the car with its occupants through the fence and back again onto the track. Jake Loiver, who, at the wheel of a Mercer, was following Donovan, managed to steer clear of the wreck, but the next car, a Stutz driven by William Sherrod, plunged into it. Almost instantly afterward, John W. Sherrill, at the wheel of a Buick, also crashed into the wreck. The fourth car figuring in the wreck was a Mercer driven by Ed Polk, and to avoid hitting the debris of the three cars Polk put his car through the fence.

Donovan, who was the sole occupant of the Studebaker, escaped with painful injuries, as did Polk and his mechanician, Freeman Armsby. Both driver Sherrill and mechanician Thomas F. Bridges were killed outright and driver Sherrod and his mechanician, "Gooch" Brown, died in the hospital later as a result of their injuries. When Polk sent his car through the fence to avoid hitting the other cars, a number of spectators were scattered and thrown down, but none of them was hurt beyond a few bruises. At the time of the accident Polk, whose car bore the ominous number 13, was on the fifth lap of the track and was leading by about 200 yards.

Previous to the accident, two shorter races were run, a five mile even going to Brown (Stutz) and a 10-mile event to Frank Bell in an Apperson. The summaries:

Five mile free-for-all—Won by "Gooch" Brown, Stutz; second, Donovan, Studebaker; third, Polk, Mercer. Time, 5:26.

Ten miles—Won by Frank Bell, Apperson; second, Donovan, Studebaker; third, Polk, Mercer. Time, 11:33.

Twenty-five mile free-for-all—Stopped at end of sixth lap; Donovan leading.

Tradesmen Disciplined by A. A. A.

For violating the A. A. A. rule governing the advertising of stock cars, discipline was meted out to one car manufacturer and four dealers by the contest board last week. The manufacturer affected is the Nyberg Automobile Works, of Anderson, Ind. The dealers are the Gwinn Sales Co., Lozier agent in Columbus, Ohio; G. L. Sitgreaves, Mercer agent in the same place, and Mercer Auto & Supply Co., Mercer agent in Cleveland, all of whom advertised victories of so-called "stock" cars. In the case of the Mercer agent in Cleveland, the advertising took the form of a sign in the show window.

The fourth dealer who was disciplined is K. C. Pardee, the Briggs-Detroiter agent in New York City, who in his show window displayed a sign stating that the Briggs-Detroiter had "Won first prize in the Catskill economy and reliability run," which assertion was not in accord with the official records. Pardee, therefore, was suspended until September 1, 1914.

To Disclose Route of Lincoln Way.

Just where the Lincoln Way, that Middle West-Pacific Coast road, is going to lie will be known Sunday, 14th inst., when the promoters of the proposition will give full publicity to their plans; Henry B. Joy, head of the Packard Motor Car Co. and also of the Lincoln Highway Association, has issued a request that all those who are on or off the route decorate their places of business on that day with Lincoln Way banners, Lincoln portraits, American flags, bunting and poster copies of the proclamation concerning the project. Poster copies of the proclamation will be furnished upon request by Joy and his associates.

Two Michigan Tours Rolled into One.

To avoid the possibility of confusion which might have resulted because of the running of the Elgin road races, the reliability contest which was to have been started August 30 by the Chicago Motor Club was abandoned, or, rather, it was virtually consolidated with the same organization's Around Lake Michigan tour, which is to start from the Windy City on September 8th and continue till the 13th.

*Indicates Sanction by A. A. A.

Aug. 30-Sept. 6, Chicago, Ill.—Reliability tour of the Chicago Motor Club.

Sept. 1-5, Houston, Tex.—Houston Automobile Club's Grade III reliability contest.

Sept. 6, Hamline, Minn.—Minnesota State Fair Association's track racemeet.

Sept. 8-13, Chicago, Ill.—Chicago Motor Club's Around Lake Michigan reliability tour.*

Sept. 9, Corona, Cal.—Speedway track races, under auspices of Corona Automobile Association.

Sept. 12, Canfield, Ohio—Canfield Fair Association's track racemeet.

Sept. 13, Covington, Ky.—Cincinnati Automobile Club's track racemeet.*

Sept. 13, Grand Rapids, Mich.—Grand Rapids Automobile Club's track racemeet.

Sept. 14, Seattle, Wash.—Kings County Fair Association's track racemeet.

Sept. 18, Asheville, N. C.—Asheville Automobile Club's hill climb.

Sept. 20-21, Detroit, Mich.—Track racemeet under auspices of Michigan State Fair.

Sept. 27, White Plains, N. Y.—Track racemeet under auspices of Geo. T. Long.

Sept. 27-28, Bakersfield, Cal.—Kern County Fair Association's track racemeet.*

Oct. 3, Trenton, N. J.—Inter-State Fair Association's track racemeet.

Oct. 3-4, Oklahoma City, Okla.—Oklahoma State Fair Association's track racemeet.

Oct. 10-17, Paris, France—Annual automobile salon.

Nov. 2-3, Los Angeles, Cal.—Los Angeles to San Diego to Phoenix road race.

Nov. 4-5, El Paso, Tex.—El Paso Automobile Club's road race between El Paso and Phoenix, Ariz.

Nov. 6, Phoenix, Ariz.—Track racemeet under auspices of State Fair Association.

Nov. 24, Savannah, Ga.—Vanderbilt Cup road race under auspices of the Savannah Automobile Club.*

Nov. 27, Savannah, Ga.—Grand Prize road race under the auspices of the Savannah Automobile club.*

Jan. 3-10, New York City—Automobile Chamber of Commerce's national automobile show in Grand Central Palace.

Jan. 24-31, Chicago, Ill.—Automobile Chamber of Commerce's national automobile show in the Coliseum and First Regiment Armory.

FIRE CHIEFS INSPECT FIRE APPARATUS IN PALACE SHOW

Motor-Driven Vehicles Entirely Displace Horse-Drawn at Convention Exhibit in New York—Makers and What They Display.

Just at present there are nearly all the ingredients of a whaling big fire in Grand Central Palace, which, as everyone knows, is in New York City; flame is about the only thing that is missing, and even that is not missing if moving picture flames can be made to answer for the real thing. There is smoke—tobacco smoke, be it added, though it still is smoke—and a really tremendous amount of motor propelled fire apparatus, and such a clanging of multifarious gongs as would warm the cockles of any fireman's heart. All of which is due to the fact that the Forty-first Annual Convention and Fire Exposition of the International Association of Fire Engineers — to give it its full title—is in full sway and will remain in full sway until Saturday night, 6th inst. It was officially opened on Monday and since then the thousand-odd fire chiefs who have come from all over the United States to attend have inspected motor fire apparatus and fires and everything that pertains to fires, to say nothing of a couple of fires.

As it is at present, the two floors of Grand Central Palace that are given over to an exhibition of modern fire apparatus look for all the world like a "sure enough" automobile exhibition, for, with the exception of a single hose reel designed to be drawn by the firemen themselves, there is not a wheeled vehicle but what is propelled by gasolene. Altogether, the apparatus makes a very brave showing, and even though there is not a great deal that really can be styled new, progress nevertheless is apparent in the apparatus on view and there is much to attract and to hold the attention, quite outside of a liberal assortment of fountain pens, souvenirs, microscopes, and vacuum clothes washers, all more or less foreign to fire and fire engines.

The American-La France Fire Engine Co. is there, of course, as are all the other large companies that made a specialty of fire apparatus, though the American-La France company undoubtedly has the biggest display of all. In all there are no less than four great hook and laddder trucks—"hookses," as the schoolboys call them—to say nothing of several combination chemical and hose wagons driven by great gasolene engines. One of the really interesting vehicles is a tractor-drawn hook and ladder exhibited by the International Motor Co. of New York City. The coupling between the tractor, which carries the Mack nameplate, and the hook and ladder part, is in the form of a great ball and socket joint. Obviously, it permits almost any amount of motion between the two parts of the vehicle without harming either or reducing its efficiency.

Packard and Pope-Hartford fire apparatus, in both cases of the combined hose and chemical type, are side by side at the entrance and further down the spacious hall loom the Seagreave vehicles, the peculiar looking Martin tractors, the giant Christie front drive converted "steamer" and the Ahrens-Fox engines. The Ahrens-Fox exhibit, by the way, has the distinction of including probably the largest of all the pieces of fire apparatus, barring the hook and ladder vehicles, of course. Outside of the size of the engine, it is distinctive by reason of the fact that the pump is out in front ahead of the radiator.

Omitting only those exhibitors not closely allied with the automobile industry, the list of those who occupy exhibition spaces is as follows: International Motor Co.; Sheldon Axle Co.; Knox Automobile Co.; Seagreave Co.; Pope Mfg. Co.; Nott Fire Engine Co.; James Boyd & Bro.; American-La France Fire Engine Co.; Martin Tractor Co.; Timken Axle Co.; Ahrens-Fox Co.; Front Drive Motor Co.; S. F. Bowser & Co.; Republic Rubber Co.; B. F. Goodrich Co.; Sewell Wheel Co.

In the program that has been laid down for the visiting fire chiefs there is much of amusement and entertainment, and that there is much of work, too, or something that closely approaches to work is revealed by the list of papers that has been prepared for presentation at the business sessions of the International Asssociation. The complete list is as follows:

"Motor Apparatus; Its Durability, Efficiency and Economy of Operation," Chief A. V. Bennett, Birmingham, Ala.; "Fire Insurance and its Relation to Incendiarism," Fire Commissioner Joseph Johnson, New York; Chief John Kenlon, New York; Mr. Frank Lock, manager Atlas Insurance Co., Ltd., New York; "British Motor Fire Engines," Arthur Reginald Dyer, assistant chief fire brigade, London, Eng.; "Fire Prevention and Uniform State Fire Marshal Laws," Thos. J. Ahearn, State Fire Marshal, Albany, N. Y.; "The Gasolene Motor Pumping Engine; Its Defects and Cost of Operation and Maintenance," Chas. S. Demarest, chief of construction, Fire Department, New York; "Inspection of Buildings and contents by Uniformed Members of Fire Departments," Chief H. C. Bunker, Cincinnati, Ohio; Com. W. N. Cash, Cincinnati, Ohio; "The Two Platoon," Chief F. L. Stetson, Seattle, Wash.; Chief John C. Enger, Kansas City, Mo.; Chief Chas. A. Slater, Omaha, Neb.

New Owners Save Oostburg's Industry.

At the sale of the assets of the bankrupt Yale Motor Equipment Co., of Oostburg, Wis., the buildings, equipment and patent rights were bid in by F. A. Tuschen, of Milwaukee, and A. G. Scheurell, of Sun Prairie, Wis. They paid $17,275 for the property and will continue the business. In addition to a muffler, which was the principal Yale production, the new owners, however, will produce horns, cut-outs and other accessories. Tuschen is well known in the automobile industry, being the owner of garages in Milwaukee and Watertown and having the State agency for the Nyberg car.

Case Includes Weeds in Equipment.

Marking an innovation in equipment, the J. I. Case T. M. Co. has added Weed tire chains as standard equipment on its 1914 cars; it is the first manufacturer of gasolene cars to include chains in its list of extras. Borland-Grannis electrics are so equipped at the factory and the Cole distributers in New York City furnish them, but the equipment is not according to Cole factory specifications. The Borland-Grannis list of equipment includes "chains" without the Weed name, but Weeds are used.

Zenith Carburetter Takes More Room.

The Zenith Carburetter Co., of Detroit, has leased what was previously the Armstrong woolen plant, on Vanda avenue in that city, of which it already has taken possession. The new location will provide much-needed "elbow room" and permit of a largely increased production.

One Morgan & Wright Addition Finished.

Morgan & Wright are taking possession of their immense new plant which recently was completed in Detroit and which will provide 400,000 square feet of additional floor space. A duplicate of the new building will be ready for occupancy about April 1st next.

Monarch Secures Factory in Detroit.

The Monarch Motor Car Co., of Detroit, has leased space in the former Carhartt automobile factory, on Jefferson avenue, and will now proceed to the production of its $1,000 car in real earnest. R. C. Hupp is president of the company.

Sternberg Doubling its Truck Plant.

The Sternberg Mfg. Co., which manufactures the truck of that name, is erecting an addition to its plant in Milwaukee which will double its capacity. The new structure will be a brick building, 150 feet square.

TRAINING SALESMEN PROPERLY

Results Which May be Obtained by Skilful Management—How One Manager "Spoiled" an Employe of the Greatest Promise.

How do you train your salesmen? Do you train them at all? Do you watch over them carefully to see that they are spending their time to the greatest advantage of the firm? Do you aim to help them develop the best that is in themselves, realizing that the more valuable they are to themselves the more valuable they are to you?

Good salesmen are precious; they need and deserve care—the kind of care that husbands their resources and helps them work to the greatest advantage—not the everlasting stir-up brand that makes them dissatisfied—and not the too generous kind that results in putting the salesman out of business.

Manager Spoiled Promising Salesman.

"That fellow over there was the greatest salesman I ever had," remarked a sales manager, pointing to a man who stood a few feet away, "but I spoiled him. I did not know it then, but I know it now. He was in another line of business. One day he came to me and said he was going into the automobile business. Would I give him a chance? I agreed, and thought no more about it. One day he called me up and said he was coming to work. I told him he was foolish to throw up a sure thing, but he said he was tired of it and he was going to learn to sell cars. 'But you won't be worth anything to me for four or five months,' I replied. He told me that if he could earn enough to pay his board he would be satisfied. To make a long story short, he came and I put him at work in the factory. He applied himself till he knew all about the cars—and the only time I saw him was when he came in at night and asked for some of our advertising matter. He devoured it eagerly. In three months' time he was in the testing department.

"The boys in the testing department knew he was different from their kind. They tried every sort of dodge that the ingenuity of a mechanic can invent to get him into trouble. They would flood the carburetter; stuff up the feed pipes; change the timing of the valves; short-circuit the magneto, and do a hundred other annoying things, but he always took it good naturedly and always located the trouble.

Learned Amazingly in Six Months.

"In six months he knew more about our stuff than fellows who had been with us three years. By this time I thought I would try him out on the road. I sent him to New Orleans, where we had never sold anything. He brought back an order for 16 cars. Then I shot him all over the country, hitting the high spots. He had a wonderful faculty for remembering names and faces, and he got the business.

"Once we were very anxious to land a big order in the West. I brought this man on, and I'll be hanged if he didn't close it! I was feeling so good over it that I called him in and said, 'Fred, here's $100; take it and spend it and make a good fellow of yourself with these people. You need not make any accounting of it. Go to it!' He did so, and that was his finish. He was no good after that. A short time afterwards I had to let him go. He simply was all in. I blamed myself more than I can tell you. I have never made such a fool of myself since—and I never will. That was four years ago, and Fred has never amounted to anything since. And he was the most wonderful salesman I ever had. It was an expensive lesson for both of us."

There is little doubt that the handling of salesmen calls for all the skill, diplomacy and judgment at the command of the sales manager, whether it be in a manufacturing business or a retail store. It pays to know your men through and through—and it pays to train them soundly.

SMALL LEAKS WHICH MAY CARRY AWAY SNUG PROFITS

The selling end of the business is rightly regarded as of the utmost importance because unless the cars are sold there will be no business. But the selling end cannot have all the attention and other departments be neglected without somebody going "in the hole."

Too many dealers give every ounce of attention to the sales and neglect the financial end. The results can always be predicted. A business must be properly financed and carefully financed if it is going to win. Leaks and losses must be found before they can be stopped. That means a thorough and reliable system of accounting—and a regular checking up by the head of the business.

How is your checkbook? Is it up to date? Does your cash check up with *your* cash book? There may be no intentional dishonesty; mistakes will occur. It is only fair to your employes and yourself that you should personally know that everything is right.

In this connection it pays to know whether or not your bills go out regularly; do you ever watch to see? Is everything billed each week? How long could a charge be held up without your knowing it? Are your books posted up? These are details—but every important ones. Many a business has been lost because the owner did not check up such details.

What does the 100 per cent. efficiency mark for the measurement of your sales force include?

Did you ever lay down the scale—get it on paper—and then proceed to measure up?

It's not a new idea, but it is a practical one and worth using.

SALESROOM—NOT STOREROOM

Thought and Study to Arrangement of Floor Worth Many Times the Effort —Dealer Who Let Valuable Space go to Waste.

There is in Buffalo an automobile dealer whose salesroom is a striking example of how to produce an unpleasing, cluttered-up, confusing effect in the mind of a prospective customer.

The exterior of the store is excellent. The show windows are large and clean, and the lettering on them is clear and well defined without in any way obscuring the view of the interior. The entrance is in the center. You step into a high-ceiled, well-proportioned room, and instantly you are struck with the discordant arrangement of the cars on the floor. Your immediate impression is that you have accidentally stumbled into a storeroom—not a salesroom. There are several big, high-priced touring cars jostling with used cars, medium-priced cars, small cars and heavy trucks. Next to an up-to-the-minute $5,000 masterpiece is a used car of antique vintage. Next to that a truck. Next to that is a $2,000 machine whose merit deserves better recognition than a tight squeeze between a truck and a used car.

Results Few Hours' Work Could Bring.

The whole effect is of the sort that sets teeth on edge and makes one wonder why such an important detail of a big business should apparently have such little consideration.

A few hours' work would completely transform that interior. The completeness of the lines could be emphasized and the effect made alluring and attractive. All that is necessary is orderly arrangement, thoughtful classification, intelligent planning.

The large, handsome touring cars should be grouped together in a manner to emphasize their exclusiveness; the medium-priced new cars marshalled where they would not come into conflict with either used cars or trucks; the used cars placed where the contrast with new cars would not be too evident.

Salesroom display is simply appealing to the mind through the eye, and it is worthy of all the time and study you can put on it.

WHEN "TOO BUSY TO READ" MAY BRING ACUTE EMBARRASSMENT

"Hello! Hello! Is this Motor World? . . . Say, what can you tell me about the Palmer car?"

Yes, he was a dealer—and a subscriber to Motor World. His friends say he is a live one—energetic, aggressive, business-like. Yet he admitted that for three weeks or more he had not looked at a paper.

He was told to turn to pages of a certain issue and he would find the Palmer car described in detail. It was just what he wanted. How embarrassing, however, to explain to the waiting prospect who asked him about this car, that he had never heard of it. Then to find it had been covered in detail weeks before by his favorite paper—that he had not read.

The wise business-man of to-day reads his trade paper carefully. He knows that some one idea picked up may mean the difference between profit and loss. He is keen to get all the matter between the covers thoroughly digested and he knows that it takes only about an hour a week to keep posted up-to-date. No man is too busy to keep informed on his own business.

ADVANTAGES OF FILING SYSTEMS KEPT UP TO DATE

A good filing system is indispensable. No matter how fine your showroom or how good your repair shop, there is something lacking—if your letters and bills and other papers are not always filed up to date. It is bad business indeed to have no file at all, but it is almost as bad to have a filing system and then have the letters accumulate for three or four months before filing.

The convenience of a filing system is the immediate accessibility of the records. It is not to bury things in, as some people think, but to make them get-at-able. A critical situation may be saved by the ability to turn at once to all the correspondence on the matter. Aside from this, no business can succeed without proper and adequate records. Have a good filing system—and then keep it up to date.

THE TYPE OF DEALER WHO KNOWS NO "BETWEEN SEASONS"

There is no "between seasons" for the dealer who is right on the job. He winds up one season one day and steps right into the next season without having any distinct line of demarcation between the two. He is selling just as hard and just as eagerly as he knows how. He does not sag, nor feel blue nor pessimistic; he has no time for that sore of thing; he has prospects to see and sales to close.

This sort of dealer is "on his toes" all the time. He keeps himself physically clean and trim and thus he is always fit. It means sacrifice, denials, grim perseverance, but he finds that it pays—and pays well. That is what he is in business for—and the keener and more strenuous the fight, the quicker he will reach the goal he is aiming it.

The older one grows in business the more he realizes that it is the little things that count. We get so used to dust on show windows and fly-specks on the signs that they seem like "regular euipment." Isn't that the best reason in the world why we should all aim at immaculate windows, at dustless cars—at well-managed, well-kept-up show rooms?

S. A. E. CODIFIES STORAGE BATTERY DATA AND RULES

Puts Instructions into Concise and Systematized Form—Designed to Render Easier the Handling of Lighting and Starting.

In going into the question of standardizing instructions for the proper care of storage batteries such as commonly are used in electric lighting and engine starting systems, the Society of Automobile Engineers has not been content with any halfway measures, and in the complete data which now has been made public, though the report of the committee that had the work in hand was accepted at the Summer Meeting in June, it is very plain that no pains have been spared to cover the question very thoroughly.

The data is entitled "Specifications for the Installation and Care of Storage Batteries Used in Connection with Electric Starting and Lighting Systems on Automobiles," and in it particular stress is laid upon the necessity for proper installation in the first place with due regard for accessibility. Otherwise the instructions are complete down to the last minute detail. The report in full is as follows:

Proper Installation First Caution.

1. Batteries must be properly installed. Keep battery securely fastened in place. Battery must be accessible to facilitate regular adding of water to, and occasional testing of, solution. Battery compartment must be ventilated and drained, must keep out water, oil and dirt, and must not afford opportunity for anything to be laid on top of battery. Battery should have free air space on all sides, should rest on cleats rather than on a solid bottom and holding devices should grip case or case handles. A cover, cleat or bar pressing down on the cells or terminals must not be used.

2. Keep battery and interior of battery compartment wiped clean and dry. Do not permit an open flame near the battery. Keep all small articles, especially of metal, out of and away from the battery. Keep terminals and connections coated with vaseline or grease. If solution has slopped or spilled, wipe off with waste wet with ammonia water.

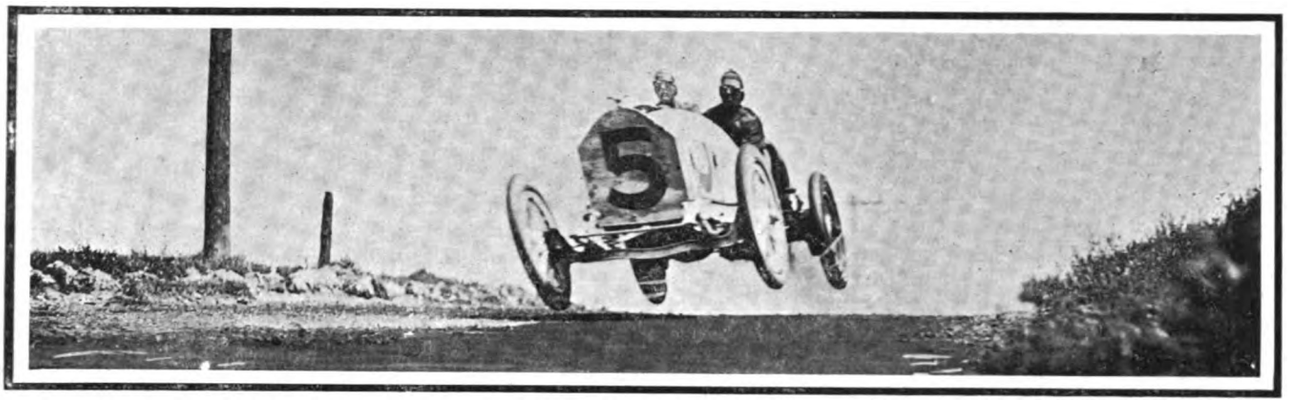
3. Pure water must be added to all cells regularly and at sufficiently frequent intervals to keep the solution at the proper height. The proper height for the solution is usually given on the instruction- or name-plate on the battery. In all cases the solution must cover the battery plates. The frequency with which water must be added depends largely upon the battery, the system with which it is used and the condition of operation. Once every two weeks is recommended as good practice in cool weather; once every week in hot weather. Plugs must be removed to add water; then replaced and screwed home after filling. Do not use acid or electrolyte, only pure water. Do not use any water known to contain even small quantities of salts of any kind. Distilled water, melted artificial ice or fresh rain water are recommended. Use only a clean non-metallic vessel. Add water regularly, although the battery may seem to work all right without it.

Density Test to Learn Condition.

4. The best way to ascertain the condition of the battery is to test the specific gravity (density) of the solution in each cell with a hydrometer. This should be done regularly. A convenient time is when adding water, but the reading should be taken before, rather than after, adding the water. A reliable specific gravity test cannot be made after adding water and before it has been mixed by charging the battery or by running the car. To take a reading insert the end of the rubber tube of the ordinary hydrometer in the cell. Squeeze and then slowly release the rubber bulb, drawing up electrolyte from the cell until the hydrometer floats. The reading on the graduated stem of the hydrometer at the point where it emerges from the solution is the specific gravity of the electrolyte. After testing, the electrolyte must always be returned to the cell from which it was drawn. The gravity reading is expressed in "points," thus the difference between 1.250 and 1,275 is 25 points.

5. When all cells are in good order the gravity will test about the same (within 25 points) in all. Gravity above 1,200 indicates battery more than half charged. Gravity below 1,200 but above 1,150 indicates battery less than half charged. When battery is found to be half discharged use lamps sparingly until by charging the battery the gravity is restored to at least 1,200. See Section 8. Gravity below 1,150 indicates battery completely discharged or "run down." A run-down battery should be given a full charge at once. See Sections 7 and 8. A run-down battery is always the result of lack of charge or waste of current. If, after having been fully charged, the battery soon runs down again there is trouble somewhere else in the system, which should be located and corrected. Putting acid or electrolyte into the cells to bring up specific gravity can do no good and may do great harm. Acid or electrolyte should never be put into the battery except by an experienced battery man.

6. Gravity in one cell markedly lower than in any of the others, especially if successive readings show the difference to be increasing, indicates that the cell is not in good order. If the cell also regularly requires more water than the others, a leaky jar is indicated. Even a slow leak will rob a cell of all of its electrolyte in time, and a leaky jar should be immediately replaced with a good one. If there is no leak and if the gravity is, or becomes, 50 to 75 points below that in the other cells, a partial short-circuit or other trouble within the cell is indicated. A partial short-circuit may if neglected seriously injure the battery and should receive the prompt attention of a good battery repair man.



7. A battery charge is complete when, with charging current flowing at the rate given on the instruction-plate on the battery, all cells are gassing (bubbling) freely and evenly and the gravity of all cells has shown no further rise during one hour. The gravity of the solution in cells fully charged as above is 1,275 to 1,300.

Charge Well But Do Not Overcharge.

8. The best results both in starting and in lighting service will be obtained when the system is so designed and adjusted that the battery is normally kept well charged but without excessive overcharging. If, for any reason, an extra charge to maximum specific gravity is needed, it may be accomplished by running the engine idle, or by using direct current from an outside source. In charging from an outside source use direct current only. Limit the current to the proper rate in amperes by connecting a suitable resistance in series with the battery. Incandescent lamps are convenient for this purpose. Connect the positive batttery terminal (painted red, or marked POS or P or X) to the positive charging wire and negative to negative. If reversed, serious injury may result. Test charging wires for positive and negative with a voltmeter or by dipping the ends in glass of water containing a few drops of electrolyte, when bubbles will form on the negative wire.

9. A battery which is to stand idle should first be fully charged. See Sections 7 and 8. A battery not in active service may be kept in condition for use by giving it a freshening charge at least once every two months, but should preferably also be given a thorough charge, after an idle period, before it is replaced in service. A battery which has stood idle for more than two months should be charged at one-half normal rate to maximum gravity before being replaced in service. It is not wise to permit a battery to stand for more than six months without charging. Disconnect the leads from a battery that is not in service so that it may not lose through any leak in car wiring.

ANDERSON LITERALLY "IN THE AIR" AND BOUNDING TO VICTORY IN THE "BIG" RACE

ELGIN NATIONAL PROVES EASY FOR ANDERSON

Stutz Pilot Takes Lead in Fourth Round and Holds it to the End, Finishing In Record Time—Chicago Trophy Goes to De Palma With Dawson in a Deltal Second—Course in Slippery Condition.

Ralph DePalma, the smiling Italian New Yorker, did not quite duplicate his double win of last year in the Elgin road races, though he came pretty near to it on Friday and Saturday last at the wheel of a wire-wheeled Mercer on the Illinois course; actually, he half duplicated the feat, and even though he did only carry away the Chicago Automobile Club's trophy that was competed for on Friday and was restricted to cars having less than 300 inches piston displacement, his performance was proof enough that he really has shaken off the jinx which pursued him so relentlessly not so very long ago. But the greatest honor of all belongs to Gil Anderson and his Stutz, for not only did Anderson win the "big car" race which was run on Saturday and which was for cars having up to 450 inches piston displacement, but he won it so decisively and left such a big margin of time between himself and the next man home that there never can exist any doubt regarding his right to the Elgin National trophy—and the $1,750 in cash that goes with it. He took the lead on the fourth round and never relinquished it.

ANDERSON'S WINNING SMILE

ORDER OF FINISH AND SPECIFICATIONS OF THE CARS.

UNDER 300 CUBIC INCHES.

Driver and Car.	Bore.	Stroke.	Disp.
De Palma, Mercer...	4.37	5.00	299.9
Dawson, Deltal	4.00	5.94	298.9
Chandler, Mason	3.81	5.00	229.0
Rickenbacher, Mason..	3.98	6.00	299.3
Endicott, Nyberg	3.75	5.00	220.9
Wishart, Mercer	4.37	5.00	299.9
Luttrell, Mercer	4.37	5.00	299.9
Mulford, Mason	3.98	6.00	299.3

UNDER 450 CUBIC INCHES.

Anderson, Stutz	4.81	6.00	437.2
Mulford, Mason	3.98	6.00	299.3
Wishart, Mercer.....	4.81	6.81	446.1
Grant, Isotta	4.72	6.30	440.0
De Palma, Mercer.....	4.81	6.81	446.0
Dawson, Marmon ...	4.50	7.00	445.3
Endicott, Case*	4.36	5.00	449.3
Bergdoll, Erwin	4.53	6.94	448.2
Haupt, Mason	4.31	6.00	350.9
Burman, Keeton	5.50	5.50	449.4
Henning, Velie	4.50	5.25	334.0
Rickenbacher, Mason	4.31	6.00	350.9

* Six cylinders.

The so-called minor events which last year served as curtain raisers to the two main features—the race for the Illinois Trophy, which went for 203 miles and was for cars having 301-450 inches displacement; the race for the Aurora trophy, which went for 152 miles and was for cars having 231-300 inches displacement; and the race for the Jencks trophy, which went for 101 miles and was for cars having 161-230 inches displacement—this year had no place on the program at all. The only races run were those for the Chicago Automobile Club's trophy and for the Elgin National trophy, and the distance for both was the same—namely, 36 laps, or 301 miles 4,440 feet; the course measures just 8 miles 2,030 feet to the lap.

DE PALMA TAKES ON WATER

It was to be expected, of course, that some speed, to drop into the vernacular, would be develeoped and some speed was developed. But even though the cars were driven around the circuit a good deal faster than cars ever have been driven over it before, it is likely that even the comparatively high averages that were made could have been bettered if those who had the oil sprinkling in hand had been either a little less generous or had started their operations a little sooner than they did. As it was, the course was beautifully smooth

				Lap Time	7:21	8:30	7:09	7:10	9:17	7:17	7:6	7:13	7:7	7:13	7:14	7:19	7:12	7:19	7:11	7:12

and all the curves had been at least partly straightened out and widened, but in parts the surface of the roads was treacherously slippery, owing to the fact that the oil had not had time properly to soak into the earth. Consequently, all the drivers were inclined to cautiousness, and only by skilful driving were disastrous accidents avoided.

Despite the slipperiness of the course, however, Anderson was apparently easily able to set up a new receord for the principal race, which is all the more remarkable by reason of the fact that the distance covered last year was only 254 miles. In the free-for-all last year, it is true, DePalma covered the 305 miles at an average rate of 70 miles an hour, but this year there was no free-for-all. Still, Anderson easily exceeded DePalma's last year's record. His time for the 302 miles was 2:53:38.97, which figures out at the rate of 71.4 miles an hour.

Following Anderson home in the race for the Elgin trophy came Ralph Mulford at the wheel of a Mason, whose recorded time was 260:31.25—nearly seven minutes behind Anderson—which is at the rate of 69.7 miles an hour. Spencer Wishart in a Mercer, who crossed the line next and who at one time had held the lead and at any time looked as if he might develop into the winner, needed 269:58.95 to make the distance; his average time was 67.5 miles an hour. Harry Grant, hero of two Vanderbilt races, was fourth in an Isotta-Fraschini in 282:14.10, or 64.3 miles an hour; and Ralph DePalma (Mercer, of course) was the only other man of the 12 that started to cross the line before the survivors were flagged. His time was 287:24.38, which is at the rate of sixty-three and one-tenth miles an hour.

In the lighter car race that proved De Palma's particular glory, the wily Italian crossed the tape in 271:56.90, which is at the rate of 66.3 miles an hour and therefore is considerably slower than the 70-mile average he set up last year for the same distance. Next after De Palma, Joe Dawson,

ANDERSON GETS CHECKERED FLAG AND ELGIN NATIONAL TROPHY

who two years ago set the Indianapolis Speedway enthusiasts by their ears by winning the 500-mile race in meteoric fashion, pounded over the line in a Deltal, and his time—279:52.75—shows that he covered the distance only slightly slower than did De Palma. These two cars were the only ones to cross the finish line before the flag dropped, leaving Chandler in a Mason and Rickenbacher in another Mason still running; Chandler was awarded third place.

On Saturday, when the big car race was run, the weather was terrifically hot—which led those in the great bleacher in front of the pits to bless a management that had provided the stand with a canvas roof, a thing hitherto unheard of—and the heat and the strain of trying to keep the cars on the track soon told on the drivers. Though there were no really alarming accidents, Rickenbacher thrilled the spectators and gave slight promise of what might be expected almost before he got fairly started. Before he had completed his first lap he skidded into the ditch, ripped off a tire and bent a front axle so badly that the car was withdrawn. On the preceding day, the heat was only slightly less intense and ice and cold water in bottles were much in demand by the drivers who stopped in front of the pits for supplies.

DE PALMA (MERCER) ACCOUNTING FOR CHICAGO TROPHY

The only other accident that is worthy the name occurred when Anderson threw a tire off his Stutz in the 20th lap of the big car race. The tire burst almost directly in front of the big grandstand, and after a couple of skids Anderson brought the car to a standstill—but the tire kept right on going. It bowled straight down the track until it encountered an over-zealous militiaman who attempted to "tackle" it, but without any success at all. It knocked him cleanly off his pins and then rolled into the ditch, while the course guard picked himself up and limped back to his station.

As was to be expected, the big car race furnished most of the excitement, and it

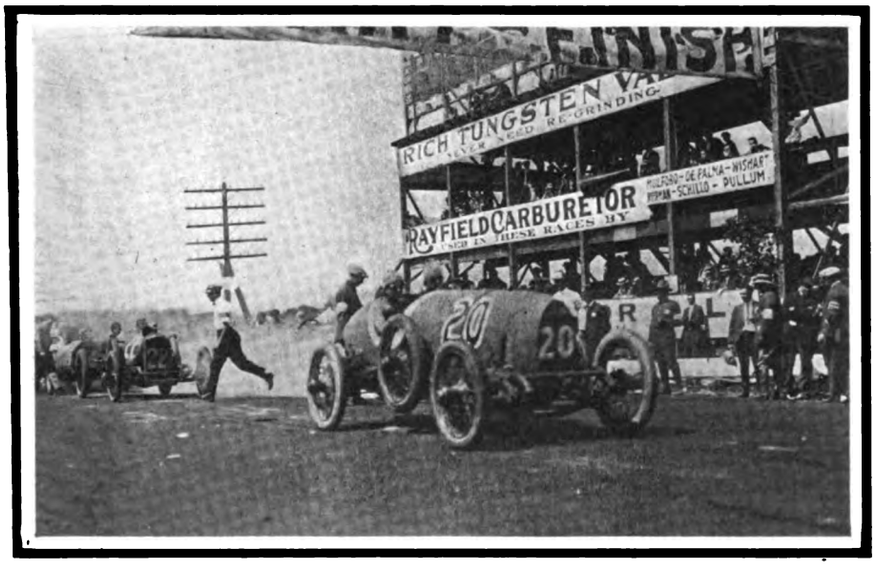
WHERE THE GOING WAS GOOD ON THE ELGIN COURSE AND THE DRIVERS "OPENED UP"

W. ENDICOTT (CASE) LEADING HAUPT (MASON) OVER BRITTON "HILL"
EVIDENCE THAT MOTORISTS WERE INTERESTED IN THE SPORT



BURMAN (KEETON) OVERTAKING H. ENDICOTT (NYBERG) MID THE CORNFIELDS
WHEN DE PALMA WAS "INCHING UP" ON DAWSON AND THE MARMON

Digitized by Google

was on it that most of the attention centered. Just before Starter Fred Wagner lined the cars up at 11 o'clock in the morning, three of the 15 cars that were scheduled to start were scratched, leaving only 12 to be sent away at 30-second intervals. The cars that did not draw up to the line were the Deltal, which Dawson drove into second place on the previous day, and the two Nybergs, which were to have been driven by Harry Endicott and Tom Madden. For some reason not made public, Madden's car was not permitted to start by the referee, and Harry Endicott, who was badly burned the previous day when his car caught fire, had not sufficiently recovered to take his place at the wheel. At the last minute, Dawson drew up to the line in a Marmon entered by Charles Erbstein.

DAWSON STARTING IN THE DELTAL WHICH PERFORMED SURPRISINGLY WELL

In the midst of a dense cloud of blue-black smoke, Wagner tapped "Farmer Bill" Endicott (Case) on the shoulder promptly as the last of the four starting bombs exploded high over the heads of the crowd in the grandstand; Rickenbacher got away next in his Mason and was followed by Mulford in another chocolate-colored Mason; Mulford's popularity was evidenced by long-continued cheering, and the start of Wishart of the Mercer team, who got away next, was almost overlooked. Gil Anderson in his ghostly Stutz followed Wishart, and almost from the start he gave intimation of his intention to "drive the heads off" all the others—if he could; Dawson, too, was roundly cheered as he started in sixth position, and, closely following him Haupt, in another Mason, slid over the line. Burman in his squat, green Keeton was next, and the others followed in the following order: Henning (Velie), De Palma (Mercer), Grant (Isotta-Fraschini), Erwin Bergdoll (Erwin special).

The first accident of the race, and the only one of any account, occurred in the very first lap, when Rickenbacher attempted to pass Endicott and in doing so skidded into the ditch, ripped off a tire and broke an axle; his car was withdrawn. When the first of the flying cars rounded into the stretch Wishart, who started fourth, had passed the three drivers ahead of him and gained the lead; his first lap was reeled off in 6:51, which was faster than any one else negotiated the initial trip around the course. Later in the race his time was several times equalled by others, and still later—in the 20th lap—he covered the distance in 6:44, which was the fastest lap turned in the race. As a result, he gets the special prize of $200 offered for the fastest lap.

For three laps Wishart held the lead, with Anderson clinging close behind in second place and Mulford and Burman third and fourth, respectively. In the fourth lap, however, a stop for tires put Wishart back into fourth place and Anderson swung into the lead, never to to relinquish it. When Anderson moved up from second place it became apparent that it was his determination to push his car for all it was worth, and it was this bit of stratagem on his part that undoubtedly is largely responsible for his victory; none of the drivers expected that he would hit up such a hot pace so early in the race, and that even his own coaches and those in the pits were ignorant of his intentions is made plain by the fact that they continually signalled him to reduce his speed and to save his car. Despite these injunctions, however, he kept his Stutz pounding along at the same rate, and as each succeeding lap was reeled off—most of them were well under seven minutes—he steadily increased his lead over the field. At no time after he assumed the lead from Wishart was he in real danger of losing it to any one else, and thereafter the race became a fight for the other places.

When Anderson took the lead, Mulford in his Mason moved up from third into second place and he, too, held his place with one exception until Wagner waved the checkered flag; in the 20th lap Wishart nosed him out, but on the following lap dropped back again into third place, where he stayed for four laps, when he dropped back another place for nine more laps before he finally regained third place and finished in that position.

When the half-way mark in the long grind was passed, the order of the cars and drivers was as follows, Henning and his Velie having dropped out in the fifth lap when his car burned out a bearing:

1 Anderson, Stutz.
2 Mulford, Mason.
3 Wishart, Mercer.
4 Burman, Keeton.
5 Bergdoll, Erwin Special.
6 Haupt, Mason.
7 De Palma, Mercer.
8 Grant, Isotta.
9 Dawson, Marmon.
10 Endicott, Case.

It was not until the 25th lap that Bergdoll, of whom great things had been expected, showed up among the first five cars. At that time Mulford still was second, with Haupt in his Mason third and Wishart, who had stopped for tires, fourth. Bergdoll then was fifth and in the next lap he moved up into third place, when Haupt dropped back into sixth. De Palma also moved up one place, from sixth to fifth, and though it was confidently expected that he would move still further forward in view of his victory of the day before, tire trouble held him back. Bergdoll continued, then, in third place until the 32d lap—four laps from the finish—when he was forced out by mechanical trouble, and Wishart took his place and held it to the end. Mulford then was second, which place he had held since the 21st lap, and Grant in the Isotta was fourth. Burman, who had dropped back from third to seventh in the 27th lap, was forced out in the 31st lap with a broken cylinder.

The light car race which was run on Friday was a fit forerunner of the event for the Elgin trophy, for in taking the lead at the 11th lap and holding it to the end De Palma virtually set the style for Anderson in the big car race. Mulford in his Mason was the first of the eight drivers to be sent away by Starter Wagner, and he held first place until the next time around, when Rickenbacher in another Mason wrested it from him and held it until the seventh round, when Mulford again showed in the front for four laps, when he sheared his

Digitized by Google

flywheel bolts and was forced out. It was then that De Palma, who had been in third and then in second place, moved up and never was displaced. At the same time, Dawson in his Deltal moved up from third into second place, where he stayed right through to the end.

Early in the race it became apparent that the sand and oil on the course combined with the rising temperature were to have a bad effect on tires long before the finish. Nearly all of the drivers had all their share of tire trouble, though despite this fact changes in positions were not as frequent as might be supposed would be the result. Chandler, in a Mason, for instance, held fourth place from the 16th lap until he was flagged in his 31st lap; Wishart in his Mercer held fifth until a broken spring put him out in the 23rd lap, and Rickenbacher was sixth until the 23d, and fifth from thence on to the 27th, when he retired. Luttrell in one of the Mercer entries went out in the 7th lap with a burned-out connecting rod bearing when he was in seventh place, and Endicott in a Case quit with a broken water pipe in the 30th lap, when he was third.

Of all the cars that started in the two races only one had a six-cylinder motor, and that one was "Farmer Bill" Endicott's Case; the others all had four-cylinder motors and the largest of the lot was Bergdoll's Erwin Special, which had slightly over 448 cubic inches piston displacement. The smallest car was Harry Endicott's Nyberg, which had only 220 inches displacement. The specifications of all the other cars in the order in which they finished are shown in the appended table.

Anderson's Stutz rolled over the course on Firestone tires, as did both Wishart's and De Palma's Mercers; Grant's Isotta was shod with Palmer tires; Mulford's Mason carried Braender tires and Dawson's Deltal was equipped with Diamonds. All but one of the cars to finish in the money was sparked by Bosch ignition apparatus, the single exception being Chandler's Mason, which is equipped with a Splitdorf magneto. Schebler carburetters were used by Dawson, Chandler and Anderson; De Palma, Mulford and Wishart used Rayfields and Grant used a Zenith. Dawson, De Palma and Grant had the only wire-wheeled cars to finish in the money.

Oldfield's Mile Record is Rejected.

Because the contest board is of the opinion that the Pendleton automatic timing device which was used on the occasion did not meet the official requirements, the A. A. A. has rejected Barney Oldfield's claim for the mile record—46⅗ seconds. Oldfield's performance was made in a time trial at Bakersfield, Cal., on April 22nd last.

RICKENBACHER PROVES STAR ON SIOUX CITY'S SPEEDWAY

Wins Six Out of Ten Numbers on Two-Day Program—Chandler Is Winner Twice—Two Time Trials Included.

Winning six out of 10 events, Ed. Rickenbacher proved easily to be the star performer at the racemeet held Monday and Tuesday, 1st and 2nd inst., by the Sioux City Automobile Club and Speedway Association on the two-mile speedway in that Iowa city; Rickenbacher carried off first money in events from two-mile time trials to a 48 mile race, and two of the first-money purses which he failed to annex were handicap contests.

Chandler, who, like Rickenbacher, drove a Mason special, won two of the remaining four and gave an excellent account of himself in other events; Sioux City race fans applauded Rickenbacher when he turned the two-mile oiled oval on the second day in a time trial in 1:27⅘, but no official credit attaches to the performance because of the absence of electrical timing apparatus.

Aside from the races won by Rickenbacher and Chandler in their Masons, a six-mile handicap was taken by Cailluette in a Moon, with Keagle (White) second and O'Donnell (Mason) third. The other handicap, also six miles, went to Schrunk (White "six"), with Raimey (Ohio) next and the ever-present Rickenbacher third. The summaries:

Monday, September 1.

Ten miles—Won by Chandler, Mason; second, Milton, Mercer; third, O'Donnell, Mason; fourth, Overmyer, Colby. Time, 9:04⅗.

Ten miles, in two heats—Won by Rickenbacher, Mason; second, Menenghetti, Fiat; third, John Raimey, Ohio; fourth, Chandler, Mason Special. Time, 7:57⅗.

Two miles, time trial—Rickenbacher, Mason, 1:31⅗; Menenghetti, Fiat, 1:33.

Six miles, handicap—Won by Cailluette, Monn; second, Keagle, White; third, O'Donnell, Mason. Time, 5:52⅗.

Tuesday, September 2.

Ten miles—Won by Rickenbacher, Mason; second, Chandler, Mason; third, O'Donnell, Mason; third, Gnehm, Colby. Time, 12:26⅗.

Fourteen miles—Won by Chandler, Mason; second, O'Donnell, Mason; third, Gnehm, Colby. Time, 12:26⅗.

Two miles, time trial—Rickenbacher, Mason, 1:27⅘.

Six miles, handicap—Won by Schrunk, White "Six"; second, Raimey, Ohio; third, Rickenbacher, Mason. Time, 5:30.

Forty-eight miles—Won by Rickenbacher, Mason; second, Chandler, Mason; third, Schrunk, White "Six." Time, 38:12.

Disbrow Cleans Up at Davenport Meet.

As is usual, Louis Dsbrow proved a little more than half the show at the Labor Day racemeet that was staged by J. Alex Sloan on the Davenport (Ia.) one-mile dirt track, and though he failed of establishing any "records" or "near" records, he nevertheless drove fast enough to satisfy spectators and to beat nearly all the other drivers who competed against him. Incidentally, he made the best time of the day by circling the track in a Simplex in 53 seconds flat. The summaries:

One mile time trial—Won by Disbrow (Simplex); time, 53 sec.; second, Wm. Endicott (Case); time, 55⅘; third, Lou Heineman (Case); time, 59⅘.

One mile exhibition by Disbrow (Case); time, 56⅗.

Five mile free-for all—Won by Disbrow (Simplex); second, Endicott (Case). Time, 5:30⅗.

Two mile free-for-all handicap—Won by Disbrow (Simplex); second, Heinie Ulbricht (Pirate); third, Endicott (Case). Time, 2:27⅘.

Three mile novelty race; two miles run, wheel changed and third mile run—Won by Endicott (Case); second, Disbrow (Simplex). Time, 3:58⅗.

Five mile free-for-all—Won by Disbrow (Case); second, Heinemann (Case); third, Eddie Hearne (Pirate). Time, 5:38⅗.

Three mile free-for-all—Won by Heineman (Case); second, Ulbricht (Pirate). Time, 32:9.

Protest Follows Oceanside Beach Race.

It is not unlikely that the beach race run on the sands at Oceanside, Cal., on August 31st, will be run over again, for though Tony Janette at the wheel of a National finished first, he was protested and Referee Batchelder refused to award him the prize, which amounts to $500 in cash. It is claimed that Janette failed to cover the course properly and that owing to the absence of the checker at the Delmar turn—he was helping Janette dig his car out of the sand—no record of his passing that point could be established.

Rickenbacher is Finally Reinstated.

Due to mitigating circumstances, E. V. Rickenbacher, of Des Moines, Iowa, has been restored to good standing by the contest committee of the A. A. A. He was suspended in 1912 for participating in unsanctioned track events, his punishment not being due to expire until January 1st next.

HANDLING MAN WHO WANTS BIG TRADE PRICE

Reilly Advises Salesman Against Too Close Following of Prospect in Certain Cases—"If He Really Wants Your Car, Let Him Dicker and Come Down," His Opinion—The Pro and the Con of it.

"Say, Mr. Reilly, what am I going to do out DeLano, the fellow who wants to ade?" asked Reilly's salesman, as he approached the dealer, who was looking over job in the repair-shop.

"Why, what now?"

"I don't know whether to follow him up

"No matter how much it is, that's what I want to know," laughed the salesman. "Aren't you going to tell me?"

"What do you suppose Napoleon Bonaparte had for breakfast this morning? Answer that; it's much easier," smiled the dealer.

"NOW, NOW, WAIT A MINUTE!" AND UP WENT REILLY'S HAND AGAIN

me more or let him alone and trust to :k. The son-of-a-gun wants $1,200 for his r and we can't possibly give him more an $800. If he didn't have that darned l boiler to trade in I would go after him a new, clean sale, but as it is I'm trying sell him a car at a profit and he's trying sell his old car for a big price, and I'm nged if I know who's going to be the st salesman."

"We certainly can't take the car and lose oney on it; we might better not take it," plied Reilly.

"That's just it," asserted the salesman. "I ant him to come down on his price and he ants us to come up, and what I want to ow is: If I chase him up is he going to ng out for the high price, or if I let m alone and try to make him chase me am going to lose him?"

"You don't want to know much, do you?"

"Something hot, probably; but anyway, what would you do?"

"Well," began Reilly, meditatively, "does he want one of our cars? Or is he juggling with three or four dealers for a price on that old wagon?"

"He has been feeling around, but I'm quite sure he prefers our car to any of the others. I've shown him what we've got and I think it appeals to him. But what sticks in his crop is that old boat; he wants too much for it."

"But are you sure he wants our car?"

"I'm positive of it."

"Then I wouldn't follow him up too close; see if you can't get him on the anxious seat instead of seating yourself on it. Make him seek you and see if you can't put him on the aggressive instead of yourself."

"But——"

"Now, now!" said Reilly, with a silencing gesture of his hand, "I know just what you're going to say, and if you say it I'll think you came in here to start an argument instead of to get information. You're going to say that So-and-so says so-and-so and that he disagrees with what I just——"

"But——"

Where Conditions Alter Situation.

"Now, now, wait a minute!" and up went Reilly's hand again. "Selling a car where there is no trade and selling where there is a trade are two different things. Selling a car where the man wants it and trying to sell him when he isn't sure what he wants are two more different things, and making a trade with a man who wants your car and making a trade with a man who isn't particular what he buys are two more something-elses-again.

"If a man isn't particular whether he buys your car or some other brand, you certainly have got to follow him up and give him the desire to own the car, regardless of whether he wants to make a trade; but if the man actually has his mind made up and you are sure of it, as you say is the case this time, and if he wants to trade, I don't think it does any harm to let him wiggle by himself a——"

"But——"

"Now, mind you," continued Reilly. "This is nothing but my own private opinion. I may be wrong, but you asked me for it, didn't you?"

"Yes, but——"

"Do you remember Goldman, the man we traded with a month ago?"

"Yes, but——"

Getting Prospect to Cut His Price.

"Well, I handled him just that way, and I have handled others the same way. Goldman wanted to trade and, as usual, he wanted about $500 more than we could give him and make anything on the deal. Goldman's next door neighbor is one of our owners, and the neighbor certainly has gotten top-notch satisfaction and service with his car. Goldman came in and looked over the new cars and said he'd buy if I would allow him $1,300. I couldn't do it and told him so. He said 'Very well' and left. I called him up a day or two later and told him I could sell his car for him right then

Digitized by Google

for $900, but he answered 'Nothing doing!'

"After that I left him alone. A week later he called up and wanted to know what I would give him for the car. I told him $800, the same as I offered him in the first place. He wanted to know what had become of the man who was going to give him $900 for it. I told him he had bought another car. Goldman kept calling me up and kept coming down, and finally he got down to $1,000. I thought I had strung him along about enough then, and told him I would make a final offer of $900 and split the difference, but that I couldn't lose money on him. He took it."

"That's all right, but——"

When not to Press Prospect too Hard.

"Yes, I know what you're going to say; supposing I had lost him. If I had lost him I would have lost him, but I knew my man pretty well and knew about how he stood. And, at that, I couldn't and wouldn't have given him more than $900. In a different case I might have done differently. It all depends on the case and the man and is pretty much a matter of personal judgment each time, but if a man really wants your car and wants to trade in an old car I think it is safe not to press him too hard.

"It is not impossible that I might have lost Goldman through my tactics, but there was just as much possibility that he would have been lost through another course of procedure. Try your best and you won't make every sale; it's a practical impossibility, and all you can do is to go ahead, use your best judgment and make as many as you can.

Avoiding Trade Argument on Start.

"If a man doesn't want the car, you certainly have got to work on him regardless of whether he is out for a trade, and if he has a car to get rid of I thing it's good policy to dodge the trading proposition if you can until you have had a chance to get in some of your stuff on your own car. If you buck up against the trade the very first thing and the prospect wants and demands more than you can give him, it is likely to put an end to the whole business right there. It certainly doesn't leave him in a very receptive frame of mind, if you start your attempted sale by getting into an argument over the trade. He——"

"But——"

"Say!" exclaimed Reilly, "you've been 'butting' for twenty minutes; now go ahead and butt your head off."

"Well, do you honestly think it's unwise to let a man alone at any time?"

"Certainly, if he——"

"But in the case of DeLano," continued the Salesman. "Don't you think that he could be followed up and sold regardless of the fact that he wants to trade. In the case of the used car alone he is the salesman and I am the buyer, and in the case of our new car I am the salesman and he is the buyer. If I want to sell him, haven't I got to follow him up. What's the matter with keeping after him on the new car proposition without paying much attention to the trading feature of the case?

"If I keep after him on the new car, hasn't he got to keep after me on the car he has to sell? Hasn't he——"

"But——"

"Wait a minute! Wait a minute!" said the salesman. "Any salesman knows, or ought

"THERE IS NO SET RULE," ASSERTED REILLY AS HE OPENED THE DOOR

to know, that there is a time to talk and a time to let the prospect talk; it's only a question of when those occasions present themselves. I know a sale that was made where the prospect had become indignant at the offer that was made for his old car and had ordered the salesman not to come near him again. But the salesman followed him up and kept after him and finally made the sale and didn't give the man as much as had been offered for the old car in the first place. This salesman believed in keeping after a man as long as he was any kind of a prospect. He——"

Induce Buyer to Help Sell Himself.

"But this man hadn't been brought to the point where he actually wanted the car," interrupted Reilly. "If he had been dropped there he probably wouldn't have bought at all. What I said was that where a prospect really wants a car and is dickering for better terms on a trade, it isn't bad practice to let him alone to a certain extent and let him come down on his price, the same as you would do if you had something to sell and were likely to come down to make a sale.

"I don't say that after you have worked on a man until he commences to want a car you should drop him entirely, but I have known instances where running after the man too much has killed the sale because he got it in his head that he ought to get more for the old car than was offered him. The appearance of too much eagerness on the part of the salesman acts badly on the prospect. In the case of DeLano, you know your man, don't you?"

"Yes, pretty well."

Letting Customers Make the Advances.

"Well, in that event your judgment ought to tell you what to do with him. I should imagine that it might be a good plan to keep your eye on him for a few days and see what happens; see if he won't start to come after you. If he once starts to come your way you are in more of a position to dictate terms than if you are running after him and trying to beat him down on his old car price. It's peculiar, too, that once you weed out the rest of the cars somewhat and get the prospect's mind on yours and get him to making you offers he generally doesn't remember that when he started out to buy a car he had a list of four or five to select from. He begins to sell himself. His interest is aroused and the more he figures over the proposition and wonders how much he possibly can get from you for his old car the more convinced he is that your car is about the only one for him to buy.

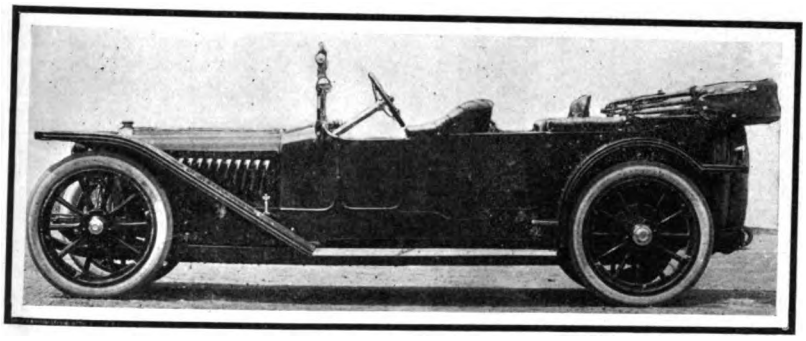
Dealer Who Refuses to Urge Trade.

"Once he starts to come you ought to start to leave him alone, and leave him alone in proportion to the extent he will come after you. I know a dealer who absolutely refuses to assume any aggressiveness with a prospect who comes in of his own volition and wants to trade. The dealer assumes that if the man hadn't preferred his car above all others he wouldn't have come in and that if he wants it he is more likely to come down on his used car if left to make all the advances himself. It may not sound like salesmanship, but you've got to give him credit for making sales through those methods. It's Blucher, over at Middletown; he says that if he kept after that type of prospect he would lose sales."

"Maybe he's right," said the salesman.

"There's no set rule," asserted Reilly, as he started for the office, whither Nellie had summoned him to answer the telephone.

As he was passing through the door he stopped to add, "There are a great many so-called rules on salesmanship, and to most of them there are exceptions, but the exceptions are as numerous as the hairs on your head."



"My head or your head?" asked the salesman as Reilly slammed the door.

THIRD UNDERSLUNG "SIX" ADDED TO AMERICAN LINE

New Model the First at Medium Price to Have Six-Passenger Body—Chief Difference from Others in Motor Dimensions.

Marking a departure from the policy of the company to limit the passenger capacity of its lower-priced cars to four persons, the American Motors Co., of Indianapolis, Ind., for which the J. I. Handley Co. is the distributer, has quietly developed and now is placing on the market a third six-cylinder chassis, equipped with a six-passenger body, to sell for $2,950. In reality, the new model takes the place of the "Traveler" model which had a 5⅜ x 5½-inch motor and sold for $4,500, and is in addition to the two six-cylinder models already produced, one of them a "big six" with a 4½ x 6 motor, and the other a "light six" with a 4 x 6 motor.

SIX-PASSENGER AMERICAN UNDERSLUNG "SIX" WHICH SELLS FOR $2,950

Except for the substitution of a new and improved type of two-unit electric lighting and engine starting equipment for the one used in the past and an alteration in the size of the motor dimensions, the new model is practically identical with the already familiar "644," which has a 4 x 6 motor rated at 40 horsepower and is fitted with a four-passenger body. Another important difference between the two models is that the wheelbase of the new one is 140 inches as against 132 inches for the older one. The new model is designated "646," the figures indicating that it has six cylinders, is rated at 40 horsepower and mounts a six-passenger body. The bore and stroke of the new motor are 4¼ and 5½ inches.

Other than for the difference in cylinder dimensions, the new motor is substantially the same as its predecessors, the six-cylinders being cast in a block but with separate exhaust ports for each cylinder; the exhaust manifold is bolted on and is easily removable. Lubrication is by splash and force feed to the main bearings and connecting rod bearings, the level being maintained constant and the oil forced by a positive gear pump.

The transmission elements, including large diameter cone clutch provided with spring inserts to ensure smooth action, selectively operated change-gear mechanism providing four forward speeds, straight propeller shaft and full-floating rear axle of the same "built-up" pattern that has been used to such good purpose for so long, are the same as those in the other six-cylinder models. Obviously, some slight alteration has been necessary in the weight of the springs, though they remain of the same type and support the chassis frame beneath the axles in the distinctive American manner.

The size of the tires in the new model is the same as those used on the light "six" four-passenger model—namely, 38 x 4½—and the equipment also is the same. Included in the list there is the combined electric lighting and engine starting apparatus, a top with side curtains and boot, windshield, speedometer and all the usual fitments, including tire repair kit, jack, horn, mats, tools, spare parts, etc.

Bosch Company to Build Casino.

Work has been started by the Bosch Magneto Co. on a casino building, 84 x 107 feet, in North Main street, Springfield, Mass., opposite its factory. The building, which has been contemplated for some time, will be a rest and recreation center for the employees of the company. It will represent a cost of $18,000.

The structure will include a rest and game room, a dining hall, 60 x 60 feet, and a kitchen and serving room connected with the dining hall. The basement will be fitted with bowling alleys. Broad piazzas will run on the north and south sides.

Velie Adds to Factory Space.

The plant of the Velie Motor Vehicle Co., of Moline, Ill., is undergoing enlargement to the extent of 120,000 square feet; the addition to the plant consists of a two-story building.

"SIX" ADDED BY MOON AND ONE "FOUR" MODEL DROPPED

"Streamline" Body and Delco Electrical System Mark New Model Selling for $2,150—Remaining "Four" Unchanged.

With one "four" less than it had last year and a new "six" that it never had before, the line of cars produced by the Moon Motor Car Co., of St. Louis, Mo., hereafter will be built around two chassis—one of them a light "four" and the other a light "six"; a larger four-cylinder model which was equipped with a 4 x 5¾-inch motor, has been dropped and, except for a two-inch increase in wheelbase length and the substitution of the Delco electric starting, lighting and ignition system for the Wagner apparatus used last year, the remaining four-cylinder chassis is practically unchanged. Quite as a matter of course, however, its body has been practically rebuilt and now presents a more rakish appearance that scarcely is suggestive of its larger size and its roomier tonneau. The price remains the same—$1,750—for touring, torpedo, speedster or roadster models. The "six" is brand new all the way through, of course, and lists at $2,150 with five-passenger touring body and at $2,225 with a body to accommodate six or seven passengers. Like the "four," it is equipped with the Delco electrical apparatus.

The whole official title of the new "six" is "Light six-50 Streamline," and the title is more than ordinarily suggestive of the car itself. Thus, for instance, the car undoubtedly is light—for a "six"; fully equipped for the road, it tips the beam at just 3,840 pounds, which, considering the capacity of the motor—namely, 58 horsepower at 1,800 revolutions—gives a ratio of power to weight that seldom is approached in the larger six-cylinder cars. The motor is of the L-head type, in contradistinction to the motor in the "four," which is of the T-head type, and has its six cylinders cast in blocks of three; the bore and stroke are 3¾ inches and 5¼ inches, respectively.

The "streamline" in the title applies to the body, of course, and is intended to convey the idea that the lines of the hood and the sides have been nicely "blended" at the dash so as to present a beautiful appearance combined with a minimum of wind resistance. Instead of a convex curve at the skuttle, the long overhang is concaved to a marked degree and the effect of smoothness is carried further back by the unbroken sides, the latchless doors and the slightly domed fenders. Following the trend of the

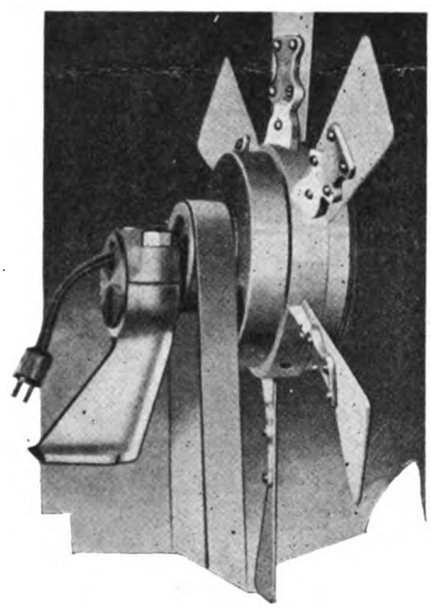
Digitized by Google

times, the side lamps have been eliminated and the windshield is built in place without the use of stays or strut rods of any kind. Tires are carried at the back of the tonneau and the running boards are perfectly clear. The steering wheel is at the left side and the control levers are in the center of the footboard.

For the transmission of power, Moon engineers rely upon a smooth-acting multiple disk clutch housed within the flywheel, a four-speed selectively operated gearset in which the shafts are mounted on imported annular ball bearings and the orthodox shaft with bevel drive on the rear axle. The rear axle, by the way, is of the full-floating type and is Timken mounted. There are two sets of brakes, of course, mounted on rear wheel drums and the wheels, all around, are shod with 35 x 4½-inch tires carried on demountable rims; the wheelbase of the standard model is 129 inches; the tread may be either 56 inches, or 60 inches for Southern roads.

In the remaining "four," the motor dimensions have not been altered; they are 4½ x 5, though by reason of a number of detail refinements the motor has been induced to give off considerably more power than it has given off in the past. Instead of the four-speed gearset with which the "six" is equipped, the "four" has a three-speed gearset though the remainder of the essential elements are the same as those in the "six," allowing for a certain difference in size of parts. The wheelbase is 118 inches, instead of 116, which was the measurement last year, and the wheels are shod with 34 x 4 tires.

The equipment for both cars is approximately the same and is as follows: Delco electric lighting, starting and ignition apparatus; windshield; top with Collins side curtains; Taylor power inflator; electric horn, and the usual complement of tools, spare parts, etc.



Now a Substitute for Inner Tubes.

Departing from the liquid and semi-liquid tire fillers which have become almost epidemic within recent months, "Bettern-Air," a German substitute for inner tubes, has made its appearance on the American market, the rights having been acquired by The Galvanizing Co., of Philadelphia. "Bettern-Air" is a chemical composition made in rolls of various sizes and when cut to the proper length is inserted in the casing and a wedge piece placed at the point where the two ends meet. It is claimed to have stood two years practical tests and it is in its favor that it is not being exploited by too extravagant claims. While not capable of high speed, it is declared that the compound is as resilient as air for speeds up to 30 miles.

MAKING THE FAN GENERATE BREEZES AND ELECTRICITY

Kemco Device Incorporates Generator as Hub of Fan — Mounted and Driven as Single Part by Fan Belt—Constructional Details.

Like many other things that are inconspicuous both as to size and location, the Kemco fan type electric generator, which is made by the Kouyoumjian Electric & Mfg. Co., Cleveland, Ohio, and already has been briefly described in Motor World, embodies more interesting features than appear at a casual inspection and is the result of no small amount of scientific experimentation. The device consists of a

KEMCO FAN-TYPE DYNAMO

diminutive dynamo which forms the hub of a scientifically proportioned fan, the whole affair weighing but 10 pounds. It is designed to be driven by the ordinary fan belt and takes the place of the ordinary cooling fan.

The generator is made proof against the intrusion of dust—which means that nothing else can get in—and there is not an unprotected opening in the machine. Within the outer casing and forming part of it, is the armature, which, reversing the conventional arrangement, rotates outside of the field magnets, which are in the center. There are two conspicuous advantages of this arrangement. Centrifugal force tends to hold the armature windings the more firmly in place, as they are, of course, on the inside of the ring, and the rapid movement tends to dissipate heat, which usually is more freely generated in the armature than in the fields.

It is claimed that one set of brushes will give approximately 50,000 car miles, due to the fact that they are thoroughly protected from dirt and that the wearing surfaces are very large. Plain round carbon is used and in case of emergency it is said that a piece of electric light carbon can be used for brushes.

The electrical characteristics of the little generator are admirably suited to the way in which it works. It has a high output at comparatively low speeds, but the output falls off as the speed increases beyond the critical point. Thus when the generator is used, as is intended, for battery charging, the car that runs around town at a moderate speed will have its charging properly done, while the speeding of a machine will not result in overcharging.

A very small ammeter is furnished with the generator, and one of its offices is interesting. If the fan belt becomes loose enough to slip seriously, the current output will, of course, drop off and the ammeter will indicate the fact. In other words, the ammeter is an efficient tell-tale on the belt, which can be given proper attention at the proper time. No increase in belt size is necessary.

The fan, which is an integral part of the Kemco generator, is built on scientific principles and, despite the solid center, is said to be more efficient than the average fan of ordinary construction. In fact, the Kemco claim is that the solid center is conducive to greater efficiency by preventing eddy currents and back draughts of air.

Here's a Top that Disappears.

Where to put the top when it is down and how to stow it away so it will look as unobjectionable as possible have worried more than one automobile body designer, and with the object of eliminating the source of worry the Automobile Roll Top Co., of Milwaukee, Wis., in which P. C. Avery is a principal, has brought out a top on the roll-up principle. When the top is up it looks not unlike any other top, with the exception that the only bows are two on each side, one extending upward from the side of the seat with a forward inclination and the other being an extension of the windshield brace, the brace being anchored back of instead of in front of the shield.

When it is desired to put the top down the bows at the sides of the seats are made to disappear into the body, those on the windshield are detached and stowed away in any small space while the top rolls into an enclosed roller at the back of the front seat. The roller is not objectionable in appearance, whether the top be up or down, and operates by a spring which draws the fabric in when the top is being put down.

& M PREPARING TO BUILD CARS; FACTORY IN DETROIT

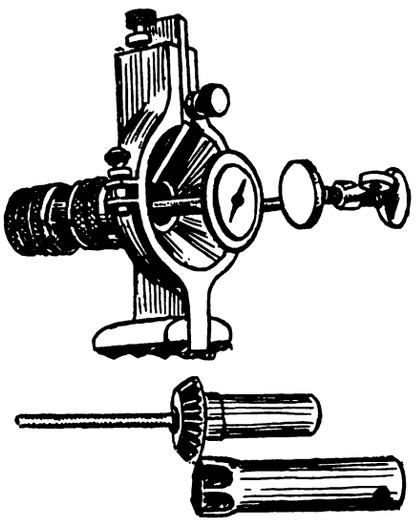
troebel and Martin to Produce Four Models from $2,485 to $3,500—All to Be "Sixes" with Left Drive and Center Control.

Having recently acquired a factory building at 1900 Mt. Elliott avenue, Detroit, the ewly organized S & M Motor Co. is making ready to enter the industry in real arnest. The car will be styled the S & M, aking its name from the two principals of he company—Edward D. Stroebel, a New ork furniture manufacturer, and Walter . Martin, at one time Cadillac agent in ew York, who, however, is now a resident of Detroit.

The car will be made in four models. The unabout will list at $2,485, a five-passenger touring car at $2,485, seven-passenger touring car at $2,535, and a limousine at $3,500. Continental six-cylinder engines, 3¾ inches bore by 5¼ inches stroke and yielding 58 horsepower at 2,000 revolutions, will be used. The components of the car will include Bosch dual ignition, Timken front and rear axles, wire wheels with Timken hubs, Warner four-speed transmission, Gemmer steering gear, Rayfield carburetter, Mayo radiator, Parish & Bingham frames, Spicer universal joints, Firestone tires and an electric engine starter.

The car will have left-hand drive, center control and will be fully equipped. The wheelbase will be 130 inches, the weight of the car 3,250 pounds and the S & M will have one horsepower for each 57 pounds. The springs are of three-quarter elliptic in the rear, one-half elliptic in the front, with underslung rear springs.

Forbid Curb Pumps in Waterloo.



Placing an oil pump at the curb in Waterloo, Ia., is obstructing the public highway, according to the opinion of the authorities and the ruling of the courts in that city; a conviction has been secured against one garage as the initial step in a campaign for the removal of all such devices; this first conviction was against the Iowa Auto Co., of 510 West 5th street, of which A. F. and F. C. Meves are the proprietors. There are about eight garages and similar establishments which will be hit by the ruling.

Spokane Men Plan Downtown Garage.

As a solution of the parking problem which is causing inconvenience for motorists and the authorities in many cities, a group of business men in Spokane, Wash., proposes to erect a downtown garage which will relieve street congestion and facilitate service to car owners; a feature of the project is a press-the-button system wherewith owners can call their cars from their office desks and have them ready and waiting in front of the office buildings when desired.

Tool that Facilitates Valve Grinding.

Valve grinding is laborious work at best, and even when painstakingly and conscientiously carried out, often leaves much to be desired, for it is not always possible, even if the operation is long continued, to rid valves and seats of ridges and pitting which sooner or later is bound to result from the corrosive action of carbon deposits. Gradually, it is being realized by those not in the trade, as it long has been

G. B. VALVE SETTING TOOLS FOR BOTH CYLINDER AND VALVE SEATS

realized by those in the repairing and overhauling business, that by far the better way to treat valves that are in bad condition is to reseat them, and for this purpose there has been placed on the market by the G. B. Sales Corporation, of 1790 Broadway, New York City, a handy tool styled the G. B. valve tool.

In its simplest aspect it consists of an adjustable receptacle that will hold valves of various sides, and a cutting tool so arranged that when the valve is inserted the cutting edge trims the seat to exactly 45 degrees. One of the unusual features of the device is that the cutting tool can be removed and sharpened, or replaced, quite easily, and when reinserted, it cannot be set at the wrong angle. The remainder of the equipment consists of the usual rose cutter for reseating the cylinder valve seats, and a suitable socket wrench to make its manipulation easy. So that the tool will stand hard usage without losing its efficiency, it is drop-forged and case-hardened and the seat cutters are made of oil-tempered high-speed tool steel. Special apparatus is not required to sharpen them.

NO RADICAL FEATURES IN CLEVELAND LIGHT TRUCK

Only Standard Construction Revealed by Four-Cylinder Motor and Orthodox Transmission—To Sell at Price of $1,250.

There really is very little in the construction of the Cleveland truck, for which C. D. Paxson, who is well known in the trade and whose offices are located in Cleveland, Ohio, has been appointed the general sales agent for the United States, that is distinctive of itself alone, for the vehicle is a standard one all the way through and conforms quite thoroughly to generally accepted truck practice. It is a light vehicle in reality, as far as capacity goes, though its price, which is $1,250, is no indication of the sturdy manner in which it is built. Several types of bodies are supplied, to suit the requirements of the individual purchaser, the vehicle that lists at $1,250 being equipped with an open express body and providing ample space for the carrying of a considerable quantity of light merchandise.

Conforming to the general tendency in the design of vehicles intended for work other than the hauling of very heavy loads, the motor is placed forward under a hood after the manner of the pleasure car, where it is instantly accessible. The steering gear and control levers are placed at the right side and the driver's seat is equipped with a substantial folding top.

In selecting a motor, cognizance has been taken of the necessity for providing ample pulling power at all speeds, and to this end a four-cylinder vertical motor of the valve-in-the-head type is employed. The valves are inclined at 45 degrees in the cylinder heads, which construction, incidentally, does away with the necessity for one cam shaft and eliminates the usual push rods and tappets. The single camshaft is driven from a vertical shaft which, in turn, is actuated by the crankshaft. Cylinders are cast in pairs with liberal water jacketing and further providing for simplicity, the cooling water is circulated on the thermo-siphonic principle. Sparks for ignition are provided by a combined low-tension magneto and battery system operating through a dash coil. The lubricating system is of the constant level pump-over type, and, in addition to keeping the cylinders and main engine gearings copiously supplied with oil, also lubricates the clutch and the gears in the change-gear mechanism.

It is important in any commercial vehicle, no less than it is important in a pleasure car chassis, that the motor and the gearset shafts be positively maintained in proper

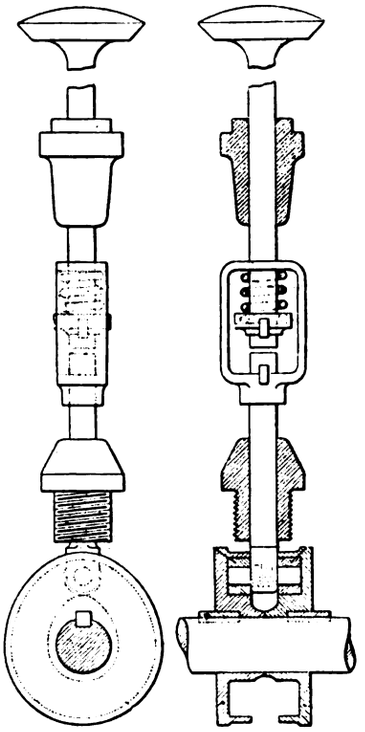
Digitized by Google

alignment, and for this reason the motor and the gearset in the Cleveland truck have been combined in a single rigid unit; hence there is no possibility of shafts getting out of alignment. The clutch is of the multiple disk type and runs in an oil bath, and the change gear mechanism, which is selectively controlled by means of the usual hand lever, provides three speeds forward and reverse; both transmission shafts are mounted in annular ball bearings.

Positively to ensure against sagging or breaking, the frame is made exceptionally strong and is mounted in front on semi-elliptic spring members and in rear on full elliptics, thus providing for easy riding qualities when the truck is loaded as well as when it is light. The weight of the vehicle complete is 2,600 pounds, and the wheels are shod with pneumatic tires measuring 33 x 4½ inches both front and rear. The drive is through a straight shaft to bevel pinions on the rear axle, which is of the floating type. The front axle is a substantial I-beam drop forging with the tie rod at the rear and the steering arm above the axle. The wheelbase of the standard model with 160-inch frame is 120 inches, and the tread may be either 56 inches, which is standard, or 60 inches.

The standard equipment that goes with the vehicle and is included in the price consists of the driver's top, three oil lamps, and the usual complement of tools, jack, tire repair kit, spare parts, etc. The trimmings are finished in nickel plate and black enamel.

Burning Insured Car Means 25 Years.



Setting fire to an insured automobile in the State of New York now carries possibilities of 25 years in jail, according to an amendment to the penal law which became effective Monday, 1st inst. If it isn't insured the penalty may be 15 years.

The revised measure was part of a large number of recent acts of the Legislature which became effective on September 1, and while it alters the situation insofar as the crime of arson is concerned it is not a new idea in law but is a rearrangement of the code. Under the laws of 1909, burning vehicles, insured or uninsured, was arson in the third degree, but the new law says that anyone "who wilfully burns, or sets on fire, a vessel, car or other vehicle, or a building, structure or other edifice, which is at the time insured against loss or damage by fire, with intent to prejudice or defraud the insurer thereof, is guilty of arson in the second degree." The second degree penalty is not more than 25 years in state's prison.

The burning of a car and the other properties included in the second degree classification "under circumstances not amounting to arson in the first or second degree" constitutes arson in the third degree. Third degree carries a maximum penalty of 15 years and heretofore both these offenses were in the lesser classification.

Valve Gear That Eliminates Noise.

Valve silencing with tappet valve motors, generally is construed to mean the positioning of plates or sleeves which, although they do not prevent the noises being set up, do render the noise less audible by confining them to the pockets which the enclosures form. The French idea as exemplified in the mechanism of the Vedry motor,

VEDRY VALVE MECHANISM

shown in the accompanying illustration, embraces the elimination of the noises and not the muffling of them.

The cam is made in two sections, each of which is slotted according to the correct contour, so that when the two halves are brought together on the camshaft the roller on the lower end of the tappet works in the slots. Thus the movement of the tappet is positive and is not at any time dependent upon the strength of a spring. The spring which serves to return the valve to its seat is housed in a yoke which is pinned to the upper portion of the tappet and through the upper part of which the valve stem works. The spring is so arranged that it is in tension when the valve is lifting, so that the valve leaves its seat before the tappet comes into contact with the valve stem, and is in compression when the tappet has been lowered by the action of the cam so that the valve is held firmly upon its seat. The cam construction, it is claimed, absolutely eliminates the noise due to the tappet striking the cam upon its return under the action of a heavy spring which is especially objectionable at high speeds, and the slighter taps which are occasioned by the contact of the tappet and valve stem are eliminated by the spring mounting.

Advantages of Short Wiring Circuits.

In wiring for any kind of electrical circuits, it should be borne in mind that the shorter the wires (regardless of their diameter) the less will be the loss of voltage due to resistance. It is well, too, to remember that lamps which light brilliantly when placed directly across the terminals of a battery will light less brilliantly at the end of a circuit no longer than the length of an ordinary touring car. Obviously, the larger the diameter of the wire, the less will be the resistance offered by it.

To Remove Dust from Upholstery.

It is doubtful if there is anything that will remove with greater certainty and less labor the dust that collects in the tufting in leather upholstery than the common or home variety of vacuum cleaner. If the broad, flat nozzle with which such devices are equipped is removed, the hose can be pushed well down into the tufting and the last vestige of dust in the upholstery will be sucked out.

When Two Gaskets Are Better than One.

It is an excellent plan when making a paper gasket to make two of them, one from the place the gasket is to fit and the second from the first one. An emergency gasket then will be always on hand and it can be put in place in a hurry if necessary. Besides, it is much easier to make a gasket from a gasket than it is to make one from the part to which the gasket is to be fitted.

When Heating Small Parts in Lead.

If finely broken hardwood charcoal is sprinkled over the top of molten lead in which small tools are to be heated for hardening, the litharge, which accumulates on top of the lead, will be prevented from sticking to the tools. As it is not always easy to remove this substance, time and labor can be saved by using charcoal in this work.

Bearings that Encourage Neglect.

Ball bearings do not require the copious lubrication that is called for by plain bearings, or to a lesser degree by roller bearings. This does not mean, however, that lubrication can be neglected or that it may be done carelessly without harm resulting to the bearings.

DEVICES THAT WATCH THE TRUCK AND DRIVER

How Profit Leaks May Be Stopped With Instruments That Write Down the Movements of Vehicles—Wherein One Grocer Failed and Why—Operation of Several Different "Recording Clocks" Made Plain.

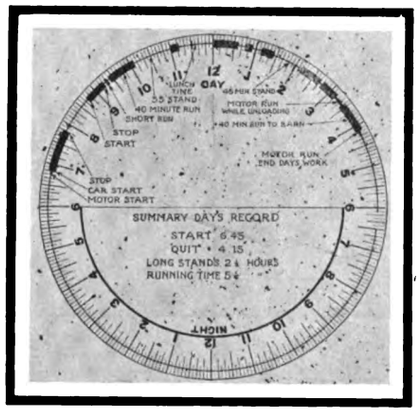
"Let me cite an example of a grocer I knew who worked in curves—and failed," says a writer in one of the popular periodicals in giving just one instance of the little things that are really big things and that work havoc with even the most carefully worked-out plans. "He had four delivery wagons, one of which delivered goods at my house. A block below my place was a field where the boys of the neighborhood played ball. The driver of this particular wagon was fond of the game, and often he would leave his vehicle in front of my house for an hour while he joined in the sport. He kept this up all summer and still held his job! The reason he held it was this: The boss did not know!

"Now, why did not this grocer know? Because he was not running his business on engineering principles. He had no standards. He did not know how long the deliveries on this young chap's route should have taken. Had he reduced the thing to engineering terms, he could have cut out this wagon absolutely. The other three wagons could have done the work easily."

Evidently, the author of these statements had a clear insight into business principles. His aim was to promote efficiency, for in advocating the laying off of one vehicle out of four he would increase the efficiency of the other three. In other words, he would work the three remaining vehicles a great deal nearer to their maximum capacity; their loafing time would be turned into paying time; the expense of one vehicle would be eliminated.

EXTERNAL VIEWS OF TWO VEHICLE MOVEMENT RECORDERS, NEITHER OF WHICH CONNECTS TO RUNNING GEAR

No Excuse for Resting the Truck.



It is not stated whether these particular delivery wagons were horse drawn vehicles or whether they were propelled by gasolene. Nor does it matter greatly, for the principle remains the same. If they were horse-drawn there might have been some conceivable reason for the driver of that lone wagon laying off for an hour to play ball. The horse might possibly have been tired, though this is unlikely. Still, it is not possible to work a horse continuously without a stop now and then to rest him up a bit. But if these four vehicles has been motor propelled there was no conceivable excuse for the delay, for motor trucks do not tire and nothing has been said about derangements of their internal economy. The driver simply stole time, and in stealing time he also stole profits. He might as well have "tapped the till" when the grocer turned his head. The method would have been just as certain to show in the monthly balance.

This stealing of time by employes is just one of the things for which the user of motor delivery vehicles must calculate and allow. And there are any number of ways in which it can be done without the knowledge of the employer. Any employe, despite how well he is recommended, and despite his intended honesty to his employer, may soothe his own conscience if he finishes his allotted daily task on time and pulls into the garage at night at the appointed hour. He has been doing the same amount of work every day—starting and finishing at the same time and delivering the same amount of merchandise—and on the face of it the proceeding seems perfectly all right. To the driver, the proceeding is all right, for has he not finished his work?

But the employer is by no means sure just how the work actually was finished.

Digitized by Google

He does not know whether the driver forced his truck in the morning so that he might lay off in the afternoon for an hour. Suppose the work laid out for the driver and truck had been computed by an expert and laid down as the greatest amount of work that could be expected from the vehicle if maximum efficiency was to be expected. Maximum efficiency, be it added, means that the maximum work compatible with the minimum wear and tear and expense must be turned out. It means, in other words, that the vehicle must adhere to a certain well-defined schedule.

TRAFILOG RECORD SUMMARIZED

Lapses Which the Devices Overcome.

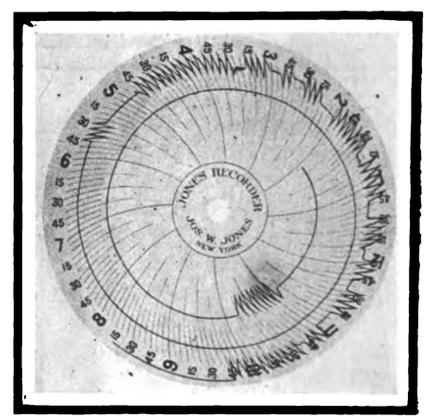
But suppose the driver of the vehicle knows that he can exceed the schedule; suppose he knows that by driving at 18 miles an hour instead of 16 miles an hour, and occasionally pushing the speed to, say, 20 miles an hour, he can finish his morning's work half an hour earlier. That means he can lay off for an hour and a half for dinner and still finish his work on time. It means, too, that he can gain another half hour in the afternoon if he is so minded.

With all due respect for the average motor truck driver, who generally is honest—even if he does like baseball—the fact remains that practices of the kind are easily possible in a great many cases. It is too well known to require reiteration that when the speed of a vehicle is pushed past a certain maximum that, it is known, will yield highest efficiency, the vehicle suffers. Next to overloading, overspeeding always has constituted one of the problems with which the motor truck user has had to wrestle. Part of the problem, it is true, has been solved by the speed governor, but there are those who prefer not to use such devices for reasons best known to themselves, and even where they are used there are any number of tricks whereby this little watchdog of the treasury can be put on his back temporarily with all four feet in the air, figuratively speaking. Hence, the problem, as such, still exists.

It is this problem that the dealer can solve for the owner perhaps better than the owner can solve it for himself, for the dealer knows of its existence, whereas the owner may never have heard of it. By tactful suggestion, the dealer can bring its existence to light, and by pointing out the means to its solution can cement his friendship with the prospective owner. Manifestly, it is to the dealer's advantage to see that the vehicles for which he is "boosting" are operated at their maximum efficiency. His efforts should lie not only in the mere selling of the vehicle. They must include service as well, and the service can be started at the outset by pointing out the solution to this really big problem. If he can show his prospective purchasers that the vehicles will pay—and they will pay in nine cases out of the proverbial ten provided they are efficiently and properly run—little else is required to cinch the sale.

SERVIS RECORD CHART

How to do it? How to go about solving this problem, or of pointing out to the prospect how it may be solved? There are any number of devices on the market—simple and certain devices—that have been designed for just this purpose. They are not all the same nor do they work on the same principle. But they all indicate invariably just how long a vehicle has been in service, how long it was "laid up"—for dinner or for baseball—and some of them indicate, as well, the speed of the vehicle at any instant of its motion.



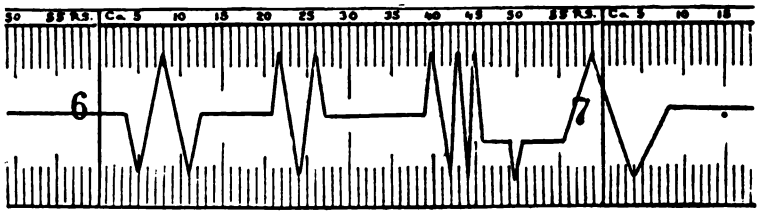
Trafilog That Works Like Pedometer.

Among these various devices, the Brown Trafilog, which is produced by the Brown Trafilog Co., of Cleveland, Ohio, is one of the simplest, though despite its simplicity it may be relied upon as an infallible tell-tale of the doings of a motor truck—or a horse-drawn one, either, for that matter—and its driver. The internal mechanism of the device is completely sealed and has no connection with the running gear of the vehicle. Briefly, it operates by the vibration of the vehicle itself and, lest it be assumed that on a very smooth boulevard the vibration would not be sufficient to cause a record to be made, it is well to add that repeated tests have shown that no matter how smooth the roadway may be, the movements of the veheicle still are recorded. The external appearance of the device is shown by the accompanying illustration, and the record it produces is shown by another picture.

Both the construction and the operation of the Brown Trafilog are so simple as scarcely to require description. The device itself is operated by clockwork which is wound up once every day when the chart record is romoved for filing. The chart consists of a sensitive disk of paper against which there presses a sharp point which is attached to the outer casing. The chart and the clockwork are partly suspended within the casing, so that the vibration of the vehicle causes the chart to move with the result that a series of marks are made on the chart. As the marks are made by the removal of part of the sensitive coating of the paper, there is no possibility of the record being tampered with.

Makes Accurate Record of Movements.

In operation, the needle which presses against the chart will trace a very fine line during the time the vehicle is at rest. Instantly the motor is started, however, the vibration causes a slightly thicker line to be traced, and when the vehicle is set in motion the line becomes a broad band which is unmistakable. All of these marks are shown by the accompanying illustration of one of the charts. This picture itself, which shows a chart taken from a vehicle in service, makes very plain exactly how much work the truck did in the interval between the beginning of the day's work and its finish. It shows, for instance, that between 10 and 11 o'clock the vehicle was permitted to stand idle just 55 minutes. The driver may have been playing ball!



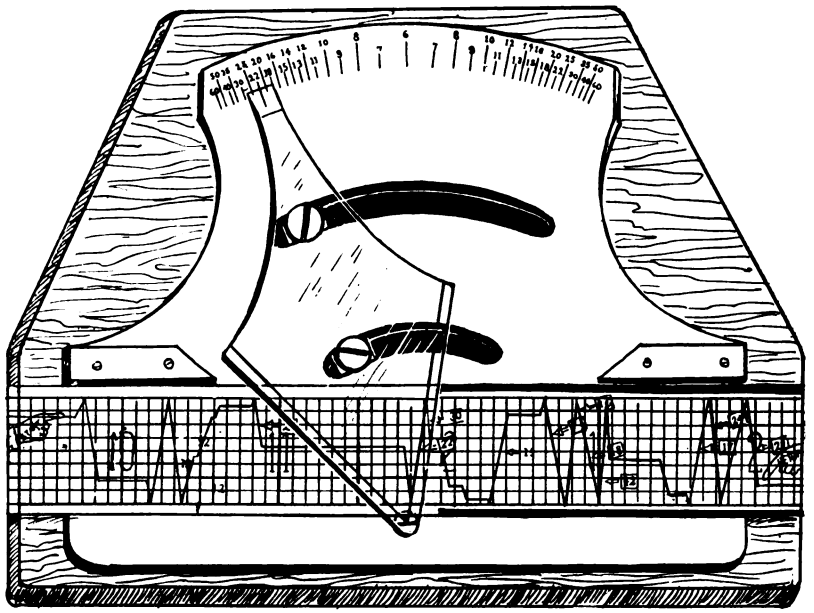
COMPLETED JONES RECORD

Digitized by Google

ıe charts for the Brown Trafilog are ıntly changeable and are supplied in types. In one type the 24 hours are led off into five-minute intervals; in other type, which is designed to give a rd covering a full week, the hours are led into 15-minute periods.

ıe Servis Recorder, which is manufac- d by the Servis Recorder Co., of Cleve- , Ohio, is somewhat like the Brown, gside of which it is shown in the ac- panying plate. It differs from the wn, however, in the important respect

TAPE MADE IN SERVICE WITH SPEEDOGRAPH INSTRUMENT



it operates by the oscillation of the cle instead of by vibration. In other ls, vibration caused by the running of motor, or by loading or unloading y merchandise, causes no record or a rd so faint that it cannot possibly be used with the record made by the vehi- n motion. Like the Brown, the Servis rder is devoid of all outside connec- ; and has no flexible shaft or other con- ing link with the running gear of the cle to which it is attached. Though the ument is very easily attached or de- ed it is so arranged that it is absolutely ssary to disturb the record in order to). In other words, the device cannot be ı off the vehicle temporarily without rd of that fact being made on the chart.

ruck's Work for a Day Recorded.

e accompanying reproduction of a taken from a Servis recorder shows the chart was placed in the instru- at 3:10 A. M.—probably by the night ge attendant. At 6:15, the truck was n 15 minutes from the garage to the and at 8:45 the vehicle was started on ıorning trip to the suburbs, returning :15. The afternoon trip began at 1:15 asted until 4:50, when the truck arrived e garage, and between 4:50 and 5, two moves—placing the truck for the —are shown. The fine line from 5 :k on is conclusive evidence that the le was undisturbed until the chart was ged at 12:45 A. M. From the record of hart, it is at once apparent that the r made only four stops of over five :es in the morning and but one in the ıoon, and that both he and the truck in service more than 10½ hours. No ılaying there!

The record also shows that for nearly 2½ hours the truck stood idle before it finally got away from the store in the morning, and though this time may have been all occupied in loading the vehicle, it is plain that there was much room for improvement in loading operations. As a matter of cold fact, the loss of time demands investigation, and if the result of the investigation can be made to cut out some of this lost time, the efficiency of the vehicle will be increased.

The Recordograf, which is produced by the Delivery Supervision Co., of New York City, is radically different from either of the two devices that have been described, for in addition to recording the length of time the vehicle is in use and the time it is idle it also makes record of the distance traveled and the speed of the vehicle at any particular moment. Also, it is operated in part by clockwork and in part by the movements of the vehicle itself through the intermediary of a flexible shaft connecting with one of the wheels. The appearance of the device is shown by the accompanying illustration, which shows the cover opened exposing the record tape and the stylus.

RECORDOGRAF TAPE AND DEVICE USED FOR MEASURING SPEEDS

The mechanism of the Recordograf is not nearly as complicated as the results obtained would seem to indicatae. The recording tape is divided longitudinally by fine lines indicating miles; the width of the tape represents a distance traveled of two miles and subdivisions indicate quarter miles. The hours are indicated on the tape by vertical lines and the tape is wound up on the drum by clockwork at the rate of a complete revolution every six hours.. Pressing against the tape there is a tiny pencil, or stylus, which is moved alternately up and down across the tape by a cam mechanism actuated from one of the wheels through the flexible shaft.

When Truck Moves Pencil Moves.

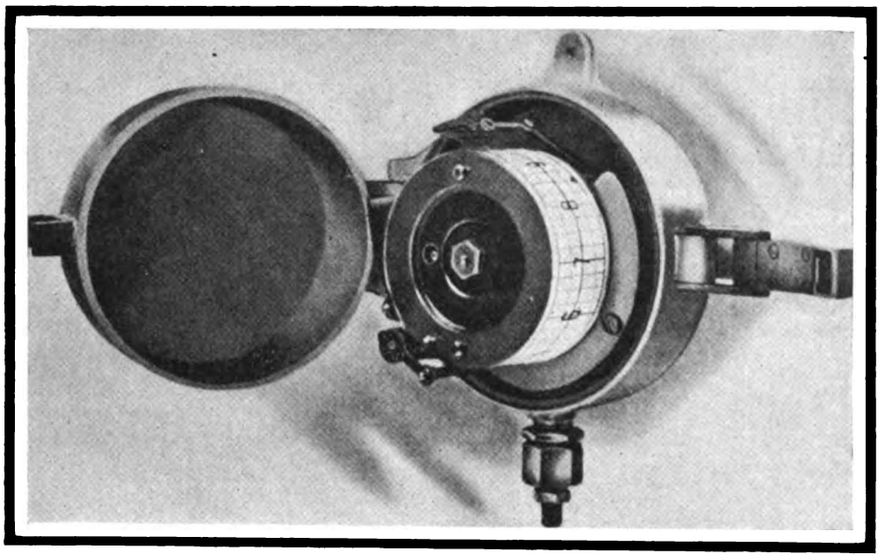
Thus, for instance, if the vehicle remains stationary, the pencil will travel along the tape a distance corresponding to the length of the stop in hours and minutes. Instantly the vehicle is set in motion (either backward or forward) the little pencil commences its travel either up or down and as the movement of the tape on the drum is constant, the line traced by the pencil will be at an angle to the vertical hour lines. It is this angularity of the pencil line which permits readings of speeds to be taken and the method of taking the readings scarcely is less interesting than the making of the record itself.

For this purpose there is used the device which is shown by the accompanying illustration and which has been especially developed for the work. When the tape is placed in the device and the hair-line placed over any one of the oblique record lines traced by the pencil, the speed of the vehi-

Digitized by Google

cle is indicated on the scale by the pointer. In the illustration, for instance, the hair-line is over an oblique line which indicates that between 11:50 and 11:55 A. M. the vehicle to which the device was attached was traveling at a rate of 22 miles an hour.

Indisputable Evidence Afforded by Tapes.

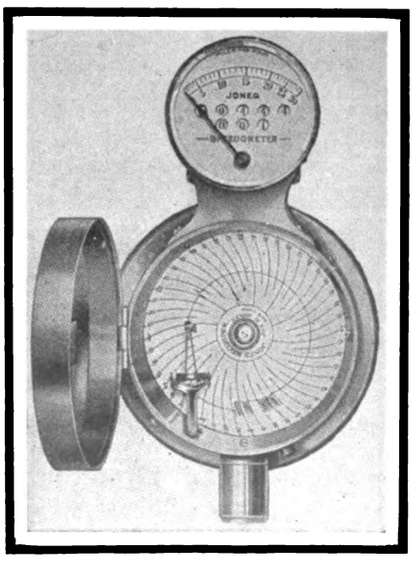


Just how valuable is this feature of being able to tell the speed of a vehicle at any time is well revealed by one case in point. A taxicab chauffeur whose vehicle is equipped with one of these devices was arrested and charged with driving at 24 miles an hour, whereas examination of the record tape showed that at no time during the 12 hours preceding his arrest had the speed of the vehicle exceeded 20 miles an hour. The evidence of the tape was allowed in court and the chauffeur discharged. In another instance, witnesses declared that a heavy truck which struck and killed a boy while rounding a corner was running at more than 20 miles an hour at the time of the accident. The record tape showed, however, that at no time during the day had the speed of the truck exceeded 12 miles an hour and that at the time of the accident it was actually making five miles an hour! The case was thrown out of court.

Simplicity of Computing Vehicle Speed.

The Speedograph, which is produced by the Recording Speedometer Co., of Newark, N. J., is another vehicle movement recording device which indicates the speed of the veheicle as well as the time in motion and at rest and the distance traveled. The method, however, is slightly different from the method used with the Recordograf. With the Speedograph, the tape is divided only transversely and the divisions represent minutes. The tape is moved by clockwork at the rate of three inches an hour. The pencil is moved up and down three-quarters of an inch for every half mile traveled by the vehicle. Hence, knowing these two factors, it is comparatively simple to figure the speed of the vehicle at any point in its travel.

In the section of record tape which is produced herewith, for instance, the record makes plain that the vehicle started at 6:03 and ran 1½ miles at the rate of 10 miles an hour (or one mile in six minutes). From 6:12 to 62:1, the vehicle was standing; from 6:21 to 6:27 it ran 1½ miles at the rate of 15 miles an hour (or one mile in four minutes); and from 6:27 to 6:39 the vehicle was standing; from 6:39 to 6:42 it moved at the rate of 15 miles an hour for ¾ of a mile, and then at the rate of 30 miles an hour for 1⅞ miles; at 6:46 there was a three-minute stop, then a quarter-mile run at 10 miles an hour, then a five-minute stop and then a run of 1⅛ miles at six miles an hour (or one mile in 10 minutes); the final stop was made at 7:08. Thus, the movements of the vehicle during the whole of the time it was supposed to be in use are recorded and the record is instantly available.



Operating on practically the same principle as the Speedograph, the Jones recorder, which is produced by Jones Speedometer of New Rochelle, N. Y., differs from the latter principally in that the record is made on a circular card. The card is moved by clockwork, just as the tape in the Recordograf and the Speedograph is moved, and the pencil is moved by a cam mechanism operated from the wheels through a flexible shaft. While the vehicle is standing, therefore, that fact is recorded by a continuous line, for the record card travels constantly beneath the stylus. When the vehicle is set in motion, however, the stylus moves upward and then downward, each zig-zag representing one-half mile of travel of the vehicle. Hence, it is simple to compute the speed of the vehicle by counting the number of zig-zags in any given period.

RECORDOGRAF WITH COVER OPEN SHOWING TAPE AND STYLUS

SPEEDOGRAPH SHOWING TAPE

JONES MOVEMENT RECORDER

Real Necessity of Recording Instruments.

That it is the idle time of commercial motor vehicles, rather than the running time, that makes for black marks on the ledger, is pretty well established, and in view of this fact it is nothing short of amazing that both users and makers have not long since insisted upon the equipment of their vehicles with some sort of a device that will record permanently the movements of the vehicle when it is away from the garage and out of sight of the owner. Granting that employes are honest, the fact remains that they also are human, and where there is a ball game, or anything else to attract the attention of the driver, there is likely to be delay—and delay spells

Digitized by Google

ruined efficiency and increased expense of operation. With the addition of some sort of a vehicle movement recording device, the owner is enabled to compute accurately the worth of his rolling stock in figures of delivery efficiency, and, like the grocer who had one wagon too many, he may find it possible to cut down expense fully one-fourth by the simple expedient of eliminating one-fourth of his rolling stock.

Black License Tags for Pennsylvania.

Pennsylvania's automobile license tags for 1914 will be black with white letters and figures instead of olive with white letters, as at present, and there will be six classes of tags issued. Pleasure cars other than those operated by dealers are in the first class; commercial vehicles are in the second class, with five sub-divisions according to weight; dealers' vehicles come in the third class and the tags will be distinguished by the letter X; traction engines constitute the fourth class, the plates for them carrying the letter E in front of the number; trailers, or vehicles that are being hauled, constitute the fifth class, and their plates will have the letter T before the number; motorcycles are in the sixth class by themselves.

Arrested as Thief of $50,000 of Cars.

Warren Rolston, alias W. T. Brown, is under arrest in Chicago, charged with having stolen a score or more of cars, the value of which is about $50,000; it is also alleged that nine months ago, while being chased by the police, he ran into and killed a man at the Rock Island Railroad and 18th street. He served six months in jail for that escapade and now is accused of having attempted to elope, three weeks ago, with a young woman whose parents, however, intercepted the couple. Last week, her affection having turned into an intense dislike, she acted as a decoy and aided the police in apprehending the youth. He is said to have numerous cars stored in various garages in Chicago.

Electric Tractors for Street Railway.

Among the many indications of the interest that is being taken in the possibilities of front drive is the fact that the New York City Railway Co. is having 14 electric trucks built in which the tractor principle is employed. The machines will be used for all sorts of trucking and the service is such that they will be thoroughly tested out in every way. The drive is by means of Couple-Gear wheels, which are of the disk type with electric motors enclosed and driving through internal gears. The wheels are being built under the bodies by the General Vehicle Co., which is acting merely as an assembler of the parts.

TRACING TROUBLE IN WIRES AND APPLYING THE REMEDY

Usefulness of the Trouble Lamp in Locating Motor and Generator Faults—Testing Armatures for Short Circuits.

In an electrical machine, motor or dynamo, in which the winding is insulated from the cores upon which the wire is wound, it is an easy matter to test for a ground—that is to say, an accidental contact between the copper of the winding, or any other part of the circuit, and the cores or the frame of the machine. Bearing in mind that there should be absolutely no flow of current from the normal circuit to ground, it is clear that if by any means a flow of current can be detected which cannot take place without in some way getting through the insulation, there must be an insulation fault somewhere, or a contact made in some abnormal way.

A simple test is to take a small electric lamp—a trouble lamp of the ordinary kind, with a battery as the source of current—and cut or disconnect one of the wires that feed it. Apply one end of the cut wire to some exposed part connected with the winding, such as a brush holder, and the other end of the wire to the frame of the motor or dynamo, as the case may be. If there is a ground the lamp will burn, for the current will pass through the winding, escape through the leak, wherever it may be, and return through the other wire of the testing lamp.

If the lamp burns in such a test it indicates, but does not locate, a ground. To find out if the trouble is in the armature, remove the brushes so there will be no normal connection between the armature winding and any other part of the circuit, and apply one end of the testing lamp wire to the commutator and the other to the armature shaft; run the wire all round the commutator. If the lamp burns, there is an armature ground. If not, there are the fields to be tried. The wires should be disconnected so that each field will stand by itself, without connection with the armature or with other fields. By touching one end of the test wire to the end of a field winding and the other to the field casting the integrity of the insulation can be proved. Of course, the field that is grounded will show a light. If there is doubt as to whether the winding of a field or any other circuit is intact, forming a continuous circuit, it can be tried out by touching one end of the lamp wire to each of the terminals of the doubtful circuit, being careful, of course, to try a circuit that should begin and end where the test wires are applied.

Tests for interruption of the armature circuit are equally simple. The commutator cars, with the armature coils, form a continuous circuit—a closed circuit—and every commutator bar is in electrical communication with every other car. Thus, if one end of the test wire is applied to a commutator bar and the other end carried around the whole commutator, touching every bar, the light should burn continuously, except, perhaps, where the current may be interrupted in passing from one bar to another. If there is a bar upon which the light does not burn, there is an interruption, and nine times out of ten it will be a break in the joint between the end of the armature coil an dthe end of the commutator bar, or in the short end of the wire from the coil to the bar.

In making such tests it must be remembered that the current—supposing the ordinary battery lighting current is used—is quite feeble, and will not pass unless the contact is fairly good. Therefore, the end that is applied to the cors, or to any part that is not clean and bright, should be well rubbed against the iron to make a good contact, or elce a little place scraped clean for the purpose. Also, a very slight or imperfect ground may not show up under such a test, the current not having sufficient strength to work through. In such a care the professional procedure is to use a testing magneto, which is simply a small, hand-cranked magneto with a bell which rings when the circuit is completed, just as the lamp lights in the rough tester referred to. Such a magneto produces a current of very high voltage, or pressure, and very low amperage, so that it has practically no heating power, and yet will force its way through even a small leak. It is not safe to use a heavy current for testing small machines, for the reason that a slight trouble may easily be aggravated by the fusing of the adjacent and almost touching metal surfaces.

Any machine that has a normally grounded circuit must, of course, he handled accordingly. But if the ground connection is interrupted so that there is no normal ground, the testing can be carried out.

Soda Solution as a Cleansing Agent.

Although gasolene long has been viewed by garage attendants as the cleansing fluid par excellence for "cutting" grease and oil, a solution of common washing soda in hot water will answer the purpose quite as well and is not nearly as expensive. One very good reason for using the washing soda solution is that it is less likely to leave small particles of ground-off metal on bearings, for instance.

1,051,927. Vehicle Wheel. Thackston Thomas, Mutual, Okla. Filed April 8, 1911. Serial No. 619,668. (Wheel with portions of spokes formed of springs.) 2 claims.

1,051,939. Resilient Tire. Paul F. Wobst, Milwaukee, Wis. Filed Aug. 6, 1912. Serial No. 713,604. (Tire with internal springs.) 3 claims.

1,051,975. Tire-Fastener. Earl G. Watrous, Chicago, Ill. Filed Aug. 3, 1908. Serial No. 446,504. (L-head bolts acting against cam surfaces.) 2 claims.

1,051,976. Automobile Motor-Starter. Charles J. Widmer, Franklin, Pa. Filed Aug. 16, 1911. Serial No. 644,363. (Compressed air starter and clutch-operating mechanism interconnected.) 3 claims.

1,051,986. Internal-Combustion Engine. Aurin M. Chase, Syracuse, N. Y. Filed July 27, 1911. Serial No. 640,740. (Piston with upper part smaller than cylinder and fitted with rings.) 4 claims.

1,051,995. Automobile Axle. Gilbert S. Gundersen, Dayton, Ohio, assignor of one-half to George M. Smart, G. Russell Wells, Andrew E. Ausman, and Otto Kolb, Dayton, Ohio, and Frank A. Tranchant, Osborn, Ohio. Filed July 15, 1911. Serial No. 638,616. (Wheels on dead axle driven by gears from live shafts.) 1 claim.

1,052,005. Valve for Internal-Combustion Engines. Philip C. Kreitz, Cleveland, Ohio. Filed Feb. 2, 1911. Serial No. 606,084. (Valve with cast iron and steel compound head and steel stem.) 3 claims.

1,052,009. Cushioned Automobile Wheel. Walter F. Nelson, Exira, Iowa. Filed Feb. 24, 1911. Serial No. 611,264. (Wheel with spring tire.) 3 claims.

1,052,027. Spring Wheel. Davis C. Anderson, Laprairie, Minn. Filed June 3, 1912. Serial No. 701,348. (Spring wheel with rim revolving on rollers carried by springs.) 3 claims.

1,052,064. Vehicle Wheel. Emil F. Krell, Detroit, Mich. Filed May 1, 1911. Serial No. 624,333. (Wheel with springs between inner and outer rims.) 9 claims.

1,052,122. Spring Tire. William E. Baker, Scranton, Pa. Filed June 29, 1912. Serial No. 706,652. (Wheel with linked section rim backed by springs.) 1 claim.

1,052,129. Tire-Retainer. Franklyn M. Carhart, Sea Cliff, and Archibald Van de Water, Glen Cove, N. Y. Filed Sept. 23, 1911. Serial No. 650,978. (Solid tire with base dovetailed into retaining rings.) 3 claims.

1,052,155. Differential Mechanism. Milton C. Lenoir, Chicago, Ill., assignor, by mesne assignments, to Frank M. Lewis, Chicago, Ill. Filed March 11, 1912. Serial No. 683,043. (Friction roller differential.) 5 claims.

1,052,170. Spark Plug. Charles E. Peterson, Brooklyn, N. Y., assignor to Michigan Motor Specialties Co., Detroit, Mich., a corporation of Michigan. Filed Jan. 28, 1908. Serial No. 413,000. (Packing joint between shell and core of plug.) 7 claims.

1,052,224. Bumper-Bracket. Grant F. Discher, Milwaukee, Wis. Filed April 11, 1910. Serial No. 554,632. (Bracket and clamp for attachment to end of car frame.) 9 claims.

1,052,250. Vehicle Wheel. John S. Hines, Portland, Ind. Filed Jan. 24, 1912. Serial No. 673,268. (Wheel with concentric hub members separated by springs.) 1 claim.

1,052,290. Wheel. Brinay Smartt, Indianapolis, Ind. Filed April 20, 1912. Serial No. 692,147. (Wheel with pneumatic tires between inner and outer rims and an outer rim, and plunger rods between the tires.) 4 claims.

1,052,339. Valve for Internal-Combustion Engines. Lodewyk Jan Rutger Holst, Lansdowne, Pa., assignor of one-third to Henry S. Williams and one-third to Morris Earle, Philadelphia, Pa. Filed Feb. 13, 1912. Serial No. 677,382. (Motor with cylindrical valve with vertical reciprocating motion.) 5 claims.

1,052,340. Valve for Internal-Combustion Engines. Lodewyk Jan Rutger Holst, Lansdowne, Pa., assignor of one-third to Morris Earle and one-third to Henry S. Williams, Philadelphia, Pa. Filed March 6, 1912. Serial No. 681,929. (Valve system including auxiliary exhaust valve.) 1 claim.

1,052,358. Cushion-Spring Wheel. Henry James Marks, Toowoomba, Queensland, Australia. Filed July 30, 1912. Serial No. 712,291. (Wheel with spokes cushioned in cylinders projecting from hub.) 2 claims.

1,052,369. Speedometer. William O. Nelson, Baltimore, Md. Filed March 23, 1909. Serial No. 485,317. (Hydraulic speedometer drive.) 12 claims.

1,052,397. Carburetter for Petrol-Motors. Walter Wingfield, Ealing, England. Filed Dec. 16, 1911. Serial No. 666,201. (Spray-nozzle regulator.) 2 claims.

1,052,416. Diaphragm-Horn. Miller Reese Hutchison, Summit, N. J. Filed Oct. 26, 1909. Serial No. 524,761. (Electric motor horn.) 13 claims.

1,052,422. Inclosed Core for Tires. James M. Miller, Washington, D. C. Filed Feb. 29, 1912. Serial No. 680,725. (Cushion tire with cellular core.) 1 claim.

1,052,436. Valve for Internal-Combustion Engines. Lodewyk Jan Rutger Holst, Lansdowne, Pa., assignor of one-third to Henry S. Willims and one-third to Morris Earle, Philadelphia, Pa. Original appplicaion filed March 6, 1912, Serial No. 681,929. Divided and this application filed April 30, 1912, Serial No. 694,070. (Four-cycle motor with reciprocating piston valve.) 2 claims.

1,052,438. Cranking Device. Richard Dow Clemson, Middletown, N. Y. Filed May 22, 1912. Serial No. 698,905. (Spring starter and clutch mechanism.) 13 claims.

1,052,485. Motor Vehicle. Alfred H. Knight, Detroit, Mich., assignor to Packard Motor Car Co., Detroit, Mich., a corporation of Michigan. Filed July 22, 1910. Serial No. 573,343. (Detachable body construction.) 6 claims.

1,052,511. Mud-Guard for Automobiles. Oliver W. Patterson, Chicopee Falls, Mass. Filed Feb. 1, 1912. Serial No. 677,092. (Mud guard hinged to front end of running-board.) 4 claims.

1,052,552. Convertible Body for Automobiles. Albert A. Ackerman, South Bend, Ind., assignor of one-half to Harry A. Engman, South Bend, Ind. Filed April 15, 1912. Serial No. 690,880. (Detachable rear body section.) 8 claims.

1,052,559. Automobile Attachment. Milton L. Bernstein, New York, N. Y. Filed Aug. 10, 1911. Serial No. 643,416. (Starting crank and engaging means.) 2 claims.

1,052,560. Tread-Band for Tires of Motor Vehicles. John Carter Berry, Harrow, England. Filed Oct. 14, 1910. Serial No. 587,101. (Non-puncturable tread for pneumatic tires.) 2 claims.

1,052,565. Spring Wheel. Robert M. Burgess, Columbia, Mo. Filed Oct. 14, 1911. Serial No. 654,685. (Wheel with helical springs enclosing spokes.) 1 claim.

1,052,570. Spring Spoke. Warren H. Clark, Burlington, N. Y. Filed July 18, 1912. Serial No. 710,302. (Telescoping spokes with spring resistance.) 1 claims.

1,052,629. Liquid-Fuel Filter. Winfield A. Utzman, Toledo, Ohio. Filed July 22, 1912. Serial No. 710,902. (Gasolene filter with spherical body.) 6 claims.

1,052,648. Vehicle Suspension. William R. Blystone, Greensburg, Pa. Filed Sept. 30, 1912. Serial No. 723,172. (Spring suspension with sliding frames.) 3 claims.

1,052,681. Spring Wheel. Marius Mathiesen, San Antonio, Tex. Filed April 30, 1912. Serial No. 694,075. (Wheel with pivoted spring spokes.) 3 claims.

1,052,692. Friction Transmission Mechanism. Albert A. Reason, Pontiac, Mich., assignor of one-third to Floyd Reason, Detroit, Mich. Filed Dec. 11, 1911. Serial No. 664,934. (Friction drive with propeller shaft.) 12 claims.

1,052,743. Timer. Arthur R. Mosler, New York, N. Y., assignor to A. R. Mosler & Co., New York, N. Y., a corporation of New York. Filed Nov. 19, 1908. Serial No. 463,476. (Timer with laminated metal contacts.) 4 claims.

1,052,752. Clip for Steering Wheels of Automobiles. Frank Revett and William Simmers, New York, N. Y. Filed May 7, 1912. Serial No. 695,676. (Bracket attachment for steering wheel.) 7 claims.

1,052,757. Vehicle Wheel. John T. Shea, Glen Cove, N. Y. Filed April 22, 1908, Serial No. 428,683. Renewed June 6, 1912. Serial No. 702,111. (Tire made of disks set on edge.) 3 clams.

1,052,763. Motor. Hawley Stone, Rosebank, and George W. Scott, New York, N. Y. Filed May 24, 1912. Serial No. 699,428. (Motor with shaft in same axis as cylinder and cam drive.) 4 claims.

1,052,795. Shock-Absorber for Vehicles. Michael Mary Brophy, London, England. Filed Jan. 3, 1911. Serial No. 600,605. (Auxiliary spring shock absorber.) 4 claims.

Holds World's Stock Championship.

National

Holds World's Record for Fastest 500 Miles in Competition

Once a National Dealer, Always a National Dealer

Electric Started and Lighted. Not only Left-side Drive, but *access* to both front doors.

Five Models, $2750 to $3400

Don't sign up to handle any car until you get our proposition

That's all we ask. Simply that you *investigate* the *National* before you put your name on the dotted line of any manufacturer's agreement.

If you happen to be one of the fortunate dealers who is making his business pay a nice annual profit, at least *investigate* the *National*, just to see if we have anything better to offer you.

Or, if you have not been getting the *net profit* you have a right to expect—by all means investigate the *National* before another day goes by.

Then decide for yourself

Here is what we claim—and it's up to you to make us prove it—the *National* is *your* logical "best seller." If we don't prove this to you conclusively—if we fail to convince you beyond the shadow of a reasonable doubt that when you sell the *National* your profits will not be eaten up in needless service and shop expenses—we won't expect you to join the great *National* Selling Organization.

All we ask is that you give us an opportunity to tell you exactly what we have to offer you and what we will do for you—then you are to decide for yourself.

You cannot afford to ignore this invitation

After thirteen years of experience in building and selling the *National*—with a thorough, intimate knowledge of every motor car on the market today—we claim that money cannot buy better materials than are used in the *National*: that the *National* has one of the most flexible, noiseless motors; the most efficient electric starting and lighting system; that it is second to none in power, dependability, ease of operation, convenience and comfort—and that *National* dealers are able to make a nice profit and *retain it*.

Write or wire at once

If you happen to be located in open teritory, ***now*** is the time to become a part of the *National* Selling Organization. Ask our competitors about us and they will tell you we are favorably known for *square dealing*, *liberal policy*, and for the *advertising* and *sales* support we give our dealers. Let us send you complete specifications, detailed descriptions and our special terms to Dealers. In requesting this information you obligate yourself in no way. Arrange to visit our factory at Indianapolis, if you can do so conveniently—write or wire us at once—it will be worth your while.

A $25.00 Electric Warning Signal now

$15.00

DEALERS!

You Wouldn't Attempt To Sell A Car With One Speed Why Sell a Warning Signal With One Warning Note?

This TUTO (two-tone) signal has two distinctly different warning notes. The ordinary signal for ordinary occasions, the abrupt, harsh, penetrating danger cry for emergency. The ordinary or first TUTO warning is adequate nine times in ten. The tone is secured by ordinary pressure on push button. The emergency warning or far away signal is secured by pushing button way down.

FIND THE CAR OWNER WHO IS IN THE MARKET FOR A SUPERIOR WARNING SIGNAL—HE IS LOOKING FOR THE TUTO

DEALERS!

Over Five Hundred Thousand Cars Are Still Bulb-Equipped All of Them Are REXO Prospects

Tens of thousands of REXO Signals are in use. Nearly a hundred thousand have been ordered for 1914 delivery. It is far and away the fastest selling accessory in all motordom and the REXO story appeals instantly to the average car owner.

In CAR-WISE logic a Good LITTLE signal will outsell a GOOD BIG SIGNAL in the same proportion that a good little car outsells a good big car. But the REXO is small in price only. The TONE is wonderfully forceful. It demands and secures the right of way in any traffic. It will sell instantly to four in every five owners of bulb-equipped cars. Behind this REXO Signal is the DEAN-ELYRIA reputation on all things electrical. May we send you our selling plan? It shows the way to leadership in the accessory field.

"BOWER SAVES POWER"

The Two-fold Job of the Front Wheels

The front wheels of an automobile perform a double function; they bear part of the weight of the car; and they are the means by which it is steered. The front wheel bearings, accordingly, must sustain both the downward pressure from the load, and the side pressure that arises from turns and from the jolts and shocks of rough roads.

Bower Roller Bearings are scientifically designed to withstand both downward pressure, or "radial thrust," and side pressure, or "end thrust." Consisting of a cylindrical roller with a flanged head at one end, the Bower Bearing by its simple construction reduces friction to the minimum. For the constant and heavy radial thrust is carried by the whole length of the roller. The side thrust is carried by the flange; *the roller at no time is subject to this strain.* Hence the roller is self-aligning and always runs free. Because, moreover, Bower rollers and race-ways are at all times parallel, a maximum diameter of roller can be used, thus reducing wear. Finally, Bower Bearings are accurately adjusted before they leave the factory, and thereafter never need adjustment.

There are the reasons why "Bower Saves Power."

A 40 Year Reputation for Quality and Efficiency of Products Behind the

CORBIN-BROWN SPEEDOMETER

"The Speedometer of Absolute Accuracy"

Forty thousand dealers testify to the quality of Corbin products.

The manufacturing policy that governs each is to so make it that it will be an advertisement for every other member of the famous line.

Ask any dealer what he thinks of Corbin products, and you will understand why the Corbin-Brown Speedometer has met with such instantaneous success.

The Corbin-Brown Speedometer was introduced because it filled a need—because it possessed none of the faults common to other speedometers in general.

The name, alone, is a guarantee that the Corbin-Brown Speedometer will give absolute satisfaction.

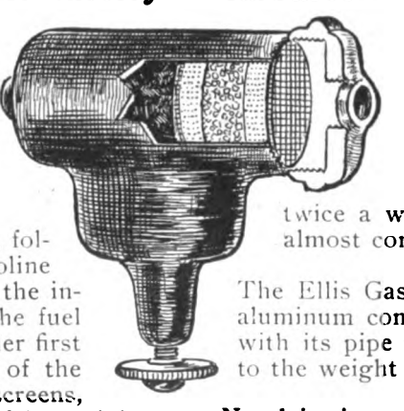
Commercial Gasoline

More carburetor trouble is traceable directly to foreign substances in the fuel than to the inability of the carburetor to vaporize the gasoline properly.



The remedy for carburetor trouble should be applied to the cause of the trouble. Remove the foreign substances from the fuel and carburetor troubles will cease.

Commercial gasoline, either high or low test, invariably contains more or less foreign matter, such as fine particles of dirt, parafine, sediment. Water collects and its presence is bound to cause trouble which ends in a "hang-up."

Probably no trouble is so dreaded by drivers as carburetor trouble. Carburetors come from the factory perfectly adjusted and even the most experienced driver hesitates to change the adjustment.

Their hesitation is natural and wise. The carburetor should do its work of vaporizing the fuel properly and when it balks, something is wrong. Invariably it is the fuel, not the carburetor which is at fault.

The Ellis Gasoline Purifier removes the cause of carburetor trouble and gives the carburetor a chance to do its work. It is more than a strainer; it filters and purifies gasoline without interfering with its free flow.

How best to understand the Ellis, follow in your mind the flow of gasoline from the tank through its pipe to the intake (left end in illustration). The fuel fills the lower portion of the Purifier first and as it rises into the cylinder of the purifier filters through a series of screens, first wire, then fine felt, quartz, felt, and last wire. Every particle of sediment, however fine, is removed, leaving nothing but pure gasoline to feed on to the carburetor.

We said that water caused a lot of carburetor trouble. This undesirable element is removed by gravity. It is caught in the lower chamber of the Purifier, and—owing to the greater specific gravity of water—the fuel rises over the water. Long before the precipitation chamber fills up with water and sediment it is drained off simply by loosening the thumb screw at the bottom of the Purifier. Once or twice a week is often enough, even with almost continual running.

The Ellis Gasoline Purifier is made either of aluminum composition or brass and complete with its pipe unions adds practically nothing to the weight of the machine.

No claim is made as to its saving in fuel costs for that is not its primary purpose.. While everybody knows that pure gasoline will develop more power than otherwise, *the great benefit of the Ellis Gasoline Purifier is found in its insurance against carburetor troubles and their recurrent expense.*

WARNER
QUALITY AUTO-METER

Finer Than the Finest Watch

THE expert watchmaker shown at the left, is adjusting the Warner hairspring—too fine to be seen in the picture—by which the speed indicating dial is returned to zero or neutral position when the car stops. This adjustment is so delicate that no machine ever devised can handle it. The workman must depend on the sensitiveness of his skilled fingers, highly developed in years of training, to tell when the tension or "pull" of the spring is absolutely correct.

We could use a larger, heavier spring, and eliminate this expensive operation. But the result would be a bulky, unwieldy part. It would lose that extremely sensitive accuracy which is an exclusive Warner feature.

THE man at the right was formerly factory superintendent and chief research engineer for one of the greatest watch manufacturers in the East. He is shown at work on one of the many experiments we are constantly engaged in for improving the Warner, in one corner of our experimental room.

The machine is a watchmaker's lathe, the most delicate of its kind ever devised. It was not delicate enough for Warner construction, however. Various refinements designed and applied to the instrument give it such an extreme nicety of operation that the parts it turns out are far more accurately formed and fitted than many of those in the most costly watches.

No other speedometer maker uses these expensive methods of manufacture. The Warner Auto-Meter is the highest quality speed and mileage recording instrument, in design, material and workmanship, in the world.

The Warner Auto-Meter Factory, Beloit, Wisconsin

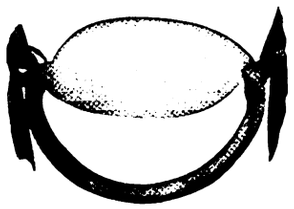
5-X-Test Tubes

The Dealer's Best Advertisement



JUST ponder for one minute, Mr. Dealer, what business building power you have in a tube like 5-X-Test.

You can sell this Tube and **know** that it will give your customer 100% service. We build that service into it. We use very fine rubber. And each tube is made very carefully by experts.

Every 5-X-Test Tube you sell is a business building advertisement for your store. That tube will not only sell scores of others among user's friends, but it will bring you business in other lines.

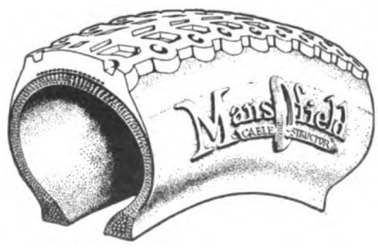
Every live, conscientious dealer wants to give the best tube possible for the money. We want you to test this tube. The quality will convince you—our special exclusive proposition will interest you.

Read how we build the Mansfield quality into it and then write us for a sample section.

Made of Fine Pure Rubber

Fine pure gum — unadulterated—is used in building 5-X-Test Tubes. We prepare the rubber by a special formula to increase the life and toughness to the maximum. Therein lies the secret of 5-X-Test superiority.

Careful Building



We build each 5-X-Test Tube very carefully—and very slowly. The work is done under the supervision of the most exacting inspectors. Through this very careful building we secure absolute tube-perfection.

Mansfield CABLE-STRUCTUR

Control the Sale of Cable-Structur

Our sales policy confines the sale of Cable-Structur Tires to **one man in a town.** You will quickly appreciate what that means to you.

We still have some territory open. Write us today and control the sale of this great tire in your city. Just say "give us your exclusive dealers proposition as outlined in Motor World, and send your catalog."

The Test of Strength

The great strength of this tube is proved by the picture. It's from a stock tube inflated to more than 5 times normal size.

Prove Our Claims

Fill in the coupon right now and let us prove our claims for 5-X-Test Tubes. We want you to compare 5-X-Test with the tube you now sell. **Our exclusive dealers proposition is very liberal** and will interest you. Write us now.

The Mansfield Tire & Rubber Co.
MANSFIELD, OHIO

The Mansfield Tire & Rubber Co.,
Mansfield, Ohio.

We have read your Dealers' announcement in Motor World, and you may send us a sample section of your 5-X-Test Tube.
Also send us your special proposition on one-third gross assorted sizes, half grey and half red.

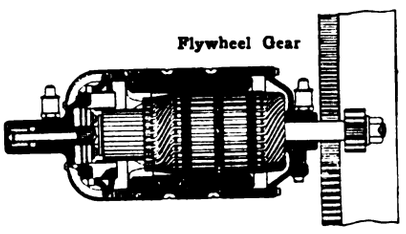
Start with the Right Starter!



The only starter really worth while is the one which just goes about its business and is never heard of afterward by the car maker or dealer. Selling a starter like that means a profit for you and satisfaction for everyone concerned.

Just Press the Button

Does that describe the starters on your cars? If it doesn't, how much is it going to cost you to keep your customers satisfied? It is better to start right with a starter that asks no apologies.

The RUSHMORE STARTER

is that kind. Pressing a foot button causes it to take hold of the engine, spin it, and let go at precisely the right instant. There are no gears to shift, no ratchet drives to wear out or stick, no friction clutch to slip, no mechanism of any sort beyond a simple electric motor, whose armature shaft carries the driving pinion and has an end-play that brings the pinion into mesh with the fly-wheel gear when the button is pressed. Disengagement is automatic, positive and noiseless.

Write for literature about the Rushmore Starting and Lighting System. It is the biggest thing of the day in the automobile world.

Rushmore Dynamo Works, Plainfield, N. J.

70 to 140 Miles Every Day

That's the steady record of the one-ton Kelly Trucks running on the Malvern Hill-Richmond Bus Line.

Each truck makes at least four trips a day between the Virginia capital and historic Malvern Hill. The distance is 18 miles and the average is 1 hour and 30 minutes.

Hundreds of Kelly Trucks are equaling or bettering this performance every day under all sorts of conditions.

Would it help your business if your wagons were able to average more than 70 miles a day? A kelly can do it.

DEALERS!

There is still some desirable Kelly territory open. Write for our agency proposition.

1913 BUSH TERMINAL MODEL FACTORY BLDG Nº 20

PART OF BROOKLYN FACTORY BEFORE MACHINERY WAS INSTALLED

PORCELAIN FACTORY, TRENTON, N.J. IN COURSE OF CONSTRUCTION

On September 15, 1913, we will consolidate our Detroit and New York factories at the

Bush Terminal, Model Factory No. 20
41st Street and 2d Avenue
Brooklyn (New York City)

Our new quarters embrace an area of 31,000 square feet—***on one floor***—two and one-half times the manufacturing and office room we now occupy.

Increased floor space permits of the installation of additional specially designed machinery, nickel and brass plating and enameling equipment.

The Bush Model Factories, constituting a freight terminal for 11 railroads, 13 coast-wise and river steamship lines and 17 trans-Atlantic and trans-Pacific steamship lines, we will have facilities for loading freight from our shipping department direct into the freight cars and holds of vessels for all parts of this country and abroad.

To better describe the extent of our enlarged operations, our corporate title will be changed from Emil Grossman Company to

Emil Grossman M'f'g Company, Inc.

Our Building at 844 Woodward Avenue, Detroit, Mich., will be continued as our Western Branch.

Our Porcelain Factory at Trenton, N. J., is being enlarged. Three new buildings and two kilns are completed.

HAVERS SIX

1914 announcement of the pioneer builder of the moderate-priced "Six"

In making this first announcement of the 1914 Havers 6-60 we wish to address ourselves particularly to dealers well established in their territories and their communities, and who have the ability and the facilities to sell a "six" of the high type represented in the Havers.

For such dealers we believe the Havers to be an especially interesting car, because of its high quality, its great power, the worth and reputation of its component parts, its equipment, and the reasonable price at which such a car can be sold with fair profit to dealer and maker.

We further believe that the dealer who is a good business man, and who is looking to the future of his investment, will agree with us when he knows the Havers car.

Note the wealth of instrument board equipment and the two hooded electric lights

Now in its fourth year, the Havers has made substantial progress and substantial success in the past.

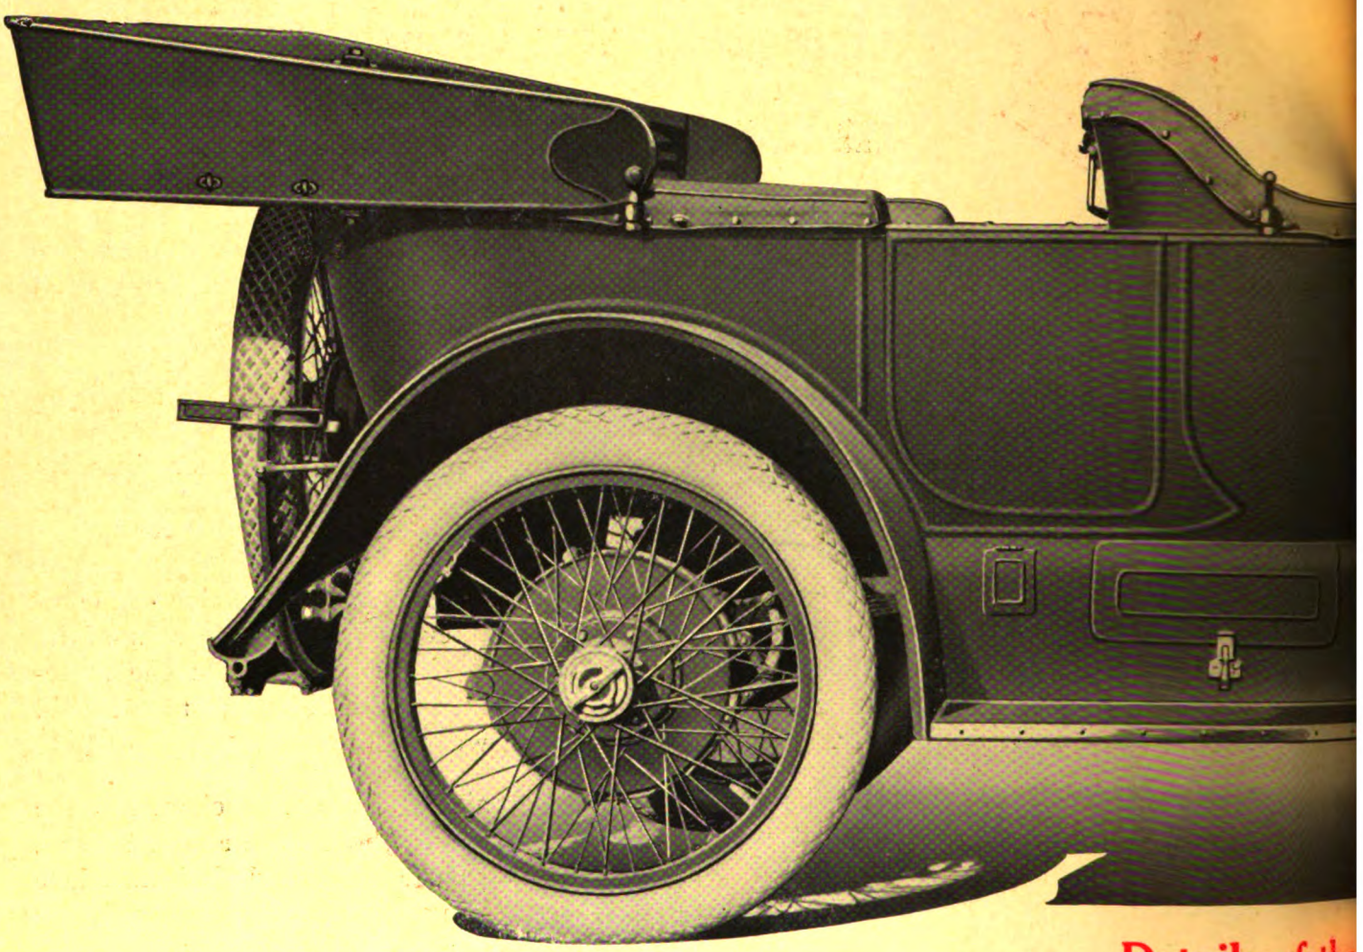
We were the first builders in America to produce a six-cylinder car under $3000.

We paved the way for other sixes, by showing that a moderate-priced six can be made a success.

The Havers has always welcomed comparison in every detail with cars of its class; and if we could make the statement stronger with reference to the 1914 product, we should do so.

Mechanically there is no change in the 1914 cars over those of the past season, simply because we could find no place where change meant improvement or greater efficiency.

In the matter of accessories and equipment, we believe no car—at any price—has ever been so completely fitted as the Havers 6-60.



Havers dealers had no trouble disposing of all the 1913 product we could supply; and the 1914 car has been made even more salable to that class of buyers who demand a complete car of the highest grade.

We shall be glad to correspond with dealers to whom such a car presents an opportunity.

A car that will sell to men who formerly

Details of the

MOTOR—Bore and stroke, 4⅛ x 5¼ inches, 60 H. P.
FRAME—Double drop pressed steel, heavy channel section, width 30 in. in front, 31½ in. in rear. Metal 7/32 in. thick.
WHEEL BASE—128 inches.
DRIVE—Propellor shaft carried in torsion tube with full universal and slip joint on transmission shaft. Driving strain on rear axle carried through radius rods. Torsional strains carried through frame by a large yoke on third member.
AXLES—Front axle drop forged "I" beam section with drop forged yokes, spindle 1⅝ in. in diameter. Rear axle full floating. Drive shaft 1½ in. nickel steel.
BRAKES—Service brake, external contracting. Emergency brake, internal expanding. Both lined with Raybestos and equipped with equalizers. Drum 16 in. diameter, 2½ in. wide.
STEERING GEAR—Worm and full wheel type, irreversible and adjustable for wear. Heavy nickel 2 in. diameter steering column, 18 in. steering wheel.
WHEELS—Wood, artillery type. Spokes of best second growth hickory. Firestone quick-detachable, demountable rims. McCue wire wheels optional, $50.
TIRES—36 x 4½ in., front and rear.
TREAD—56 inches.
SPRINGS—Front, semi-elliptic, 40 in. long by 2 in.

There is a class of men who demand the highest quality in their cars, but are perfectly willing to take a saving in the purchase price.

To such men the Havers 6-60 makes its strongest appeal.

It offers the quality, the stability and the engineering skill embodied in the costliest cars.

It offers the same high power, the same efficiency in road work.

It offers the same silence of operation; the same convenience; the same comfort.

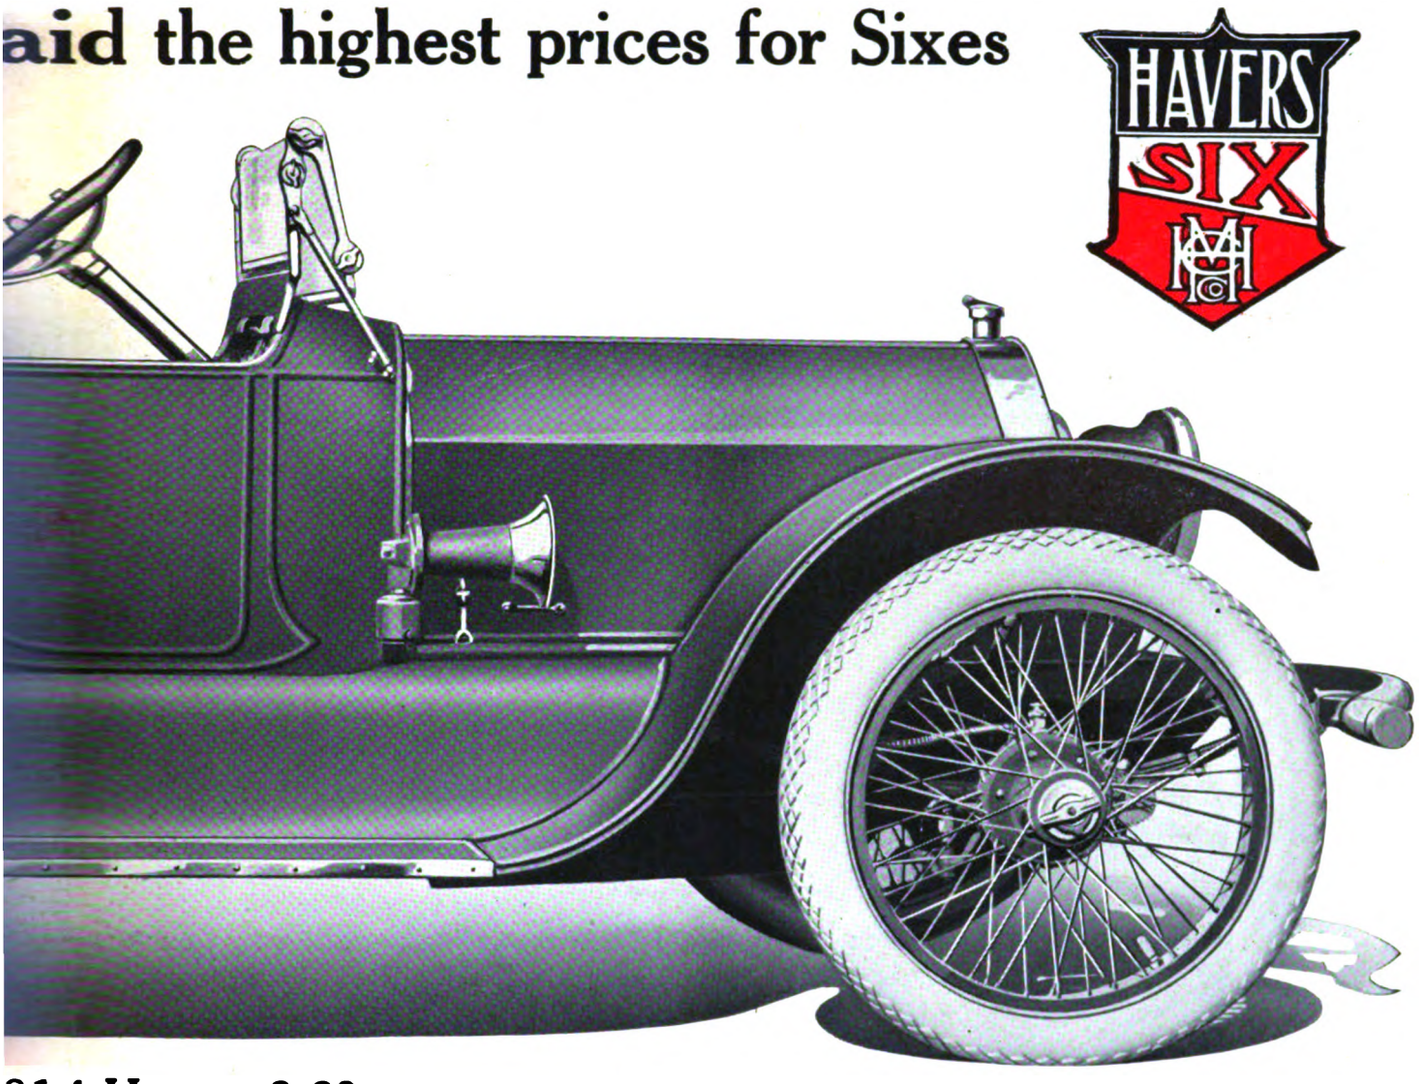
And in equipment—the big things and the little things that every man likes to have on his car—it goes far ahead of any and all of its contemporaries.

And there is another class to which the Havers makes an appeal almost equally strong.

This class is made up of the men who have tried the cheap six.

The men who have found their cars under-power for their weight; "up against it" on the hills; hard-riding and generally unsatisfactory; yet who appreciate and want the advantages of good six-cylinder construction.

In both of these classes are the men who will be buyers of the Havers 6-60 in 1914.



We speak of the Havers as a car of the highest quality because of the reputation and standing of the manufacturers who supply its various units.

The motor is the Continental—the finest product

Havers Motor Car Co.,

aid the highest prices for Sixes

914 Havers 6-60

wide. Rear, platform. Sides, 46 in. long by 2 in. wide. Cross, 36 in. long by 2 in. wide.

CONTROL—Hand gear change lever and emergency brake lever at driver's right, inside body; service brake, right foot pedal; clutch, left foot pedal; foot accelerator.

OIL CAPACITY—8 quarts.

GASOLINE CAPACITY—20 gallons, with 10-gallon storage tank at rear. Force feed, air pressure maintained by pump driven by motor.

STANDARD COLORS—Regal blue or Brewster green.

STANDARD EQUIPMENT—Cowl board on which will be assembled, flush with same; Warner speedometer, eight-day clock, gasoline gauge, air gauge, ammeter, volt-meter, 4-gang double button lighting switches, two dash lights, new design full nickel wind shield of the highest quality, Tonneau light, trouble light with cord, rode rail bag with four compartments, toilet articles in one. High grade top, complete set of slip covers, including top dust boot of the same material, license brackets—front and rear, foot scrapers for running board, new type double rear tire irons, power-driven tire pump, Klaxet electric horn, heavy steel truss rubber cushion front bumper, oil can holders, North-East system for electric starting and lighting.

PRICE—Fully equipped f. o. b. Port Huron, Mich., $2485. Two folding tonneau seats, $50. Wire wheels, $50.

from the oldest plant in America making high-grade motors.

Its horsepower is 60—one to each 60 pounds of car weight—which we believe to be a higher power and weight proportion than found in any other six.

Weston-Mott axles front and rear, are the guarantee of axle soundness.

Transmissions are from the Warner Manufacturing Company; universal joints are Spicer; bearings Hess-Bright and Hyatt; Warner steering gears.

This roll of honor is a big selling point; for, as you know, these parts are the best that money can buy.

Port Huron, Michigan

In the Havers they are combined harmoniously by the highest engineering skill we can command.

So here, in the vitals of the car, you have every element that makes for quality in the finished product.

Moreover, when you have sold a Havers car, you have sold the most completely equipped car on the market.

Your buyer is required to add nothing; you are required to add no equipment item at your own expense.

Seat covers, front bumper, electric horn, power-driven tire pump, oil can holders, tire irons—everything is on the Havers 6-60.

Let us hear from you at once if you believe you can sell the Havers 6-60.

HAVERS SIX

The 6-44—a splendid running mate for the larger Havers

Our enthusiasm for the Havers 6-60 is shared by this car's splendid running mate, the 6-44, at $1985.

This is a car that has made an unassailable place for itself by its steady and consistent performance.

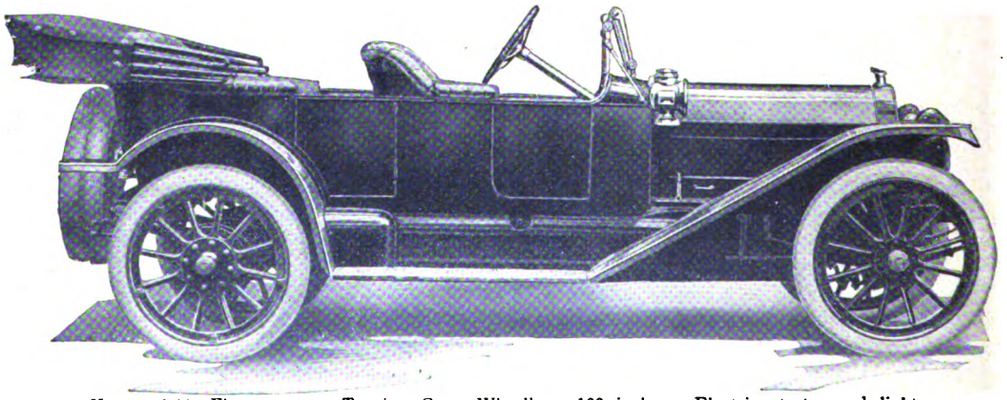
It is the direct lineal descendant of the first Havers; and has never failed to uphold the good name of the line.

Its motor is rated at 44 horsepower, which, in proportion to the weight of the car, is more than ample.

So, here, in a six, is a car priced no higher than a high-grade four, and which carries out to the perfection of present development the advantages of six cylinders over four cylinders.

As we have already said, the Havers Motor Car Company has had three substantially successful years.

We feel that our success has been due to three elements—the car we build, the organization we have perfected, and our policy of conservatism and service to owners.



We feel that the good dealer appreciates methods of the sort we pursue.

And that we are correct in this is evidenced by the inquiries about 1914 cars that have reached us prior to any public announcement.

We have room for more dealers; our output is to be increased for 1914.

We would like to hear from you without delay if the Havers line presents itself to you as an opportunity for 1914 and following years.

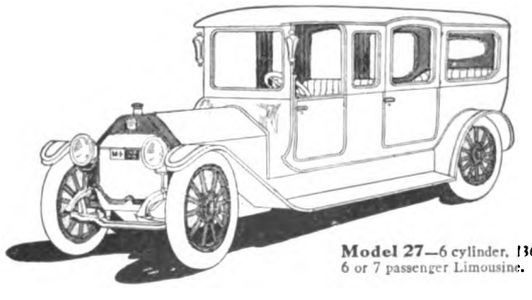
The car automobile buyers are wild to see

The old-reliable Haynes with its year-in-advance features, creates an opportunity for Haynes Dealers never before equaled in the annals of the American automobile

For twenty years the Haynes car has been piling up prestige. The first in the field and with years the start of other cars, it has constantly led in all that makes a motor car dependable and roadworthy.

HAYNES

America's First Car



Here are a few instances of Haynes pioneering: first two-cylinder opposed car, first user of aluminum in crank shaft, first user of nickel steel in axles, first to make side door car, first to use throttling carburetor, make and break spark, jump spark, electric ignition, magneto and double independent system of ignition, through two sets of spark plugs.

And now, the Haynes again leads the field in the adoption of the most wonderful improvement of motoring history—the Vulcan Electric Gear Shift.

Far greater than the electric starter is the Vulcan Electric Gear Shift, standard equipment with the Haynes

The electric starter was a great invention—but it is used only when the car is to be set in motion. The device that shifts the gears automatically—the Vulcan Electric Gear Shift—comes into use *constantly*—every time a change of speed is to be made.

If the electric starter is great, we must call the electric gear shift much greater. If the self-starter was of sufficient interest to draw crowds to the salesrooms of the cars which were first to make use of it, picture the greater throngs that are hastening to see the Haynes with the Electric Gear Shift.

Model 27—6 cylinder, 136-in. wheelbase, 6 or 7 passenger Limousine. Price, $3850

Digitized by Google

Specifications of the New Haynes

Motor—Bore 4 1-4 in., 5 1-2 in. L-head Haynes. Cylinders cast in pairs. Model 26, A. L. A. M., 43.38 H. P., Dynamometer 65 H. P. Model 27, A. L. A. M., 43.35 H. P., Dynamometer 65 H. P. Model 28, A. L. A. M., 29.9 H. P., Dynamometer 48 H. P.

Weight—Model 26, 3800 lbs. Model 27, 4000 lbs. Model 28, 3400 lbs.

Cooling—Centrifugal pump and pressed steel fan.

Wheel Base—Model 26, 130. Model 27, 136. Model 28, 118.

Ignition—American Simms magneto.

Carburetor—Stromberg.

Lubrication—Splash and gravity feed.

Control—Left hand. **Vulcan Electric Gear Shift.**

Transmission—Selective type, three speeds forward, one reverse.

Steering Column—Worm and worm gear type.

Clutch—Haynes contracting steel band.

Rear Axle—Full floating Timken on Models 26 and 27; McCue, Model 28, Gourney bearings.

Front Axle—I-beam. O. H. steel heat treated.

Wheels—Artillery type. Funk demountable rims.

Tires—Models 26 and 27, 36 x 4 1-2. Model 28, 34 x 4.

Springs—Front semi-elliptic 39 1-8 x 2, rear 48 x 2.

Brakes—15 1-4 external and 15 internal, Models 26 and 27. 12 and 16 internal on Model 28.

Finish—Indiana dark blue body. Pacific tourgray, optional.

Gasoline Feed—Pressure. Automatic feed.

Upholstery—Buffed leather, deep cushions.

Starting and Lighting—Leece-Neville electrical system.

Cowl-Board Equipment—Electric lights, sight oil feed, automatic cut-out for generator, dash light, auxiliary air pressure pump, air gauge and speedometer. Models 26 and 27 have rim wind clock.

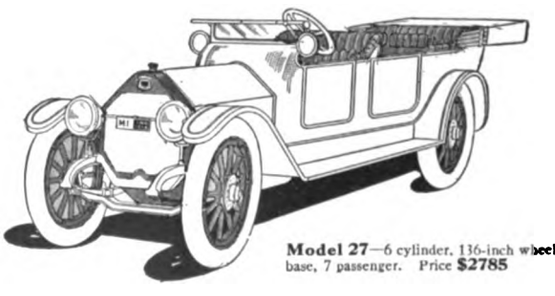
Other Standard Equipment—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind shield, Vulcan electric gear shift, two large electric headlights, electric side lights, electric tail light, full dash equipment, electric starter, generator, 12 volt, 80 ampere hour storage battery, horn, coat and foot rails, tire irons, full tool equipment, one extra demountable rim and Collins curtains. Models 26 and 27 have shock absorbers.

Hand lever shift optional, all models, at $200 reduction.

Two of the new Haynes Models and a glimpse at what they offer

The mere outline of the specifications of the new Haynes models is interesting and convincing—it reveals the most noteworthy line of features ever offered in any automobile at any price.

Yet these specifications, convincing as they are, can't make you realize what a good proposition the Haynes really offers—you must see the new models themselves to appreciate the long, sweeping lines, the beautiful bodies, the completeness, and the comfort of these latest Haynes cars.



Of their reliability nothing need be said. You well know the Haynes reputation in that respect.

The Vulcan Electric Gear Shift, the greatest feature in automobile history to bring the prospects in—the Haynes, America's First Car, a grand car in every respect to clinch sales. You can't beat this combination

Hartford Cone Clutches

THE limits of half-thousandth and quarter-thousandth of an inch to which certain parts of Hartford Cone Clutches must come are very close. It is one thing to set certain limits and another thing to live up to them. If such limits are worth while setting, it is equally important that they be adhered to.

These limits are insured. The most careful machinist and the most careful inspector may make a mistake while using a micrometer. One turn too many will make all the difference in the world, so to avoid any chance of error, we employ "go and not go" gauges. These gauges cannot make a mistake. The part being tested either goes or does not go.

Standard Hartford Cone Clutch Unit Complete With Universals. This is the Type Clutch We Have Specialized in for Years.

Each part is tested and inspected after each operation. It is work, inspection, work, inspection—with clock-like regularity. Our own interests are served just as well as the manufacturer's interests and the trouble we go to in making the repeated inspections serves to keep the parts which go to make up the complete clutch assembly accurate and to insure their passing the "final" inspection and test. By detecting every slight variation from the perfect and correcting it as it develops, it is scarcely ever necessary to discard the complete assembly as faulty when it gets to "final" inspection.

Another, and probably the greatest benefit resulting from the rigid tests in force at the Hartford plant, the reason why such scrupulous care is well worth while, is found in the fact that it insures against a defective clutch ever reaching a customer, with its consequent return to us, and the moral effect of such a contingency.

The quality and efficiency of Hartford Cone Clutches is well worth the investigation of every car or truck manufacturer in the country.

Reo the Fifth

Fall Series

Electric Starter — Electric Lights
Completely Equipped for $1,175

30 — 35 h. p.
34 x 4-in Tires
New-Style Body—
Roadster or Touring Car

Now $220 Less

Last season's model of Reo the Fifth, with electric starter and complete equipment, sold at $1,395. And the year was our record year, exceeding our previous year by 25 per cent.

Now we have added many improvements. And, without sacrificing one feature, without skimping one part, we are quoting the car at $1,175 complete.

This is how we have done it:

The best electric starters cost much less this year. Our chassis is standardized. Our capacity is largely increased.

All the special machinery, jigs and tools for this chassis have been charged against previous output. These items from now on are wiped out from our cost.

So we offer you now the best car that R. E. Olds ever built. We offer the handsomest car that ever went from this factory. And we offer a price $220 less than a car of this class ever sold for.

This is the greatest innovation which has ever been offered in the history of the Reo concern.

Reo the Fifth with Many Improvements

The New Things

Now comes this car with a new-style body—a low, rakish, low-hung body. A wider body. A cowl-front body with a gondola back—the very latest mode.

The instrument board, with all instruments set flush, is brought within reach of the operator.

The windshield is ventilating, clear vision and rain vision. The searchlights have dimming attachment. The upholstering is deep and soft.

There's a new-style tire carrier on the back, which also holds the tail light and the number tag in a manner which complies with all laws.

We add an electric horn.

The transmission has been changed in ways which accomplish utter silence.

Electric Starter Electric Lights

Now Reo the Fifth comes completely equipped with all that modern cars require. No extras are needed.

Electric self-starter — electric lights.

Speedometer — windshield — electric horn.

Mohair top, curtains and envelope.

Extra demountable rim.

Tools, robe rail, etc.

Our Exclusive One-Rod Control

This car alone has our center rod control. A rod which connects directly with the gears. No outside levers, no connecting links.

The gear shifting is done by moving this rod only three inches in each of four directions. And the rod isn't in the way.

No side levers, no brake levers. Both brakes are operated by foot pedals. The driver's entrance from either side is clear. These appealing features are found in no other car.

Every Feature Retained

We still retain every costly feature which made this car distinctive. It is still the best car R. E. Olds can build, after 26 years' experience.

The steel is twice analyzed, so the strength is made certain. Each vital part, at much added cost, is given 50 per cent overcapacity.

The gears are tested for 75,000 pounds per tooth — the springs for 100,000 vibrations.

The car is over-tired. We use 15 roller bearings and 190 drop forgings. The carburetor is doubly-heated.

All the extremes, all the costly precautions which made this car famous are here. All the tests and inspections—all the margins of safety—all the utter exactness. This car is built for low cost of upkeep, and to run year after year as well as it runs when new.

Now with all these unique features, with all these improvements, we quote you a saving of $220. That's the result of three years' concentration on a single model. Such a car at such a price would be otherwise impossible.

Look where you will, you will not at this price—nor anywhere near it—find a car you would think of preferring.

We have dealers in a thousand towns. Go see this new model and ask when you can get one. Also write for our catalog with full specifications, details and comparisons.

48 "Six" KISSELKAR 48 "Six"

A Spontaneous Success

THE warm reception of the new **KisselKar 48-"Six,"** and the popularity it has attained in only a few weeks, prove beyond doubt that the public is quick and keen in the recognition of automobile values.

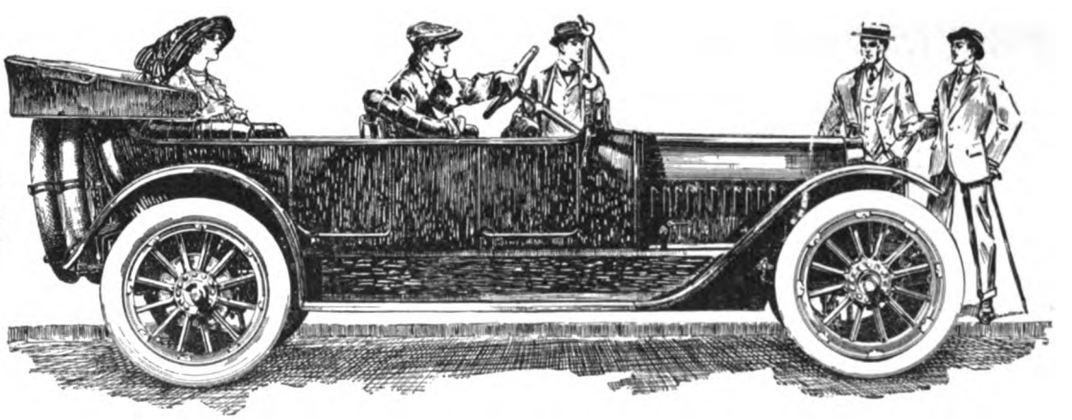
Wherever this car has been shown it has created genuine enthusiasm. Its low hung chassis, clean, artistic lines and general refinement of design create an instantly favorable impression, which is decisively confirmed by a study of the specifications and practical test of its riding qualities.

The **KisselKar 48-"Six"** is more than "eye-deep." While it is good to look upon—every inch an aristocrat from radiator to tail-light—the real measure of its merit lies in the things that have to do with **service** and **comfort.** In these vital factors the **KisselKar 48-"Six"** challenges comparison with any car regardless of price.

There is no more efficient power plant under the hood of any automobile. The Kissel engine is famous for its power, responsiveness and silent, smooth running qualities. It is easily accessible, as transmission and clutch are combined in a single unit.

Exceptionally liberal wheelbase, big door openings, springs and shock absorbers, roomy tonneau, deep upholstered seats and de luxe equipment, including Golde patent "one man" top, Warner speedometer and Klaxon horn, afford all the comfort and convenience provided by cars costing hundreds of dollars more than the **KisselKar 48-"Six."**

The more you draw comparisons, the more you will be impressed that the new **KisselKar 48-"Six"** is a car of rare distinction and unmatched value.



There are three KisselKar Models: 48-"Six" at $2350; 60-"Six," $3150, and 40-"Four," $1850. All fully equipped, electric lighted and started; left hand drive, center control.

Now being shown by our representatives everywhere. See your nearest dealer for demonstration, or write us for Catalog.

KisselKar Trucks—1500 lbs. to 6 tons—are used in over 200 distinct lines of business. Write for Truck Catalog.

KisselKar Service Contract—The KisselKar is sold under a written guarantee of service to owners—a tangible, definite and specific contract that clearly stipulates the scope of KisselKar Service. Ask for a copy.

HUDSON Six-54, $2250
Seven Passenger

Something Really New---

Six Cylinders---Distinguished Beauty

Never before have HUDSON designers brought out in one model so many advances.

But it happens that Europe, after reaching the limit in fine engineering, has suddenly corrected many faults in bodies.

And America must follow. Some makers will delay, some chafe and protest. But sooner or later we have always followed European vogue. Those who waited found their models obsolete ere long. You remember how it was with fore-doors.

Here is an ideal body type which marks the coming mode. The world's best designers agree on it. All the best foreign makers will this year exhibit nothing but stream-line bodies.

We have not merely copied—we have Hudsonized the type. We have ourselves worked out countless improvements. We have, we believe, the handsomest car you'll see. But the general effect is such as must mark any up-to-date car this year.

Europe is Right

And Europe is right. Look at passing models. Note that abrupt and inartistic angle at the dash. Compare with this model, where the streamline runs unbroken from tip to tip.

Compare the high-hung, top-heavy bodies with this low-hung effect. Compare old-type fenders with these new.

Compare the old way of carrying extra tires, blocking one front door, or on the rear, when the balance of the car is disturbed. Now both front doors are clear and still the tires are where they should be—on the running board.

Note that every door hinge is concealed. Why did we ever have body sides marred by projecting hinges?

Note the left-side drive, the center control, the deep cushions with high backs. You sit in the car, not on it.

Now we have four forward speeds.

We have wide tonneau doors.

We have every operation and control within reach of the driver's hand.

You know that these things are desirable. Now that they have been thought of, and adopted abroad, what car can resist coming to them?

Other New Things

Here are other new features which we have adopted in this new HUDSON Six-54.

A seven-passenger body, where the extra seats fold out of the way.

135-inch wheel base — 36 x 4½-inch tires. Gasoline tank in dash, also an European innovation.

The Delco system of electric self-cranking—the rapid type built especially for this car. Powerful electric lights with dimming attachment.

Speedometer set in dash. Concealed noiseless gears set into the axle.

Yale lock on ignition control.

Rain-vision windshield. Genuine Pantasote top with curtains attached, ready for instant lowering. Electric horn — trunk rack — tire holders — license carriers. Every comfort and convenience known.

Built by Howard E. Coffin and His Engineers

Here too is the latest production of Howard E. Coffin and his great engineering corps. The men who built the former HUDSON Six, one of the greatest successes ever known in this industry.

This is their masterpiece. The largest, finest, strongest car these men have ever built. Their sturdiest car, their most comfortable car, most dependable.

And note the price. Note how this factory, with its mammoth output, has cut the cost of Sixes. Think of a Six of this power and size and room selling for $2250. Even one year ago such a price was unthinkable.

See This Innovation

Your local HUDSON dealer has this car on show. Go see it, if only to see the trend of design in motor cars. Compare it side by side with old-style cars and judge which you want to drive.

See it now—while it's new.

Our catalog on request.

The Teeth that Always Fit

Part I

The Gear with the Polished Teeth

ON the manager's desk lay a gear with teeth that shone like silver. 'Twas the first thing that caught the motor car engineer's eye when he called at the Timken-Detroit plant. The first question that he asked concerned the gear with the polished teeth.

TIMKEN-DETROIT · AXLES ·

It was explained to this engineer, for one of the highest grade cars, that Timken-Detroit gears are ground by a Timken-patented process which corrects all the microscopic inequalities left by even the finest gear cutters.

He was taken out into the factory and shown the special Timken-built machines at work. He saw at a glance that the theory of perfect master gear and master pinion controlling the gears to be ground was sound.

Next day he brought the production manager of his plant to see the wonderfully simple and efficient machines.

The Proof Demanded

The process looked right, but they asked foy proof of results.

"Send us," we said, "some of your gears that have failed to pass your inspection. Mark them secretly and, after they're ground and returned, mix them with others and send them through your testing department again."

This was done. Ten gears that had failed to pass were sent us to grind. They were put through the Timken-Detroit gear grinding process and returned.

Every one of these gears passed inspection

The inspector was asked to pick out the ten best gears in the lot. He picked out the ten that we ground.

The Result

Today the driving and pinion gears in each of their cars are ground by the Timken-Detroit process.

The company has gained because the process corrects faults that formerly scrapped many gears.

The car owners have gained because all the gears are now perfect. Friction has been reduced and noise practically eliminated.

Applied to Timken-Detroit Axles

Every gear in the Timken-Detroit Axle is ground by this special process.

Timken-Detroit Axles are the only axles equipped with gears ground by a process that produces the results which so thoroughly convinced this engineer and this production manager. (Names will be given on application.)

In the next issue of this magazine you'll find Part II of this series of talks on "The Teeth that Always Fit."

"American" Axles

Furnish the Logical Mounting for the Finest Known Type of Worm Drive

IT is a source of extreme pride to us, that we not only are producing "American" Full Floating Axles containing the Lanchester-Daimler Worm Drive for gasoline and electric pleasure cars, but we hold the sole rights as axle manufacturers for this gear in America.

The development of this type of gear began much earlier in England and the Continent than in America. The conspicuous and acknowledged leader of the type was the Lanchester-Daimler.

That such a gear was certain to be immensely popular in America was easily foreseen. Its silence, its remarkable efficiency and its marvelous record for mileage and endurance were beyond argument.

Careful study of the leading foreign worm gears proved to us that the Lanchester-Daimler was easily the best of this remarkable type. Our own corps of engineers thus unanimously confirmed the verdict that had been awarded by foreign manufacturers and car owners.

We were convinced that the Lanchester-Daimler Worm Drive stood, in its class, on precisely the same high plane in Europe that is universally accorded to our Bevel Drive type of axles in America.

It was clearly proved that the Lanchester-Daimler is more efficient than any other worm drive, by reason of its superior excellence of design, and certain constructive features peculiar to it alone.

As one prominent American manufacturer has said: "When the Lanchester-Daimler Worm Drive Was placed in an American Axle, the highest possible standard for the worm drive, as applied to gasoline and electric pleasure cars, was at once established in America."

In American Axles only can you have the option of the highest class of Bevel or Worm Gears. Both types are fitted throughout by us with the best types of foreign made ball-bearings.

The adjusting and full floating features of "American" Axles are fully covered by our own patents and by shop rights from other patentees

THE AMERICAN BALL-BEARING COMPANY, Cleveland, Ohio

THE VITAL POINTS

of your motor car—the transmission, the carburetor, the engine, etc. require duplicate parts of uniform accuracy.

We've had such a long experience in serving builders of motor cars and accessories, that our knowledge of their requirements is intimate. That's why NAMCO special milled products will serve your purpose so well.

NAMCO parts have clean threads, accurate diameters and smooth finish. They assemble easily, fit just as you want them to, and stand all the strains to which they are subjected.

You can get any kind of duplicate milled parts up to 2¼" diameter quickly. Our unusually large production capacity and facilities enable us to give exceptional deliveries.

For special parts, send samples or blue prints. Mark them for "Quotation Dept." and price and delivery will be promptly furnished.

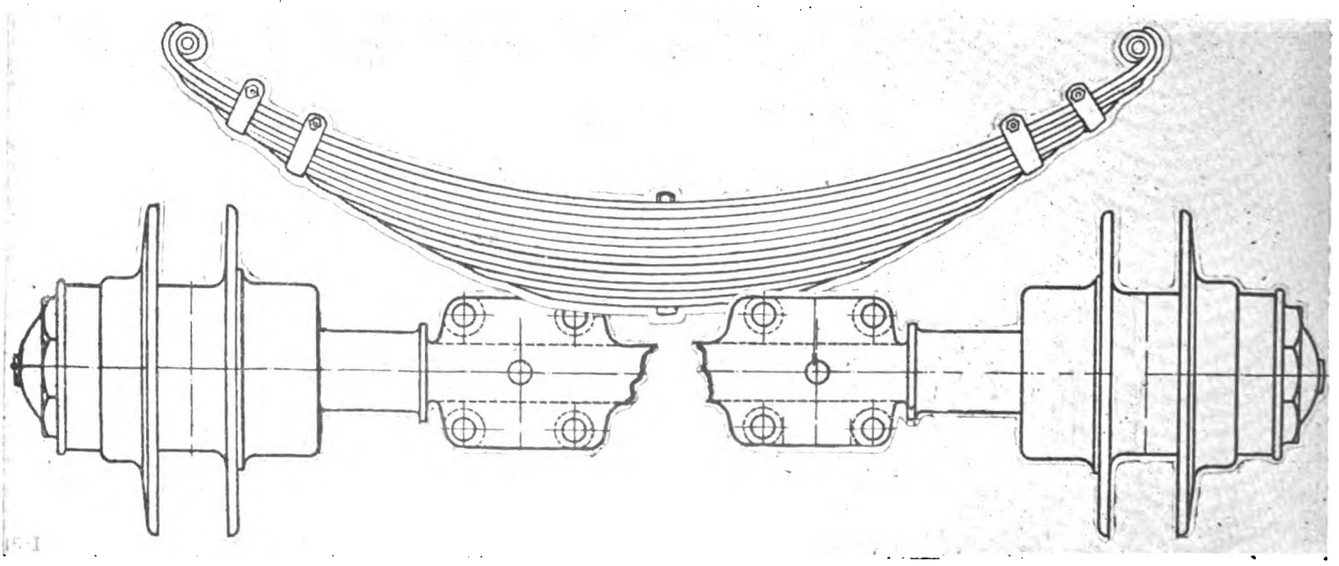
SHELDON AXLES and SPRINGS ARE SALES HELPS

Every manufacturer endeavors to build into his car those selling points which will assist the dealer in his sales.

Every unit of national reputation in a truck helps to sell that truck. The public knows the value of that unit because the manufacturer, who is a specialist in that particular subject, has convinced them of its splendid qualities.

SHELDON AXLES and SPRINGS have a nation-wide reputation. Their quality has been proved in actual service. Their splendid design and superior mechanical construction is an accepted fact in engineering circles. Only the best scientifically treated materials are used. In fact, so persistently has the public been told—and so well do the engineers know—these qualities that the synonym for axles and springs is "Sheldon."



You *can* utilize this reputation. Why not build it into your trucks? You can thus have it help you sell your car.

SHELDON FOUNDATIONS for every type of service.

Continental Motors

A Product of Evolution

The fittest survive—the weaklings and the hybrids perish. Through the operation of this law grows civilization, literature, science,—the race.

In the making of automobiles, the product of this law of nature is called the "standard" car. It is the car of today. And the most vital factor in its success is the motor—a unit representing nearly one quarter of the cost of the finished product.

More than sixty makers of motor vehicles have seen the coming of the car of standard parts—made by specialists. They are building on the solid foundation of the Continental Motor—America's standard—the motor of today.

For into this famous motor goes the combined knowledge of the engineering staffs of these sixty odd builders as well as of our own capable corps, specialists who for ten years have dreamed and wrought nothing save Continental Motors. Such motors are the permanent type—the fittest.

For the coming year more than 40,000 new Continental Motors have been specified. Engineers known as leaders to every American who reads, willingly stake their professional reputation on the acknowledged pre-eminence of the Continental motor—the motor of today.

Their reputation is your guarantee of unfailing service in the motor they endorse.

This is one advertisement in a series that is helping to sell cars Continental equipped. Watch them and keep posted.

We are telling the American public who motor or use motor trucks, the importance of the motor in the car and the dominating position held by the Continental.

This is benefiting car maker and dealer who build on the firm foundation of Continental Quality and Prestige.

It is creating a demand for Continental equipped cars which will make them doubly strong in 1914 — the crucial year.

Get the jump on competition — specify Continental.

CAPACITY
GURNEY
ENDURANCE

Again Why-

do we so persistently emphasize the matter of RACE CONTOUR?

Because it is really the most important single item among the things that determine the real quality of a ball bearing, and because among the several essentials of ball bearing efficiency this one is nearly always forgotten or overlooked by the user and slighted or ignored by the maker.

The raceway should be of the closest possible conformity to the curve of the ball. It has been found by careful and exhaustive experiment that the race curvature may approach to within 4 per cent. of the curvature of the ball before friction begins to increase materially. Now—with this close contour the steel of balls and races has to yield but very little to gain a considerable area of contact and so realize great increase in load capacity. This slight springing of the steel is safely within the elastic limit. In the raceway conforming less closely to the ball the steel must be distorted much more to realize an equal area of contact. The elastic limit is soon reached and the steel, both of balls and races, soon breaks down.

This is obvious: the greater the area of contact the greater the load that may be borne—the closer the conformity of race contour to ball curvature the greater will be the area of contact—hence, the closer the race contour to ball curve the greater the load capacity. Experience has taught us that we may conform as closely as within 4 per cent. of the ball curve without objectionable friction.

Of course, all these considerations apply with equal or even greater force to irregularity of race contour. If there is the slightest ridge in the raceway the steel in this ridge will receive excessive punishment. And it will likewise give excessive punishment to the balls. Thus both raceways and balls will fail to give the full measure of capacity and endurance.

In the GURNEY factory these incontrovertible truths stand among the cardinal tenets of our working religion. And this in some measure explains the unequaled **CAPACITY** and **ENDURANCE** of the GURNEY BALL BEARING.

More Than 100 Revolutions Per Minute

This new Auto-Lite Electric Starting Motor for automobiles is acknowledged to be one of the simplest and most efficient motor starters so far produced.

Its superiority is due to its great turning power—the rapidity with which it will spin a large engine and the small amount of electric current that it uses to do it.

For example—this motor will spin a 6-cylinder engine, 3¾ in. bore x 5¼ in. stroke, compression 60 pounds, at a speed of 100 revolutions per minute (absolutely insuring positive starting), with a current demand of 95 amperes at 6 volts. In other words, here's an electric starting outfit that is correct in itself—well made mechanically—well protected—simple in construction—easy to inspect—a motor that will crank your engine every time, winter or summer.

AUTO-LITE ELECTRIC STARTING and LIGHTING SYSTEM

"As Sure As the Whirl of the World"

A WORD OF EXPLANATION TO THE AUTOMOBILE OWNER

While our electric lighting generator and system can be easily installed upon the average car without difficulty, an electric starting motor is more difficult to attach as it requires skilled labor and necessitates a certain amount of machine work, and also requires considerable space which is not allowed for on a car not designed for a system of this kind—hence, we do not solicit orders for our starting motor from individual owners.

Your 1914 car, however, should carry the Auto-Lite system as standard equipment, no matter what price you pay. Due to its already widespread use, manufacturers can equip with the Auto-Lite if you so specify.

Insist on having the complete Auto-Lite system on your next car.

GET THIS BOOK

Send for our "Handbook on the Care and Operation of Automobile Electric Systems," a book so full of interesting information on all modern electric systems that no automobile owner can afford to be without it.

Explains in detail, functions of the various parts—how to locate and remedy troubles of all kinds, embraces all electrical automobile systems.

The large operation chart which it contains is alone worth the price.

Regular price 50c.

Will be sent to you for 10c. in stamps if you use this coupon.

The Electric Auto-Lite Co.
116 Michigan St., Toledo, Ohio

BRANCHES:
New York Detroit Kansas City San Francisco

But Note This!

The Auto-Lite Electric Generator can be applied to almost every automobile now in use.

If you wish to put an electric lighting system on your car, write the Installation Engineer, care of the Electric Auto-Lite Company, Toledo, Ohio.

He will give your request his personal attention and answer your questions fully.

This Coupon Saves You 40c.

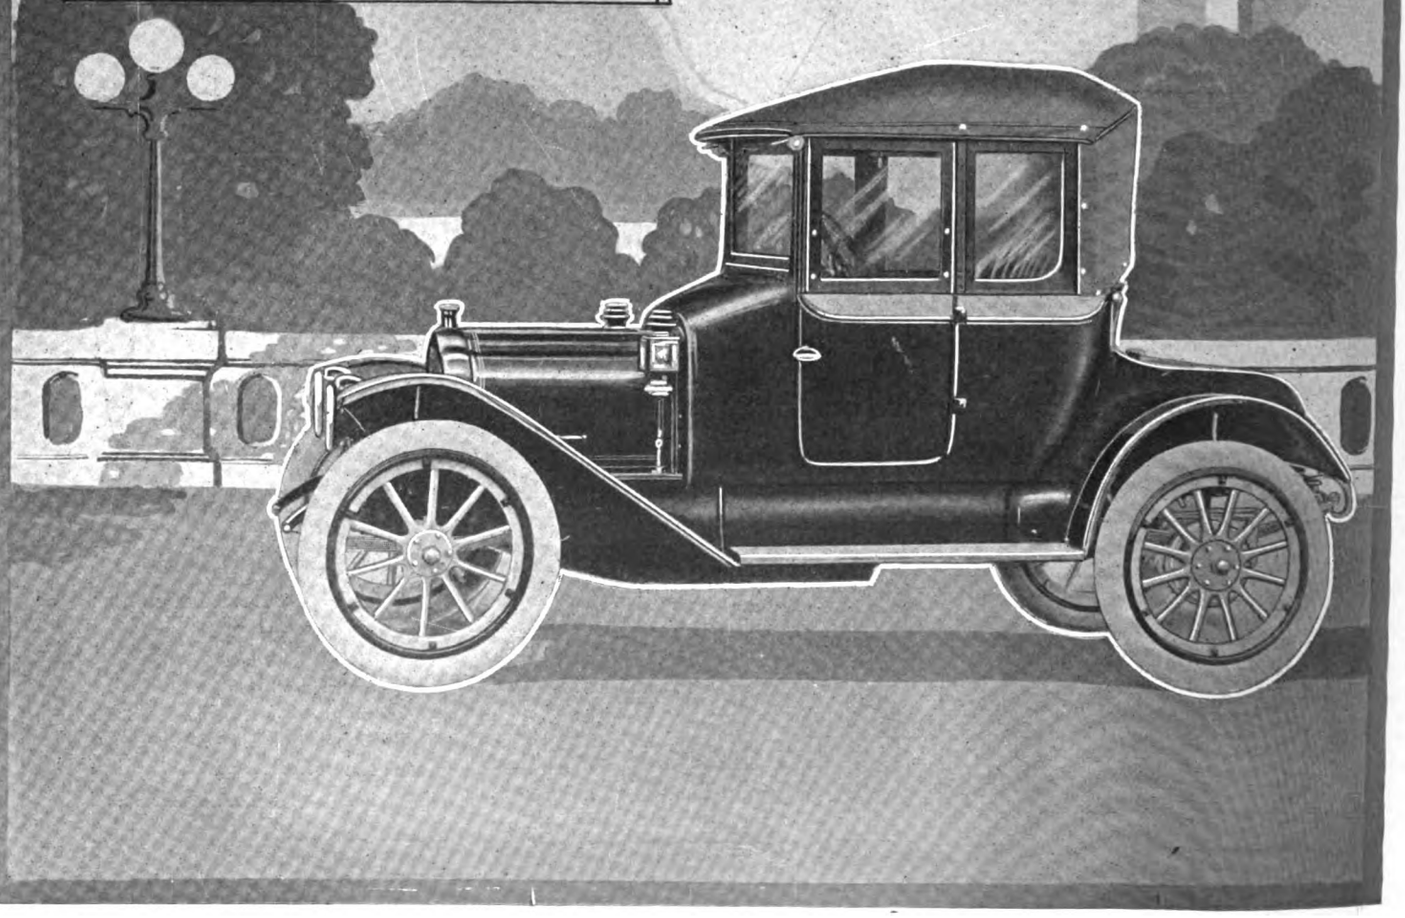
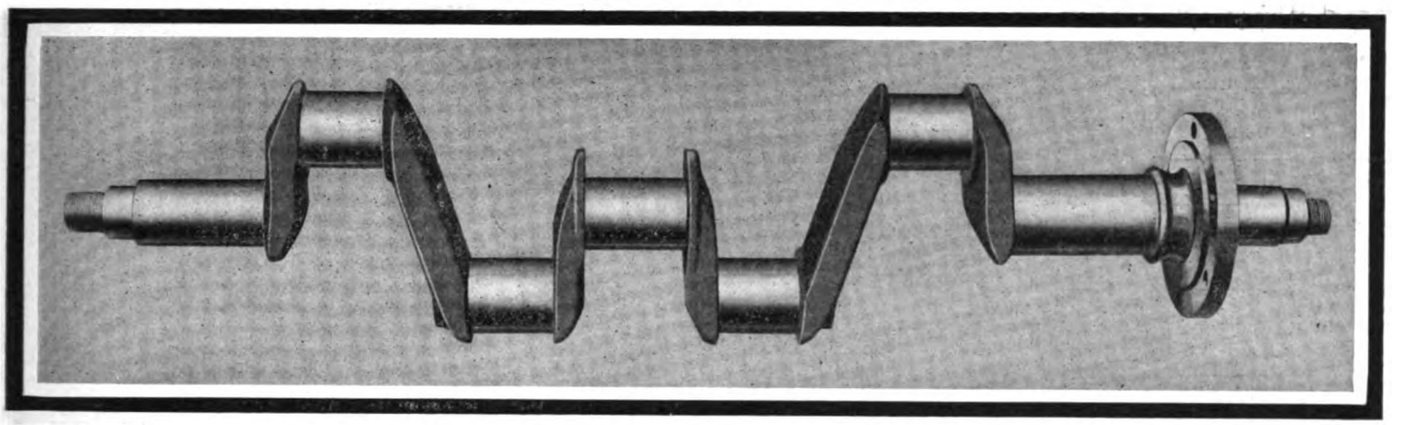
SPRINGFIELD
CONVERTIBLE BODIES

Springfield Convertible Bodies are the embodiment of refinement in the matter of lines, material, finish and ease of adjustment.



The runabout convertible body shown here illustrates one extreme of a line that goes on up to the highest grade limousine, landaulet and town car.

Even this faithful reproduction cannot approximate the beauty and convenience of the equipments as they actually appear. They must be seen to be fully appreciated.



The ease of operation is remarkable; the tops are rapidly raised into position, the doors are opened, the hinged glass swung up into position, the remaining windows are removed from a box in the back of the front seat and buttoned into position, completely enclosing the car in less time than an ordinary top can be erected and the curtains adjusted.

Write for brochure of reproduced photographs.

Your Crankshafts must be machined right—and delivered right on time

In these days of big outputs, quality and deliveries are vital. It is impossible to take chances.

Questionable work—machining that is not right up to standard in trueness and accuracy—has no place in our shops. We insist upon exactness and we back our insistence with an elaborate and thorough inspection system.

Poor work has no chance to squeeze by in the Michigan Crankshaft Company's plant. That explains why our records show ***less than two per cent rejects*** on the part of manufacturers for whom we work.

Frankly, we claim no particular merit for being extraordinarily particular; it is simply good business. We realize that both our present and our future depend on maintaining high standards, so we scrutinize every detail.

Located at Lansing we have the best shipping facilities—and low taxes, low overhead expense. This means that we can afford to and do deliver better quality of workmanship for the same or less money.

We are not after the trade that is known as "cheap" but we can offer excellent reasons—with satisfactory proofs—why manufacturers seeking right deliveries and high quality work will find it mighty profitable to do business with us.

Send us blue prints and details and we will do the rest.

THE ATTERBURY LINE

Three things are essential to the man or group of men who wish to engage successfully in the transportation sales business:

Business ability first—this you must possess in a greater degree in selling trucks than in selling pleasure cars. Your sales will be made to business men and upon a business basis. This is an essential you must provide yourself; the best truck ever made cannot sell itself.

Next—a business-like agreement with the concern whose line of trucks you sell, regarding territory, terms, discounts, parts stock, etc., etc.

Then, a line of trucks to sell which are adaptable to the majority of business requirements, trucks whose first cost is compatible with their length of life so that their charge-off for depreciation is within reason. The value of concentration in business will readily show the wisdom of handling a complete line, from delivery cars to heavy-duty trucks, all of one make.

The Atterbury Motor Car Co. would like to communicate with business men who contemplate entering the truck sales field. The Atterbury sales agreement is one of the most business-like in force today and appeals to business men far more strongly than others apparently more liberal. The Atterbury Company has always believed that an agreement which was unbusiness-like in its liberality was one of the leaks which sooner or later would sap the parent company's vitality, and for that reason to be avoided by the company and dealer alike.

As a preliminary to any future negotiations, write for our booklet describing the various Atterbury models and details of construction. One of the most convincing proofs of the desirability of signing up with the Atterbury Line may be had by a visit to the Atterbury Shops. You are assured of a cordial welcome and courteous treatment.

The Atterbury Motor Car Company
BUFFALO, N. Y.

Jeffery-Dewitt SPARK PLUGS in the Making

Scene III. "Throwing" department. Here the clay, previously blended by the famous Jeffery-Dewitt process, is thrown up into cylindrical blanks which are afterwards partially dried, placed on spindles and turned to proper dimensions. The throwing gives the clay a "wrapped" effect, which is one of the reasons why Jeffery-Dewitt Spark Plug Porcelain resists the high voltages.

At 75c. These Two Plugs Lead the World

The Conical Type Spark Plugs, so called because the cylinder end of the porcelain is conical in form, give excellent results. They have gained wide popularity.

The Petticoat Type, also named from the shape of the cylinder end of the porcelain, affords extra insulating surface around the central electrode. For oily motors, this plug with the closed end is the best plug made.

Both Conical and Petticoat types may also be had with platinum points, at 50 cents extra.

Sooner or later—every man with a balky motor becomes a *J-D* patron, for *J-D* plugs are the standard cure for over-oiled and dirty engines. There is—in the *J-D* line—a type for every kind of motor, for every ignition defect, for every motorist's preference, for every pocketbook.

J-D plugs are as good for bad motors as they are superlative for good motors. As a result—they oversell every other make. *J-D* dealers are everywhere recognized as ignition experts—as specialists in spark plugs.

J-D dealers reap the rewards of this popularity. The merit of the *J-D* line puts dollars in their pockets. If you are not already selling *J-D* plugs, write at once and find out why you ought to.

The Right Lamp for the Right System

We co-operate closely with car builders and the makers of lighting systems in the manufacture of Edison Mazda (drawn wire tungsten) Lamps for automobile service. When **Edison Mazda Lamps** are used, car owners are assured of getting the right kind of lamp to meet the requirements of different lighting systems.

We supply lamps for any make of car and standard lighting system, with either the double contact bayonet candelabra base or single contact bayonet candelabra base, using ground return.

Edison Mazda Lamps are on all the representative cars—adopted as standard by car manufacturers, because of their successful and continued operation.

This detailed manufacture—making the lamp to fit the lighting system—cannot help but ensure the most satisfactory and efficient service.

All over the country there are Service Stations established where **Edison Mazda Lamps** for renewals may be readily obtained.

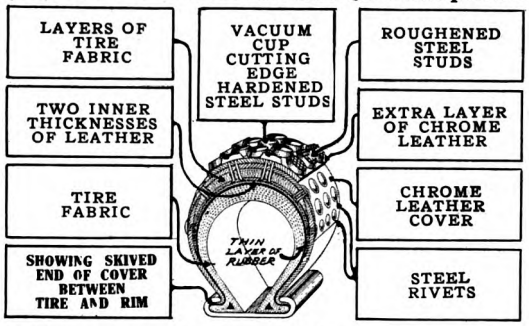
Our departments of engineering and design co-operate with the men who build the car—combining their weight of experience in radiator making with the particular requirements of the designer of the automobile.

We will not, however, endanger the reputation we have made by making radical changes from established design. In standing by this resolve, we have, on rare occasions been obliged to lose business—something to be regretted, but none the less necessary.

Mayo Radiators are built to hold the engine at an even temperature—not too hot to endanger its usefulness, nor too cool to lose its efficiency. "Tolerance" in change of design is therefore liberal—but it has its limits.



If you, as the man who has sold the car, find yourself in "hot water" so to speak, with a leaky, inefficient radiator and a "superheated" customer, then be sure this car was not equipped with a Mayo Radiator. Dealers who sell cars Mayo equipped know that the radiators will stand up under any unfavorable condition short of a blow with a hammer or a bad collision.

Mayo Radiator Co.

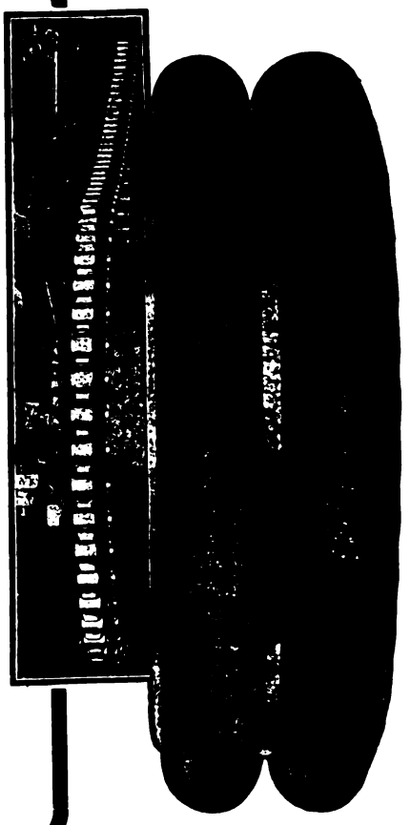
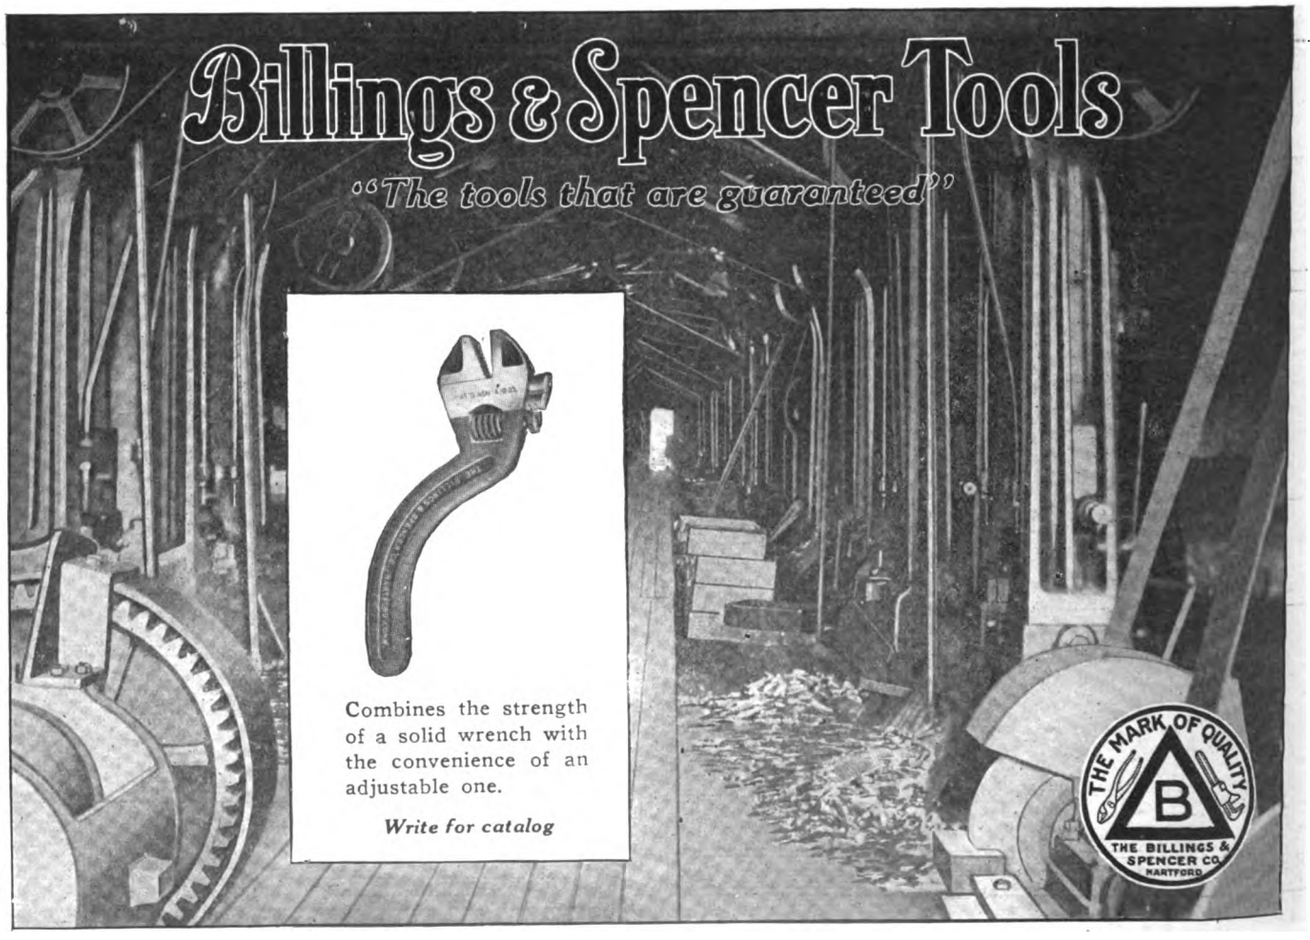
"WHITNEY" Chains

WE call your attention here to "Whitney" Cotter Detachable Chains as the most practical chains ever offered for motor vehicles. They have made a record for themselves which no other Detachable Type has approached.

This Cotter Pin feature is so practical and necessary that it calls for little detailed explanation. The illustrations tell their own story, proving that this form of construction is logical and necessary for chain equipped motor vehicles. This Cotter Detachable Chain can be taken apart at any link and lengthened, shortened or repaired without the use of any special tool, as the Cotter Pin can be removed with pliers, screw driver or any sharp pointed instrument. The use of "Whitney" Cotter Detachable Chains assures the builder, owner and driver of commercial vehicles uninterrupted service on account of the ease of repair.



"Whitney" Chains are made from steel best adapted for the purpose, carefully hardened and calculated to resist the most wear, while in the matters of machining and assembling the utmost care is exercised and thorough inspections and tests characterize each process of manufacture. Their future service, however, depends upon the accuracy of sprockets, care, lubrication, alignment and adjustment, for the best chain in existence cannot withstand the evil influence of improper conditions and give best results.



Write for our illustrated catalog which shows top and side views of each size of all Roller chains manufactured by us.

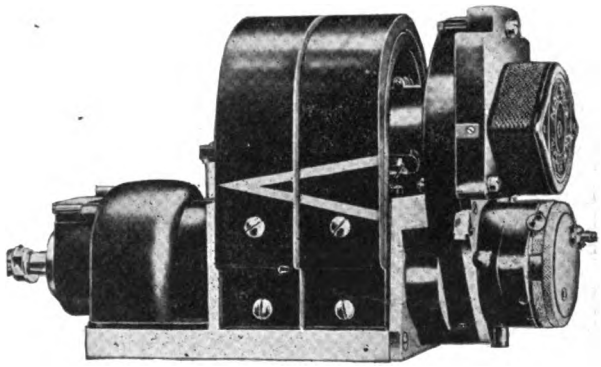
EISEMANN

The performance of Eisemann Ignition Systems during the Indiana-Pacific Tour justifies every claim we have ever made for Eisemann efficiency and dependability.

Each and every one of the eleven Eisemann Systems performed at highest efficiency, making the entire trip from Indianapolis to the Pacific Coast without the slightest trouble. The same efficiency was maintained even in the highest altitudes, where the mixture of gas and air is very hard to ignite. The Eisemann Systems met these adverse conditions without missing a shot.

The dependability of Eisemann Ignition needs no stronger proof than the fact that eleven of the eighteen entrants decided to rely upon Eisemann Ignition for the trip. Their confidence in the Eisemann product was vindicated and strongly, too, because every one of the Eisemann Ignition Systems came through without trouble in the most remarkable test ever attempted.

We have made frequent claims that the Eisemann Magneto was not only a sales asset but a service asset as well. The perfect performance of the Eisemann Systems during this remarkable service test so substantiates our claim that it is fast becoming an accepted fact by those who know.



If the Magneto on the product you handle is an Eisemann, you may be sure of satisfied customers in so far as ignition goes to make a satisfied customer.

FEDERATION OF TRADE PRESS ASSOCIATIONS OF THE UNITED STATES

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

75% of all tire trouble is due to under inflation

THERE is no method yet discovered of ascertaining the pressure in the inside of a tire, except by the use of a pressure gauge. A casing containing 40 pounds of air looks and feels exactly like a casing containing 80 pounds. If your tires require 80 pounds and you only give them 40, they're on the quick road to the scrap-heap.

A Thumb Nut and Stud Terminal with each ⅞ x 18 Rajah Plug.
Rajah Plugs can be used on any motor and with any other make of terminal with our special adapters.
The Packard and Ball Terminals are furnished only on special request or in exchange. Send for our 1914 catalog.

RAJAH AUTO SUPPLY COMPANY, Bloomfield, N. J.

A Mercury Switch Does It!

Benjamin F. Bailey, the eminent electrical engineer, has made it possible at last for the purchaser to secure a high grade starting, lighting and ignition system on a medium priced car—a system in which all troublesome devices, such as reverse current relays, magnetic switches, vibrating contacts, delicate rheostats, slipping clutches, corroding platinum points have been eliminated. A patented mercury switch does it.
There are no moving parts in its system of regulation.
The outfit is high-grade in every respect, and it is much superior to that offered by most cars selling for twice as much. Our Book "Bailey Electric Systems and Electric Lighting Explained" will be of great interest to you. It gives details and prices.

INTERLOCKS
Double Your Mileage and Stop Tire Trouble

Interlocks are complete inner tires—not inner shoes—placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They insure safety—make new tires give twice the usual mileage, and add 1000 to 5000 miles to old ones. Don't affect resiliency. Make your tires blow-out proof.

NEW SOSS CONCEALED DOOR HINGE NO. 121

This new hinge requires a pillar only ⅞ inches wide. It is detached by removing two screws as indicated in illustration. The trouble avoided and time gained in hanging doors when using Soss Hinges are important factors.

Soss Concealed Hinges can be instal'ed flush with the outside of the pillar, allowing the steel or aluminum panel to be turned over flush on to the face of the hinge, and fastened down securely in the rabbet provided on the edge of the face to receive it, thus allowing more than ordinary clearance.

The non-corrosive case attached to the pillar section of the hinge, prevents water from reaching the wood of the pillar through the hinge.

Description:

Face of hinge on pillar, ⅞ in. x 3¼ in.
Face of hinge on door, ⅞ in. x 3⅛ in.
Water-proof case mortises into pillar, ⅞ in. x 1⅝ in. x 1¼ in. deep.
Clearance in opening, 11-16 inches.

Motor World Publishing Co., 1600 Broadway, New York

Digitized by Google

"Soot-Proof" Spark Plugs Never Balk

Over 2,000,000 Prove it

Not all spark plugs will carbonize. Not all get dirty, grow weak or short-circuit. And not all spark plugs call for frequent replacement. Your customers, Mr. Dealer, want the plug which has all spark-plug advantages and which eliminates all spark-plug faults. Mr. C. A. Mezger—after twelve years spent on spark plug problems—has perfected and patented the Soot Proof Plug. This plug is warranted to clean itself. It never clogs, never leaks, never short-circuits. It lasts for years. It is built with a double chamber and offers at least three times the resistance of any other spark plug made. And it will outlast any other by two or three times over. This has been proven by over two millions in use. One "Soot-Proof" plug will prove this to you. Try it in connection with any other plug and note the results. In a word, "Soot-Proof" Plugs forever wipe out spark plug troubles.

If you are not already handling "Soot-Proof" Plugs, it will pay you to do so. Hundreds of thousands of drivers are using them now and know their worth. Others, who have had trouble with sparking are bound to go to some "Soot-Proof" user for spark plug advice, so the demand for "Soot-Proof" plugs is growing. Get in on the popular demand—it means more and more satisfactory sales for you.

Every motorist is a live prospect for a good vulcanizer

What This $2.00 Vul-Kit Will Do

Actually vulcanizes any tube puncture as well as the most elaborate plant could. Burns alcohol—or gasoline may be used for roadside repairs. No experience required to operate it.

SHALER Vulcanizers

Every motorist needs one. While the sale of most accessories is limited by the fact that they are furnished with the car, no car is equipped with a vulcanizer. No accessory has as little competition. The motorist must buy it from his dealer.

There are steam, electric and gasoline heated Shalers for every requirement—the only complete line in the world. Automatic temperature control on every model.

C. A. SHALER CO.

H B — D W F

THE first generally successful ball bearing was the direct product of rigidly scientific investigation conducted by the German Small Arms & Ammunition Works (the D. W. F.) of Berlin.

¶ We were pioneers in the production of annular ball bearings. Our manufacturing facilities, consisting of Plant No. 1 (the D. W. F.) of Berlin and Plant No. 2 at Philadelphia are the largest and best equipped of their kind in the world.

¶ Those manufacturers who prefer to use Hess-Bright Ball Bearings on the cars they make are assured that we never will relinquish the distinction of producing the highest grade ball bearings known.

IF A CAR IS KLAXONIZED the manufacturers say so. In their advertisements, or in their catalogues.

When the car's list of equipment contains simply the words "electric horn" the chances are the horn is a "buzzer." Knowing the bulb-horn is no good and out of date, car manufacturers have sought the cheapest way in which they can say "electric horn" - taking the chance that you won't look too carefully at it until the car is sold.

If, however, you have driven a car and know the difference between the "buzzer" and the motor-driven signal - then the car agent has to furnish you a Klaxon before you will take the car.

58 CAR MAKERS believe that this is short-sighted policy. They supply the Klaxon in the first place.

A. E. C.	Davis	Mors (European)	S. & M. "Six"
Alco	F. I. A. T.	Multiplex	Schneider (European)
Armleder	Havers "Six"	National	S. G. V.
Autocar	King	Nyberg	Simplex
H. H. Babcock	Kissel	Oakland	Stafford
Benz	Knickerbocker	Ohio "Six"	Staver
Borland Electric	Knox	Oldsmobile	Stearns
Broc Electric	Lancia (European)	Packard	Sternberg
Buffalo Electric	Locomobile	Peerless	Stevens-Duryea
Roadster	Lozier	Peugeot	Stoddard-Dayton
Century Electric	Marmon	Pierce-Arrow	Touraine
Charon (European)	Matheson	Pope-Hartford	Walker Electric
Chicago Electric	Maxwell "Six"	"Six"	Ward
Columbia	Mercedes	Pratt	White
Croxton	Metallurgique	Rambler	Winton

ON other cars, look carefully at the "electric horn." See if it has a name. Often-times not only has the name-plate been removed but the horn itself has been placed under the hood - out of sight. See if the name means anything to you except what the agent says about it; or if you ever heard of it before. Ask him for a Klaxon - the signal you know about, - and see that he supplies one. He will do it rather than lose the sale of the car.

Studebaker

THE owner of a Studebaker car is fortunate. He has every mechanical perfection and every luxury in his car and, in addition, Studebaker service.

North, South, East or West, wherever his travels may take him a Studebaker dealer is always nearby, ready to extend loyal Studebaker Service.

Studebaker integrity and the belief of Studebaker in the "square deal" has extended over a period of Fifty years. Fifty years of continuous business life is pretty strong evidence of ample resources and that the public believes in Studebaker and in Studebaker products.

That is one reason why contracts to sell Studebaker cars are so eagerly sought. Another reason is that Studebaker cars are easy to sell and, finally—the interest and co-operation of Studebaker with dealers is a big help not only in making sales, but in keeping the owner satisfied after the sale is made.

All the Cars which Started in the Elgin Road Race had Truffault-Hartford Shock Absorbers

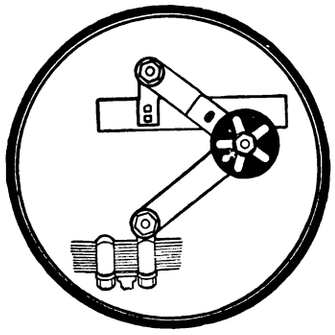
Little wonder that we add another victory to our long list of triumphs.

Gil Anderson finishing first, succeeded in smashing all previous records for this race, maintaining an average speed of 71½ miles an hour. Hard on his heels was Ralph Mulford in a Mason. Third place was captured by Spencer Wishart in a Mercer car.

One of the remarkable features of the race was the noticeable absence of tire and spring trouble.

Truffault-Hartfords, apart from the extra ease and comfort they make possible, prevent all ordinary spring trouble and by keeping the wheels of the car on the ground add materially to the life of the tires. Axle crystallization, and its attendant disastrous results, is made much less probable.

Among professional drivers there is a decided preference for this equipment. Even at the sacrifice of other accessories, many drivers have included Truffault-Hartfords, often being obliged to remove certain parts in order to make up for their slight extra weight.



There are few leading car manufacturers today who do not include Truffault-Hartfords as regular equipment. There are now over 200,000 motorists who enjoy the manifold benefit which their use confers.

Manufacturers and owners alike are urged to take proper cognizance of these facts. They point to the universal preference for the

Truffault-Hartford Shock Absorber

"The Pioneer Shock Absorber"

Fits any car and makes any car fit for any road. Unlike other devices, the Truffault-Hartford does not mar the appearance of the car or add materially to its weight. Its efficiency is one hundred per cent. Five models from $15 to $60 per set of four, including the New Automatic type.

12 Years

Standing between you and our guarantee of quality and performance is an experience and study of 12 long years spent in developing and perfecting a real service giving spark plug.

The result of that period of pioneering

A plug which cleans itself, which burns the carbon as fast as it forms—a plug which doesn't require frequent replacement and which, under ordinary conditions, should last as long as your engine—the C. A. Mezger

"Soot Proof"

Soot Proof Spark Plugs are controlled by basic patents which make successful imitation impossible. Built with a double chamber. Therefore they offer three times the resistance of any other spark plug made.

Millions in use today on the best built cars in America, some of them after 8 years' continuous service.

On a basis of repeat orders alone you should stock Soot Proof Plugs—to say nothing of the satisfied customers you will make by pushing Soot Proof Plugs as your leader.

MOTOR WORLD

Vol. XXXVI New York, U. S. A., Thursday, September 11, 1913 No. 12

BOSCH SOON TO LAUNCH AN ELECTRIC ENGINE STARTER

Details not Yet Divulged, but it Will be Worthy of the Name—Gould Coupler also Developing a System.

While it may have appeared that a concern of such world-wide prominence in the electrical industry as the Bosch Magneto Co. has been strangely indifferent to the electric starting and lighting system, appearances have been deceitful; for it transpires that for a long period the Bosch people have been engaged in perfecting a system of the sort fit to bear the Bosch trademark and it is known that the Bosch system is now almost ready for exploitation.

Little more than this bare fact has leaked out, but there are reasons for believing that the Bosch device will differ from others of the kind in several substantial respects, particularly in the method of control. Detailed information concerning it probably will be forthcoming within the next month, but it is understood that in all likelihood it will be the first of the year before deliveries will be undertaken.

One other electric lighting and starting system from an even more unexpected source is in process of development, the Gould Coupler Co. having a device of the sort in hand, but as it is not ready to make its appearance on the market no information is obtainable. The relation of railroad car couplers to automobile lighting systems is not so close as to have caused the Gould Coupler Co. to be suspected of having a production of the kind, but the fact that it is closely related to the Gould Storage Battery interests undoubtedly accounts for the experimentation and development work which is now in progress.

Lancia Adopts American Electric Starter.

Despite the apparent apathy or antipathy which exists abroad, not all of the foreign manufacturers have set themselves against electric lighting and starting systems. Evidence to the contrary is contained in the fact that the Rushmore system just has been adopted for use on Lancia cars, chiefly as the result of a visit which Signor Lancia paid to America last fall, at which time he made a tour of the American trade and investigated starting systems very thoroughly. Two other well-known Continental automobile manufacturers and two in England are also authoritatively stated to have adopted the Rushmore system, but for some reason their names have not yet been permitted to become public property.

Only One Bid for Flanders Real Estate.

Only one bid having been received for the real estate of the bankrupt Flanders Mfg. Co., Pontiac, and none whatever for the property in Chelsea, Mich., the receiver, the Detroit Trust Co., considering the offer insufficient, no sale occurred on the dates fixed, Monday and Tuesday last, 8th and 9th inst. Instead the receiver passed up the matter to the court for decision.

The bid for the Pontiac real estate and buildings was tendered by the Harris Bros. Co., who previously purchased the machinery and stock on hand. They offered $65,000 for all of the Pontiac plants, or $25,000 for the gear works and electric plants—prices that are almost ridiculous.

The Chelsea plant, which is a big model industrial establishment, erected by a defaulting treasurer of Michigan, has been a "white elephant" on the hands of all who ever owned it, and the Harris brothers do not want it at any price.

Edge Gets American Shock Absorber.

According to advices credited to J. P. Baldwin, president of the Martin Shock Absorber Co., of Los Angeles, the foreign rights to that device have been conveyed to the well-known S. F. Edge, of London, who about a year since retired from the Napier motor car company. Edge, it is stated, will manufacture the shock absorber for both the British and Continental trade.

CLAIM MOTZ CUSHION TIRE INFRINGES CADWELL PATENT

Men Who Control Rights Bring Suit Against Akron Manufacturer—Revoke License and Sue Swinehart for Royalties.

Although the Swinehart Tire & Rubber Co., of Akron, Ohio, was allied with Edwin B. Cadwell, a Detroit banker, Frank J. Johnston, a Detroit business man, and Frank M. Ashley, a New York lawyer and inventor, in a suit brought some time ago for infringement of patent No. 887,997 in the use of Motz under-cut tires, the three owners of the patent have fallen out with the Swinehart company and are acting alone in a new suit filed this week in the United States District Court for the Southern District of New York against the Motz Tire & Rubber Co., of Akron.

In the first suit, which was against a user of Motz tires, the Swinehart company appeared in the position of a licensee under the patent, but recently the owners of the patent revoked the Swinehart license, are considering extending it to another manufacturer, and meantime have taken steps in an effort to establish that that tire, which is known as a distinctive Motz product and which has been featured by that company, is an infringement of their patent.

Not only has the trio brought suit against the Motz company, but it has instituted an action in the Court of Common Pleas, in Akron, against the Swinehart company for $7,000 royalties alleged to have accumulated during the term of the Swinehart license. The patent was granted May 19, 1908, to Cadwell, who assigned third interests to Ashley and Johnston. Not long after its issuance the owners licensed the Swinehart company on a basis of a minimum royalty of $1,800 a year. The Swinehart company made but few tires and are said to haev paid no royalties.

Meantime the Motz company was devel-

Digitized by Google

oping its under-cut tread, the appearance of which has become familiar to the entire trade, and October 8, 1909, the three owners and the Swinehart company instituted an infringement suit in the Federal court in New York City against the Rapid Safety Filter Co., which was using four Motz tires on a delivery vehicle. The Motz company took more or less of an interest in the suit, but the filter company was permitted to "lie down" late last May and judgment was taken against it.

It was supposed that the Motz company had by this action given some recognition to the Cadwell patent, but the contrary proved to be the case, and the present suit has been started to establish the status of the patent. The details of the break with the Swinehart people are not divulged and neither is the name of the company which is negotiating for the new license.

Gerber Must Explain Michigan Debt.

Pittsburgh papers continue to print glowing stories of the "clean cut" purchase and control of the bankrupt Michigan Buggy Co., of Kalamazoo, by the E. F. Gerber Co., the Michigan agents in Pittsburgh, although, as stated in last week's Motor World, the receiver, the Detroit Trust Co., denied the alleged sale, which denial was repeated only yesterday. Gerber, it now appears, did offer $375,000 for the property, but it was not seriously considered, as the Michigan company owes $3,000,000. Letters are being mailed today soliciting bids for the assets, and instead of having acquired them, Gerber has been cited to appear in the Federal court in Pittsburgh tomorrow for examination concerning the $385,000 he owes the Michigan company.

Sweet Retires from Disco Company.

Accustomed to surprises, Detroit automobile circles received one of which no inkling had escaped when it became known yesterday that George P. Sweet, who earned an enviable reputation in building up the business, had disposed of his interests in the Disco Co. and resigned the office of general manager. Sweet is not yet ready to announce his future plans and, in fact, has left Detroit, with Mrs. Sweet, for several weeks of hunting and fishing in Georgian Bay. He will remain there until Oct. 5th.

Biggan to Make Clutches in Buffalo.

The Biggan Engineering Co., of Buffalo, N. Y., which recently was incorporated with an authorized capital of $200,000, will engage in the manufacture of clutches, transmissions and control lever sets at 26-28 Lansing street, which premises have been leased for the purpose. H. F. Biggan is president of the company and O. Seelbach secretary and treasurer.

RECEIVER SAYS SCHACHT IS HOPELESS AND FAVORS SALE

Reorganization Impossible and Continued Operation Merely Adding to Losses—Discloses Faults Contributing to Failure.

If the report of the receiver, filed yesterday, is confirmed by the court, the Schacht Motor Car Co., of Cincinnati, which became financially enmeshed in April last, will soon become but a memory.

The receiver, John F. Deitz, a Cincinnati desk manufacturer, who was also a Schacht director, declares that "there is no possibility of a reorganization or continuance of the business at a profit." He, therefore, recommends that all necessary help be discharged and the property be advertised for sale. At the time of the failure, internal dissensions were said to have precipitated the trouble, but the receiver's report indicates that manufacturing and sales delinquencies were the real roots of the evil.

Asserting that the business "is losing money every day" and that "the longer it continues the worse the situation will become, and with greater loss to the creditors," he says that his investigations have disclosed that, as conducted, there was "little system and no modern inventory or stock account in the manufacturing department;" that "the repair department was being conducted at a loss because customers who bought machines were allowed repairs at less than cost" and that "the sales department was not properly organized and was very expensive."

The receiver is one of those who evidently is greatly impressed by the necessity for season's models, for he states that the Schacht company has no 1914 model to put on the market in order to meet competition, and that present models are growing older and by next year will be so out of style that practically nothing can be realized on them. His report also brings to light that there are some 1912 models still on hand and, it is naively added, that "they are constantly deteriorating."

Likely to Probe Removal of Lansden.

With the return to Newark, N. J., of the property of the bankrupt Lansden Co., which was removed to Allentown, Pa., shortly before the failure, it is stated that an investigation will be made as to the reasons which prompted the dismantling of the Newark plant and its removal to Pennsylvania. Martin E. Kern, manager of the Lansden Co., gave as the reason that it was designed to merge the Lansden and the Webb companies and to obtain new capital in Allentown, but the explanation stated, is not considered sufficient.

According to assertions of the attorney for the Lansden trustee, not only has no attempt been made to set up the machinery, which has been removed to Newark, but approximately $70,000 worth of unfinished Lansden electric truck parts were found stored in the plant of the Mack car Co., in Allentown, in which John D. Mack, who is also heavily interested in both the Lansden and Webb companies, is the chief figure.

Big Men in Chicago Supply Company

The Matador Tire & Vulcanizer Co. [illegible] Michigan avenue, Chicago, has been taken over by a new corporation, styled Consolidated Automobile Supply Co., which is capitalized at $500,000. Bert Walger, general manager of the Matador company, will be vice-president and manager of its successor. All of the other officers of the Matador company—L. G. Smith, president; C. [illegible] Griswold, vice-president, and James A. Findlater, secretary—will also be identified with the Consolidated corporation, among whose directors are Potter Palmer, the Chicago capitalist; William S. Megaris, a Chicago lawyer, and W. S. Sims, a jeweler.

Chalmers's Earnings Show Large Gain.

During the fiscal year ending June 30th last, according to its report which just has been made public, the net earnings of the Chalmers Motor Co., of Detroit, amounted to $1,273,261, an increase of $71,510. Gross earnings were $11,632,951, an increase of $680,564. The 7 per cent. dividend on the $1,500,000 preferred, calling for $105,000 a year, was earned twelve times over. After deducting it the balance, $1,163,261, was equal to 23.3 per cent. on the $5,000,000 outstanding common, which receives 10 per cent. dividends annually.

Klaxon Acts Against Boston Dealer.

Having already filed one suit of the [illegible] and decided to institute similar actions in most of the other large cities, the Lovell-McConnell Mfg. Co., of Newark, N. J., this week filed a suit in the Federal Court in Boston against the Henry Kimball Co., of that city, distributer of Hudson cars. The Boston dealers are accused of infringing the Klaxon patents Nos. 923,048, 923,049 and 923,122, the special infringement complained of constituting the promotion of the sale of Hudson cars equipped with Sparton horns.

Rauch & Lang Branch in Kansas City

The Rauch & Lang Carriage Co., of Cleveland, Ohio, have opened a branch in Kansas City. It is located at 35th and Main streets.

PACKARD PARES PRICES; ONE MODEL REDUCED $400

Low Price Now $3,750 for "Little Six" Phaeton; High, $5,150 for Imperial Limousine—Nineteen New Body Styles.

Reports which have been afloat for months, to the effect that the Packard Motor Car Co., of Detroit, is making ready to place on the market what might be termed a popular priced model, were, for the moment at least, set at rest this week when the 1914 prices of the "little six" became available.

While reductions, ranging from $50 to $400 have been made, even the lowest priced model—the five-passenger phaeton to which the $400 reduction applies—will be listed at $3,750, which is hardly within the general notion of a popular price. The old and the new prices of the "little six," which is the Packard 38-horsepower model and which is now styled model 238, are as follows:

	Old.	New.
Touring (6-passenger).....	$4,150	$3,850
Touring (7-passenger).....	4,150	3,850
Phaeton (5-passenger)....	4,150	3,750
Runabout	4,050	3,750
Limousine (7-passenger)..	5,200	5,000
Landaulet (7-passenger)..	5,300	5,000
Imperial limousine	5,400	5,150
Brougham (6-passenger)..	5,200	5,000
Coupe	4,500	4,450
Chassis	3,500	3,100

Some of the Packard people explain, however, that owing to their adoption of 19 new body styles, there really is no correct basis for comparison of present and former prices.

Prices of the "big six," the 48-horsepower car, will not be announced until next spring, when the new model will be ready for the market.

All Packard "fours" finally have been discontinued, which, of course, means that hereafter "sixes" only will be produced.

Court Shortens Square Horn's' Defense.

After the Square Motor Horn Co. and the Salvini Electric Horn Mfg. Co. had compiled a list of 175 American and 59 foreign patents as instances of the prior art in defending the suit brought against them in the Federal court in New York City by the Lovell-McConnell Mfg. Co., makers of the Klaxon horn, the court this week, upon motion of the Klaxon counsel, ordered the list shortened; it directed that the Square Horn companies cut the list down to five patents and five instances of prior use, the object being not to encumber the records and proceedings.

The Klaxon company charges infringement of patents Nos. 923,048, 923,049 and 923,122, and also succeeded in having stricken out that part of the defendants' answer seeking to bring in the Hutchison Electric Horn Co. and Miller Reese Hutchison, and also a patent application owned by the defendants and that part setting up as a defense the Klaxon-Newtone suit now pending in the Federal court in Brooklyn.

Proprietor Loses Life in Garage Fire.

Injuries sustained in a fire which followed the explosion of a brazing machine which he was operating in his garage in Newburyport, Mass., on Merrimac avenue, caused the death Tuesday, 9th inst., of Edwin M. Ingalls, who had been connected with the trade for many years. The fire which followed the explosion destroyed the garage, a theater and other buildings and did a total damage of $50,000, $20,000 of which fell upon the garage. Ingalls was fatally burned and died in a hospital.

A charred body found in the ruins is believed to be that of Raymond Carpenter, 21, of Rowley, a garage employe. The clothing and hair of Miss Marion Flanders, the bookkeeper, were set fire by the explosion and she ran to the street, where a city official wrapped his coat about her and extinguished the flames. Assistance was summoned from nearby towns to fight the fire.

Ingalls was 47 years old and is survived by a widow and three children.

No Relief for R. C. H. Corporation.

Creditors who met in Detroit on Tuesday last, in an effort to find a way out for the R. C. H. Corporation, could find none. The receiver suggested a plan whereby material on hand might be converted into 500 cars, but it did not appeal to the creditors, and, accordingly, the plant will be ordered sold. Meanwhile it will remain in partial operation. Some of the larger creditors, it is stated, are endeavoring to raise a fund to bid in the property.

Court Refuses to Confirm Cutting Sale.

As expected, the Federal court has refused to permit the sale of the assets of the Cutting Motor Car Co., of Jackson, Mich., the appraisal of the property having shown it to be worth approximately $268,653. The $30,000 bid was made by W. M. Thompson, of the Jackson City Bank, when the receiver offered the assets for sale last month. In refusing to confirm the sale, the court expressed the opinion that a better price can be and should be obtained.

New Plant for Motor & Manufacturing.

The Motor & Mfg. Co. has let contracts for the erection of a new plant in Dunkirk, N. Y. It will comprise one two-story structure, 57 x 85 feet, and a one-story building, 30 x 84 feet.

3-CENT FUEL IS "FOUND"! "OIL TOPPINGS" ITS NAME

Hitherto Unconsidered Refinery Product Propels Truck 472 Miles for $1.40—Ten Miles per Gallon—"Gas" Would Have Cost $6.74.

Automobile fuel at three cents a gallon is the promise held forth by the California oil refineries as a solution of the problem presented by the high cost of "gas," the promise being contained in what is technically termed "crude oil tops" or "oil toppings." Actually, there is nothing very new in the fuel itself, for it long has been used for firing boilers and furnaces, though not until recently has any attention been paid to it as a possible substitute for gasolene—and even for kerosene and distillate, both of which fuels are high in price as compared with "oil toppings."

The picturesque designation of the fuel comes from the fact that it represents that portion of crude oil refinings which floats at top of the tanks and heretofore has been either drained off and discarded or sold for use in furnaces at less than half the cost of distillate. In specific gravity, "oil toppings" measures approximately 38.5 Baume at 60 degrees Fahrenheit and its cost as compared with the cost of other and well-known fuels is as follows:

	Gravity Baume.	Cost per gal.
Oil toppings	38.5	.03
Kerosene	42.7	.09
Distillate—½ kerosene...	47.6	.08
Distillate	51.4	.07
Gasolene—½ distillate...	55.3	.11
Gasolene	59.7	.14½

These prices obtain in Los Angeles, where the discovery was made that "oil toppings" is suitable for use in automobile motors. The test which demonstrated the suitability of the fuel was made with a Kissel truck, which was driven from Los Angeles to San Francisco, carrying a 2,000-pound load, in the remarkable time of 24 hours 40 minutes, the total distance covered being 472 miles and the average fuel consumption approximately 10 miles to the gallon; altogether, just 46½ gallons of "oil toppings" were used in making the run. The fuel was fed to the engine through a Master carburetter, a comparatively new device designed by H. A. Miller and produced by the Master Carburetter Co., of Los Angeles; according to the foregoing figures the total fuel cost, not including the cost of 3½ gallons of lubricating oil, was less than $1.40—or approximately one-third of a cent to the mile.

At approximately 10 miles to the gallon, sufficient gasolene for the trip would have cost $6.74 at the present price of that com-

Digitized by Google

modity in Los Angeles, and at the price of gasolene in the East—approximately 17 cents a gallon—it would have cost $7.90; sufficient distillate, even, to propel the truck the 472 miles between the two ctiies would have cost more than twice as much as the "oil toppings" cost.

Pathfinder Splits California in Two.

Having divided the State of California into two parts, the Motor Car Mfg. Co., of Indianapolis, has turned over its representation in Northern California to the Pathfinder-Pacific Motor Sales Co., of San Francisco, which was organized for the purpose. As heretofore, the Southern part of the State will be controlled by the Pathfinder Motor Car Co., of Los Angeles, which formerly maintained a branch in San Francisco.

The agency in the latter city is backed by James H. Borland, a San Francisco capitalist who acts as president of the new company, and J. R. Pringle, vice-president, who is an attorney of prominence in San Francisco; J. M. Whited is secretary-treasurer and general manager, and Barry Cool is sales manager. It will maintain branches in Sacramento, Oakland, Fresno and Watsonville and later will establish similar branches in Reno, Nev., and in Honolulu. The extent and completeness of its service department, which is under the direction of John D. Stall, will be one of the features of the new company.

Destribats Sails to Revisit France.

Louis P. Destribats, vice-president of the Ajax-Grieb Rubber Co., sailed this week for France, where he will spend six weeks. He is a native of that country, which he has not visited since leaving there as a young man, and is now going chiefly to see his father, whom he has not seen for many years. It will be his first vacation of any kind since he joined the Ajax-Grieb company in 1905.

Empire and Peekskill Garage at Odds.

Demanding $196.53 on goods supplied, the Empire Tire Co., of New York City, filed suit this week in the Supreme Court for New York county against William H. Ash, proprietor of the Peekskill Garage, in Peekskill, N. Y. He is alleged to have contracted the obligation between September 4 and October 26, 1912.

Indian Sues Chittenango Garageman.

The Indian Refining Co. this week filed suit in the Supreme Court for New York county against C. C. Bartholomew, a garageman in Chittenango, N. Y. The oil company asks $97.65 for gas and oil supplied between September 16 and October 29, 1912.

OAKLAND PARES ITS "SIX"; PUTS UP PRICE OF "FOURS"

All Cars to Have Full Equipment, Including Delco Apparatus—New "Little Six" Soon to Be Added to the Line.

Although no very great amount of mechanical alteration has been made by the Oakland Motor Car Co., of Pontiac, Mich., in the newer models which have just made their appearance, the price list has been very materially altered and further to round out the line one new model—a "little six"—has been added. Instead of the option of equipment or no equipment, all the cars now are listed with Delco electric lighting and engine starting apparatus and all the other fitments that go to make up a complete list.

In the case of the six-cylinder model which was added only last year, the price has been reduced from $2,550 (including Delco equipment) to $2,450, though in every other case the price has been raised. The larger of the two "fours," which last year sold for $1,450, now sells for $1,785, the increase in price being due to the fact that it has a much larger motor and is a larger car throughout; and the smaller "four," which heretofore has listed at $1,075, now lists at $1,200. Neither price nor specifications of the new "little six" have as yet been made public.

The larger of the two six-cylinder cars is virtually a reproduction of its predecessor, except, of course, that details have been refined and corners smoothed off, so to speak, and the equipment list filled out; motor and transmission elements remain the same. The motor measures 4⅛ x 4¾ and is rated at 60 horsepower. Similarly, the smaller of the two "fours" scarcely has been changed at all and retains its 3½ x 5-inch motor. In both of these cars, and also in the larger "four," cone clutches and three-speed selectively operated gearsets are used; the steering column remains at the right side.

It is in the larger "four" of the two that the greatest mechanical change has been made, though the change is confined almost wholly to the motor. Instead of measuring 4⅛ x 4¾—the dimensions of the "six"—this model now has a 4¼ x 5¼ motor the rating of which is 29 horsepower, as against 27 horsepower for the old dimensions; obviously, however, both figures are considerably lower than the actual power developed, the discrepancy being greater in the case of the new motor because of the greater difference in stroke-bore ratio. In other respects the car has been slightly enlarged and now has a roomier tonneau and u[illegible] three of the cars the various switches, meters, etc., have been more advantageously placed on the cowlboard and a running board tool box added.

Senate Passes the Underwood Tariff.

By a vote of 44 to 37, the Senate on Tuesday last, 9th inst., passed the Underwood tariff bill without further amendment of the automobile rates. As provided by the upper house, they are as follows:

Finished automobiles valued at $1,50[illegible] over, 45 per cent.; valued at less than $1,500 and more than $1,000, 30 per cent.; valued at less than $1,000, 15 per cent.; automobile chassis and finished parts of automobiles, not including tires, 30 per cent.

These rates, as is well known, represent substantial amendments of the duties as provided by the House, and although the bill will now be considered by a conference committee representing both chambers before it again comes before the House, there is small doubt that the Senate rates will be adopted and enacted into law.

Edwards Sues A. C. A. for $9,000 Salary.

William A. Edwards, former secretary of the Automobile Club of America, filed suit this week in the Supreme Court for New York county against the club for $9,000 which he claims is owed him for services between February 18, 1912, and August 18, 1913. He states that his predecessor received a salary of $6,000 a year, that both he and the club contemplated the payment to him of a reasonably large salary, that he has not received it, although he has demanded it, and that his request is fair and reasonable.

Zenith Carburetter Chief Coming Over.

Antonin Boulade, vice-president of the Zenith Carburetter Co., of Detroit, and the moving spirit in the three foreign plants, is en route to this country to superintend the removal of the Detroit plant to its new location on Vanda avenue in that city. Incidentally, Boulade just has received the Legion of Honor decoration from the French government for distinguished services in military aeronautics and ballooning, photography, as well as in the science of carburation.

Brazilian Plant for British Dunlop.

Apparently the Goodyear Tire & Rubber Co. will not have the only tire factory in Brazil, for the British Dunlop interests have organized the Dunlop Pneumatic Tire Co. of South American, Ltd., which, like the Goodyear people, will erect and operate a plant in Rio de Janeiro. The Dunlop enterprise is capitalized at $25,000 in £1 shares. The Goodyear is capitalized at $3,000,000.

The Week's Incorporations

Detroit, Mich.—Oleson-Adams Mfg. Co., under Michigan laws; authorized capital, $10,000; to manufacture motor cars.

Detroit, Mich.—Princess Cyclecar Co., under Michigan laws; authorized capital, $200,000; to manufacture motor cars, hydroplanes, etc.

Hondo, Tex—Hondo Auto Sales Co., under Texas laws; authorized capital, $2,000. Corporators—Claude W. Gilliam, Chas. W. Robers and others.

Milwaukee, Wis.—McDonald Motor Car Co., under Wisconsin laws; authorized capital, $10,000. Corporators—Carl G. Pauli, John McDonald, Jr., Ida Pauli.

Portland, Me.—F. O. Bailey Carriage Co., under Maine laws; authorized capital, $50,000; to manufacture and deal in vehicles of every description, supplies, etc.

Yoakum, Tex.—Universal Motor Car & Supply Co., under Texas laws; authorized capital, $3,000. Corporators—Otto Wagoner, F. F. Klohs, H. Sockamp.

Atlantic City, N. J.—Parkway Co., under New Jersey laws; authorized capital, $100,000. Corporators—W. Lewis, R. L. Beyer, J. H. Hayes, Jr., all of Atlantic City.

Trenton, N. J.—The Motor Shop, under New Jersey laws; authorized capital, $25,000. Corporators—R. C. Manning, J. L. Bodine, W. L. Cox, Jr., all of Trenton.

Bowling Green, Ohio—Bowling Green Rubber Co., under Ohio laws; authorized capital, $25.000. Corporators—Charles W. Greene, M. L. Cope, Cecilia P. Cope.

Detroit, Mich.—Detroit Ball Bearing Co., under Michigan laws; authorized capital, $2,000; to operate a motor car repair-shop. Corporators—Joseph Pauer, James Corney.

Ayer, Mass.—E. O. Proctor Co., under Massachusetts laws; authorized capital, $50,000; to deal in motor cars and operate a garage. Corporators—E. O. Proctor and others.

Detroit, Mich.—Metal Parts Engineering Co., under Michigan laws; authorized capital, $25,000; to manufacture motor car parts. Corporators—W. L. Kenfield, W. W. McIntyre and others.

Detroit, Mich.—Cameron Wire Wheel Co., under Michigan laws; authorized capital, $25,000; to manufacture wire automobile wheels. Corporators—A. A. Leslie, F. F. Cameron and others.

Los Angeles, Cal.—Vic-Mac Garage Co., under California laws; authorized capital, $50,000. Corporators—Victor A. Machris, Alfred P. Machris, George L. Machris, A. M. Marlian, S. Stephens.

Chicago, Ill.—Petschel Storage Battery Co., under Illinois laws; authorized capital, $75,000; to manufacture electrical supplies. Corporators—H. T. Scarrett, N. E. Cole, R. T. Jefferson, all of Chicago.

Chicago, Ill.—Fred S. Decola Co., under Illinois laws; authorized capital, $2,500; to maintain and operate a garage and motor livery. Corporators—Canian Grisco, John A. Navigato, James R. Navigato.

Walkerville, Ont.—Fisher Motor Co., under Canadian laws; authorized capital, $150,000; to manufacture motor cars, machinery, etc. Corporators—C. F. Gerraghty, F. E. Fisher, F. W. Vollans and others.

Utica, N. Y.—Wahl Auto Sales Co., under New York laws; authorized capital, $2,000. Corporators—M. F. Robinschon, 237 Rutgers street; E. E. Robinschon, 16 Bristol street; J. J. Lanz, 5 George place.

Waterbury, Conn.—East Side Garage, under Connecticut laws; authorized capital, $5.000; to conduct a garage. Corporators—Lois S. Phippeney, Robert V. Cooper, Jennie V. Cooper, William R. Price.

Cincinnati, Ohio—Eureka Automobile Co., under Ohio laws; authorized capital, $10,000; to deal in motor cars. Corporators—G. W. Ammerman, J. M. DeCamp, R. M. Ochiltree, E. C. Stang, Joseph Carney.

New York, N. Y.—Sireno Co., under New York laws; authorized capital, $5,000; to manufacture automobile horns. Corporators—George H. Tamlyn, Charles F. Pearce and Walter H. Pearce, all of 18 Rose street.

Richmond, Va.—Auto Cover & Supply Co., under Virginia laws; authorized capital, $15,000; to manufacture, buy and sell motor car accessories. Corporators—A. W. Evans, A. Blackburn, H. B. Williamson.

New York, N. Y.—Francis Motor Renting Co., under New York laws; authorized capital, $10,000. Corporators—Robert H. Elder, 115 Broadway; Helen B. Inch and Francis B. Inch, both of 1531 Broadway.

Eau Claire, Wis.—Darwin Motor Car Co., under Wisconsin laws; authorized capital, $10,000. Corporators—O L. Darwin, Eau Claire; W. C. Tuffts, Withee; Gunder Anderson, Owen; M. D. Garrison, Thorp.

New York, N. Y.—Oleo Shock Absorber Co., under New York laws; authorized capital, $30,000. Corporators—John F. Booth, 271 Broadway; August Estelmann and Harry A. Bell, both of 500 West 56th street.

Chicago, Ill.—Mogul Starter Co., under Illinois laws; authorized capital, $75,000; to manufacture automobile accessories. Corporators—S. G. Harrison, M. Beringer, P. T. Morris, C. W. Paltzer, all of Chicago.

Brooklyn, N. Y.—Bushwick Automobile Co., under New York laws; authorized capital, $2,000. Corporators—David Werchen, 994 Myrtle avenue; Isaac Rosenberg and Sophie Rosenberg, both of 80 Beaver street.

Brooklyn, N. Y.—United States Garages, under New York laws; authorized capital, $500. Corporators—Henry D. Bristol, Rockville Center; John H. Herman, Jr., 194 Woodbine street; Rose Simon, 934 Madison street.

Indianapolis, Ind.—Herff-Brooks Corporation, under Indiana laws; authorized capital, $100,000; to conduct a general motor vehicle business. Corporators—Jacob Herbert and George Herff, H. H. Brooks, R. Samuels.

East Cleveland, Ohio—Euclid-Superior Auto & Supply Co., under Ohio laws; authorized capital, $10,000; to deal in motor cars. Corporators—C. R. Williamson, E. M. Ball, W. R. Winn, P. A. Knoedler, D. J. Lombard.

Brooklyn, N. Y.—Williams Auto Service Co., under New York laws; authorized capital, $2,500. Corporators—Lawrence G. Saglona, 9 East 10th street; Annie S. Williams and Albert E. Williams, both of 126 Sterling place.

Toledo, Ohio—Griffin Taxicab Co., under Ohio laws; authorized capital, $10,000; to conduct a general taxicab business. Corporators—Sherman B. Goss, C. C. Sampson, Chas. W. Thompson, John H. O'Leary, Geo. N. Goss.

Wilmington, Ohio—Wilmington Auto Co., under Ohio laws; authorized capital, $10,000. Corporators—Carl Bangham, Frank L. Gallup, W. H. Hoskins, N. J. Lewis, Harry McKay, E. T. McPherson, O. L. Pidgeon.

Brooklyn, N. Y.—Killmer Co., under New York laws; authorized capital, $10,000; to

manufacture Gilson primer and gasolene saver. Corporators—Nelson B. Killmer, Ralph H. Killmer and Mary A. Killmer, all of 396 State street.

Buffalo, N. Y.—Clifford Co., under New York laws; authorized capital, $15,000; to manufacture equipment for motor cars, boats, etc. Corporators—William M. Sellec, Rochester; Clarence C. Clifford and Welford Golden, both of Buffalo.

Troy, N. Y.—Scott D. Nichols, Inc., under New York laws; authorized capital, $10,000; to engage in a general motor vehicle business. Corporators—Scott D. Nichols, Marion Nichols and Anna MacNeil, all of Hoosic and Burdett avenues.

Bronx, N. Y.—Arrowsmith Mfg. Co., under New York laws; authorized capital, $10,000; to manufacture automobile accessories. Corporators—Frederick Kalmbach, 1068 Hall place; Albert Kalmbach, 784 Elton avenue; John M. Flick, 991 Freeman street.

Lynbrook, N. Y.—Metropol Motors Corporation, under New York laws; authorized capital, $50,000. Corporators—Robert D. McKay, 407 West 18th street, New York; J. Frank Wiggin, 11½ West 65th street, New York; F. W. Preuss, 1926 Broadway, New York.

Richmond, N. Y.—Commercial Auto Body Co., under New York laws; authorized capital, $12,000. Corporators—William Hertz, 139 Park Hill avenue, Yonkers; Caspar A. Scheiper, 396 Bay street, Staten Island; Arthur W. Owen, 208 West 69th street, New York.

Brooklyn, N. Y.—Flatbush Avenue Taxicab Co., Inc., under New York laws; authorized capital, $5,000; to operate a taxicab service. Corporators—Charles Stork, 336 Flatbush avenue; John Wilmartin, 369 Flatbush avenue; William H. Fangemann 320 Union street, all of Brooklyn.

Onawa, Iowa—Monona County Auto Co., under Iowa laws; authorized capital, $20,000; to operate a garage and deal in motor cars. Corporators—W. J. Benson, H. L. Craven, E. P. Myrland, of Onawa; James McIntyre, of Blencoe; Ira Brown, of Whiting; John W. Anderson, Max Grant, C. E. Underhill.

Sioux City, Iowa—Self-Compressing Indestructible Auto Tire Co., under Iowa laws; authorized capital, $100,000; to manufacture and sell a non-pneumatic tire. Corporators—A. Fahlenkamp, Carl Meyer, Ben Short, J. B. Barnes, W. H. Farnsworth, and J. W. Kennedy, all of Sioux City, and A. J. Schnoor and Peter N. Arp, of Holstein.

Changes in Capitalization.

Detroit, Mich.—Grant Motor Car Co., from $165,000 to $200,000.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

A. S. Robinson, former sales manager of the Kissel Kar branch in Los Angeles, has been promoted to the post of manager. He succeeds to the vacancy created by the death of E. Rogers Stearns.

Following in the footsteps of G. M. Berry, treasurer, E. S. Maddock, assistant secretary of the Thos. B. Jeffery Co., of Kenosha, has resigned that office. Maddock has been with the Jeffery company since 1908.

C. F. Bockus, superintendent of Studebaker plant No. 4 since its establishment, has been promoted to a special position created for him and which will have to do with the specialization of manufacturing methods.

C. M. Logan has been appointed Eastern traveling representative of the Lozier Motor Co., of Detroit; he will make his headquarters in Cleveland. Previously he was connected with the Studebaker Corporation.

Arthur A. O'Neil has been appointed Eastern sales manager of the Empire Automobile Co., of Indianapolis, and will make his headquarters in Boston. He acquired the necessary experience with the Studebaker and Jeffery companies.

L. L. King has been appointed advertising manager of the Goodyear Tire & Rubber Co., of Akron, and will take over most of the duties previously performed by H. S. Quine; the latter will hereafter act more as a direct assistant of President Seiberling.

Otis Funderburk has been appointed sales manager of the carburetter division of the Detroit Lubricator Co., which recently took up the manufacture of the Stewart carburetter. Previously Funderburk was Michigan manager of the Rayfield carburetter interests.

Fred W. Nichols, assistant sales manager of the Chalmers Motor Co., of Detroit, has been transferred to Boston, where he will serve as district manager of the New England territory. He has been succeeded by L. E. Blocker, who has been with the Chalmers company since its formation.

Richard E. Baus, who at one time was manager of Studebaker Plant No. 3 but who more recently has been acting as manager of the Maxwell branch in Dayton, Ohio, has returned to the Studebaker Corporation, where he again will be attached to the production department under Mr. Wollering. Baus will apply himself to specialization of cost methods, stock keeping and other details.

D. B. Williams, former advertising manager of the American Motors Co., of Indianapolis, who three months ago relinquished that position to become a district sales manager for the company, has returned to the advertising department now with enlarged duties. He just has been appointed advertising manager of both the American Motors and Marion Motor Car companies, both of which are J. I. Handler properties.

W. McK. White has been appointed sales manager of the Esterline Co., of Indianapolis, which means that hereafter he will have to do with lamps, electric lighting outfits and other electrical appliances instead of motor cars, with which he had been so long identified. White had experience with several of the best known automobile companies, his most recent connection having been with the Marion Motor Car Co. of Indianapolis.

R. H. Kately, former sales manager of the R. C. H. Corporation, of Detroit, and Alwyn Gloetzner, former factory manager of the Krit Motor Car Co., of the same city, who at one time was identified with the Olds interests, have been added to the staff of the Thomas Howard Co., of Brooklyn, which markets the output of Correja cars and which is preparing to turn out in Detroit a light $495 car which will bear the name Howard. Kately will be business manager of the Howard company and Gloetzner designer and factory manager.

As one of the first moves in the semi-reorganization of its headquarters staff, the Moline Automobile Co., of East Moline, Ill., has appointed L. M. Bradley advertising manager and assistant sales manager. Bradley is well known, both in the East and in the West. At one time he was assistant general manager of the American Motor Car Manufacturers' Association, the anti-Selden organization, and later became advertising manager of the United States Motor Co., relinquishing that office to go first with the Studebaker Corporation and later with the Willys-Overland interests, of whose respective publicity departments he had charge.

Crockett Here from Asia for Short Stay.

James B. Crockett, of Detroit, who has charge of the Studebaker business in Asia where he has been located for two years, arrived in this country last week. He will spend a month at the Studebaker factory in Detroit before returning to his duties in the Far East.

Digitized by Google

In the RETAIL WORLD

John Stumpf, of Templeton, Cal., has completed a garage.

C. P. Lutz and E. F. Allen are about to open a garage in Lenoir, N. C.

Plans have been secured by F. N. Rothenbush, of Stockton, Cal., for a garage; it will cost $3,500.

D. J. Carson, of Dubois, Pa., is building a garage; it is located on West Washington avenue.

Lew Bierley, of Chillicothe, Ohio, has opened a garage; it is located at 34 East Main street.

Roiff & Leinbacn are about to erect a new garage in Reading, Pa. The site is on Madison avenue.

The Reading-Brownlee Co., of Allentown, Pa., has awarded the contract for a one-story garage.

Kientop & Hubbell, of Alliance, Neb., have secured permission to build a garage, 40 x 150 feet.

Henry R. Nelson plans to erect a garage in San Diego, Cal. He has secured a site on Ivy street.

Fred Hendrick, of Reading, Pa., plans to build a garage, 40 x 50 feet; the site is on Schuylkill avenue.

Fred Cramm, of Hutchinson, Kan., has secured permission to erect a new garage; he is a Buick dealer.

A. J. Reynolds has opened salesrooms in Tampa, Fla., at 100 Lafayette street; he will handle Cleveland trucks.

William and Isaac Smith, of Trenton, N. J., plan to erect a garage on West Hanover street; it will cost $4,000.

Hewitt & Son, of Hillsdale, Mich., have sold their garage to George Frost, of Montgomery, in the same State.

T. J. Evans and J. L. Harris plan to build a garage in San Pedro, Cal. They have secured a site on 12th street.

Christ Ricker has sold the Ritzville (Wash.) Garage to Hanna & Moore; Ricker will maintain his car agency.

Charles M. Hammond, of Middleport, N. Y., has been granted authority to erect a garage; the site is on Vernon street.

H. W. Gable has entered the trade in Belvidere, Ill. He has secured the Hudson agency and has located on Elm street.

Bender & Moore, of Tulare, Cal., have let the contracts for a garage to be erected on K street; the estimated cost is $40,000.

The Overland Automobile Co., Overland distributer in Houston, Tex., has taken possession of new quarters at 908 Main street.

The Northwest Motor Co. has entered the trade in Washington, D. C. It will deal in supplies and accessories at 1709 14th street.

J. S. Coleman, of 326 West 70th street, New York City, is to erect a garage; it will stand at 122 West 56th street and will cost $9,000.

A. J. Starn and J. B. Symes, of Sparta, Mich., are about to open a garage; they have purchased a site on North Union street.

J. E. Fisher has purchased a half-interest in the W. H. Millican Garage in Luling, Tex. Additional garage equipment will be installed.

Kratz & Kratz, operators of a garage, livery and supply business in Detroit, have branched out; they have taken the Speedwell agency.

P. F. Compton, of McFarland, Cal., has sold a half interest in his garage business to J. F. Bocco, formerly of Baldwin, in the same State.

The Germantown (Pa.) Garage & Storage Co. is preparing plans for a one-story brick garage; the cost will be approximately $30,00.

R. W. Mayer, of Frostburg, Md., has been granted authority to build a garage on Water street; he is now locatetd at 38 East Main street.

The Dreadnaught Motor Co., of Oakland, Cal., is erecting a new garage and salesrooms at 2543 Broadway; the company stocks Moline cars.

Jonas Brower plans to erect a garage, 40 x 100 feet, in Flora, Ind., on South Center street; he will commence construction about September 15.

The Miller Bros. Automobile & Supply Co., of Washington, D. C., has taken possession of new quarters; they are located at 1st and Pierce streets.

Edward Faust purposes opening a garage in Portland, Ind. Formerly he was connected with the Buick Garage Co. in Bluffton, in the same State.

C. E. Evans & Sons, of Sawtelle, Cal., are erecting a new garage and machine-shop on 3rd street; they are now located at 4th and Colorado streets.

The Palouse (Wash.) Garage has been sold by Cruver & McDonald to H. F. and F. J. McDonald; it was established two years ago by A. E. Cruver.

James Chipman, of Chipman & Fisk, garage operators in Constantine, Mich., has withdrawn from the firm; A. F. Fisk will continue the business alone.

Henry Mitchell, of 1932 Watts street, Philadelphia, Pa., has been granted authority to erect a garage at 1933 North Broad street; its cost will be $9,000.

C. A. Fay, of Clinton, Iowa, has become a dealer; he has secured the Kissel agency for Clinton county, Iowa, and Whiteside, Carroll and Jo Daviess counties, Ill.

The Auto Body & Repair Co. has been formed in Houston, Tex., and will locate at 309 Smith street; the company will build and repair automobile tops and bodies.

The Green Taxi & Auto Co., of Houston, Tex., has secured plans for a new three-story garage; the site in on Upper Main street. The company is now located at 1407 Main street.

M. Gerhart, of Des Moines, Iowa, has purchased from C. E. Erbe the business and garage of the Independent Auto Co. The company has the Locomobile and Moline agencies.

A. E. Avery, of Clarkston, Wash., has purchased the interest of his partner, Geo. Bittle, in their garage business; it is styled the Clarkson Garage and will be operated by Avery alone.

W. J. Kiley, of Pontiac, Ill., has purchased the Cullom Garage of Cook & Chandler; E. Cook has removed to Chicago, but D. Chandler has not yet decided on his future plans.

The Herkimer Garage Co. has been formed and will take over the Clark Garage in Herkimer, N. Y., on South Washington street; new equipment and a stock of accessories will be added.

The Universal Motor Car & Supply Co. has been formed in Yoakum, Tex., to operate a garage; the stockholders are: Otto

Digitized by Google

Wagoner, L. T. Burns, H. Seekamp, Ross W. Irwin and F. S. Klohs.

August A. Belgard and Eber D. Jackson, of Los Angeles, have awarded the contract for a one-story garage to be erected on Grand avenue, between 1st and Court streets; the estimated cost is $10,167.50.

William J. Schuh has sold the Iowa Auto & Garage Co., of 655 Iowa street, Dubuque, Iowa, to the Iowa Vulcanizing Co. Schuh will manage a service garage at Minneapolis during the Minnesota State Fair this month.

The American Automobile Exchange has been organized in Indianapolis and has located at 429 North Meridian street; it deals in new and used cars. W. W. Thomas is president and A. A. Lease secretary and treasurer.

The Rader & Bates Automobile Co. has opened a garage and salesrooms at Waterloo, Iowa, at East 9th and Sycamore streets; Buick cars will be stocked. Bates formerly was a territorial representative for the Buick Motor Co.

The Auto Repair & Guarantee Service Co., of New Haven, Conn., has changed its name to Central Garage Co. and has removed to 212 State street; the company, which handles Chase trucks, formerly was located at York and Grove streets.

Lewis Raapke and his son, William, have opened a garage and salesrooms in Council Bluffs, Iowa, at 8th street and Broadway, under the style Raapke Motor Car Co. They have the Cartercar agency. The Raapkes formerly were in the wholesale grocery business in Omaha.

Thomas McCurnin, of Des Moines, Iowa, will build a two-story brick and steel garage, 66 x 132 feet, at 1106-10 Locust street; it will represent an expenditure of $14,000.

The Morse-Abrahamson Co., of Minneapolis, Minn., has opened headquarters at 1408 Hennepin avenue; the company deals in used cars.

E. D. Loomis has entered business in Jackson, Mich., under the style Loomis Transfer Co. He has located in two Ruby steel garages, 66 x 25 and 10 x 14 feet, at Main and Perrine street, and has four taxicabs, two touring cars and a truck. His drivers are uniformed. He also will store cars and sell supplies and acccessories.

The Hunter Automobile Co., which has maintained a garage and sales business in Waterloo, Iowa, has discontinued the garage and will devote itself to the sale of Ford and Cadillac cars; the Blaine Auto Co., which operates a garage in Redfield, in the same State, will occupy the former Hunter location in the Harper building. The Blaine company is State agent for Chalmers and Overland cars.

LINCOLN WAY ENDORSED BY CHAMBER OF COMMERCE

Will Support Project and Render Assistance — Directors Plan Campaign of Education Regarding Truck Tire Maintenance.

After a "recess" of two months, the board of directors of the Automobile Chamber of Commerce resumed their monthly meetings in New York on the 3rd inst, and although a considerable volume of work had accumulated, most of it was of the usual routine nature.

Practically the only subject of general moment which was considered was the Lincoln Highway project, which by resolution was formally endorsed and the Chamber committed to "render such assistance from time to time as may be proper and feasible."

The directors also adopted as their own views the declaration of road principles recommended by the good roads committee, the principles being of the sort designed to evolve permanent highways and means of caring for them.

As the special committee which is considering the revision of the car and truck guarantees with a view of combining them in a single warranty, is not yet ready to report, the directors approved the recommendation of their commercial vehicle committee urging the re-adoption of the motor truck standards adopted last year by the defunct National Association of Automobile Manufacturers, and which has to do with speed ratings, body weight allowances, frame widths, overloading and overspeeding and demonstration charges.

As it has been discovered that truck users in England are obtaining two or three times the mileage from solid tires that is usual in this country, the Automobile Chamber of Commerce practically committed itself to a campaign of education, tires, next to drivers' wages, being the largest single item in the cost of operating gas trucks in America. The education will take the form of the publication and distribution of a pamphlet dealing with the subject and instructive articles in the daily and periodical press as to the causes of solid tire destruction.

Milwaukee Partners Go Separate Ways.

Orrin Hughes and John McDonald, Jr., who constituted the Hughes-McDonald Motor Car Co., 239-241 Wisconsin street, Milwaukee, one of the largest selling agencies in that State, have dissolved partnership and each is going into the same business on his separate account. McDonald, with Carl G. Pauli, had organized the McDonald Motor Car Co., and will continue to occupy the old company's premises, handling the Lozier, the Ohio electric and the Koehler truck. Hughes, in his own name, has located at 170 Ogden avenue, where he will handle the Apperson for the State of Wisconsin. The Garford, formerly one of the Hughes-McDonald lines, has been taken over by the Maxwell Auto Sales Co., organized by J. J. Koehler, Lee Lippow and August Hahn.

Recent Losses by Fire.

Sheldon, Ia.—Eindeg & Engle, garage destroyed. Loss not stated.

Odebolt, Ia.—Einspahr & Co., garage destroyed. Loss not stated.

Newburyport, Mass.—Edwin M. Ingalls; garage destroyed. Loss not stated.

Kansas City, Mo.—Charles H. Bronston, 1020 Olive street; garage destroyed. Loss not stated.

Hempstead, N. Y.—Willis Young, Fulton and Cathedral avenues; garage destroyed. Loss not stated.

Pueblo, Col.—Congress Garage, 7th street and Santa Fe avenue; garage and seven cars destroyed. Loss not stated.

Pittsburgh, Pa.—Schenley Auto Accessory Co., 302-6 Craig street; building and stock damaged. Loss, $2,500.

New York, N. Y.—John Wanamaker, 152 East 31st street; garage damaged by explosion and fire. Loss, $10,000.

Minor Business Troubles.

Richard D. Daniels and Rudolph H. Behrend have been appointed receivers for the C. B. B. Motor Car Co., of Washington, D. C.; they were required to furnish a joint bond of $3,000.

By order of the court, the stock of the Auto Owners' Supply Co., in Hartford, Conn., is being disposed of this week at public sale. The company went into the hands of a receiver several weeks ago.

A petition in bankruptcy has been filed against Edward Bean, who formerly conducted a garage on Columbus avenue, in New Haven, Conn.; his debts are placed at 3,000. Bean, it is stated, left the garage in an automobile, Sunday, August 21, and has not been seen since.

Receiver for Failure to Pay Judgment.

Because Leland A. Mitchell, of the Mitchell-Edmonson Garage Co., of 23 West 62d street, New York City, failed to pay a judgment secured against him in the Municipal Court of New York City by the Warner Instrument Co. he was examined this week in supplementary proceedings in City Court and a receiver appointed for him; the amount of the judgment is $74.41. He stated that he received $40 a week for his connection with the garage.

ROAD TESTS FOR FINISHED CARS.

It would be interesting to discover how many manufacturers subject more than their chassis to road tests; in other words, to learn how many finished cars are actually "put through the mill" of actual usage before they are placed on the market. Whatever may be the case, it is certain that not a few manufacturers might profit exceedingly did they seek to discover first hand just how their cars are affected when bodies or tops, or both, are applied to them.

As a rule, testers are concerned chiefly with the proper operation of engines and other moving parts. What the finished car "feels like" is almost a foreign experience to them, and yet the bodily comfort of purchasers is so greatly affected for better or worse not merely by the design of the body but by the "feel" of it, the wonder is that road tests of finished cars are not more general.

Tops, and closed bodies particularly, so greatly accentuate every noise set up by the engine or other moving parts that, if for no other reason, the effort to eliminate such noises would make the effort worth while. It is a fact easily susceptible of proof that many highly strung or otherwise nervous women are affected by the drumming and other peculiar noises set up by at least some limousine bodies. The proper ventilation of such bodies is also a factor which is too greatly overlooked, and one on which no factory tester of his own accord ever will be able to render a report. Yet the "stuffiness" of closed cars probably is the cause of the most general complaint leveled at them, as manufacturers must be well aware.

The tester of a finished car, however, would have no trouble in detecting what Motor World several years ago described as "torture chambers"—that is, the front compartments of even touring cars which, because of the heat of the engine or pipes, particularly in hot weather, are rendered almost unendurable because of an absence of ventilation.

Since Motor World applied that term to them ventilators of some kind have been applied to most cars, but there are some of them which are still lacking in this respect and others in which the ventilation is still inadequate. At even the normal summer temperatures the floor boards of some of these cars become so hot that, as one owner-driver recently described it, his feet seemed to be swollen to twice their natural size.

Rattling doors and rattling tool boxes, or tools, to say nothing of other rattles, probably also would be detected if finished cars, equipped for touring use, were subjected to extended road tests.

How certain items of equipment are affected by lack of such testing is indicated in the case of one of the best-known cars, to which the rear tire rack is affixed; the top rests on the tires, not only permitting friction that wears holes in the top cover, but also requiring that the top be partly raised before a tire can be removed, an awkward performance at best.

Undoubtedly many other of those things which come under the head of refinement of details, and which would prove real refinements, would be rendered possible at practically no cost, were the practice of testing finished cars the rule rather than the exception.

PRINTED MATTER THAT LACKS POINT.

Judged by their printed matter, not a few manufacturers of new accessories assume that an illustration and a few superlatives are sufficient to tell the story of their respective wares. They seem possessed of the notion that descriptive matter is unnecessary; at any rate, the number of circulars exploiting accessories which convey no information regarding either make-up or method of operation is not short of astounding. It may be due to this fact that much printed matter of the sort utterly fails to produce results and otherwise goes to waste.

If more accessory manufacturers would appreciate that most buyers desire to know of what an article is made, and just how it is applied, and at least the principle on which it works, it is probable that their ways would be made happier. Adjectives and strong claims occasionally may create an impression, but it requires more than that sort of thing to sell goods. At best circulars do not receive a particularly warm welcome, and when they convey no real information or highly technical information they rarely find the recipients in a frame of mind to write for further particulars, even though they may have condescended to actually read them.

COOPER TWICE VICTORIOUS IN CALIFORNIA ROAD RACES

Stutz Pilot Takes Corona Free-for-All and Medium Car Events—Waterman Gets "Baby" Race—Barney Oldfield Wrecked.

Over a three-mile boulevard course solidly flanked on both sides by spectators, Earl Cooper, at the wheel of a Stutz, won both the free-for-all and the "medium" car races that were run under the auspices of the Automobile Club of Corona (Cal.) on Tuesday, 9th inst.; the races were run concurrently, the former going for 301.81 miles and the latter, which was restricted to cars having not more than 450 cubic inches piston displacement, going 251.97 miles. In the free-for-all, Coopers' time was 4.02:38, which is at the rate of 74.7 miles an hour, and in the other event his time was 3:21:29½, which is equal to 75 miles an hour. Ed. Waterman, who not so long ago, in the Santa Monica race, made a name for himself and for the second-hand Buick he drove, by pressing hard the winner, easily finished first in the light car race, which went for 102.45 miles and was restricted to cars having not more than 230 inches displacement. His time was 1:37:20 and his average 67.7 miles an hour—is better than any existing record for the class.

Those who started in the three events and the order of finish was as follows:

FREE-FOR-ALL—301.81 MILES.

Driver and Car.	Time.	
Cooper, Stutz	4:02:38	74.7 m. p. h.
Verbeck, Fiat	4:10:20	72.5 m. p. h.
Hill, Fiat	105 laps	Flagged
Tetzlaff, Fiat	90 laps	Engine trouble
Jeannette, National	77 laps	Flagged
Oldfield, Mercer	59 laps	Wrecked
Magonne, Stutz	41 laps	Magneto trouble
De Palma, Mercer	24 laps	Cracked cylinder
Wishart, Mercer	12 laps	Burned bearing

230-450 INCHES—251.97 MILES.

Cooper, Stutz	3:21:29	75.0 m. p. h.
Caldwell, Marmon	4:09:31	60.5 m. p. h.
Jeannette, National	77 laps	Flagged
Wilsen, Marion	60 laps	
Oldfield, Mercer	59 laps	Wrecked
Magonne, Stutz	41 laps	Magneto trouble
Mansfield, Macomber	25 laps	Engine trouble
De Palma, Mercer	24 laps	Cracked cylinder
Leach, Macomber	17 laps	Engine trouble
Wishart, Mercer	12 laps	Burned bearing

161-230 INCHES—102.45 MILES.

Waterman, Buick	1:37:20	67.7 m. p. h.
Jackson, Reo	1:41:06	60.7 m. p. h.
Goode, Studebaker	1:56:12	52.8 m. p. h.
Owen, Ford	37 laps	Flagged
Rhoades, Studebaker	36 laps	Wrecked
Crawford, Maxwell	36 laps	Wrecked
Schanck, Ford	35 laps	Flagged
Trooe, Studebaker	32 laps	Flagged
Caldwell, Maxwell	20 laps	Engine trouble
Pratt, Ford	11 laps	Clutch trouble

Although several of the cars were wrecked, only one of the accidents proved really serious, and that accident served to demonstrate once more that apparently Barney Oldfield was not born to be killed in or under a racing automobile. In the 59th lap of the medium car race, Oldfield was leading Cooper by a comfortable margin when a wheel collapsed and threw the car and its occupants through a flimsy fence and against a pepper tree. Almost immediately afterward, Oldfield emerged from the wreckage of the car, calmly smoking his cigar, and walked to the grandstand.

The new Corona speedway (so-called) is a beautiful, broad boulevard that encircles the city of Corona, and though it presents probably a smoother surface and less rough going than any other similar course not an actual speedway, it soon became apparent that tire trouble was going to play an important part. As early as the 11th lap, the heavier cars commenced coming to the pits for tires and thereafter nearly all the cars made regular stops.

In the free-for-all, Oldfield early assumed the lead, closely followed by Cooper, who, at the end of 10 laps was 19 seconds behind Barney; a stop for tires put Oldfield back in the 15th, however, and Cooper went to the front only to drop back again in the 19th when forced to stop for tires. From then to the 59th lap, when Oldfield was wrecked, it was a see-saw between him and Cooper for the lead, Oldfield eventually opening up a two-minute gap in the 55th lap. When Oldfield went out, and Cooper moved up, Verbeck took up the running with Hill, a comparatively new hand, third.

As is indicated by the accompanying summary, the winners of the two other events had no great difficulty in keeping ahead of their rivals, Waterman winning by a margin of some four minutes and Cooper by a margin of eight minutes. The prizes that were awarded were $1,000, $500 and $250 to the winners of first, second and third in the light car race, $1,750, $750 and $500 for the three places in the medium car race, and $3,000, $1,500 and $750 for the three places in the free-for-all. A special prize of $1,000 for a new world's record goes begging, for the average of 78.72 miles an hour made at Santa Monica last year was not beaten.

Harry Endicott Killed in Practice.

In practice for an exhibition race which was to have been held the following day, Harry Endicott, brother of William, otherwise known as "Farmer Bill," was killed on a mile dirt track in Jackson, Mich., on Friday last. Endicott was driving a heavy car and the accident was the result of a burst tire, which swerved the machine and crashed it through a flimsy fence. Endicott's mechanician, George Benedict, was badly injured, as was Mrs. Mabel Walters, who was watching the practice; a 10-year-old girl named Mary Sarata was crushed by the car as it tore down the fence, and died later from her injuries. Harry Endicott was 32 years old and made his debut as a racing driver in 1904.

ELEVEN PERFECT SCORES IN SEATTLE RELIABILITY

One Fatality Mars Pacific Coast Event Otherwise Distinguished by Much Mud—The Winners in Both of the Divisions.

Although the reliability contest which was promoted by the Seattle (Wash.) Post-Intelligencer was finished as long ago as Tuesday, 2nd inst., the score sheets were found to be in such disorder that it was not until nearly a week later than the final results could be ascertained and winners in the touring car and roadster classes evolved. Of the 27 drivers who competed in the two divisions, 11 finished the run, with perfect scores.

In the resultant draw for the Post-Intelligencer trophy, Jack Campbell, who drove a Michigan car, was the lucky driver; Capt. Smylie (Buick) drew the Ballou & Wright trophy for touring cars; T. F. Barsby (Studebaker) drew the New Washington Hotel trophy for roadsters; Fred Pentroast (Cartercar) drew 10 dozen pints of Rainier beer, also put up as a prize in the roadster division; and E. E. Fick (Locomobile) drew a barrel of oil. To the others who finished with perfect scores engraved certificates, attesting that fact, were presented.

The eleven survivors who incurred no penalizations were as follows: Capt. Smylie (Buick), T. F. Barsby (Studebaker), M. S. Brigham (Cadillac), George Yost (Cadillac), E. E. Seers (Hupmobile), Edward Fick (Locomobile), George Evans (Chalmers), Fred. Pentroast (Cartercar), Jack Lawson (Krit); Jack Campbell (Michigan), and Harry Hastings (Stearns-Knight). The others who competed were as follows: Park Brawley (Stutz), Earl Staley (Studebaker), W. A. Wicks (Franklin), J. W. Johnson (Hudson), Norman Abrams (Speedwell), William Shellhorn (Mercer), E. L. Baker (Franklin), Clayton Gibson (Chandler), Claude Smith (Overland), J. P. Schreave (Metz), Thomas Little (Cadillac), M. A. McCullough (Pope - Hartford), Bruce Griggs (Abbott-Detroit), H. L. Davies (Krit).

Despite the care with which the cars were driven over the 400 miles from Seattle to Hood Canal and return, which for the most part were more than ordinarily rough, and the elaborate precautions which were taken to prevent over-speeding, one accident, which resulted fatally for one of the participants occurred. When traveling at high speed in order to make up time lost on the road, the Havers "six" roadster driven by Harry Gray skidded and crashed through the guard rail on a bridge near Oxbow, precipitating all the passengers onto the roadway. George W. Walsh, Jr., manager of the Seattle branch of Hughson & Merton, accessory dealers, was killed almost instantly and Gray was injured badly; he sustained a dislocated hip and internal injuries from which it is not likely that he will recover.

The route of the tour, which was spread out over four days, led the contestants over a winding trail, skirting Puget Sound, south to Centralia, and thence to Pacific Court and finally to the Hood Canal, where the procession was turned and the journey back to Seattle commenced. During the first two days, the weather remained fine and little difficulty was experienced in making controls on time, despite the rough roads.

During the last two days of the run, however, the rain came down in torrents and what had once been roads soon became little more than seas of mud. In consequence, scores were quickly soiled, for not more than half of the contestants found it possible to plow through the mud fast enough to check in on time. As the contest was run under modified Grade I rules of the American Automobile Association, which provide penalties not only for lost time but for work done on the road and for parts replaced as well, it was no easy task for those who did so to complete the run without black marks to their discredit.

It was during the last day of the run that the worst roads on the route were encountered; the day's run, incidentally, was the longest on the schedule. Heavy rain soon made the going very hard, but owing to the fact that the downpour did not begin until after the cars had left the starting point the running time allowed was not increased. Strange as it may seem, few of the drivers were thoughtful enough to include chains in their equipment, and even those who had them were compelled to go slowly over the swimming roads. Many of the drivers had gone thus far with unblemished records and preferred to take chances rather than to slacken speed and incur penalties and, according to the tales of those who witnessed their skidding feats, the only wonder is that they survived at all.

When Seattle finally was reached, the rain still poured down in sheets, and the finish of the contestants, many of them without chains and slipping and sliding over the wet pavement, was spectacular. Immediately after the checking in was completed the records were turned over to the referee, but owing to their muddled state they had practically to be gone over with a fine-tooth comb before the standings of those who competed could be ascertained and charted.

CLEAN SCORES FOR TWO IN HOUSTON RELIABILITY RUN

Half Dozen Contestants Complete Unexciting 750-Mile Tour in Good Order — Propose Literally to Split Trophy.

With two cars out of the half dozen that started to finish with clean scores, the 750-mile reliability tour that was run by the Houston (Tex.) Automobile Club and that was finished Friday last, 5th inst., furnished little that was thrilling to the participants and not much of general interest to others. "Cold feet," to put it in expressive language, caused the withdrawal of a number of entries at the last minute and, according to report, spread the impression that Houston motorists are "poor sports" for not lending greater support to the contest.

Of the six cars that started—not counting the pacemaker, which was a Cartercar entered and drived by E. Emmert—the two that finished with clean slates were a Jackson, entered by the Jackson Automobile Co., and a Haynes, entered by J. J. Gorman, and as they were tied for the $100 trophy offered the winner, it is planned now to split the trophy in twain and give half to each.

The route that was covered by the seven cars led the motorists to Corpus Christi and return, passing through Brenham, San Antonio and Beeville, and during the three days of the run roads that were really bad were not encountered, though not all of them could be classed as good. Only one near-accident occurred, and it nearly ruined the chances of the perfect score Haynes. Gorman swung his car sharply to one side to pass a wagon and in doing so precipitated one of the front wheels over the edge of the road into the ditch. The momentum of the car was sufficient, however, to carry it back onto the road.

Of the other cars in the run, a Cadillac driven by W. F. Robertson was penalized 11 points for a broken fan belt and an overheated motor; an Overland driven by A. P. Sullivan was penalized 43 points for a broken spring; another Overland driven by W. H. Strong was penalized 151 points for a nut lost off the rear axle collar, which caused much delay; a third Overland, driven by F. S. Roberts, was penalized 513 points.

All along the route of the tour the natives of the small towns through which the motorists passed offered hospitality, and just outside of Brenham a telegram was handed the pacemaker to the effect that a new ordinance had been passed forbidding the tourists to go through without stopping for refreshment.

"JUST OUT" BUSINESS LOSER

Impossible to Sell Things That Are Not Kept in Stock—Four Out of Five Garages That Were "Just Out" of Transmission Oil.

The habit of being "just out" of certain standard articles needed in the everyday conduct of a garage business continues unabated. Last week four of five Syracuse garages were "just out" of ordinary transmission oil. They all carried it regularly in stock, so they said, but alas, to-day they were "out"!

The fifth garage was that of the Jefferson Garage Co., 428 Jefferson street, Syracuse. They had it, the attendant served it and also inqured if there was not something else the driver needed, reminding the motorist of numerous wares.

"Just Out" Mark of the "Small Store."

The habit of being "out" or "just out" of ordinary things belongs to the small corner grocery and other small stores that stay small. It indicates lack of careful stock-keeping and spasmodic buying. The concern that grows large does so by selling things it has in stock at a profit; perhaps that is why the Jefferson Garage of Syracuse is so much larger than many of the others.

If you have not already installed a complete system that enables you to keep tab on oils, greases and the other supplies you are selling regularly so that you know the condition of the stock almost daily, start one. Such a system need not be complicated and will not be difficult to keep up. It should show the amount of reserve stock, if any, as well as the quantity in cans from which customers are served. Daily checking of sales slips now used in almost every garage against these will show the exact condition of stock at all times and, incidentally, will prove a surprisingly effective check against those mysterious leaks and losses in the gas and oil end of the business.

MENTAL ATTITUDES THAT MAY CAUSE LOSS OF SALES

Negative thoughts—making up your mind that the other fellow will not buy before you have asked him and tried to sell him—are responsible for the failure of more than one dealer and salesman.

"What's the use of calling on him? He won't buy; he's too close," or "he hasn't the money." These are remarks frequently heard when certain prospects' names are mentioned. Has any one seen him lately? No. Has anybody ever really tried to sell him? Well, not recently.

As a matter of fact, when everything is said and done, the only thing that is blocking the sale is the way the salesman is looking at it. The thought every good salesman carries in his mind is "How can I sell him?" not "How can I **not** sell him?" Don't worry over the objections; they will come fast enough when the prospect trains his guns on you. It is up to you to busy yourself developing reasons why he should buy. Study his needs carefully and then you will know exactly how and where your car fits in.

SOURCE OF RETAIL SUCCESS EXPLAINED BY BIG COMPANY

If a successful business man were asked to sum up the source of success in retailing, whether it be drygoods, cars, accessories or any other merchandise, he very likely would scratch his head for a while and then make an answer which, after his questioner had gone, he would recognize as being far from complete—and very poorly systematized. And if he were asked to do the whole thing in 42 words he probably would use more words than that in saying it couldn't be done, but the National Cash Register Co. has presented to its retailers a 42-word "success chart" which is comprehensive.

Success in retailing, it states, comes from:

Work—Physical and mental, by employer, employes, equipment and machinery.

Enthusiasm—in employer, employes and customers.

Knowledge—of wants of customers, values of goods, organization, system, business principles and how to handle clerks.

Study—of selling, purchasing, advertising, system and training employes.

System—in handling cash, credits, accounts, clerks and customers.

TIME LOSSES THAT MAY BE CUT BY TIME-CARD SYSTEM

A shock-absorber salesman had been getting his device placed on cars by a certain garageman who shall be nameless. A flat price of so-much per car had been agreed upon. Then men in the garage took so much time putting on the shock-absorbers that the salesman began to wonder how the proprietor could afford to do it. He watched the men and soon after called the proprietor's attention to the matter. He had discovered the secret.

Time All Charged to Repair Jobs.

The men did not care how much time they took because the time was all charged up against cars on hand for repair anyway. The business was just so much clear profit. When the salesman spoke to him about it the proprietor was indignant. "Bring in the time-tickets for yesterday and I will prove it to you," said the salesman: and the salesman did so.

This is one of the ways that a garage earns a bad name for itself. It is hardly the sort of thing that commends itself to the man who wishes to be honest. It is going on, nevertheless, in a good many places. The time-card system that will permit such a practice to flourish is out-of-date. More accurate and thorough systems should be installed.

AWAKE N DISING WORLD

COURTESY A SALES ESSENTIAL

Without It Man of Cleverness or Knowledge Is Heavily Handicapped — Ford Manager Says It Is as Essential as Oil in Engine.

"Cultivate courtesy," is the urging of Gaston Plantiff, Ford's New York manager. "It is one of the factors in the make-up of the good salesman. It is something that is due the public and cannot be developed to too high a degree. It is too often taken for granted by the man selling the car that the public is as well posted as he is on the intricacies of a machine and his answers to questions are made with an air of abrupt superiority.

"Not only in words is courtesy expressed, but in the manner of delivering them. Make all your answers as comprehensive as possible and be certain that you are qualified before doing so. Your customer will feel at home and it will ease the road to the final sale.

Courtesy Increases Value of the Man.

"Courtesy is like oil to the engine, it makes friends of those you meet and increases your value to the organization which you represent.

"Cultivate every customer you do business with. It pays in the satisfaction to yourself and good-will to your firm.

"Courtesy is far-reaching. By taking care of the little things in the beginning, it means that you meet the same men in larger deals in after years.

"The salesman with ambition to go higher cannot lose sight of courtesy. He may be the mirror of fashion, a technical expert and so forth, yet lacking the human touch of tolerance, he will have to take a back seat to his brother salesman who is possessed of the milk of consideration.

"Consideration of the ordinary conventionalities goes a long way. If a lady is in the party looking at a car, don't have your hat on. Don't have a cigarette in your mouth. And if you do not make a sale don't get peeved. Escort the party to the door, express your regrets and impress upon them that if they are not satisfied, to return and you will be glad to go all over the matter with them once more.

"Granted that a good percentage of those you have dealings with are stubborn and seem hard to please, don't lose your temper. The majority of people are human and the salesman whose daily work brings him in contact with the public should appreciate the fact that he is expected to measure up to the standard of courteous handling."

MAKING REPLENISHMENT OF GASOLENE MORE CONVENIENT

Convenience of arrangement by which customers can be served quickly with a minimum loss of time on the part of both the garage and the customer is well worth time and thought. Some garages keep their gasolene in the rear, so that cars seeking replenishment must drive through the garage and then back up and turn around to get out again. This is decidedly inconvenient, for by the time a car has been filled up there frequently will be another car back of it and both must waste much time jockeying for position and room to get out.

The Geneva Auto Co., Geneva, N. Y., solves the problem in an up-to-date manner by having a door labeled "Entrance" through which cars must drive into the garage. This pathway takes them straight to the gasolene pump and oil supply, leaving the car in line with the door labeled "Exit." On the other hand, the Baker Bros. Auto Co. have their pump stationed at the right side of the door going out from the garage and a room containing the stock of oils and greases on the left, so that customers going in or coming out can be waited on with utmost speed.

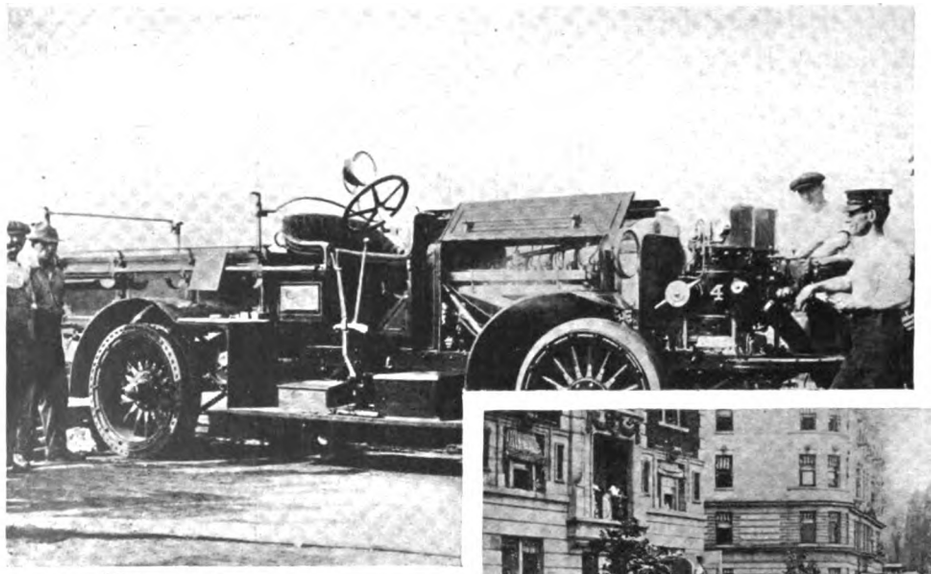
That Baker Bros. are looking after the pennies as well as the dimes is indicated by the installation of a penny-in-the-slot match device and gum machine, also near the door.

ABSENCE THAT MADE HEART GROW FONDER OF OTHER CAR.

A car purchaser on whom some very vigorous effort had been expended without apparent result came into the store of a Hamilton (Ont.) dealer and inquired for the proprietor. The proprietor was out. When would he return? The office girl did not know and there was not a soul in the shop who had a clue to his whereabouts. The car purchaser hung around for exactly 90 minutes, according to the girl, and then went down the street and bought from a nearby dealer whose salesman had made almost as good an impression with his car.

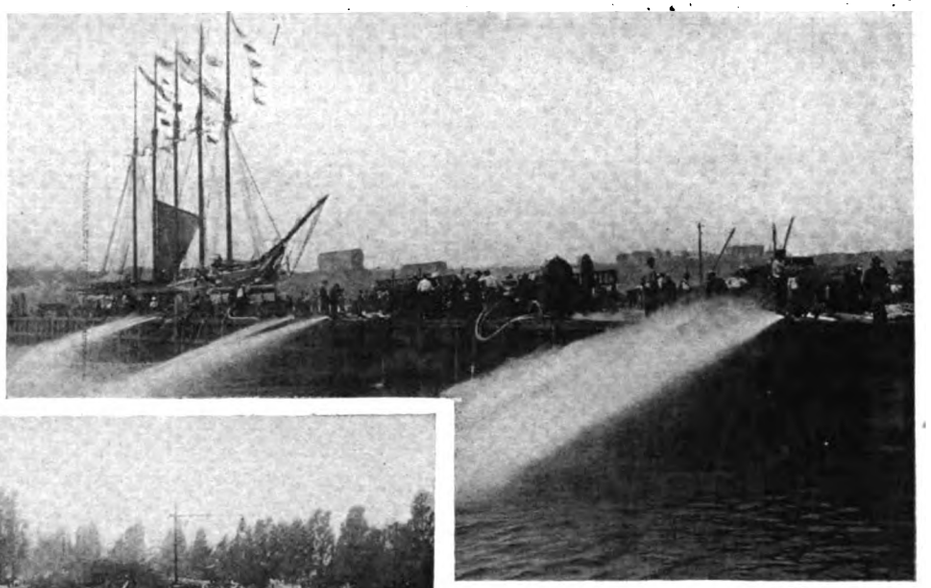
Such an episode does not occur often, but it made that Hamilton dealer realize that there was a possibility it might happen again unless he left word as to where he could be reached when absent during business hours. A lesson of the sort drives home a point that is of great importance.

PLACARD THAT ASSISTS IN KEEPING GARAGE BASIN CLEAN



Has any attempt ever been made to clean the wash-basin in your garage? True, it gets dirty and "looks like sin," but why not adopt the plan of one dealer who manages to keep his basin fairly clean most of the time by the adoption of a very simple expedient. Right over the basin, at the height of the average eye, is a card reading:

PLEASE!



This basin is for the convenience of our customers. When through using please use the brush and the "Dutch Cleanser," so basin will be clean for the next user. Thanks!

ASOLENE FIRE APPARATUS IS PUT THROUGH ITS PACES

:leven Massive Engines Pump Eight Million Gallons of Water—Parade and Unveiling Wind up the Convention.

Eight million gallons—count 'em—of lirty salty water were pumped out of the North River on Wednesday last week and pumped right back again before the gaze of the fire chiefs of the world, who, as was told in Motor World last week, were gathered in New York City for the Forty-first Annual Convention and Fire Exposition of the International Association of Fire Engineers.

All the pumping was part of a demonstratiton, of course, and, quite as much a matter of course, it was a demonstration of motor-propelled fire apparatus, for there is scarcely anything that interests the fire departments of the world just now more than do gasolene engines. All day long, 11 massive engines were lined up on a dock at the foot of West 54th street and nearly all day they pumped the North River through lengths of fire hose, and smoked and made a fearful din. And even though the din may have been to the liking of some of the fire chiefs who watched the demonstration, it was not to the liking of them all, and not a great many of them stayed to the end.

As early as six o'clock in the morning the tests were commenced, and for six hours the engines were required to be run at full capacity, or very near to it, the exact requirements being a continuous run of six hours at 120 pounds pressure, the water to be drawn through three lines of hose from the river and discharged through a single nozzle. During the whole time the tests were in progress the scores were posted on an immense blackboard nearly a city block in length. During the first hour readings of the discharge rates of the various engines were taken every minute and posted up, but before long the amount of work involved in this method became apparent and the intervals between readings were lengthened out to five minutes. Even then the number of figures appearing on the blackboard was appalling, and their final condensation into readable and understandable statistics likely will require some time. Suffice it to say—and these are the only figures available as yet—that the 11 engines together pumped no less than 700,000 gallons of water during the first hour of the test. Until the official scores of the machines have been checked by the committee in charge no results will be divulged.

The engines that were used in the test were those that were housed in Grand Central Palace during the convention of the chiefs, and after they had been put through their paces at the 54th street pier the public was given another opportunity to view them in the mammoth parade which occurred on the following day. Although there were a few pieces of horse-drawn fire apparatus in the parade, the line-up was principally made up of motor-propelled engines, and the display served to make very plain that even though the horse may not be disappearing as a draught animal in trade it most certainly is disappearing, and disappearing very fast, from city fire departments.

Serving as a fit conclusion to the parade, and virtually to the Convention, for the following day was given over almost wholly to pleasure, the Firemen's Memorial Monument was unveiled on Friday afternoon by four little girls, dressed all in white, whose fathers had lost their lives fighting the flames. The monument itself stands at Riverside Drive and 100th street and is of marble in the form of a votive tablet flanked on either side by groups representing Duty and Sasrifice. On the eastern side of the monument the dedication inscription faces the street and is as follows:

"To the men of the Fire Department of the City of New York who died at the call of duty, soldiers in a war that never ends, this memorial is dedicated by the people of a grateful city."

During Saturday, the fire chiefs were entertained aboard the steamer Grand Republic, which carried them to Coney Island, past New York's fleet of fireboats lined up in review and spouting great streams of water from every one of their various nozzles. At Coney Island, all the bathhouses and pretty nearly everything else was free to any one in a fireman's uniform, and most of those who travelled down to the sea took advantage of the privileges accorded them. In the evening, and during nearly every other evening while the convention was on, the cares of the fireman's life were laid aside temporarily and the chiefs and their wives and daughters laughed or grew serious over the offerings of the various playhouses in the city.

It is proposed to hold the next convention in Norfolk, Va.

Two Branches With Silver Lining.

C. T. Silver, the metropolitan agent for Overland cars, has placed two of his branches—those in Brooklyn, N. Y., and Newark, N. J.—on a profit sharing basis, so far as the managers are concerned. The latter, C. G. McGregor, of Brooklyn, and C. M. Dow, will each share in the profits of their respective branches to the extent of 40 per cent. annually.

TWO WESTERN FAIRS HAVE AUTOMOBILE EXHIBITIONS

Dealers in Indianapolis and Milwaukee Stage Early Shows at County Expositions—The Exhibitors and What They Display.

"About this time," the farmer's almanacks should say, "look out for County Fairs," and they well might add, "automobile shows"; for apparently the practice of exhibiting automobiles along with prize cattle and horses and farm truck grows apace and the automobile exhibitions at such annual functions grow larger. Sizable expositions are drawing crowds in two large Western cities—Indianapolis and Milwaukee. In both of these cities, State fairs were opened on Monday, 8th inst.

In Indianapolis dealers were not so fortunate in obtaining space within the exhibition grounds as they were in the other two cities, and as a result some of the 16 exhibits are housed in the Studebaker pavilion, a structure affording some 10,000 square feet of floor space, and the others will be housed as near by as possible. The complete list of exhibitors is as follows:

Cole City Sales Co., Cole; Ford Motor Co., Ford; H. T. Hearsey, Hupmobile; Nordyke & Marmon Co., Marmon; Indiana Cadillac Co., Cadillac; Oakland Motor Co., Oakland; Peterson-Keyes Auto Co., Regal; National Motor Vehicle Co., National and Hudson; Motor Car Mfg. Co., Pathfinder; J. I. Handley Co., American and Marion; Gibson Auto Co., Overland and Garford and Willys truck; McFarlan Six Sales Co., McFarlan and Federal and Standard trucks; Auburn Automobile Co., Auburn.

In Milwaukee, 50 makes of cars are housed in a mammoth exhibition hall of concrete consisting principally of a roof sustained by immense pillars, the whole being more like an open-air show than a palace exhibition. The list of exhibitors is as follows:

J. I. Case T. M. Co., Case; Kissel Motor Car Co., Kissel; Mitchell Automobile Co., Mitchell and Detroiter; George W. Browne, Overland, Stutz and Garford; Creek Motor Sales Co., Oakland, King and Empire; Buick Motor Co., Buick; Hickman-Lauson-Diener Co., Ford; Wisconsin Auto Sales Co., Chevrolet; F-S Motors Co., Petrel; Imperial Auto Sales Co., Imperial and Krit; R. D. Rockstead, Warren and Paige; Curtis Automobile Co., Reo; Carter-Car-Wisconsin Co., Carter and Crown truck; John Tellier, Jackson and Hupmobile; Chase Motor Truck Co., Chase; The White Co., White; T. E. Allen Co., McFarlan and Marathon; Thos. B. Jeffery Co., Rambler

"My Best Sale and Why I Regard It as My Best"

Salesmen Tell of Satisfying Achievements in Competition for Motor World Awards for Stories of "My Best Sale"—Real Sales Effort and Square Dealing and Two Signatures Which They Drew to Contract Blanks.

By C. W. COLE, Boston, Mass.

CONFIDENCE OF THE BUYER WON BY REFRAINING FROM BELITTLING OTHER CARS

I learned that Mr. ———, of Boston, was in a position to buy an automobile and that if the right man came along and influenced him into the thought, he could be sold a car. I paid him a visit at his home one evening and talked along the line of the comfort he and his family would derive in the use of a car. He seemed somewhat interested before I left him, and he told me that he would think about it and advise me.

Friend Demonstrated a Rival Car.

I did not hear from him for three days, so I made it a point by accident to call at his office. He informed me that he had talked to a friend who owns another make of car and had promised him to take him for a demonstration in it that afternoon. He took the demonstration and, of course, was more or less pleased, for his friend was a strong booster for that car and called his attention to the excellent features the car possessed.

This demonstration caused several motor car salesmen to get on my prospect's trail, and then the fun started. I made it a point to try to get in touch with him every day, but he refused to give me an audience until he had heard the other salesmen's stories. After waiting a day or two, I paid him another visit at his home and got a rather chilly reception—he claimed he had practically concluded to buy a car of another make. I did not stop here, but put on more steam than ever, though I never said anything about any other car.

Salesmen from all parts of the country have narrated stories of their "best sales" in the contest which Motor World has just brought to a close. In this issue men from Boston and Kansas tell of orders they "put over" by real and clever salesmanship. One sale was as good as lost but was saved by an afterthought that flashed when the prospect had gone. Both required hard, honest and consistent sales effort.

Got the Whole Family Out for Ride.

I succeeded in getting the whole family out for a short ride that very night, and upon our return home I accompanied them into the house. We all joined in the talk and, of course, all kinds of arguments and criticisms were thrown at me, but I had the goods and believed in them, and just put forth every effort to show them where our car was superior to any other car on the market for anywhere near the price; I dwelt on the subject of unexcelled long life and service, and our ability to furnish parts for any of the cars we have ever built.

Sticking to Own Car Won Confidence.

The evening soon passed, and it was filled completely with talk on our car alone. I gradually learned the equipment that Mr. ——— would have on his car if he were to buy one, and I filled in the order blank as we went along. I footed it up and found it amounted to $2,225. I passed it over to Mr. ———, he looked it over carefully, and I kept right on feeding the ideas of confidence in our car to him and sidestepping all questions he put to me regarding other makes as best I could, and at 12.15 A. M. he finally signed the order. In so doing he said, "I am going to be frank with you; I am giving you the order not only because you have won my confidence, but I have carefully noted in every talk I have had with you that you have never said an unkind thing about any other make of car, but have worked wholly and solely on your own product."

By R. E. CURTIS, Lincoln, Kan.

REFUSAL TO SUPPLY EXTRA TUBES AND HOW IT CONVINCED PROSPECT OF DEALER'S FAIRNESS

Although it seems to me that my sales are easily made, since I keep at the prospects from time to time until I have finally landed them, there is one sale which I made a short time ago which impresses me as being my best because I made it after the prospect had become angry and left the salesrooms.

Wanted a Cut as Matter of Principle.

I had been working on this prospect for some time, but we could not agree as to price; he had gotten cut prices from two other dealers, and I believe his principal desire in getting me to cut was to have the satisfaction of fixing the price on what he was going to buy. I finally convinced him that I could not reduce my price, as the company which makes the car had set it low in the first place and did not allow us to alter it.

Although he was convinced that I was right in refusing to cut the price, that didn't end it. He then wanted me to throw in a couple of tubes for $5 extra, whereas I had told him the tubes were $8.50. I refused to do so, whereupon he became about half angry and walked out and down the street.

That set me to thinking, and I picked up my order book and started after him. When I had caught up with him I said, "Do you know that if I wanted to I could have given you a couple of cheap tubes that don't cost half what the ordinary tubes cost and you wouldn't have known the difference?"

"I hadn't thought of that; I guess you're right," he replied.

Afterthought Worked in Application.

At the same time I was writing up the order, and as soon as I got through he said, "Let's see that order, anyhow." As he looked it over I sharpened a pencil and handed it to him. He took it and signed up, saying, "I guess you might as well get one ready for me. I believe you are square and will treat me right. I'll have to give you credit for it, since you wouldn't take advantage of me on those tubes."

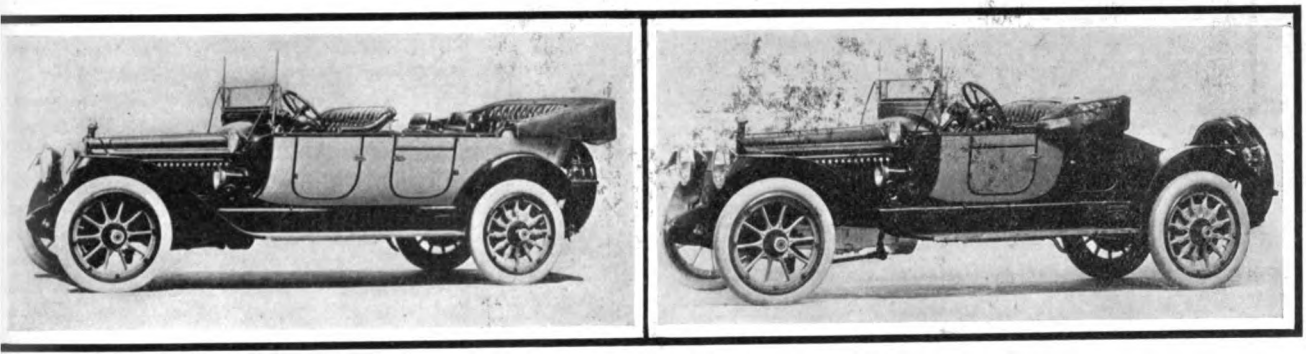
RIPLE CAST CYLINDERS IN LATEST PACKARD "38"



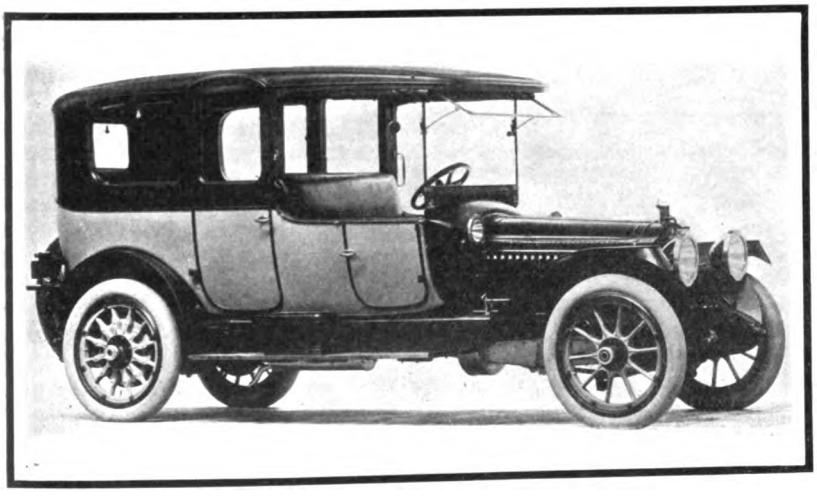
mensions Remain the Same, How-ever, and Few Other Changes Made—Oiling System Refined and Bodies Beautified.

With $400 lopped off the price of the ndard chassis, and a number of detail im-ovements, including a new clutch and a w method of casting the cylinders, the ckard light "six." otherwise known as "38" now has added to its designation

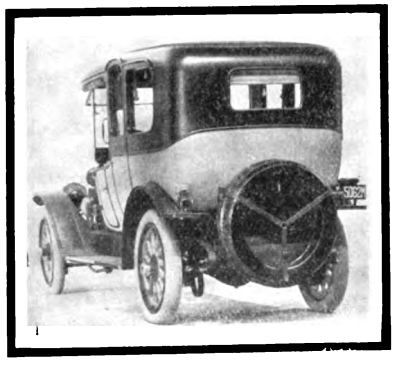
ing the cylinders, which now are in sets of three instead of in pairs, as they always have been in the past. In changing over from pair-cast to triple-cast cylinders, Packard engineers have had in view, among other things, the positive elimination of back pressure in the exhaust manifold due to the overlapping power impulses, and this very desirable feature has been surely obtained by the simple expedient of providing a double manifold with separate exhausts for each set of three cylinders. The arrangement of the cylinders in sets of three has other important advantages, of course, not the least desirable of which, overlooking the possibility of greater rigidity, is that a

rectly with the spark plugs. The only wiring visible leads from the magneto distributor to the end of the open conduit; not more than a couple of inches are exposed.

Although the number of blocks of cylinders has been reduced, the shape of the cylinders themselves remains unchanged and, as heretofore, all the valves are on the one side, nor have the cylinder dimensions been changed, though by reason of the new exhaust manifold and other less apparent refinements the power curve now reaches to 60 horsepower at 1,800 revolutions, although the nominal rating is a conservative 38 horsepower. The bore and stroke are 4 inches and 5½ inches, respectively.



PACKARD "238" TOURING AND ROADSTER MODELS SHOWING NEW HOOD AND BODY LINES



umerals one more figure and hereafter will e known as the "238," the addition serv-g to signify that the new model is in real-y the second series of this particular chas-s produced by the Packard Motor Car

much more compact motor is possible and that greater simplicity follows this method of construction as a matter of course. In the Packard engine this feature of simplicity has been particularly cultivated and

The lubrication system of t' ..otor operates on the same principle adopted some time ago and used with such success ever since, though an obvious improvement has been made in the elimination of all outside piping. The oil is forced to no less than 35 main bearings by means of a gear driven

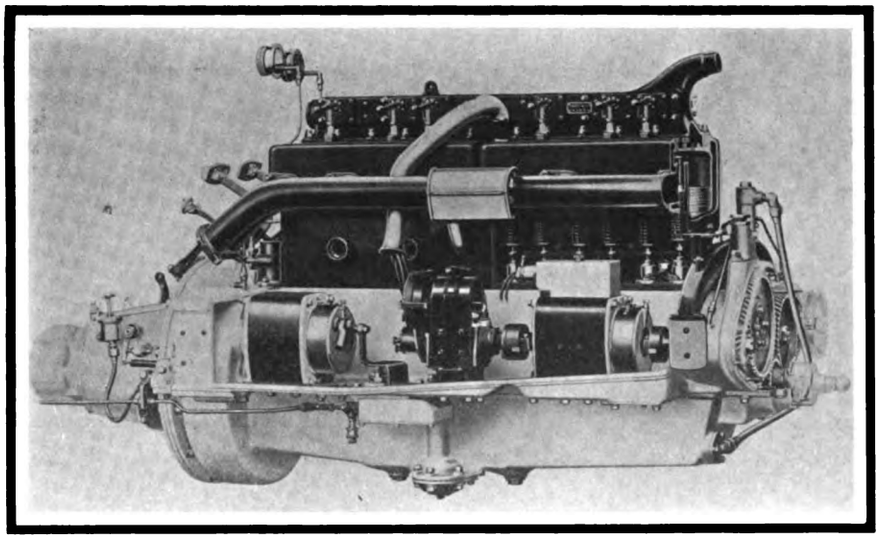
SEVEN-PASSENGER LIMOUSINE SHOWING ARCHED DOOR

SMOOTH AND ROUNDED CORNERS

Co., of Detroit, Mich. The standard chas-is now lists at $3,100 instead of $3,500.

Other than the adoption of the distinc-ively new type of worm bevel driving gears vhich were fully described and illustrated n Motor World bearing date of August 4th, the only really important alteration n chassis design is in the method of cast-

is well exemplified in the housing of the valve mechanism and the careful enclosing of all wiring; from the high tension Bosch magneto that furnishes the ignition spark a conduit leads to a vulcanized rubber distributor mounted atop the cylinders and on this distributor there are mounted small knife switches connecting di-



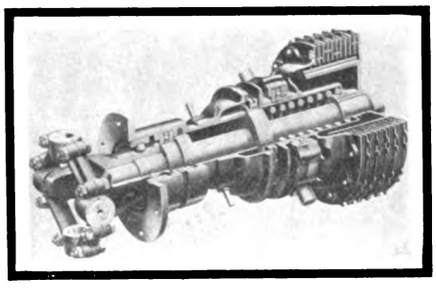
pump, this constituting the main system and the only system in use for ordinary running. For heavy pulling, however, or when the throttle is opened wide, an auxiliary oiling system comes into use and oil is forced directly to the cylinder walls; control of this system is interconnected with the throttle lever. To assist in proper vaporization of the fuel mixture, a hot water jacketed intake manifold has been adopted.

In the electrical apparatus forming part

Digitized by Google

of the equipment—the Bosch high-tension magneto, and Packard-Bijur lighting and starting system—complete segregation of the three units has been effected. The lighting generator is driven from the spiral timing gear train and a straight-through shaft drives the magneto. The starting motor is another unit and connects through the flywheel.

As heretofore, the motor and clutch form a single rigid unit, the flywheel being completely housed. In the clutch, a number of detail refinements, calculated to increase smoothness of action, have been made



MAGNETO SIDE PACKARD "238" ENGINE SHOWING WIRING

though the device as a whole remains of the dry plate multiple disk type. The gearset, which provides three speeds forward and reverse, is mounted as a unit with the differential mechanism on the rear axle, which is of the floating type. The chassis is mounted in front on semi-elliptic and in the rear on three-quarter elliptic spring members proportioned to give the maximum of resiliency with the minimum oscillation. Two sets of brakes are employed, of course, the service set being external contracting and the emergency set internal expanding; bayonet locks prevent rattling. The wheelbase of the standard chassis is 140 inches.

The external appearance of the newer series Packards has undergone very little change; it may be summed up in a slightly more accentuated taper to the engine hood and the addition of a mud apron at the front between the fenders. Naturally, the steering column remains on the left side and no change has been made in the location of the control levers, which also are at the left. Engine controls, lighting switches and carburetter adjustments all are centralized in the distinctive Packard steering column switchboard. Gear shift and emergency brake levers have been refashioned to permit of easier entrance to the driver's compartment.

As usual, the Packard company permits an unusually wide latitude for choice with regard to body styles, no less than 19 distinct types being cataloged. Among them, the standard six-passenger open touring cars hold prominent place and to the line there has been added a new six-passenger body which, while not appreciably different from the standard bodies in appearance, nevertheless lists at $500 less than do the regular models; the chassis upon which it is mounted is the standard Packard chassis, of course. The remainder of the standard bodies includes five-passenger phaeton, roadster, limousine, landaulet, imperial limousine and imperial landaulet, five-passenger brougham and inside driven coupe; for the

PACKARD DRY PLATE CLUTCH

first time, a seven-passenger touring car is regularly listed.

As usual, equipment is complete and includes a "one-man" top which has a number of distinctive features all its own. As the designation implies, the top may be raised and lowered by one man without assistance; furthermore, both tonneau doors and the right front door are fitted with attachments which permit the side curtains to open when the doors are opened, thus obviating the necessity for unbuttoning curtains and rebuttoning them. Incidentally, the tonneau doors are wide, affording easy entrance and exit, and the running boards are quite clear, spare tires being carried at the rear of the tonneau.

Another "wrinkle" in equipment is the provision of an efficient ventilator for the front compartment. It is in the form of a long shutter extending the length of the windshield and is regulated by a small lever within easy reach of the driver. In all the closed bodies, the ungainly and often unmanageable strap window adjuster has been eliminated and its place is taken by modern window regulators operated by a usually hidden lever. Folding auxiliary seats with arms are standard, though Pullman type seats are optional. The seven-passenger enclosed bodies retain the curved back and arched doorway, but the six-passenger bodies have square corners and a lower roof.

S. A. E. Deliberates on Rim Strengths.

At a meeting of the pleasure car wheels division of the Standards Committee of the Society of Automobile Engineers which was held at the New York headquarters of the society on Tuesday night, 9th inst., it was tentatively decided, as the result of tests, to advocate a bursting strength of 200 pounds in the rims for 3½ to 4 inch tires and 225 pounds for 4½ to 5 inch tires. Rims that were tested were divided into two classes, those having no side rings being in one class and those having side rings being in the other. In tests which were completed by the Goodyear and Hartford companies, 69 out of 87 rims tested survived; in the Hartford company's tests 18 clincher and 10 straight side rims failed; the Goodyear failures being 12 clincher and two straight side. The failures of the clincher rims were due largely to the rolling over of the retaining rings. It is proposed to place the matter of rim strength standardization in the hands of the Clincher Tire Association for debate.

Negro Ex-Champion Takes up Spring Tire.

Marshall Taylor, of Worcester, Mass., who, better known as "Major" Taylor, was one of the world's wonders during the heyday of the bicycle, and the only negro who ever made his mark in that sport, has evolved a spring tire, and for the purpose of making and marketing it has organized the Major Taylor Mfg. Co., which is being incorporated under the laws of Maine with an authorized capital of $1,000,000. E. O. Leonard is Taylor's chief assistant in the project. The tire, which will be called the Major Taylor, is designed chiefly for motor trucks. Unlike so many other bicycle champions, Taylor saved his earnings and invested them in Worcester property.

BEING A FATHER TO FIVE THOUSAND CAR OWNERS

Service the Big Dealer Is Called Upon to Render and Is Able to Give Because He Is a Big Dealer—Cadillac Distributers in Metropolitan District Believe in "Quick Satisfaction."

There are close to 5,000 Cadillac cars running in what is known as the Metropolitan District and the number is growing. Men—and not a few women—who never owned cars before buy Cadillacs and some who have owned other makes buy Cadillacs, but the particularly pleasing thing to the Cadillac people in New York is that those who have once dealt with them generally come back when they want another car. And why?

Service that Was of Countless Value.

At 3 o'clock one afternoon not many days ago a telegram came to the Cadillac establishment on Columbus Circle from a New York man who was touring New England in his Cadillac. It had been filed in a little mountain town some distance north of Bretton Woods, in the White Mountains of New Hampshire, 300 or more miles from New York. It said the owner had met with an accident which crippled his car. He didn't make demands for immediate relief or lay down the law as to what he expected would be done; he had dealt with the Cadillac people long enough to know they would at least do what was fair and right, but what they did do he had never dreamed of.

The wire came at 3 o'clock; Ernst H. Brandt, the general manager, bade an expert repairman get ready for a trip; what tools or parts he needed were packed and the repairman was on the train leaving New York at 5 o'clock—two hours after the wire arrived. The repairman traveled all night and arrived in the mountain village at 7 o'clock the next morning; he hunted up the car, set to work, and was not long in putting it in shape for the road. That night he returned to New York. The trip cost $24.80 and the man's time, but it didn't cost the owner anything. His car was laid up only about half of one afternoon, and he was an intensely happy individual when he was enabled to continue his trip the next day. Some day this man will want a new car, and when he does he probably won't "shop" up and down Broadway to find which one he wants. Any car might have taken him to Bretton Woods, but Cadillac service was what got him back.

Service may mean almost anything in the automobile trade; some dealers who haven't anything else to shout about shout service and the service is mostly shout; the dealer shouts before the sale and the owner shouts afterwards. It cannot be gainsaid that the term is much abused and is held up oftentimes and shaken to attract the prospect's attention while he is signing the order blank, after which he finds that the glittering prize he was to get is as substantial, tangible and valuable as a Budweiser "collar."

Promises Little but Does Great Deal.

Service is something which is valuable in a dealer's advertising and is equally valuable as advertising, and comprehensive as is that given to Cadillac owners in New York it is little mentioned in advertising; but as advertising it does good work.

The company promises to render service for 90 days—no more; but, despite the promise, an owner who is in trouble never fails to find relief in the service establishment. Even what might be regarded as unreasonable requests are granted, if possible During the recent convention of fire chiefs in New York City the chief from New London, Conn., walked in, announced that he was a Cadillac owner, that his city was sending several pieces of fire apparatus to New York to take part in a convention parade, and that he wished to quarter the apparatus in the service station. His sole claim to the favor was that he was a Cadillac owner—but it proved to be claim enough, and all the New London firemen made the service station their headquarters during the convention.

Satisfaction Leads to More Business.

A man in Southampton, L. I., had trouble with his lighting system; it was a lubrication trouble, pure and simple, and was due to the negligence of the chauffeur, which the service men made plain but which did not prevent the same old trouble cropping up several times. It was the chauffeur's fault, but each time the difficulty was remedied and the owner was kept satisfied. In fact, he was so well satisfied that he is now getting a limousine body for his car.

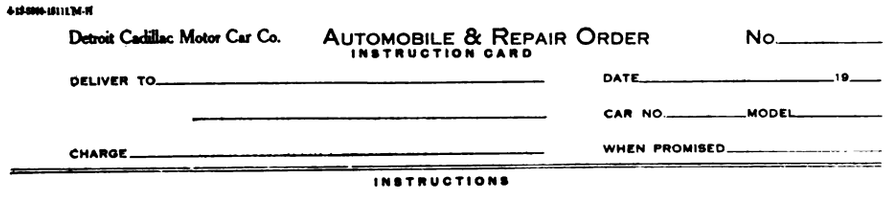
Another owner, who lives in Larchmont, N. Y., is one of a class which sometimes "kicks" on the service—but the "kicks" are welcome. He notified the service establishment that his car was out of commission, and a repairman was dispatched to his residence. The repairman monkeyed around for about five minutes, then stuck his hand into the motor, gave something a twist and went home. The owner, who had expected the repairman would put in several hours, was disgusted—with himself. He wrote a letter to the Cadillac dealers, told them what he thought of himself, said he refused to accept the adjustment as free service and demanded that a bill be sent him for the repairman's time.

A somewhat different attitude was that of a wealthy man who one day sent his car to the service department for a repair that

Digitized by Google

would require a day or so, although whenever possible all cars are turned out the same day they are received. This owner demanded that another car be given him to use while his own was in the shop; it was his idea of service and if put into effect would compel the dealers to maintain a fleet of nearly one hundred substitute cars on such days as Mondays. When this owner was told the granting of his request was impossible he informed the dealers of his financial connections in the automobile trade and threatened to "get their jobs," but according to latest bulletins they are still in business.

Help Extended to All Who Come.



Not only to metropolitan owners is service extended, but to motorists from every State in the Union; during the summer when touring is popular Cadillac owners, from two to a dozen a day, drive to the service statiton and seek garage accommodations. These cars are kept over night with no charge, although the owner comes from a town miles away and will never buy a car in New York, but the spirit is one of boosting for the whole Cadillac line and not for the New York dealers alone.

Along the boosting line, but not intimately connected with service, is the missionary sales work which is done for dealers in all parts of the country; tourists from everywhere, visiting New York, seem to find pleasure in inspecting the models on the floors of the metropolitan salesrooms The New York salesmen use their best persuasive powers on these prospects, who go home and buy of the dealer in their own town. This applies, probably, to all New York and other big city salesrooms.

These instances indicate what real service may include and while it is model service it probably is not within the reach of some smaller dealers; the big dealer, with several thousand cars in his territory, can do more than a smaller man in the same territory. It is just like big and little stores—the big store can afford to deliver a 50-cent order in quick time, whereas the little store, with less extensive delivery equipment, cannot always do it. The dealer with but two repairmen could not well afford to send one 300 and the other 50 miles away to take care of complaints; it would tie up his shop; wherefore the big dealer's service approaches nearest the ideal.

"Quick Service" the Dealers' Ideal.

Brandt, the general manager, well expressed his companys' idea of service when he said, "We aim to give satisfaction in the shortest possible time." The man in Bretton Woods might have been satisfied had his car been repaired in two days, but he was much better satisfied when a repairman arrived as quickly as trains could carry him. Speedy turning out of cars which need fixing up is a fetish. When an owner drives into the service building an expert tester immediately takes the car in hand and, like a physician, diagnoses the case. If it is something which can be fixed in a short time, the job is turned over to the repairman and the car is turned over to the owner at once.

CADILLAC DEALERS' SERVICE AND REPAIR ORDER BLANK

If it is a job which requires a longer time it is sent to the Cadillac shops, on West 62d street; the company is preparing a new home in the old Panhard & Levassor quarters at Broadway and West 62d street, and meantime the "shops" are located across the street in a six-story building, about 100 x 60 feet. The plant is in charge of E. R. Mertens, who for 13 years was superintendent of the Columbia Motor Car Co.'s factory in Hartford, Conn., and a force of about 125 men is employed. The building contains equipment sufficient to build a complete car and, in fact, bodies have been built there for several ambulances now running in New York.

"Shops" Provide for Larger Repairs.

When a car needs more than a quick-time repair the work to be done is typewritten on an order card, 7¾ x 9 inches, which contains blanks for the owner's name, account to which to be charged, date, when promised, etc. Carbon copies are prepared for filing and several other purposes and the original goes to the shops. Mertens recently devised a holder for keeping the cards clean and for preventing their becoming detached from the car with which they belong; the device is a celluloid envelope with cloth-bound edges in which the card just fits. A cloth strap affords a means of attachment to a car, on the steering wheel or some other part. Not only does this prevent the card's becoming unduly soiled, but there is no likelihood of cards getting mixed with the possibility of the repairmen taking the motor out of Bill Jones's car and putting a bumper on Bill Smith's car when things should have been the other way about.

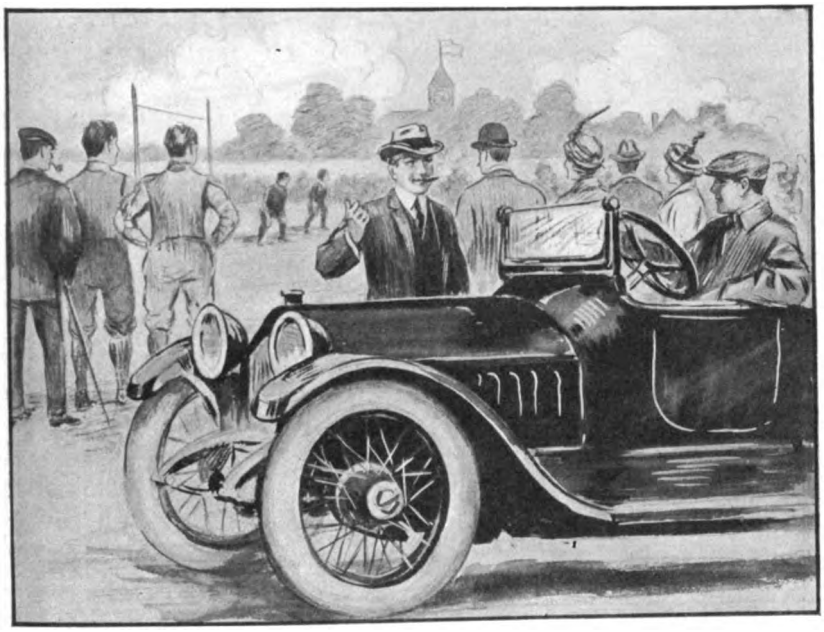
When the car is turned over to the workmen each workman checks off with his initials each part of the work as fast as he completes it. If anything is not correctly done the check mark shows who is to blame, wherefore little is incorrectly done. The same system is applied to new cars, which are looked over and lubricated before they are placed in the hands of an owner. If lubrication proves deficient and the card shows that Pat Casey did the job the superintendent has a conference with Casey, and it is needless to add that Casey seeks to make these conferences as few and far between as possible.

"Lubrication" Cause of Most Trouble.

Brandt was asked what caused the majority of what might be termed "unreasonable" service requests. "Lubrication," was his quick response. "Many men who drive cars neglect lubrication, and when things go wrong they seldom can see where they are to blame. They insist that they kept the oil reservoir full and that something else must have been the trouble.

"Also, it can't be called trouble or anything like that, but we are called upon more and more every day to extend assistance to women. The electric starter has caused a large increase in the ranks of women drivers and they, of course, require more attention than men, so far as things mechanical are concerned. But we are glad to help them, for it encourages them and others to drive cars."

While the Motor World man was talking with Brandt a woman walked up to his desk and asked when she could have a bumper put on her car. She seemed familiar with what would need to be done and discussed the matter with a mechanical intelligence that was commendable.



Many, probably a majority, of the Cadillac owners in New York drive their own cars, and on the days following Sundays and holidays the service station is busy. With 5,000 cars on the road in one pleasant day, numerous little things are bound to develop, so that Mondays and after-holiday-days see between 50 and 100 cars in for attention. But Sundays, holidays or at night the service station is open. Two crews of four men each are on the job to meet any emergency.

CULTIVATING HEAD WORK—LEARNING TO THINK

Reilly Advises Those Who Would Rise Above Their Level to Make Full Use of Their Thinking Powers—Emergency Tactics of a Quarterback Illustrate Dealer's Talk to His Salesman.

Young "Chuck" Krevett slapped the uards on their backs, became tense for a ıoment as he made a noise that sounded ke a miscellaneous selection from an arithıetic, dropped back for a forward pass nd the center of the high school's first eam snapped the ball to the waiting quarterback. Krevett cast an eye at the line and at the spot where his right end was supposed to be waiting for the ball. but before the end reached the position a "scrub" tackle, plunging with outstretched arms, was within a couple of yards of Krevett.

"WERE YOU THINKING OF GOING BACK TO THE OFFICE?" SMILED THE SALESMAN

"Aw-w-w-w-w!" groaned Reilly, who had spent a half hour watching the scrimmage. "Hurr-a-a-a-y! Good work, Chuck!" was the change effected in his tune of disappointment as the quarterback dropped back a step, let the tackle plunge on his face in the turf, and leisurely but accurately sent the ball for a good 15-yard gain.

"Some head on that kid!" exclaimed another mature townsman as he pounded Reilly on the back.

"That's real brain work!" replied Reilly with just as much gusto and as many thumps, and then he joined in the general silence as young Krevett again began a mysterious quotation from the arithmetic.

While the canvas-clad lads were extricating themselves from the heap, which was three yards further along than the last one had been, Reilly's attention was drawn by a car at the side of the field and which looked suspiciously like his demonstrator with his salesman at the wheel.

"Weren't thinking of going back to the office, were you?" smiled the Salesman as Reilly guiltily drew near the car.

"Guess I am about an hour overdue," admitted the dealer.

"More or less, mostly more."

"But the kids are going to have some team this fall," enthused Reilly as the Salesman let in the clutch.

"Pretty good, are they?"

"Better than that. And that young 'Chuck' Krevett! He's the best quarter they've had in years."

"Is he any relation to Krevett of the City Auto Supply?" inquired the Salesman.

"Sure! Krevett's his father; the kid's got a head just like the old man, too. He can think of more darned things and more ways of getting out of a tight hole than anyone I know."

"Did old Krevett ever play football?"

"Not that I know of," answered Reilly, "but a head is good for something besides football, isn't it? The old man plays business just like the kid plays football, and they're both making successes of what they're——"

"Bastian says Krevett's a bum salesman."

Creative Ability as Differentiation.

"Bastian's a sorehead!" snapped Reilly. "Just because he can't sell cars and because Krevett's making good he's sore. Krevett, the day he began, was better than Bastian is today. One thing which differentiates the two is their respective head work or creative ability. All Bastian knows about selling and business is what he sees some one else do or what some one tells him. He couldn't think up anything original in a million years."

"Have you known Krevett long?"

"Quite a while," replied Reilly. "I knew him when he was a salesman on a salary—and he was some salesman, too! He used to travel for the Mace Carburetter Company, and he climbed fast. Krevett always was possessed of a creative turn of mind and was always trying to conceive something better than any one else had done, or trying to think up some new scheme or plan that would bring greater and quicker results than any system then in use. Bastian values other men's ideas—if he recognizes them at all—for the good they can be if incorporated in his business; Krevett, when he spots another man's idea, doesn't grab it as a good thing and copy it, but tries to go it one better, and generally he does so. He uses his head every minute."

"No ruts for him, eh?"

Salesman Whose Thinking Helped Him.

"None at all," continued Reilly. "The company sent him out to sell carburetters to anyone who would buy them, but their greatest desire was to get the stuff specified as stock equipment on manufactured cars. Krevett got away with his quota of business and the company didn't have any complaints to make, but one day he suggested a boosting scheme that, while it would entail more work for the salesmen, would produce greater results in the end. His idea was to work on the manufacturers through the dealers.

"His scheme was to sell carburetters,

Digitized by Google

just as they had always been sold, but in addition to convince the dealers that the carburetter was a good thing. Some of the salesmen kicked when a little extra work that didn't bring immediate orders was loaded onto them, but the company adopted the plan. The salesmen were instructed to work on the dealer every chance they got, persuade him to try out a carburetter on one of his cars, see that it gave him satisfaction and get the dealer to boost it. The result was that a sentiment for the Mace carburetter began to grow, the dealers suggested it every time anything went wrong with the regular stock carburetter, and that practically forced or led a lot of manufacturers to put them on.

Evolved Plans and Schemes of Selling.

"He was so good at the business that they took him into the factory as assistant sales manager. He was thinking, thinking, thinking, twenty-four hours a day, it seemed. He must have dreamed of his work. He evolved more original schemes for pushing sales and inaugurated business wrinkles and systems, and when the sales managership was open he got it. If he saw a chance to do a little extra work he jumped in and did it, and if there was a nasty bit of responsibility to be shouldered he was under it and walking away with it before anyone had a chance to worry about dodging it."

"Some worker."

"And he never was stumped by an emergency; he exercised his head so much that it seemed to work automatically. Nothing ever came up that he couldn't think up a way out of; he used his head just like young 'Chuck' does. You should have seen that kid fool a tackle and make a forward pass this afternoon. But after a while he realized that he had gotten about as good a job as he could with the Mace people; they were paying him all they thought they could, and he began to think up something better for himself.

Store Popular Because it is Different.

"He looked things over and decided that it wouldn't be a bad thing for his old age to have a business that he could turn over to the kid, so he started the supply store. And he's been thinking and using his head ever since, and is to-day. Everybody knows about Krevett because he's different. His store is different; it's alive and moving. Where other supplymen copy, he leads; he thinks, uses his head, and by the time some rival has copied one of Krevett's schemes Krevett has a new one that is much better. Creative work is his specialty and it makes money for him."

"He's got a great personality, hasn't he?" commented the Salesman.

"Yes, he's more or less gifted that way," replied Reilly, "but a great many salesmen —any man, for that matter—could surprise themselves if they would learn to use their heads—and think. In the case of hundreds of men, there is no necessity for their plugging along for years in the same rut, on the same level, at the same salary. If Krevett hadn't made his thinker work he probably would have been traveling around to-day on his same old job of selling carburetters.

Lack of Thought, not of Ambition.

"He would have remained merely an average salesmen who was moderately satisfactory to the company and he might have kept the job until he got so old they had to put him on the shelf.

"It isn't a lack of ambition; many men are ambitious, but they don't seem to make the start. They just hope, hope that some day they are going to get a better job; one big trouble with them is that the better job is the one big object within their range of vision; they don't realize that they ought to try to be a little more than satisfactory. Everett was not required to advance that carburetter boosting scheme, and when he broached it to the company he probably never thought much about how much of a raise in salary it would bring him, but it was just a chance to go one better on the existing method of selling and he was glad to see the Mace people get the benefit of it. His own promotion was a secondary consideration and was thereby made more certain.

"Kids who work in shops, clerks in offices, men and women in every walk of life, get themselves above the common level in just that way. The clerk who plugs along and does just what is required and no more can keep on doing just that and no more as long as he doesn't prove so unsatisfactory that he isn't any use any longer."

Advises Salesman to Seek Opportunity.

"Trying to get me to thinking, are you?" asked the Salesman.

"I'm not aiming anything at you; I'm just talking about Krevett," answered Reilly, "but I will say this, that if you make full use of the head God gave you you won't be with me many years longer. You are pretty handy with your gray matter, if I do say it, but I can't do much better by you than I am, and if you want the advice of a friend —not your employer—quit me the first chance you get at a better job and a field of greater opportunity.

"To ask you to hold yourself back just because it would benefit me would be selfish on my part and I hope I'm too good a friend to you to do it.

"Too many men consider themselves handicapped in the business world when they are failing to make use of the assets with which nature endowed them. They don't make their heads help themselves. Young Krevett has seen scores of backfield men tackled when they were trying to make a forward pass, and if he had followed precedent he would have stood there and lost the play, but he used his thinking machine and won where precedent said he should have failed—and it didn't take much intelligence, either."

"You used to be a halfback, didn't you?"

"But they didn't have forward passes in my day."

"They say a good football player learns to be good-natured under all circumstances; is that where you get yours?" asked the Salesman.

"Not at all, not at all," replied Reilly. "It's the sunniness that goes with poverty."

"Huh!" ejaculated the Salesman. "If poverty brought happiness I'd be in hysterics all the time."

International Adopts Part-Payment Plan.

In order that the lack of ready capital may not prevent a business man owning a truck, the International Motor Co., of Broadway and West 57th street, New York City, has inaugurated a part-payment plan of sale for Mack and Saurer commercial vehicles. The purchaser pays 25 per cent. in cash at the time of purchase and the remainder in 12 notes which mature within a year at the rate of one each month.

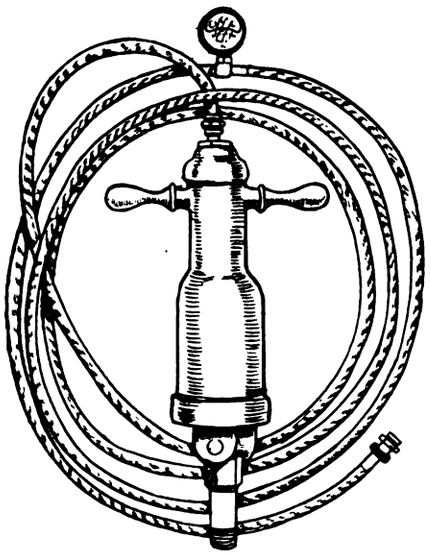
Close Organizes a Rubber Company.

Due chiefly to the efforts of Mont Close, the Bowling Green Rubber Co. has been organized in the Ohio city of that name for the purpose of manufacturing tire accessories and other rubber goods. It is capitalized at $25,000. Close will be its manager and C. W. Greene, of Toledo, will be in charge of the sales department.

Olds Re-Establishes Pittsburgh Branch.

The Olds Motor Works is reestablishing its branch in Pittsburgh, the premises 5040-42 Baum street having been leased for the purpose. It will be in charge of George S. Morrow. The Olds company maintained a branch in the Smoky City until about three years ago, when its account was turned over to dealers.

"Yale Mfg." Becomes "Yale Muffler."



F. A. Tuschen, of Milwaukee, and Andrew C. Scheurell, of Sun Prairie, Wis., who purchased the assets of the bankrupt Yale Mfg. Co., at Gooseberg ,Wis., have changed the name of the enterprise to the Yale Muffler Co. In addition to making mufflers, however, they will manufacture several automobile accessories.

SPARK PLUG PUMPS TO INCREASE GARAGE PROFITS

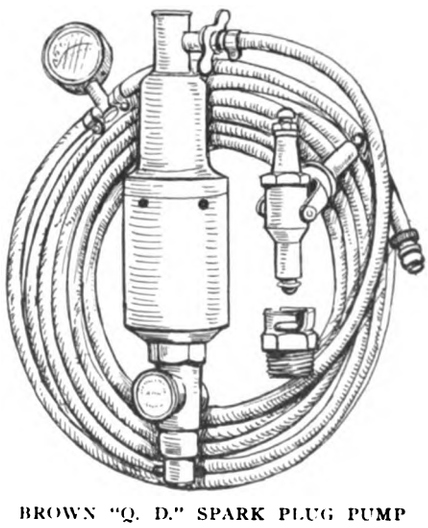
How One Wide-Awake Garage Proprietor Discovered a Real "Elastic Hose," or What Corresponded to One—Types of Cylinder Tire Inflators—Construction and Operation of Simple and Compound Pumps.

Service is, and always has been, the backbone of good business. Give a man what he wants when he wants it and he will come back for more; give him a little more than he wants—or expects—and he will pass the good word along to all his friends and the foundation of a perfectly good endless chain of business will be laid down. It is the principle upon which more than one big

WOODWARD HANDLED PUMP

business has been built, and it is the principle upon which Billy Rea, whose story was told in Motor World of June 26th, built up his garage business; and he has gone right on building it up in a manner that is suggestive of his insight into human nature and also of his foresightedness.

Helps Himself by Helping Others.



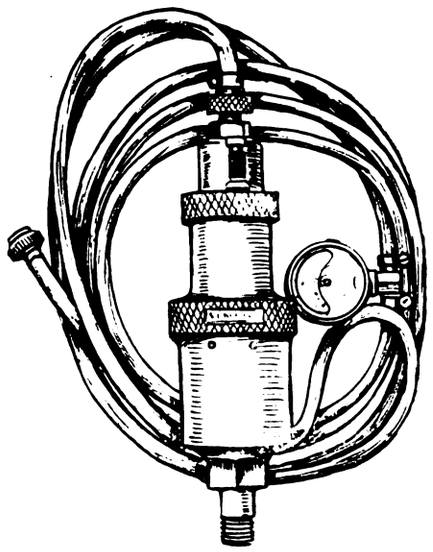
Billy Rea, be it remembered, is a humanitarian; but he places a broader meaning on the word than did Daniel Webster. Webster says that a humanitarian is a person who believes that man's duty is limited to right doing toward others. Billy Rea rather amplifies the definition, or sees deeper into its meaning. He figures that in doing right toward others he is also doing right toward himself. And that is why he equipped his garage with a small air compressor and invited his patrons to make free use of it. It was good for them and it was good for him; it was service in the broadest sense of the term.

One day when one of Billy Rea's "star boarders" had finished inflating his tires and was coiling the air line up over the hook, he said:

"Billy, you're a good fellow; dust doesn't stick to me now the way it used to stick, for I don't work myself into a sweat pumping tires before I leave the garage; but your air hose isn't long enough; it won't reach me when I'm out on the road." "You ought to have an elastic hose," he added, as an afterthought, chuckling at his own attempt at a joke.

"Elastic" Hose that Reaches Miles.

Right then and there a great big light broke in on Billy Rea, but he did not climb up on the roof and shout it out. He had seen in his mind's eye the patrons of his garage bowling over rolling boulevards secure from tire trouble because they made liberal use of his free air and kept their tires properly inflated. Now he saw one of them on a hot, dusty road; the motorist



BROWN "Q. D." SPARK PLUG PUMP

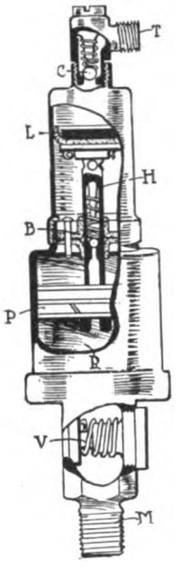
was bending over and straightening up rythmetically, and every once in a while he would stop to kick his front tire or to wipe the perspiration off his face. No need to explain what he was doing.

"Gee, whiz!" thought Rea, as he visualized the scene. "I give 'em all the free air they can carry, but they can't carry more than they can put into their tires; I can't give 'em a can of air to tuck under a seat! An elastic hose is what I need, all right, and I'm going to get one or know the reason why."

Now, two of the cars in Rea's garage at the time were the latest models then available; like all other modern cars they carried more than ordinarily complete equipment. So he cautiously lifted the hood of first one and then the other and took a slant at the tiny little power tire inflators snug-

SIMPLEX SIMPLE PUMP

gling next to the magnetos. Nothing doing; he shook his head. "Too much fitting and fussing," he soliloquized. "Sanderson would never stand for all that work on his old Acme; neither would Campbell (Campbell had a sort of mongrel car, but it was a pretty good mongrel); maybe Rand would stand for the price, but he always kicks like fury at even five minutes' delay. Guess I'll have to give it up. No, I won't either—leastwise not until I have a look through Supplyem's catalog."



Supplyman's Catalog Gives Light.

So he looked through Supplyem's catalog—and he found that he really could get an elastic hose; a hose that would stretch from his garage up into the mountains or down to the seashore or anywhere else that motor cars are likely to go. Only it was not styled an elastic hose. It was called a spark plug pump and it was exactly what he was looking for.

There were several different kinds of

Digitized by Google

spark plug pumps listed in the catalog—as any one else can discover if he is so minded—but he could not quite figure out how they worked—how without any visible connection between the source of power and the pump they forced air into the tires. "Remove a spark plug, replace it with the pump, attach the hose to the tire valve and start the engine," is what the catalog stated, and it appeared to be simple enough. Obviously there was no fitting to do; no machine work and no delay. Would such a pump work on any engine? He consulted the catalog and found it would—provided the engine was of the four-cycle type, and as most engines now-a-days are four-cycle engines there seemed no reason for passing up his new-found "elastic hose." He bought one and tried it on the man whose

MAYO CONSTRUCTION

humor had first suggested the possibility of an elastic hose. That man took it along the next time he went out and luckily (for Rea) got a puncture. He tried the pump; it worked; there is not much more to the story.

He told Rea is worked, but Rea knew that already, for he had tried it as soon as it came in. But what is more to the point, he told all his friends about it and his friends told their friends, and they all flocked around as fast as he showed them and thereby hangs the moral.

Spark Plug Pumps Added to Stock.

Rea saw what was needed and he provided it; it just happened to be pumps, this time, but if it had been anything else he would have provided it just the same; he already carried a small stock of spark plugs and grease and wrenches and grease guns and the hundred and one other things a motorist wants in a hurry, and those who kept their cars in his garage bought their supplies from him because they could get them when they wanted them; no need to wait till they got "down town." Now, Rea is looking for something else to add to his stock, and as soon as he finds it he will stock it—but he won't keep it, for he won't buy it till he knows it really is wanted, and then he will sell it. He doesn't keep things; he sells them.

Simple and Compound Construction.

As for the spark plug pump that Rea has in stock—it is a good deal like several other spark plug pumps there are on the market but it is not exactly like any of them. As a matter of cold fact, they all look a good deal alike, but each differs slightly from the other and each has its individual features. They are common only in that they all fit into the top of one of the cylinders in place of a spark plug, and that, briefly, is why they are styled spark plug pumps.

There are two distinct types of spark plug pumps and they operate on two different principles. One of them operates on the simple principle and the other operates on the compound principle. In the latter class, the Mayo, which is produced by the Mayo Mfg. Co., of Chicago, Ill., is a good example and the accompanying part sectional drawing will make plain just how it works.

The thread that fits the spark plug hole is designated M and to attach the pump it is only necessary to remove the plug and screw in the pump with the hands; a wrench is not needed. On the suction stroke of the cylinder the metal piston P is drawn downward and at the same time the valve V opens, admitting air into the combustion chamber of the cylinder. Live "gas" is not sucked through the carburetter because the tension on the valve V is light.

How the Air Gets into the Tires.

On the compression stroke of the engine piston the air in the engine cylinder is forced upward into the chamber R and then through an opening in the center of the piston, through the check valve B, and to the small chamber H. On the next downward stroke of the engine piston, the air in the chamber H is compressed and forced past the leather-faced piston L. The air then is above the smaller piston L, and on the next compression stroke of the engine cylinder the air is forced through the check valve C and to the tire through the connection T.

Though it not infrequently has been supposed that spark plug pumps employ "gas" for inflating the tires, it should be clear from the foregoing description that such is not the case. Actually, nothing but pure air is compressed and forced into the tire. Similarly, it should also be plain that it is well-nigh a physical impossibility for oil or grease to be pumped into the tire along with the air. In the first place, very little oil is required properly to lubricate the pump, and in the second place it is extremely unlikely that oil from the engine cylinder could find it way through the pump to the tire hose, unless the engine were raced—and if the engine is raced the pump automatically locks itself. The pump will operate only when the engine is run slowly.

The Brown impulse tire pump, which is produced by the Brown Co., of Syracuse, N. Y., and which operates on practically the same principle as the Mayo, is distinctive in its method of attachment to the engine cylinder. The equipment, as may be seen by the accompanying illustration, consists of a special spark plug with a separate center electrode fitted with a tiny handle.

NATIONAL INTERNALS

When the pump is to be operated, it is merely necessary to remove the center electrode from the spark plug, by means of the handle provided for the purpose, and insert the pump, which is held in place by means of a bayonet lock. The shell of the spark plug thus remains permanently in place. With the Brown pump, as with the Mayo, it is not necessary to disconnect the second spark plug if a dual ignition system using two sets of plugs is employed, for the mixture in the engine cylinder is disturbed and rendered useless for power purposes by the air admitted through the pump valve.

One Piston Larger than the Other.

All the spark plug pumps illustrated employ a double piston, which is to say, the upper piston is considerably smaller in diameter than is the lower one, and the reason for this difference in size is not difficult to understand. If both pistons were the same diameter, for instance, it would

Digitized by Google

not be possible to obtain higher air pressure in the tire than is obtained in the engine cylinder on compression stroke. With a smaller pumping piston, a smaller amount of air is forced along the tube at each stroke, and as the power behind the piston remains constant, the pressure obtainable is higher.

Spark plug pumps that operate on the simple principle differ from those that operate on the compound principle in that there is no connection between the two chambers in the former other than the piston itself. In other words, there is no by-pass for the air between the two chambers; the upper piston is integral with the lower one, hence there is absolutely no possibility of "gas" being pumped into the tires. In the compound pumps, this possibility is eliminated, of course, by the air inlet valve.

Internal Mechanism of Simple Type.

The construction of the simple spark plug pump is well illustrated by the part sectional view of the National pump which is reproduced herewith. The pump itself is manufactured by the National Motor Supply Co., of Cleveland, Ohio, and is exactly alike in principle to the Woodward pump, which is produced by Woodward & Son, Toledo, Ohio, and the Simplex, which is distributed by the American Auto Supply Co., of New York City. Another pump, quite similar, is produced by the Dewey-Anderson Co., of Toledo, O.

The operation of all three of them can be gathered quite readily from the sketch of the National pump, which shows the smaller of the two pistons and the inlet and outlet valves. When the piston in the cylinder to which the pump is attached descends on the intake stroke, the vacuum formed in the cylinder sucks down the lower piston in the pump, and as the upper piston is made integral with the lower one, it, too, is drawn down, creating a partial vacuum in the upper cylinder, which is relieved by air rushing in through the inlet valve. When the engine piston commences its compression stroke, the two pistons in the pump are forced upward by the pressure in the engine cylinder and the air in the pump cylinder is forced along the tubing to the tire. As there is always an air cushion between the pump piston and the ends of its cylinder, the operation of the pump is noiseless.

No Wrench Needed for Any Plug Pump.

With none of these spark plug pumps is it necessary to use a wrench; it will suffice to screw the pump in place with the fingers for the leak at the threads is so slight that the operation of the pump is not affected. The Woodward pump differs from the other two in that it is provided with insulated handles which always remain cool, regardless of the length of time the pump is in use.

When any simple spark plug pump is put to work, it is absolutely necessary to remember that if two sets of spark plugs are used, the ignition current must be cut off from the remaining plug in the cylinder to which the pump is attached. If the ignition cable is not disconnected, the cylinder will fire with probably disastrous results to the pump. Double precaution is necessary in this respect, for as it is necessary to stop the engine in order to insert the pump it is a natural proceeding to start the motor again on the battery—and if the battery ignition apparatus is connected through the other plug in the cylinder with the pump, the pump likely will go sailing; at least, it is more than likely to be harmed.

It is doubtful if there is any one who drives or who rides in an automobile who has not heard the stern injunction, "Keep tires well inflated." The tire makers themselves make plain on every occasion, and without provocation, the necessity for proper pressure in tires. Hence it is not necessary to explain why 60 or 70 or 75 pounds to the square inch is essential—depending on the size of the tire—if any kind of satisfaction from tubes and shoes is to be expected. Suffice it to say that if a piece of copper wire is bent back and forth continually, it will break in very short order, and this is exactly what happens to a tire that is improperly inflated. The sides give and spring back into position alternately until finally the shoe blows out. Billy Rea, humanitarian garage proprietor, knew this, and that is why he fitted his garage out with an air compressor. But he knew, too, that no one can foretell when or where a puncture will occur, and that is why he fitted out his patrons with spark plug pumps.

A. A. A. Disqualifies Many Drivers.

For competing in an unsanctioned event, Harold A. Hall, Fresno, Cal., has been suspended by the A. A. A. contest board until January 1st next. R. H. Pennebaker, of Memphis, Tenn., and Charles B. Perry, of Santa Ana, Cal., both of whom failed to report for races in which they were entered, were disqualified until January 1, 1914.

For competing in an unsanctioned hill climb in Mount Vernon, N. Y., the following riders were suspended until January 1, 1914: C. R. Kenyon and A. N. Kerr, of Yonkers, N. Y.; B. B. Kendig and N. Brown, Mt. Vernon, N. Y.; E. H. Bowman, White Plains, N. Y.; John S. Clark and A. S. Jenks, of Portchester, N. Y.

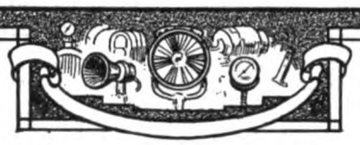
H. Van Wyck, of Hartsdale, N. Y., who also competed in the Mount Vernon event, felt a heavier hand, being suspended until September 1st of next year, while S. G. Thebaud, Jr., of White Plains, was placed on the shelf for an even longer period—until September 1, 1915. Thebaud's offense was driving a G. J. G. car under the false name of N. E. Smith.

All of the drivers, owners and officials who had to do with an unsanctioned event on a motorcycle track in Philadelphia on August 12th last were disqualified until January 1, 1914. They are F. C. Bishop, V. P. Padula, George H. Jones, Eddie Bauer, J. C. Dunsmoor, C. B. Higgins, J. Signor, Frank Shaw and W. B. McCullough.

Savannah Road Races Now in Doubt.

Whatever prospect there was for the return of the Grand Prize and Vanderbilt road races to Savannah, Ga., this fall seems very slim at present, and it is not wholly unlikely that the events will be called off. According to Harvey Granger, president of the Savannah Automobile Club, who traveled to the Elgin races to induce drivers and manufacturers to invade Savannah, differences have arisen which make it improbable that a large enough list of entries to warrant the holding of the two contests will be forthcoming. Granger has let it be known that both drivers and manufacturers have demanded that all entrance fees be waived and that in many instances freight be paid on machines both to and from the scene of the races. Granger is emphatic, however, that all entrance fees must be paid, and that unless there is a satisfactory entry list by Oct. 15th the events will be abandoned.

Cyclecars Only to Round Lake Michigan.



Because of lack of entries—only six were received—the Chicago Motor Club decided at a meeting held on Thursday last to abandon its second annual reliability tour, which was to have led the tourists around Lake Michigan and would have started Monday, 8th inst. It is likely, however, that the division of the run restricted to cyclecars will be held, as preparations for it still are being made. No date for the event has been set, nor will one be named until a sufficient number of entries, in the opinion of Chairman Charles P. Root of the committee that has the work in hand, is received. Root himself is making ready to start a cyclecar publication.

Truffault-Hartfords Plentiful at Elgin.

Although Truffault-Hartford shock absorbers always are well represented in nearly every track or road racing event of any prominence, it is not often that they are as well represented as they were at the Elgin races of August 29th and 30th. Of all the 20 cars that rolled over the 8½-mile course in the two events, not one was without Truffault-Hartfords.

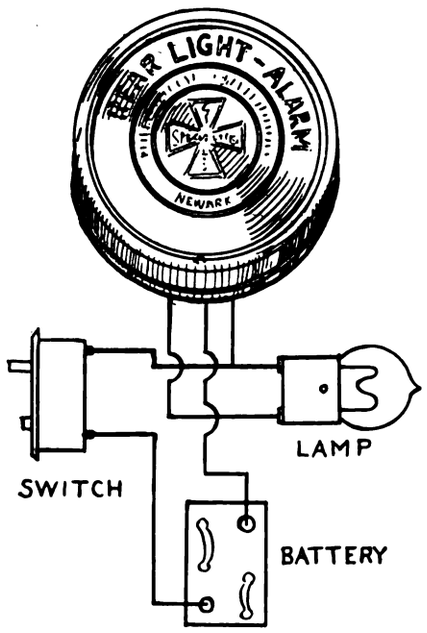
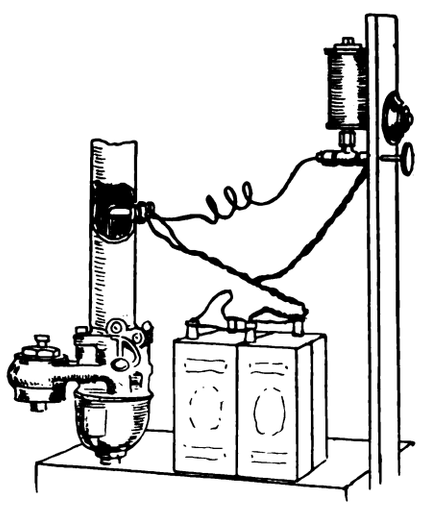
RECENT DEVELOPMENTS in ACCESSORIES

To Facilitate Starting in Winter.



As everyone, or nearly every one, knows, or ought to know, it is not always the easiest thing in the world to start a cold motor on a cold morning, though this is no fault of the motor; it is simply because gasolene does not vaporize as easily when it is cold as it does when it is warm, and every one ought to know that, too. To make starting easy, the Volcano Electric Primer Works of Virginia, Ill., has developed an electric device which not only warms the gasolene but provides it as well.

The whole apparatus, as it is attached, is shown by the accompanying illustration and consists of a small receptacle which is attached to the back of the dash and which holds a small amount of gasolene, a length of wire and a plug which is inserted in the intake manifold between the cylinders and the carburetter. Depression of a button on the dash permits a small quantity of gasolene to flow from the miniature tank to the intake plug when subsequent pressure on a push button makes the circuit between a battery—any battery, whether used for starting and lighting or for ignition—and the plug thus heating the plug and vaporizing the gasolene. "Live gas" thus is liberated directly in the intake manifold, and this, when mixed with air drawn through the carburetter when the engine is cranked, forms a sufficient quantity of highly explosive gas to ensure an easy start. It is pointed out by the makers that the apparatus can be installed on any motor in not more than 30 minutes.



Here's the Electric Rear Light Alarm.

Although the practice of wiring tail and dash lamps in series so as to provide an indication of the failure of the tail lamp is fairly common, there are those who are disinclined to burn dash lamps all the time the tail lamp is lighted both because of the dazzle which is likely to disconcert the driver and because of the drain on the battery. As an alternative to the practice, or rather to eliminate any necessity for it, there has been placed on the market by the Guaranteed Specialties Co., of Newark, N. J., a clever little device which is styled a rear light alarm.

In its simplest aspect, it is nothing more complicated than a small relay which is inserted in the wiring in series with the tail lamp. In operation, when the lamp is extinguished, either because of a faulty or burned out globe or through a broken wire, a loud-sounding buzzer apprises the driver of that fact in no uncertain manner.. In construction the device is rugged and is calculated to withstand almost any kind of use or abuse short of actual mechanical injury. It is set at the factory to operate on a six-volt circuit of not more than 1½ amperes and requires absolutely no attention after installation; it may be placed in any convenient location, though the dashboard is its logical place. The scheme of wiring the device in the circuit, as well as the appearance of the alarm, is shown by the accompanying illustration, which makes plain that no extensive knowledge of things electrical is required properly to fit it on almost any car. It is made of hard rubber, and is waterproof. Complete electric tail lamp outfits, including the alarm, also are supplied and may be attached by almost anyone of average intelligence.

REAR LIGHT ALARM WIRING

VOLCANO PRIMING DEVICE

Brings Out Detachable Limousine Top.

The Sterling Top & Equipment Co., of New York City, has placed on the market a detachable limousine top which is designed for attachment to any runabout or touring car in place of the regulation, collapsible leather top; the article is constructed of wood and aluminum and ranges in price from $250 to about $500. The intention is to supply owners of open cars with this equipment for winter use. Each top is constructed according to the specifications of the body it is to fit and attaches to the same brackets which hold the leather top.

Correct Spreading of Cotter Pins.

Despite other advice on the subject, it is the better part of wisdom to spread the ends of cotter pins as widely as possible, for if they are spread only enough to prevent them falling out of their holes by their own weight there is danger that they may be crowded out by accident. The only reason for not bending the pins any more than can be helped might be one of economy, but it is better to use a pin once and know it is secure than to attempt to use it several times and run the hazard of it falling.

Anderson's Stutz Leaves Braender Trail.

It has been stated to be impossible that two finger prints should be exactly alike, and though it likewise is exceeding improbable that two tire tracks should be exactly alike, it is very probable that not only two but all four of the tire tracks made by Anderson's Stutz in the Elgin race were so nearly alike that the adjective exact may be used without fear of straining its meaning very greatly; for all four of the tires were Braenders. Anderson used Braender tires both front rear, as did Bergdoll, Haupt and Mulford, and he did not, as inadvertently was stated, use Firestones on his front wheels.

HOW CAN THE MANUFACTURER HELP THE DEALER?

By Being Progressive and Up-to-Date in Little Things, Says Dealer Who Recently Entered the Trade—How Failure to Keep Up With Progress Makes the Dealer's Road a Rough Highway.

When one seeks an opinion on a situation r anything else it is common practice to nake this fountain head of knowledge a nan who has long been in touch with the ituation and is familiar with it through a ong experience and, acting on this theory, Motor World recently printed an expres- ion from C. H. Larson, of New York City, in answer to the question "What can he manufacturer do for the dealer?"

Larson, who is the head of the Cutting-Larson Co., Oldsmobile distributer in the metropolitan district, has been connected with the automobile trade for many years and has been a dealer for seven years, but the views of a newer tradesman are likely to prove fully as enlightening, for the new man sees as an ensemble what the older man has been a part of for years. Among the newer entrants to the trade in the metropolitan territory is Henry Drouet, president of the Drouet & Page Co., of 1890 Broadway, and when he was asked "What can the manufacturer do for the dealer?" he replied, "They're all right in the big things, but they ought to look more to the little things."

Relations of Making and Selling Ends.

In elucidation of his answer, Drouet remarked upon the not too amicable relations which sometimes exist between the manufacturing and selling ends of the business, and pointed out instances of little omissions or acts by the manufacturer which have loomed big for the dealer in that they have meant the loss of sales to him. Anything which blocks a sale for a dealer is a big thing to the dealer and it should be equally as important to the manufacturer, for unless the dealer sells the cars the manufacturer might as well stop making them.

"I speak of general conditions as I see them," said Drouet, "and not of the Palmer & Singer company, whose cars I sell, for I believe our relations represent the exact opposite of the conditions of which I speak. The things I mean are the little details of construction which will help the dealer sell his cars but which are not put on by the manufacturer.

"The reason why some manufacturers adopt this attitude is hard to give, but my opinion is that they are influenced by mechanical men and designers who are not so anxious to please the selling end of the business as they are to have their own way about designing. Some manufacturers are inexcusably slow in keeping up with advanced ideas and in putting on the new things and the little details that make the cars 'take' with the buyers.

Racing Driver's Advice Was Ignored.

"The whole attitude is best summed up in the experience of a racing driver whom I know. This man was engaged to drive a special racing car. He went to the factory to see it and was asked how he liked it. He said, 'It's a pretty good looking car, all except the wheels; I don't want to drive the car with those wheels.' 'What's the matter with the wheels?' snapped the designer; 'they're regular stock wheels.' 'I know that,' replied the driver, 'but you don't think I'm going out on the track with 36-inch wheels, do you? I wouldn't stay right side up ten minutes.' 'You'll drive it as we designed it or not at all,' replied the designer. 'Oh, very well,' was the answer; 'you can take your car and go to hell! But mark my word, the first man who goes out in it will be killed.' And the driver was right; the driver who took it out was killed.

Poor Cover That Lost Dealer Sale.

"That attitude was wrong, but it illustrates the attitude some car builders take in designing their product. You wouldn't think a little thing like a slip cover for a top would kill a sale, would you? But it did We had a woman prospect who had her mind made up to buy one of three cars, an A——, a B——, or ours. Finally it narrowed down to ours and the B——, and she bought ours. After she had signed the contract, out of curiosity I asked her why she bought our car instead of the B——. 'I'll tell you,' she answered. 'When I was down in the B—— salesrooms they had the top down and I saw that the slip cover was nothing but common oilcloth. I knew that the first time I got it wet it wouldn't last a minute, and I thought if that was the kind of a car it was I didn't want it.'

"Now, as a matter of fact, the B—— car is a good car, even if it did have a cheap slip cover, and I don't know whether the dealers ever thought to call the manufacturer's attention to the quality of that particular part of the outfit, but that cover, and that alone, lost a sale for the B—— dealers, and if the man who builds the car maintains that the cover is plenty good enough and that, anyway, he isn't going to change it, he is making a big error.

"The situation is brought about largely by the point of mechanical perfection to which cars have been brought to-day; almost every car is a pretty good car. I can't tell a man that the motor in our car will run away from every other motor on the road or that it will pull three of any other make up a hill or do any such nonsensical thing; it won't. There are superior points about our motor, but people don't come in to-day and ask about the bore and stroke, or how many bearings we have in the crankshaft or any such things as that. They are satisfied when they come in that the car will run satisfactorily and most of them are sold on other points.

Progress in Design and Its Value.

"Beauty of design is an important feature to-day; women are playing a larger part in the buying of cars, and no manufacturer who wants to be up-to-date can afford to neglect the details. Yet how many of them do! Just stand in the door and watch the cars go by. Unsightly radiators, inharmonious body designs, skimpy equipment and many other things which, while not exactly defects, are not sales helps.

"Instead of working to get a good-looking car, many manufacturers follow in the path they have always trodden and seem to think that what was good enough yesterday is good enough to-day. If a dealer says he thinks he could sell the cars more easily if the radiator were made more sightly and the body lines made to look like those of a regular automobile, the manufacturer pays little attention to him. The car sold yesterday, therefore it ought to today. He loses sight of the fact that other manufacurers are sweeping past him in these refinements and that just as fast as they pass him it is making it easier for other dealers to outsell his dealers.

"One 1914 line of cars has a top that I have heard commented upon in several places because of its hideousness and low

Digitized by Google

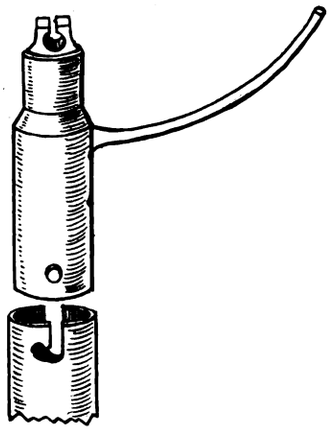
quality. I don't see why the manufacturers ever put it on and I don't suppose they can see any good reason why they should take it off.

"You wouldn't think that clock would sell a car, would you?" asked Drouet, pointing to a little metal clock in the center of a Palmer-Singer dash. "Well, it has," he continued. "With all cars as good as they are to-day, it is little things like that which make talking points. I wanted that clock and several other things put on as a help in selling the cars and the company put them on without a protest. It has more than paid, for we have been able to make sales that otherwise would have come hard and might have been lost entirely. Refinements count.

Little Things That Helped Make Sale.

"One young man came in to look over our line; he didn't seem at all anxious about the mechanical part of the car, and if we had had no other selling points I would have had to hammer away at him on the mechanical line and on construction, comfort and such things, which line of talk, with a few variations, will fit almost any car that is any good at all. But this young fellow was strong for the little things. The dash clock took his eye, and I told him I would put on a cigar lighter if he wanted it. That made a big hit.

"I also told him I would put on a swivel sign-lamp and one or two other things, all of which didn't cost me much but which sold the car. A car equipped like that was what he wanted. So long as the car looked all right and ran all right he would have been satisfied with any make. Many cars are sadly lacking in attention to minor appointments, and I don't see how some Broadway dealers get along. There is nothing particularly attractive about their cars; they are just cars, and that's all. There isn't a thing to make them a bit better than others, or even as good.



Summary of History of Front Doors.

"You may remember when front doors came out. Some manufacturers hung back and refused to put them on. They couldn't or wouldn't see it. The dealers felt the demand for them and set up a yell for front doors, but still a lot of the manufacturers would not put them on. But would you try to sell a car to-day without front doors? The manufacturers put them on at last—all of them—and why couldn't more of them have been prompt in getting behind the dealer and giving him what his customers wanted?

"The manufacturer would do well to blend his manufacturing attitude more with the sales attitude. The typical manufacturing attitude is 'build and sell what I want,' while the real money and success is in building and selling what the people want. And since the dealer is the sales medium he is quite likely to know what the people want; wherefore, if he conveys to the manufacturer authentic information as to what would make the cars more salable, why shouldn't the manufacturer give some heed? The cars that are going to take are the cars that are kept up-to-date, and unless the manufacturer cooperates with the dealer in that direction some dealers are going to have hard traveling."

Gas Burner for Emergency Use.

Reversing practice current at the time when electric lights first assumed real prominence about a year ago and apparent in the production of numerous devices

EMERGENCY ACETYLENE BURNER

for converting gas lamps into electric lamps, the Acetylene Gas Co., of Milwaukee, Wis., just has placed on the market an acetylene burner designed to be temporarily substituted for electric lamps should anything occur to darken their brilliance.

The device, which is shown by the accompanying illustration, consists of a small pillar constructed to fit the ordinary Ediswan electric lamp socket, where it is held by the usual bayonet lock. The acetylene burner is slightly smaller than usual, to obviate the possibility of damage to reflectors, and the gas pipe line connection is near the top. The burners themselves list for 65 cents, and as they are no larger than an electric light globe they can be carried quite easily with spare globes. Where no acetylene tank is carried, which is the case with a great many modern cars, the smallest size tank, produced for the use of motorcyclists, can be carried in the tool kit for emergency use.

Tip of "$499,995.40" to Taxicab Driver.

Just because a few capitaliists have acquired a good share of the wealth of the country need not prevent anyone from feeling like a millionaire; all that is required, according to the theory of Finley Alexander Washington, of Jersey City, N. J., is a pen and check book. Finley, who is a negro, went for a taxicab ride in New York the other day, and after the meter had climbed as high as $4.60 the chauffeur began to look anxious about the money.

This worried Finley not at all; he pulled out a check book, wrote a check for $500.00 and presented it to the chauffeur with directions to "keep the change." The "change" was an imaginary $499,995.40. When arraigned in the Yorkville police court the negro said that he owned all the automobile factories in the city and had made arrangements for the purchase of all the hotels owned by the Astor estate. He also promised an automobile to each of the court attendants. While waiting for the ambulance which was to take him to Bellevue hospital, Washington was placed in a cell with a man whose bondsman had failed to qualify. Hearing his tale of woe, the negro promptly wrote out a check for $10,000 and generously presented it to his cell mate.

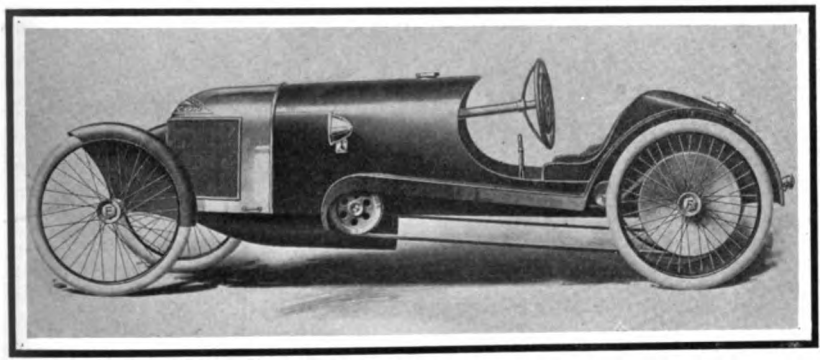
Spends 38 Hours in Jail as Protest.

As a protest against what he termed the injustice of Chicago's headlight ordinance, in that it makes no provision for accidental extinguishing of lights, and against the conduct of the police, John D. Cameron, retail sales manager of the International Harvester Co., spent 38 hours in a cell last week rather than recognize the authority of the police and sign a bail bond. Cameron's tail light went out, he claims, because someone put water in the oil, and a motorcycle policeman arrested him while it was out, although Cameron insists he had relighted it several times. When the case came up in court he was discharged.

Reo Ball Player Applies for Damages.

Because, so he claims, he was ordered by his foreman to don a uniform and play on the Reo team in the factory baseball league in Lansing, Mich., Clifford Vetter, of Grand Lodge, has entered a claim for compensation for a broken wrist; in his application to the Industrial Accident Board he claims he intended going home had he not been ordered out to play. Owing to the fact that he was not regularly employed as a ball player by the Reo Motor Car Co., the outcome of his request for remuneration is in doubt.

To Locate Garage in Yosemite Park.



Permission having been granted for the limited entry of automobiles into Yosemite Park, Cal., the Federal government now plans to erect a garage in the national preserve; it is designed to shelter the cars of motorists who wish to visit points of interest by other means of transportation.

ALCON CYCLECAR EMPLOYS UNUSUAL CONTROL METHOD

[as Friction Change Gear Mechanism Operated by Wheel on Steering Column—Electric Lights and Engine Starter Standard.

Carrying the cyclecar idea probably a lit-e further than it has been carried so far, ıe Falcon Cyclecar Co., which shortly will ? incorporated in Cleveland, O., with $250,-)0 capital by Francis R. Hoyt and others.

FALCON BELT-DRIVEN CYCLECAR SHOWING FRICTION CONTROL

preparing to bring out a light vehicle hich, while belonging properly in the cy-ecar class as defined by the British Royal utomobile Club, still will have such unmis-ıkeable evidence of the full-sized automo-ile as an electric lighting system. For the ıanufacture of the vehicle, which will be yled "Falcon," a factory building in all robability will be erected on East 105th reet in Cleveland.

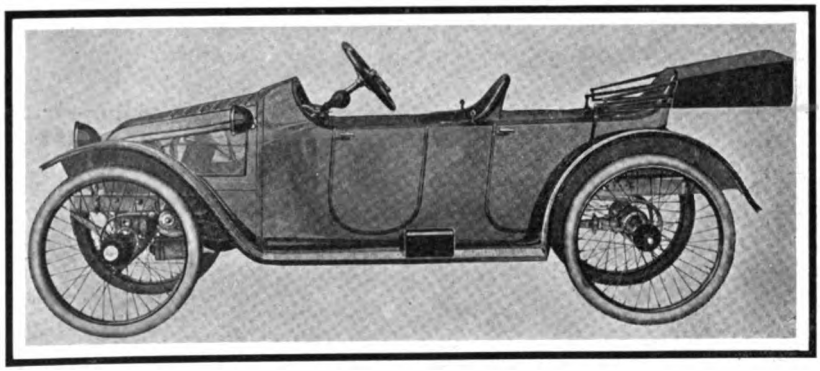
In external appearance, the Falcon has all ıe material aspects of the typical foreign yclecar. Which is to say, it is quite low nd rakish; has light wire wheels, and is riven by long V-section belts running ver pulleys on a countershaft and on the ear wheels. Also, it has accommodations or only two passengers, and though the eats are arranged side by side, the overall idth of the car is only slightly more than ıree feet; the tread is exactly 36 inches nd the wheelbase is 96 inches. The weight f the car complete, as it is shown by the ccompanying illustration, is 325 pounds.

For power, a two-cylinder air-cooled mo-or set forward behind a grating is used; the iston displacement of the engine is 70 ubic inches and the rated horsepower is 10. rovision for starting the engine from the river's seat, which is placed at the left ide, is made.

One of the distinctive features of the new ar is the unusual arrangement of the speed hanging mechanism. The gear ratio be-ween the engine and the road wheels is al-tered through the intermediary of a fric-tion mechanism not unlike the apparatus already familiar. But instead of the usual hand lever for shifting the position of the driven disk, there is a hand wheel which is placed atop the steering column inside of the steering wheel; its location may be seen quite clearly in the picture. Another un-usual feature is the method of springing the front axle; though the arrangement is not shown in the illustration, it is pointed out by the designer that "the front springs are so designed on a pivotal principle that road shocks are not communicatetd from the wheels to the body."

Wheels are shod with pneumatic tires measuring 28 x 3 inches, and, as is sho vn in the picture, the front mudguards are fas-tened not to the chassis but to the wheels, with which they turn. The fuel capacity of the car is nine gallons and the oil capacity one gallon. The equipment included in the list price, which has been set at $385, in-cludes a tool box, tire repair outfit and a kit of tools.

When Alcohol is Better than "Gas."



For removing grease spots from leather, it is not a good plan to use gasolene or benzine, for there is danger of removing also some of the coloring matter of the leather. The better plan is to use wood al-cohol—and to use it very sparingly.

MANUFACTURE OF WOODS MOBILETTE NEARS REALITY

Company About to Build Cyclecar of Which Model Was Completed Twenty Months Ago — Has Three-Disk Friction Drive.

Although the Woods Mobilette, which is produced by the Woods Mobilette Co., of Chicago, Ill., and which is one of the latest additions to the swelling ranks of the cycle-car contingent, was conceived as long ago as 1906 and, it is asserted, has existed for the past 20 months as a complete vehicle, arrangements for its production have but just reached the stage where deliveries can be promised in the near future. Specifica-tions which now are available reveal that the little vehicle has a number of interest-ing features all its own.

In the first place, the vehicle is a true cyclecar, at least as far as weight and size are concerned, for it measures only 35 inches in overall width, weighs approxi-mately 450 pounds and the wheelbase is but 89 inches. The seats, which accommodate two persons, are arranged tandem fashion, like the original French Bedelia cyclecar, though unlike that interesting vehicle, the power plant and transmission elements of the Woods Mobilette approach more or less closely to current practice apparent in full-sized automobiles.

SIDE VIEW OF WOODS MOBILETTE SHOWING UNUSUAL SPRING SUSPENSION

It is in the transmission elements and the spring suspension of the car that what novelty there is exists, for in neither case has the designer adopted for his own the whole plans of others. Thus, though power is transmitted from the motor to the rear axle through friction mechanism, it is fric-tion mechanism of a new kind, or rather of new arrangement. At the after end of the engine, and virtually forming the flywheel, there is a heavy bevelled edge disk which drives a similarly beveled disk mounted at right angles to the first. Against the face of

Digitized by Google

this second disk there presses a third disk, which is splined to and slides on the propeller shaft.

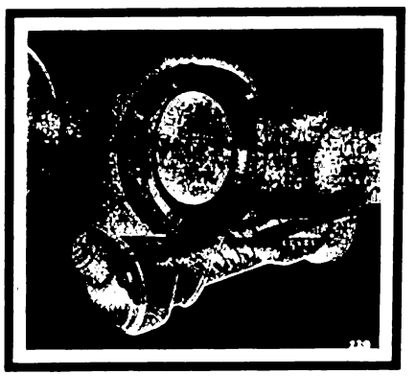
To obtain the necessary adhesion between the second and third disks, the third is fitted with fiber inserts and the desired speed changes are obtained by simply sliding the third disk along the propeller shaft after its contact with the second friction disk has been disturbed by the depression of the "clutch" pedal. Two pedals are provided for the control of the car, the first simultaneously disengaging the drive and applying rear wheel brakes and the second disengaging the drive only, to facilitate speed changes.

The power plant of the car consists of a two-cylinder four-cycle V-set motor cooled by air and sparked by a magneto The bore and stroke measure 3⅛ inches and 3 inches, respectively, and the rating, according to the A. L. A. M. formula, therefore, is slightly more than 7 horsepower; the piston displacement is 92 cubic inches.

In the spring suspension of the car, the designer has adopted what is probably the simplest system possible, and it is a system that is quite different from anything else designed for the same purpose. The springs, which are best made plain by the accompanying illustration, are merely spirals attached to the chassis frame and partly coiled about the axles. The wheels, which are of wire and are of the type rendered familiar by motorcycle practice, are shod with 28 x 2½-inch tires. Though no definite price has been set for the complete car, it is expected that it will retail for close to $350.

Concerning Pierce-Arrow's New Truck.

Leaving little room for doubt regarding the actual carrying capacity of the new Pierce-Arrow two-ton commercial vehicle, compeer to the five-ton vehicle produced by the Pierce-Arrow Motor Car Co., of Buffalo, N. Y., and to correct misunderstandings, the manufacturers point out that, while the total admissable load on the chassis is 5,200 pounds, this total load must include the weight of both body and paying load. If the body weighs in excess of 1,200 pounds, the paying load will be less than two tons by the amount of the excess; as the average weight of bodies is 1,200 pounds, the permissible average load is exactly two tons, and not 2½ tons as has been stated in one or two instances; there is no guaranteed percentage of overload.



In the braking mechanism of the new vehicle, the designers could find no better model than that used in the five-ton truck and hence, the service or foot brake remains aft the transmission and consists of contracting shoes lined with suitable fabric, and is not, as inadvertently has been stated, a band brake.

UNUSUAL WORM DRIVE FOR DETROIT ELECTRIC CARS

Copious Lubrication Positively Ensured by Mounting of the Worm —Many Detail Refinements Mark New Models.

In electric pleasure vehicles it is quite as important as it is in gasolene vehicles that both design and construction be kept abreast of the times and up to the minute in both theory and practice, and though the Anderson Electric Car Co. of Detroit, Mich., has found a few changes to make in models that always have been well received, the changes are not of a radical nature but rather are deeper down and have to do more with wear than they have with appearance.

Thlus, for instance, though the company

DETROIT WORM MOUNTING

has for the past three years employed worm drive in some of its models and therefore has become quite familiar with its characteristics, construction in the new models has been materially improved by the adoption of a new and more thorough lubrication system for the worm and wheel.

The worm-driven chassis is not the only one that will be produced, however. A bevel-driven chassis will be produced as well, and on it there will be mounted four distinct body styles—a roadster; a five-passenger forward drive car operated from the front seat; a four-passenger single drive car, driven from the rear seat, with a revolving chair in the front right corner; and a luxurious open Victoria. Three body styles, as follows, will be mounted on the worm-driven chassis: a five-passenger duplex drive car which can be operated from either front or rear seat; a four-passenger single drive car with wide, roomy seat for three persons and a revolving chair in the front right corner for the fourth passenger; and a roadster.

Among the more important improvements that have been incorporated in all models is the adoption of larger batteries, which means, of course, that mileage has been increased considerably; all cars now are equipped with larger tires, making for easier riding and reduced upkeep expense; an electric brake operated from the controller handle is standard; Hanlon rain vision front glasses, for which the Anderson company recently acquired the patent rights, are standard; oval crowned fenders now are standard; the equipment has been increased by the addition of a Warner speedometer and a high-grade clock; and a number of detail improvements have been made in upholstery and in the finish of the cars.

The improvement in the worm driving mechanism — it is a Daimler-Lanchester worm, by the way, and is imported especially for the Detroit electric cars—really is the most apparent change in construction and it is a change that is calculated to increase smoothness of action and to reduce wear to a considerable extent. Needless to point out, the worm gearing is absolutely quiet in operation, a point of no mean consideration in an electrtic. By the new mounting, which is illustrated in the accompanying illustration, the worm, which is hung beneath the ring gear, operates in an oil bath and for this reason constant and copious lubrication—an essential feature in any worm gearing—is positively ensured. The worm gear is standard on models 46, 47 and 48; the bevel drive on models 43, 44 and 45.

On the bevel-driven chassis—both chassis are shaft driven, and always have been shaft driven—the four-passenger brougham lists at $2,550; the Victoria at $2,300; the forward drive five-passenger brougham at $2,800. On the worm-driven chassis, the roadster lists at $2,500; the four-passenger brougham at $2,850; the duplex drive five-passenger brougham at $3,000. All these prices are for standard lead battery, $880 being added where Edison battery is specified, except in the case of the model 44 Victoria, when the increase in price for Edison equipment is $664.

Cyclecar Coming from Cincinnati, too.

The De Cross Cy Car Co. is the title of a new company which has been formed in Cincinnati, Ohio, for the manufacture of a cyclecar of that name. Operations are being carried on in a plant at the junction of the C., H. & D. railroad and Gulow street. The De Cross car will mount a two-cylinder air-cooled 9-12 horsepower engine and will be driven by friction transmission, a 1¾-inch belt constituting the final drive. It will have a tread of 36 inches and utilize 28 x 2¾-inch wire wheels. The list price has not been definitely settled, but it will be less than $400.

Digitized by Google

What is the biggest mistake dealers make?

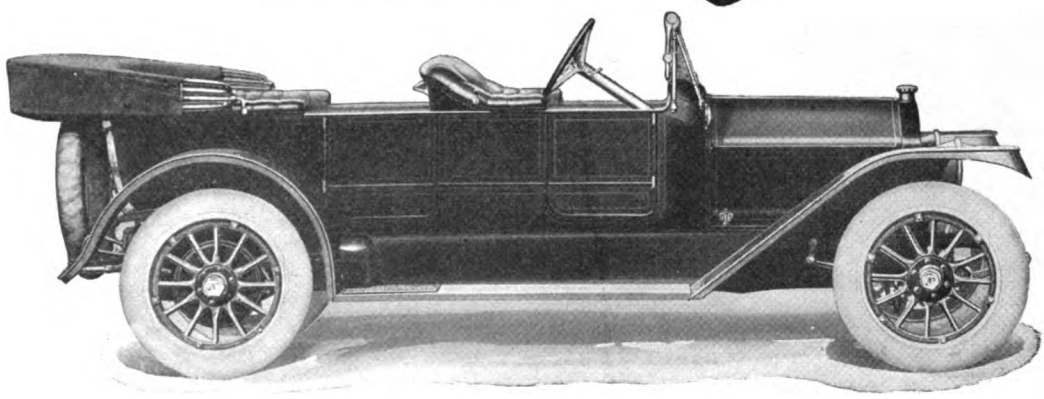
We asked this of several experienced dealers and traveling representatives for the *National* cars. We, of course, received various answers—but here is one mistake many agreed upon—

"They make promises they can't keep"

And it is explained that too often the dealer is absolutely sincere and believes he can make good on the promises he gives a customer for the car he sells him.

We have eliminated this mistake absolutely for you when selling *National* cars. In the first place the plain unvarnished truth about the *National* would be a gross exaggeration if applied to other cars. Often we find people who smile when we tell them the truth about the *National's* value. They smile until you prove it—then they do actually smile the smile that brings both a sale and a satisfied customer this year and years hereafter because the *National* is good year after year, steady, consistent, and always at the top in service, power, speed, beauty and most modern equipment.

The *National* dealer does not have to make promises he can't keep in order to force a sale. The *National* dealer promises more than other dealers and keeps his promise because the fulfillment of all the promises he makes is actually in the car he sells.



We put it in these cars in our thirteen-year-old factory. The *National's* success in contests—which makes it today the Stock Champion and International 500-mile race record holder—is one proof of the superiority of these cars.

If you are fortunate enough to be in open *National* territory please advise us at once. It will cost you nothing to learn more about our cars and the square and liberal manner in which we co-operate with dealers.

Holds World's Stock Championship

1,052,782. Starting Device for Explosion-Engines. Arey V. Winegarden, Eldorado, Kan., assignor of one-half to Alvah Shelden, Eldorado, Kans. Filed May 16, 1911. Serial No. 627,584. (Lever starter and clutch mechanism.) 14 claims.

1,052,827. Automobile Starter. Clarence L. Johnston, Berkeley, Cal., assignor, by direct and mesne assignments, to Standard Motor Starter Co., San Francisco, Cal., a corporation of California. Filed June 14, 1911. Serial No. 633,051. (Air starter and fluid pressure clutch mechanism.) 10 claims.

1,052,829. Automobile. Maxim Karminski and Charles Peters, Thompsonville, Conn. Filed Oct. 7, 1910, Serial No. 585,834. Renewed Nov. 26, 1912. Serial No. 733,705. (Motor mounted over and belted to front wheel.) 2 claims.

1,052,873. Protector for Pneumatic Tires. Chas. B. Woodworth, Niagara Falls, N. Y. Filed Aug. 24, 1911. Serial No. 645,807. (Studded tread with hard and soft metal studs.) 3 claims.

1,052,897. Carburetter. James M. Dayton, Torrington, Conn., assignor to Excelsior Needle Co., Torrington, Conn., a corporation of Connecticut. Filed April 9, 1910. Serial No. 554,502. (Carburetter with U-shaped air passage.) 7 claims.

1,052,917. Carburetter. Frank H. Heitger, Indianapolis, Ind. Filed Sept. 29, 1910. Serial No. 584,418. (The Heitger automatic carburetter construction.) 3 claims.

1,053,013. Internal-Combustion Engine. Willliam B. Cowles, Cleveland, Ohio. Filed Dec. 7, 1910. Serial No. 596,157. (Motor with pumping chamber above and tandem with power cylinder.) 19 claims.

1,053,080. Lamp-Trimmer's Wagon. Eddy R. Whitney and Emlen S. Hare, Philadelphia, Pa., assignors to Commercial Truck Company of America, Philadelphia, Pa., a corporation of Pennsylvania. Filed May 2, 1911. Serial No. 624,587. (Lamp-trimmer's tower wagon with controls at top of tower.) 18 claims.

1,053,136. Carburetter. Carl S. Daellenbach, Ellwood City, Pa. Filed Jan. 27, 1912. Serial No. 673,897. (Carburetter with needle-valve direct connected to throttle.) 6 claims.

1,053,141. Rim and Tire for Vehicle Wheels. Jas. A. Cooper, Chattanooga, Tenn., assignor of one-half to D. W. Hughes, Chattanooga, Tenn. Filed Feb. 9, 1911. Serial No. 607,684. (Springs between inner and outer rims.) 1 claim.

1,053,145. Carburetter. Frank H. Ball and Frederick O. Ball, Plainfield, N. J. Filed Oct. 5, 1910. Serial No. 585,400. (Carburetter in which friction between air and passage walls is utilized.) 23 claims.

1,053,164. Magneto-Interrupter. Willard E. Dow, Braintree, Mass. Filed Oct. 18, 1909. Serial No. 523,137. (Rotary interrupter with timing adjustment.) 6 claims.

1,053,166. Spring Wheel. Ernst Henry Fisher, Philadelphia, Pa. Filed Feb. 17, 1912. Serial No. 678,189. (Helical springs, with adjustment, between inner and outer rims.) 1 claim.

1,053,188. Throttle-Controlling Means for Motor Vehicles. Allen Loomis, Detroit, Mich., assignor, by mesne assignments, to Packard Motor Car Co., Detroit, Mich., a corporation of Michigan. Filed Feb. 16, 1909. Serial No. 487,329. (Spring device in throttle control system.) 13 claims.

1,053,195. Starting Device. James McNamee, Amsterdam, N. Y. Filed Nov. 16, 1910. Serial No. 592,723. (Anti-kick crank with friction clutch.) 4 claims.

1,053,200. Automobile Anti-Skidding Device. Robt. A. Moore, New York, N. Y., assignor to The Moore Auto Skid Preventer Co., New York, N. Y., a corporation of New York. Filed Sept. 26, 1911. Serial No. 651,455. (Anti-skid device operated by pedal.) 10 claims.

1,053,202. Speed-Indicator. Wilhelm Morell, Leipzig, Germany. Filed Nov. 18, 1910. Serial No. 593,023. (Centrifugal speedometer with spring fork mechanism.) 3 claims.

1,053,228. Dirigible Automobile Lamp-Bracket. Allen J. Sayville, Richmond, Va. Filed May 10, 1912. Serial No. 696,459. (Headlights operated by movements of steering gear.) 2 claims.

1,053,238. Tire. Geo. A. Stewart and Harlan E. Goodell, Ridley Park, Pa. Filed Jan. 23, 1912. Serial No. 672,845. (Tire with two practically concentric casings.) 2 claims.

1,053,241. Auxiliary Spring or Broken-Spring Repairer. Chester Taylor, Paso Robles, Cal. Filed Sept. 7, 1912. Serial No. 719,102. (Miniature leaf spring to clamp to broken leaf spring.) 1 claim.

1,053,248. Interrupter for Magneto-Electric Igniters. Gustav Unterberg, Frankfort-on-the-Main, Germany. Filed Sept. 26, 1910. Serial No. 583,932. (Cam and lever interrupter mechanism.) 3 claims.

1,053,269. Radiator. Kinderman M. Boblett, Toledo, Ohio. Filed July 12, 1911. Serial No. 638,057. (Cellular radiator formed of sheet metal corrugated strips.) 6 claims.

1,053,329. Traction-Engine. Daniel T. Timberlake, Baileyville, Kan. Filed July 6, 1909. Serial No. 506,032. (Driving system for tractor having two swivel-jointed trucks.) 2 claims.

1,053,332. Vehicle Wheel. Allen R. Weaver, Batesville, Ark. Filed Feb. 17, 1910. Serial No. 544,386. (Wheel with concentric rims separated by air cushions.) 5 claims.

1,053,346. Wheel Rim for Pneumatic Tires. Erle K. Baker, Chicago, Ill., assignor, by direct and mesne assignments, to Universal Rim Co., Chicago, Ill., a corporation of Illinois. Filed Oct. 21, 1905. Serial No. 283,797. (Quick detachable rim and fastenings.) 2 claims.

1,053,347. Wheel Rim for Pneumatic Tires. Erle K. Baker, Chicago, Ill., assignor, by direct and mesne assignments to Universal Rim Co., a corporation of Illinois. Filed July 27, 1906. Serial No. 328,051. (Quick-detachable rim and fastenings.) 3 claims.

1,053,360. Starting Means for Internal-Combustion Engines. Clyde J. Coleman, Rockaway, N. J., assignor to Conrad Hubert, New York, N. Y. Filed Oct. 7, 1903. Serial No. 176,165. Renewed July 20, 1912. Serial No. 710,694. (Intake valve for ignition starter.) 11 claims.

1,053,402. Spring-Wheel. Edgar B. Keemer, Washington, D. C. Filed May 18, 1912. Serial No. 698,199. (Small cross springs in tire.) 5 claims.

1,053,470. Electric Spark Plug. Frank R. Blake, Malden, Mass., assignor to Blake Spark Plug Co., Boston, Mass., a corporation of Massachusetts. Filed Jan. 24, 1912. Serial No. 673,049. (Spark plug with bayonet joint between outer and inner parts.) 2 claims.

1,053,504. Anti-Skidding Device for Tires. Michael C. Harris, Philadelphia, Pa. Filed May 22, 1912. Serial No. 698,949. (Cross-bar non-skids and fastenings.) 1 claim.

1,053,574. Cylinder Lubrication. Jay C. Cook and Clarence E. Welever, Pasadena, Cal. Filed March 18, 1911. Serial No. 615,432. (Oil pump consisting of expanding and contracting ring in piston groove.) 1 claim.

1,053,636. Vehicle Wheel. Charles J. Ohlsson, New York, N. Y. Filed July 8, 1911. Serial No. 637,450. (Wheel with springs between inner and outer rims.) 4 claims.

1,053,700. Internal Combustion Engine. Cecil M. Billings, Newark, N. J., assignor of one-half to John G. Reichstetter, Newark, N. J. Filed July 13, 1911. Serial No. 638,238. (Motor with two-diameter piston and separate gas chamber.) 9 claims.

1,053,707. Spring Tire for Vehicle Wheels. Samuel J. Casey, Keeseville, N. Y. Filed April 5, 1912. Serial No. 688,606. (Tire with both radial and circumferential springs.) 4 claims.

1,053,723. Resilient Wheel. Carroll D. Galvin, Merchantville, N. J. Filed July 23, 1912. Serial No. 709,119. (Cushioning tire between inner and outer rims.) 15 claims.

1,053,727. Differential-Gear Mechanism. Howard C. Hart, Russiaville, Ind. Filed March 8, 1911. Serial No. 613,089. (Ratchet clutch drive.) 1 claim.

1,053,759. Internal-Combustion Engine. Willard Irving Twombley, New York, N. Y., assignor to Twombly Motors Co., New York, N. Y., a corporation of New York. Filed Sept. 12, 1910. Serial No. 581,633. (Opposed cylinder motor with opposite pistons rigidly connected.) 19 claims.

1,053,778. Wheel. Gustave Louis Bourquin, Sellersville, Pa., assignor of one-half to Rudolph Loeb, Camden, N. J. Filed March 11, 1911. Serial No. 613,691. (Springs between inner and outer rims.) 3 claims.

1,053,790. Piston for Explosive-Engines. Frank W. Derby and Herman Kaiser, Oakland, Cal. Filed May 11, 1912. Serial No. 696,656. (Expanding piston taking up wear automatically.) 8 claims.

1,053,800. Starting Mechanism for Internal-Combustion Engines. Adolph F. Feller, Berkeley, Cal., assignor of one-fourth to H. C. Hansen and one-fourth to E. J. Broberg, Oakland, Cal. Filed Aug. 29, 1910. Serial No. 579,562. (Fluid pressure starting system and gearing.) 23 claims.

1,053,821. Resilient Tire. Robert L. Jenkins, Richmond, Va., assignor of one-fourth to Lee B. Hancock, Richmond, Va. Filed Sept. 22, 1910. Serial No. 583,223. (Springs between inner and outer rims.) 1 claim.

1,053,824. Vehicle Frame. George Hill Jones, Aldan, Pa. Filed March 17, 1910. Serial No. 549,895. (Sheet metal frame forming part of body.) 6 claims.

1,053,832. Movable Headlight Support. Ned Gensemer Krimmel, Pine Grove, Pa. Filed April 16, 1912. Serial No. 691,253. (Headlights moved by movements of steering gear.) 2 claims.

1,053,847. Tread-Band for Pneumatic-Tire Wheels. James McLeod, St. Kilda, Victoria, Australia. Filed March 15, 1911. Serial No. 614,602. (Grooved metal tire protector.) 2 claims.

1,053,889. Vehicle-Wheel. Joseph Frank Starbuck, Philadelphia, Pa. Filed April 24, 1912. Serial No. 692,907. (Wheel with curved spokes of flat spring steel.) 6 claims.

1,053,938. Guiding Apparatus for Automobile Lamps. George L. Berg, Seattle, Wash. Filed Jan. 22, 1912. Serial No. 672,631. (Lamps connected to and moving with steering gear.) 1 claim.

1,053,939. Engine-Oiler. Charles E. Brooks, St. Louis, Mo., assignor to Brooks-Latta Automobile Mfg. Co., St. Louis, Mo., a corporation of Missouri. Filed May 13, 1912. Serial No. 696,939. (Oil distributing system for two-cycle motor.) 5 claims.

1,053,995. Tail-Lamp for Motor-Vehicles. Russell Huff, Detroit, Mich., assignor to Packard Motor Car Co., Detroit, Mich., a corporation of Michigan. Filed May 17, 1910. Serial No. 561,906. (Tail lamp set in hole in mudguard.) 3 claims.

1,054,057. Spring-Governor for Vehicles. Walter E. Trufant, Whitman, Mass., assignor to Hartford Suspension Co., New York, N. Y., a corporation of New York. Filed Dec. 8, 1906. Serial No. 346,865. (Telescoping shock-absorber.) 13 claims.

1,054,080. Method of Combining Air and Gas and Utilizing the Same in an Internal-Combustion Engine. Gustav A. Bachman, Baltimore, Md. Filed Feb. 24, 1911. Serial No. 610,461. (Forced injection of compressed air on compression stroke.) 2 claims.

1,054,104. Motor Road-Vehicle. Guido Fornaca, Turin, Italy, assignor, by mesne assignments, to F. I. A. T., Poughkeepsie, N. Y., a corporation of New York. Filed Nov. 20, 1907. Serial No. 402,984. (Rear axle casing and torque tube formed of two sheet steel parts flanged for joining in a horizontal line.) 8 claims.

1,054,157. Four-Cycle Engine. Nathaniel B. Wales, Braintree, Mass., assignor to Guy B. Collier, Kinderhook, N. Y. Filed March 2, 1907, Serial No. 360,259. Renewed Oct. 24, 1911. Serial No. 656,526. (Motor with hollow piston valve.) 3 claims.

1,054,162. Vehicle Lamp. Joseph E. Allen, Chicago, Ill., assignor to Dearborn Hardware Mfg. Co., Chicago, Ill., a corporation of Illinois. Filed Dec. 1, 1911. Serial No. 663,392. (Bulb socket for electric headlight.) 2 claims.

PATHFINDER TOURING CAR
40 horse power *120 inch wheelbase*

You can have the same success we are having with the Pathfinder

¶ Announcements are always interesting. Maybe they will open to you a chance to make a more profitable connection. They will surely give you a line on your competition.

¶ The Pathfinder announcements are awakening more interest because it is generally conceded that it is a beautiful car, and that the mechanical construction represents the best in European and American engineering.

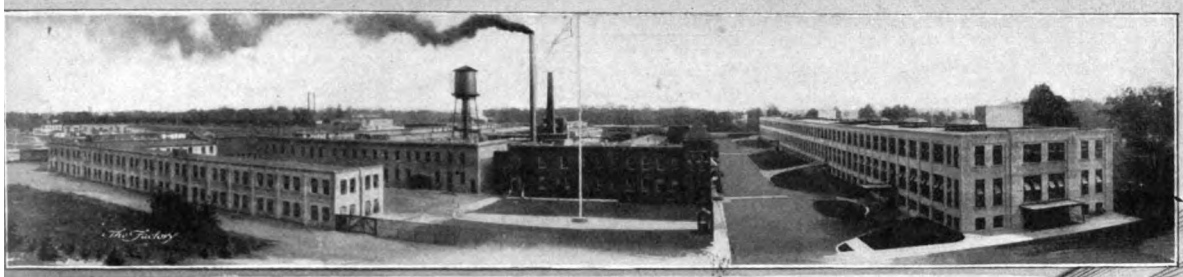
¶ Possibly you do not care particularly about car construction and your interest lies in the jingle of hard dollars rather than in the hum of a motor.

¶ Times have changed in the auto game, and you must sell a good car to make money. It follows naturally that the most money will follow the best car.

¶ The Pathfinder is that car. Proof?—Our sales last period increased 117% over the same period in 1912, the largest increase of any established car.

¶ The Pathfinder will make you money permanently. It is one of the four best money makers in the market today.

¶ Don't delay, but start right in your 1914 business by working with us.



¶ Write us what territory you can cover and we will submit a plan whereby you can make a similar increase in your business. Our scientific selling plan combines the "101 Reasons" and will show you the way to unexpected profits.

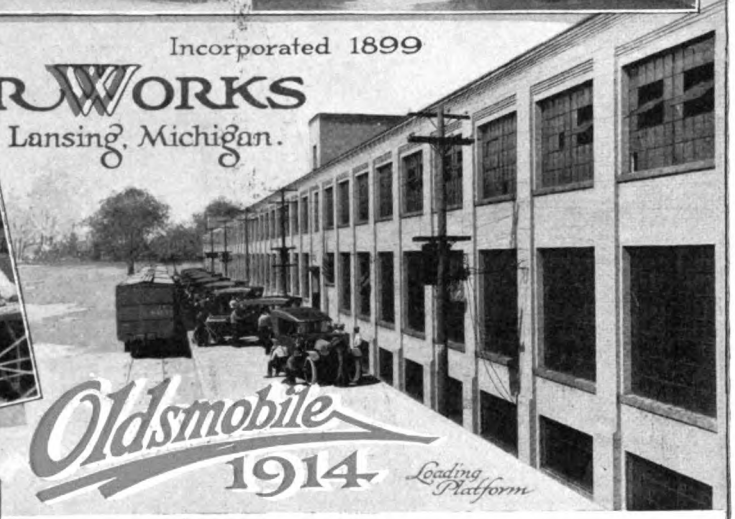
Established 1880 Incorporated 1899

OLDS MOTOR WORKS

Lansing, Michigan.



Four- or Five-Passenger Phaeton, Touring Body Type, $2975. Seven-Passenger Touring Body, $175 Extra. Limousine, $4300

$2975 For a Six Cylinder OLDSMOBILE $2975

Lower in price, and even higher in quality than any of its predecessors—the Model 54—1914 Oldsmobile is creating more concrete evidence of live dealers interest than any other high grade six on the market.

The Price

$2975 practically eliminates competition with dealers handling cars priced from $4000 to $5000—for the Oldsmobile is as good as any of these. The lines of this car are of distinctive Oldsmobile design—a standard which has led all competition, whatever the price.

We Are Six Cylinder Pioneers

Oldsmobile pioneered the six cylinder motor, and it is unnecessary to dwell on the value of the years of ripe experience in the manufacture of six cylinder cars—which is back of Model 54. The Oldsmobile unit power plant 3 point suspensions (bore 4¼, stroke 5¼) is a wonderful piece of machinery. In performance and appearance it meets every and all requirements, and astonishes the experienced motorist with its marvelous flexibility and power. Words cannot adequately portray its many good qualifications.

Matters of Comfort, Utility and Refinement

We learned how to build comfort into the Oldsmobile in the early days of the industry. If we knew of any better equipment or little matters of refinement than are on the Model 54 we would be the first to install them: But we have put everything into this car that spells utility, comfort and refin ment.

Prompt Deliveries

Never in the history of this Company have we been so well prepared to take care of our dealers by prompt shipment of cars as ordered. We began the delivery of our new models August first, and each day sees the regular quota of cars coming through the factory, tested and inspected down to the minutest d tail, on schedule time. You can absolutely count on all delivery promises being adhered to rigorously.

Write Us at Once

In a short while, orders for all cars available for the coming season wi l be closed, and we shall be unable to go beyond this point. We urge, therefore, that if you wish to sell a car that measures up to the highest standards of quality, workmanship and design, you write us at once, letting us know your prospects, size of territory desired, and your facilities for properly representing the Oldsmobile line.

RAYFIELD CARBURETORS

are Most Economical

in All Kinds of Weather
With All Makes of Cars
Using All Grades of Gasoline

Every Rayfield user knows that economy is one of the cardinal features of Rayfield carburetion, whether touring, hill climbing, racing or driving on the boulevard.

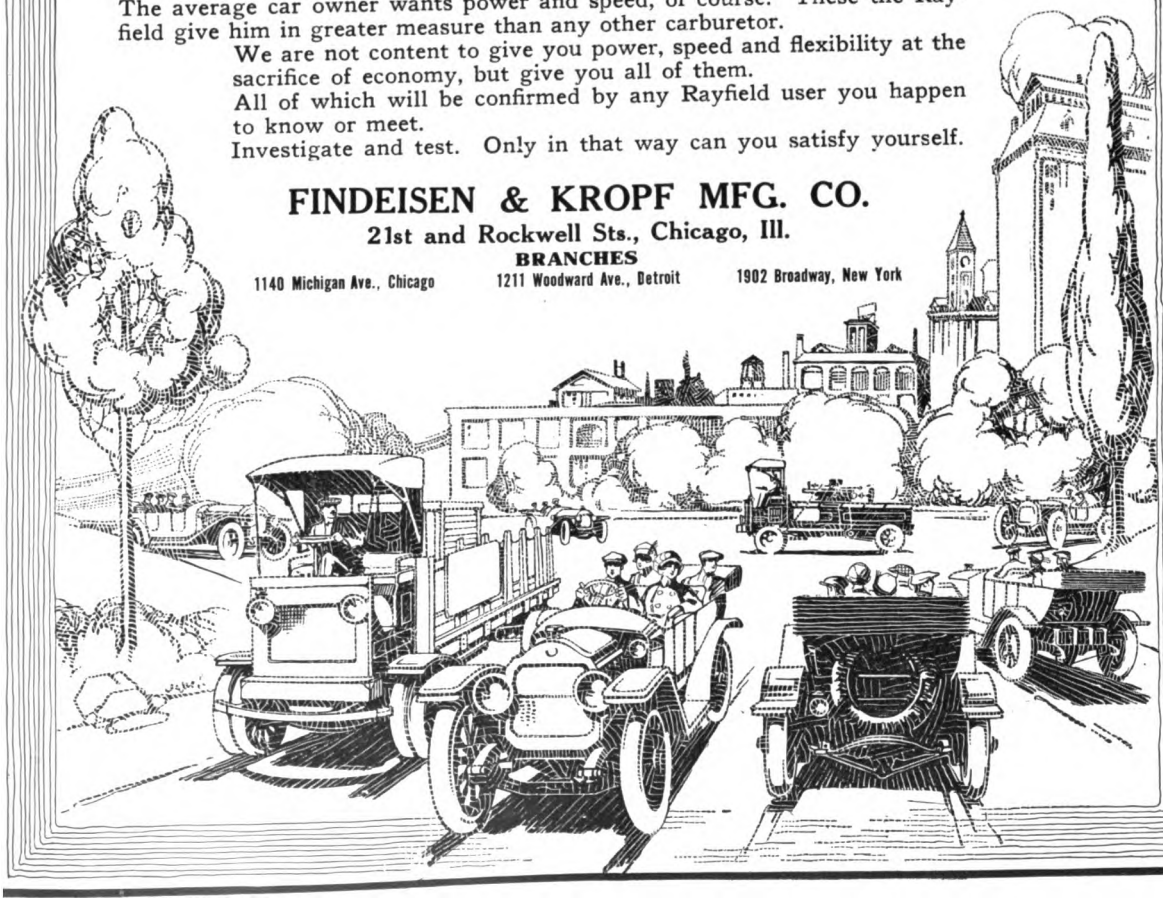
This carburetor, in the most recent economy tests for heavy, high-powered six-cylinder cars, established the world's record.

Many an owner of a car that was eating up gasoline and returning six, seven or at most eight miles per gallon, has installed a Rayfield and found his mileage increased and his operating expense reduced.

The average car owner wants power and speed, of course. These the Rayfield give him in greater measure than any other carburetor.

We are not content to give you power, speed and flexibility at the sacrifice of economy, but give you all of them.

All of which will be confirmed by any Rayfield user you happen to know or meet.



Investigate and test. Only in that way can you satisfy yourself.

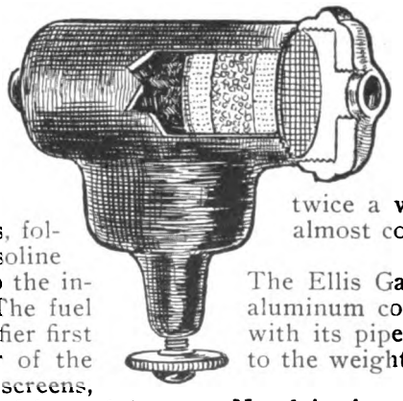
Commercial Gasoline

More carburetor trouble is traceable directly to foreign substances in the fuel than to the inability of the carburetor to vaporize the gasoline properly.



The remedy for carburetor trouble should be applied to the cause of the trouble. Remove the foreign substances from the fuel and carburetor troubles will cease.

Commercial gasoline, either high or low test, invariably contains more or less foreign matter, such as fine particles of dirt, parafine, sediment. Water collects and its presence is bound to cause trouble which ends in a "hang-up."

Probably no trouble is so dreaded by drivers as carburetor trouble. Carburetors come from the factory perfectly adjusted and even the most experienced driver hesitates to change the adjustment.

Their hesitation is natural and wise. The carburetor should do its work of vaporizing the fuel properly and when it balks, something is wrong. Invariably it is the fuel, not the carburetor which is at fault.

The Ellis Gasoline Purifier removes the cause of carburetor trouble and gives the carburetor a chance to do its work. It is more than a strainer; it filters and purifies gasoline without interfering with its free flow.

How best to understand the Ellis, follow in your mind the flow of gasoline from the tank through its pipe to the intake (left end in illustration). The fuel fills the lower portion of the Purifier first and as it rises into the cylinder of the purifier filters through a series of screens, first wire, then fine felt, quartz, felt, and last wire. Every particle of sediment, however fine, is removed, leaving nothing but pure gasoline to feed on to the carburetor.

We said that water caused a lot of carburetor trouble. This undesirable element is removed by gravity. It is caught in the lower chamber of the Purifier, and—owing to the greater specific gravity of water—the fuel rises over the water. Long before the precipitation chamber fills up with water and sediment it is drained off simply by loosening the thumb screw at the bottom of the Purifier. Once or twice a week is often enough, even with almost continual running.

The Ellis Gasoline Purifier is made either of aluminum composition or brass and complete with its pipe unions adds practically nothing to the weight of the machine.

No claim is made as to its saving in fuel costs for that is not its primary purpose.. While everybody knows that pure gasoline will develop more power than otherwise, *the great benefit of the Ellis Gasoline Purifier is found in its insurance against carburetor troubles and their recurrent expense.*

Write for booklet, information, prices and discounts to dealers.

Five-Passenger Touring Car $2900

Lyons-Knight

"THE CAR OF SILENCE"

Specifications

Engine—Lyons-Knight, four cylinder, four cycle, 4½ inch bore, 5½ inch stroke, water cooled.
Horse Power—50.
Oiling—Lyons-Knight pressure feed to all bearings, pistons and sleeves, regulated in accordance to engine power.
Carburetor — Improved double jet, especially designed, with adjustment on steering column.
Ignition—Dual, water-proof, high-tension magneto.
Clutch—Three plate, Raybestos faced.
Transmission—Silent, selective, three-speed, sliding gear type embodied in rear axle housing.
Driving Gear — Worm drive, silent, smooth and always efficient in operation.
Rear Axle — Full floating, Timken bearings.
Brakes—Two sets, double acting, internal and external on 16" rear wheel drums.
Wheel Base — 130 inches, tread 56 inches.
Wheels—Wood with quick detachable, demountable rims and 37 x 5 inch tires front and rear. Wire wheels special.
Gasoline Tank—22 gallon capacity on upper part of dash over toe board, giving gravity feed direct to carburetor.
Drive—Left hand drive with center control.
Equipment — Electric starting and lighting, with dash lamp and two-tone electric horn, patent one-man pantasote top with drop side curtains, special windshield with ventilator, dust cover, speedometer and clock, combination tire holder and trunk rack, two extra demountable rims, coat and foot rails, cocoa matting in tonneau and complete tool and tire outfit.
Prices—Five Passenger Touring Car, $2900. Seven Passenger Touring Car, $2980. Sedan Type, $3900. Berline Type, $4300; f. o.b. factory Indianapolis, Indiana.

Why No Other Car Can Be Compared To The Lyons-Knight

First—bear in mind this Lyons-Knight is a car of distinctive features—with Knight engine, worm drive and many other new and individual points—

Made in a great factory covering sixty-five acres with its own foundries, machine shops, drop forge and die cast plants, with six miles of its own railroad tracks within the factory itself—

Backed by unlimited capital to produce an unequaled car.

Guaranteed Better

We guarantee this Lyons-Knight engine, with its improved automatic force-feed oiling, new sleeve design and other features, to surpass the performance of any poppet-valve engine made of equal size—to surpass the performance of many six-cylinder poppet-valve engines of larger size.

The Lyons-Knight Worm Drive brings to this big 130 inch wheelbase car — a new and delightful freedom from the noise and grind of bevel gears. It delivers a greater per cent. of power—grows better and smoother with use.

"The Car of Silence"

really sounds a new slogan in the automobile world. A ride in the Lyons-Knight is different — as one man said, "It spoils the enjoyment of any other car." Its silent, smooth, efficient operation brings a new delight to motoring.

The Dealer Knows

the advantage of selling a car that is not in any other class.

The Lyons-Knight is so much lower priced than other high-class cars that there is no comparison.

It is so far in advance of any other car of its price that comparison is avoided.

It is in a class by itself. It cannot be compared to any car because it brings a new idea to the world of motoring.

That is why wise, far-seeing dealers are writing for information, coming to the factory and securing territory on the "Lyons-Knight."

There are definite reasons why you should learn all the facts quickly.

Get the Particulars

You may question these assertions. Ask us to send you the Lyons-Knight advance Catalog and the "Proofs of the Lyons-Knight."

We are willing to put the case up to a one man jury—you.

Act.

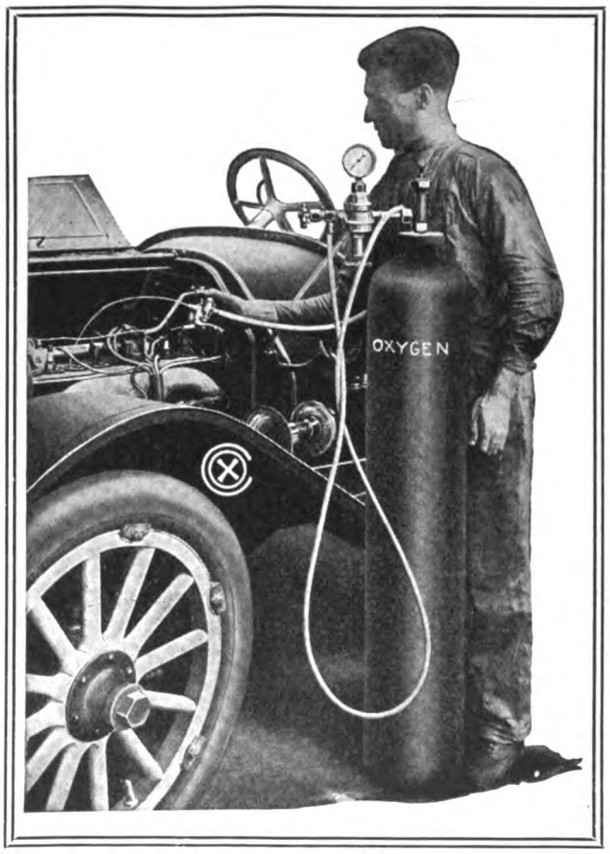
COX OXYGEN CARBON CLEANER

A Money-maker for your Garage — Prompt Service to Customers

THE Picture shows a Cox Oxygen Carbon Cleaner at work. Compared with the old, obsolete method of cleaning cylinders, the Cox Oxygen Carbon Cleaner does its work in a thorough manner, in about one-tenth of the time and returns to you a big profit on this branch of your work, besides doing its work in a way that does not tie up the car and deprive the owner of its use for more than an hour at the most.

A Thorough Job



The Cox Oxygen Carbon Cleaner burns off and consumes every particle of carbon deposited in a cylinder, even in the most remote corners, in from six to ten minutes. The device is absolutely safe to handle and can not cause the slighest damage to the motor.

Costs

The outfit costs $25 complete. You are not charged for the Oxygen tank—it is loaned to you. In each tank there is sufficient oxygen to clean from 35 to 40 cylinders. Refilling a tank cost $2.00 and this is the only expense after you have purchased the device.

Its Earning Power

Since the creation of the automobile no device has ever been offered to the dealer or garageman which will return such handsome profits to him as the Cox Oxygen Carbon Cleaner.

The usual price charged for cleaning a motor is $1.00 per cylinder. Sit down and figure this out. Outfit costs $25 and lasts a lifetime. Tanks cost $2 each. $15 per week man does the work. Time required to clean a cylinder, from six to ten minutes.

Other Benefits

Can be moved around any place in the garage. It is not necessary to remove cylinders, simply remove spark plug. The job is thorough and does not depend upon the workman's patience as does the old way of scraping the cylinders. You pay for the apparatus in a day or two and it immediately begins making a substantial profit. You make better satisfied customers. Can you afford to overlook this proposition.

Write for further particulars. Don't let your neighbor in business get the jump on you

The True Gauge of a Motor Truck's Worth

A MOTOR TRUCK succeeds or fails according to the ***cost per ton mile.*** The Stewart Hub Odometer supplies the last link in the data necessary to figure the cost per ton mile. You already know the total cost and the weight of the load. You've got to know the distance traveled. The Stewart gives it to you ***correctly.***

An instrument that is not always correct is worse than none at all. It misleads. In order to be sure whether your truck is earning or losing, and how much, you must be ***certain*** of your mileage.

The Stewart Hub Odometer cannot make a mistake. It is positive gear driven and cannot go wrong. There are no doubtful springs, pawls and ratchets. There is nothing that can fail.

When your figures taken from the Stewart Hub Odometer show too high a ton mile cost, you know there is something wrong about the operation of your truck. The danger gong has sounded. You can look for the trouble and set it right. Without this warning you may be losing money that a little investigation would save.

The Stewart Hub Odometer registers to 100,000 miles and tenths. It can be connected to a truck of any make and will outlast the truck. It retains its precision for life.

Whether you buy a ***gasoline*** truck or an ***electric,*** it will pay you to gauge its worth right from the start with a Stewart Hub Odometer.

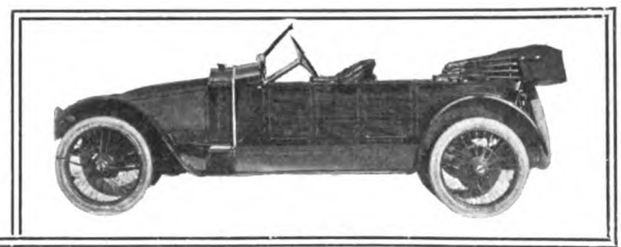
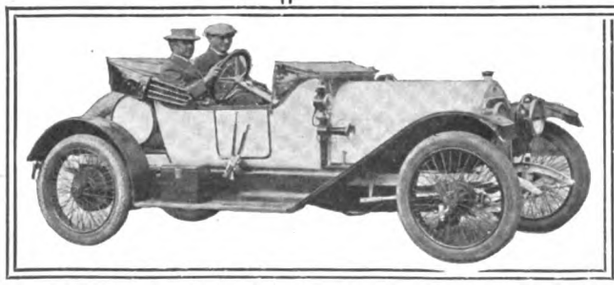
SAFETY





Compared with the millions of people who ride in motor cars, the number of those who sustain accidents from this mode of travel is a very small percentage. A certain percentage of accidents is inevitable but it is so small that the most pessimistic person alive does not think for a moment that motor cars, as they are built today, are unsafe.

But if there is a single stone left unturned to minimize the percentage of accidents, every manufacturer will, sooner or later, make the necessary refinement in his cars. The refinement we point to is the replacement of wooden wheels by steel wire wheels.

Possibly the most likely illustration of this point is found in the way railway companies have developed their trains from the wooden passenger car to "all steel" passenger coaches and Pullmans in order to get SAFETY FIRST with comparatively greater speed and comfort. A striking illustration of the inadequacy of the obsolete wooden passenger cars has been forced upon us repeatedly within the last three or four months. On the other hand, many of our foremost railways operate their limited trains at terrific speed, while none question the safety of traveling in their all-steel trains.

The Final Step in All-Metal Construction

THE McCUE
Buffalo

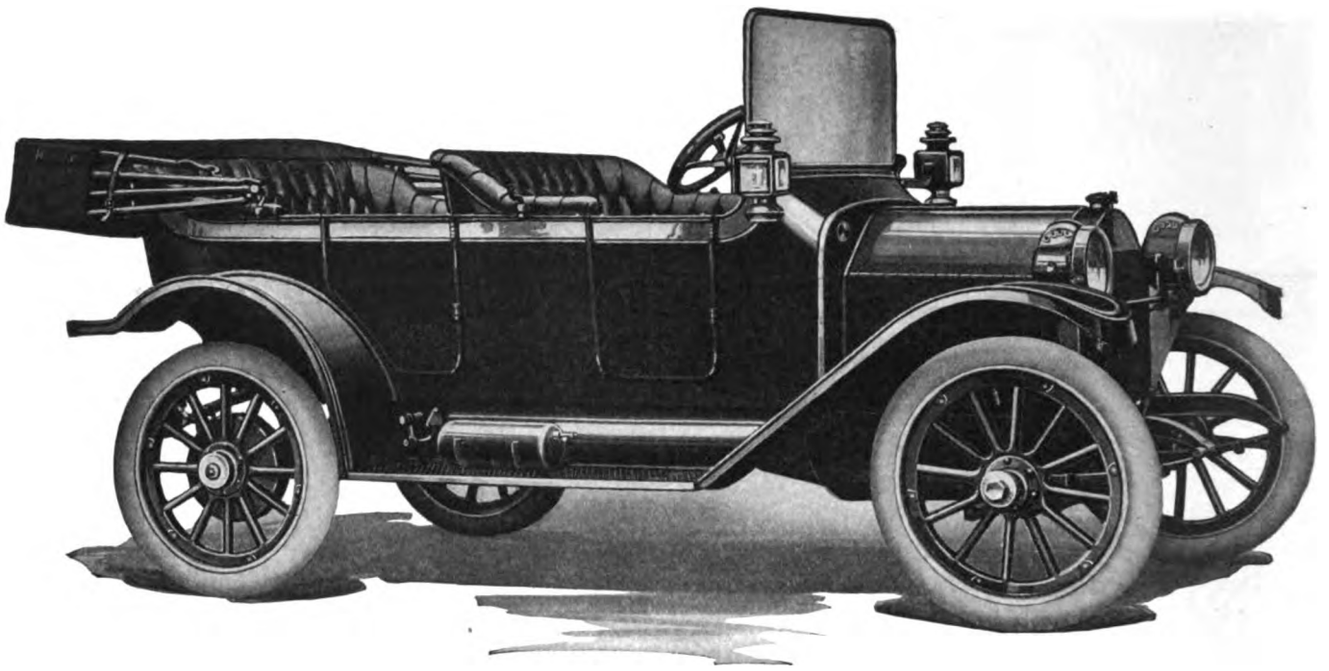
Digitized by Google

FIRST!

We hardly ever think of safety without it bringing to our minds the closely related thought of strength—strength to provide safety.

By tests, capable of exact determination, wire wheels have proven that they possess from five to seven times the carrying strength of wooden wheels. Observation of wire wheels in everyday usage has convinced engineers and other motor car experts of the practical value of the truths deduced from such tests.

Another and even greater result has been found both by tests and by use, that wire wheels have as high as fifteen times the strength of wooden wheels to resist side thrust. In the French Grand Prix Race at Amiens, this year a wire wheel equipped car, colliding with an embankment, turned completely over landing upon its side. The driver and his mechanician righted the car, changing one rear wheel because of a torn tire (the wheel was not bent, even slightly), whereas the front wheel, which sustained an even greater blow, but whose tire was unhurt, was left on and the car continued in the race.



A full test of the strength of wire wheels hardly ever would occur in everyday motoring, but the performance of wire wheels under the most gruelling tests give good indication of the service that reasonably can be expected of them under ordinary conditions.

A rainy day and slippery pavements is an ordinary occurrence and present conditions under which skidding is sometimes unavoidable. A car, skidding into the curb, would have to strike it with a blow considerably harder than would collapse a wooden wheel to even bend a wire wheel. Under the worst kind of skidding the wire wheel, though bent, still would enable the car to limp home or to the nearest repair station. With the wire wheel, all that can come is a small bill for straightening; with a wooden wheel a complete replacement. The collapse of a wheel may cause excessive damage to the other mechanism of the car.

Investigation will remove all doubt as to the strength, and consequent safety of wire wheels. Many of our announcements have pointed out the economy of wire wheels on tires. It is at least a 50% saving. While such a saving is a sordid virtue when compared with the safety of wire wheels, this very tire economy adds to the already overwhelming factor of safety in favor of wire wheels.

Detroiter

A Smashing Value

Made the Selling Record of the Year in Its Class; Will Better It in 1914

More Attractive Than Ever for Dealers

We believe it is good policy to pass our success around. Accordingly we are making even a better proposition to our dealers than ever before.

Next season the Detroiter will have everything you have been looking for — price, beauty, equipment - it will continue to lead.

We have never had a traveling salesman; we have never needed traveling mechanics. That money goes into the car.

It may take quick action on your part to get territory, for this car that, out of 192 makes, has jumped to eleventh place in point of sales within two seasons.

But we'll do our share, now and hereafter, if you are out wholeheartedly for a good car.

Meanwhile, ***get our proposition by return mail.***

Chalmers—1914

The New "Six"

$2175

Fully Equipped, f. o. b. Detroit

T-head motor
4x5¼, 40-65 H.P.
All moving parts enclosed.
Electric Starter.
Left drive, center control.
Bosch Magneto.
132-inch wheel base.

The Ruler of a Kingdom

The man who sits at the steering wheel of his new Chalmers "Six," rules an empire. Here within reach of his arm is a little world all his own. Power, speed, endurance—the forces that make for change and enjoyment—are under the sway of his sceptor.

Let's Take a Day Off

Don't you feel like cutting the traces and getting away to the hills? Let's strike out—what do you say?

Push the switch of the electric starter. There—the engine is running with scarcely a sound. It's the silent Entz starter—the best yet—it never fails.

Floating Away Like a Swan

Close your eyes now as we let in the clutch and see if you can tell when we start. This new clutch is a wonder. The steel discs with their many fingers of cork, grip so firmly, yet so gently, that we move away with the silent grace of the swan.

Notice how flexible the power—mounting quickly to 20, 30, 40 miles an hour. Now we throttle it down to a crawl, without shifting gears.

This wondrous flexibility is in the motor itself. There's no need to resort to cumbersome double gearing.

Easy Chair Comfort

Have you noticed that you don't feel the vibration you do in most cars? The six cylinders of this Master Motor give an unbroken stream of power, there is no interruption in the push of the pistons. So there's a smoothness impossible in any "four"; a lack of vibration that adds years to the life of the car.

The new "Six" costs but little more than a "Four" at the start and a lot less in the end.

A Little Friend In Need

Try to stall this motor once. Throttle it down to a snail's pace—run it into that deep sand ahead.

It's no use—this motor is unstallable. Even should the gas be cut off accidentally, the electric starter—always on duty—keeps the motor running. It can never "go dead" in a crowd or on a crossing.

Beauty That Has Utility

Don't shrink as we run through this stretch of mud. Those graceful oval fenders sit so close not a drop of mud can reach you. The extra wide doors fit like a watch case. The long underslung springs cushion the bumps of the roughest road.

Left hand drive and center control leaves room to enter on either side.

Put This Car to the Test

Let our dealer take you out on our Standard Test Ride. It imposes no obligation. It's a part of our regular sales plan. It is our way of proving to you that this car will do things that no other car will do.

But first write for our literature. Get all the facts.

MODELS AND PRICES

Roadster	$2175	Six Passenger	$2275
Four Passenger	2175	Coupe	2850
Five Passenger	2175	Limousine	3600

All bodies interchangeable. Wire wheels, $80 extra (five).

The Foreign Trend

The builders of motor cars abroad are constantly introducing new idcas, new body designs, new equipment and new methods of construction.

There are wire wheels and worm drive now. And other things are promised.

But some things there, as here, are standard.

One is The Jones Speedometer.

Seven years ago The Jones became Europe's most popular speedometer.

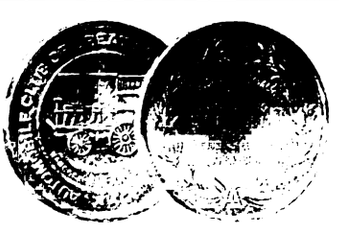
It won the Royal Automobile Club's gold medal for all around superiority in a test that covered 2,000 miles and lasted 30 days.

It was placed on the cars of the King of England, the Emperor of Germany, the Czar of Russia, the King of Italy, the King of Spain, and the Kings of Siam, Norway, Sweden, Denmark and Belgium. The President of Switzerland and the President of France, and hundreds of other notables used it.

It is used by these rulers and thousands of others on the best cars today.

No other speedometer ever gained such prestige or was ever so widely sold abroad. No other sells there today like the Jones. The love of new things—the foreign trend—doesn't dislodge the Jones.

It is regarded as the Standard Instrument because of its accuracy. And nobody ever thinks of displacing it. The makers of thousands of American cars are factory-equipping their product this year with the New Jones Speedometer.



They expect their cars to be used the year 'round and they know the Jones isn't affected by temperature. The Jones is the Universal Speedometer. Makers and owners are finding this out. It is accurate, *always*. The simplest in principle. And the longest-lived.

It's the product of Jos. W. Jones, the inventor of the speedometer as used on motor cars. Nothing else will ever serve like the Jones Speedometer.

Let us send you the man who knows it in detail and can give you the fullest information in regard to placing it on your car.

THE JONES SPEEDOMETER

Broadway at 76th Street NEW YORK CITY

This is the Gold Medal presented to The Jones Speedometer by the Royal Automobile Club of Great Britain and Ireland. Eleven different instruments competed in the test—foreign and American makes. The Jones made the only perfect score on seven points of superiority. And the Jones is the only speedometer that has ever won this medal.

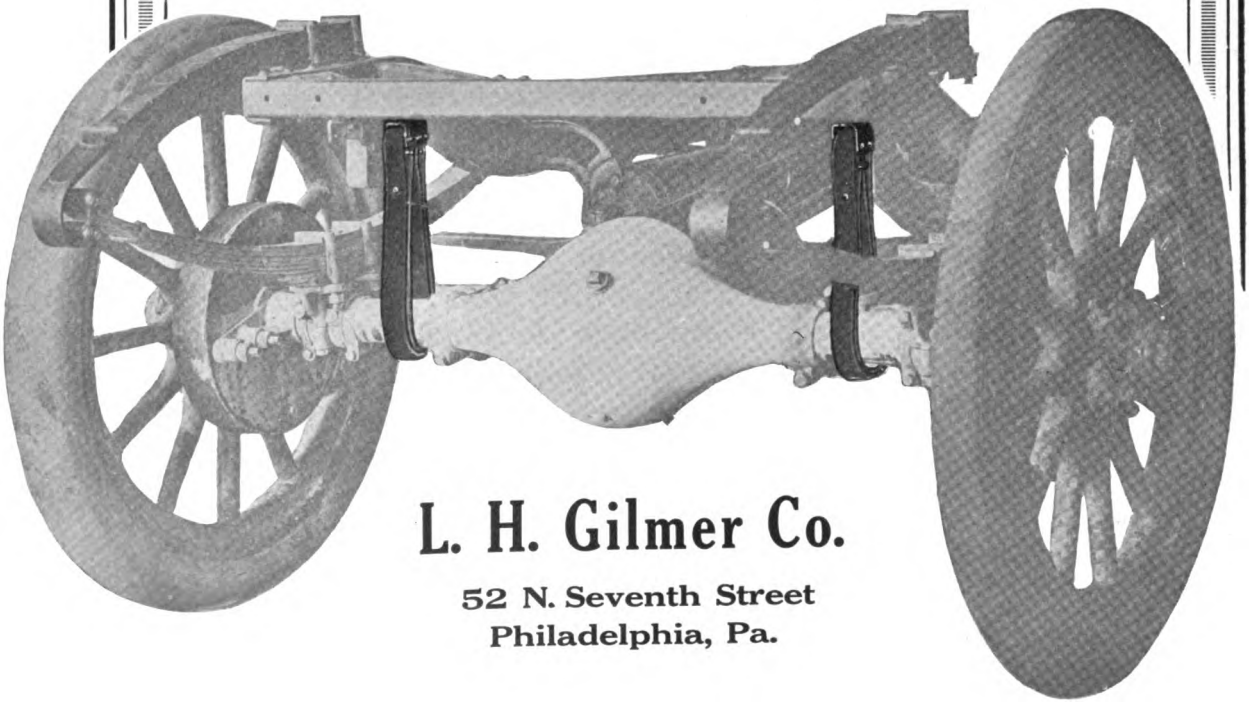
INSURE your customers against spring breakage—at the same time that you are making a nice profit by handling Gilmer Rebound Straps.

Gilmer Rebound Strap



Gilmore Rebound Straps come in three different lengths, and they are made endless and woven from the highest grade long cotton yarn tested to 5000 pounds. They are waterproofed and weatherproofed, and guaranteed unbreakable for a year's service.

The fact that these straps have been tested and then adopted by the following car makers as regular equipment is ample proof to you of their superiority over the old-fashioned short lived leather straps---as well as proof that there is really a big demand for Gilmer Rebound Straps. The following cars are equipped with these straps: Packard, Cadillac, Hudson, Hupmobile, Premier, Cartercar, Westcott and Chevrolet.

Special for Ford Dealers

As special equipment for Ford cars we can supply you with with Gilmer Rebound Straps that can be installed in five minutes without drilling holes or requiring any special fittings. In use on Ford cars these straps not only protect the springs and occupants of the car from the extreme rebound jolts but they eliminate all sidesway and hold the car level.

Write us today for our special dealers' proposition on this fast seller. We also manufacture fan belts, endless belts of all kinds and cotton woven lacing to prevent hood rattling.

HYATT QUIET BEARINGS

THE flexible Hyatt Roller absorbs vibrations instead of transmitting them, as in the case of a rigid bearing, and thus reduces the noise.

Hyatt Roller Bearings, by cushioning the road shock, relieve the gears and shafts of strain. The smooth Flexible Rollers give under excessive jars or jolts, but are rigid enough to carry the load and remain round.

Hyatt Roller Bearings are self cleaning and have a perfect system of lubrication. The hollow rollers carry the lubricant and the spirals, alternating from left to right, spread it throughout the bearing.

Any dirt or grit that gets into the bearing is forced into the hollow center of the roller through the spiral slots and is carried in the lubricant. This feature prevents it from grinding or cutting the bearing.

Our engineers' date book will give you complete information in regard to sizes, loads, etc.

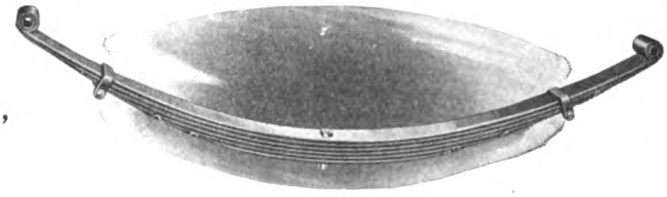
Never Before Such Springs as These!

Cleveland-Canton Automobile Springs

Springs that outlast ordinary springs three to one — springs that never seam, crack or split— springs that mean long life, reduced upkeep, retarded depreciation of your cars.



Steel experts tell us they have reached the limit in this new "cross-rolled" process. Instead of rolling the steel longitudinally only, the steel used in Cleveland-Canton Chrome-Vanadium Springs is worked both longitudinally and transversely.

It is knit closer together, more homogeneously, more uniformly. It is free from blow-holes, flaws, and hidden defects.

Only such steel is fit for Cleveland-Canton Chrome Vanadium Automobile Springs. We use it exclusively.

Cross-Rolled Chrome-Vanadium

"Not a Bump In One of Them"

"Built for Life-Long Endurance"

Poor springs ruin cars. For an engine cannot long stand the severe jolting and racking such springs permit.

But Cleveland-Canton Chrome-Vanadium Springs stand terrific strains, absorb the shocks, and are amazingly enduring. *In five years not one Cleveland-Canton Chrome-Vanadium Spring returned because of breakage or settling.*

If you want to
—Prolong the life of your engine
—Reduce up-keep expense
—Retard depreciation
—Add to comfort and safety
—Prevent delays and repairs

See that your cars are equipped with Cleveland-Canton Chrome-Vanadium Springs. They shield the whole delicate mechanism of the car and carry it gently over rough roads. You should be vitally interested in this. Let us tell you the whole story. Write today.

Unit Power Transmitting Plant of a Timken-Detroit Rear Axle

TIMKEN-DETROIT
AXLES

The Teeth that Always Fit

Part II

A Sequel to the Gear with the Polished Teeth

THESE gears with polished teeth are made to fit. ¶ The angles and curves of their shining surfaces are exact. ¶ They are fixed by the Timken process of grinding every gear to its master pinion, every pinion to its master gear.

But that accuracy of gear-grinding is not enough. We must know that the teeth will fit *after the gears are installed, as long as they are in the car*—or uneven wear, noise. and loss of power would result.

How We Know the Teeth Will Fit

All the gears are supported by a pear-shaped carrier bolted to the front of the axle-housing.

The pinion shaft enters from the front. the driving gear and differential are supported by two curved arms extending into the housing at the rear.

It is because we know that carrier is made right that we know the teeth of the gears will always fit.

Four Big Problems

The front of the carrier must be in a plane exactly at right angles to the plane of the drive-gear; the axle shafts must also be exactly at right angles to the plane of the drive gear; and at exactly the right distance from the pinion; the pinion-shaft must be exactly parallel to the plane of the drive-gear.

These four problems are each double—each step must be done right, each must be proved right after it is done.

The doing and the proving are two mighty interesting chapters in the story of "The Teeth that Always Fit."

In the next issue of this magazine you will find Part Three of this series, on "The Four Holes."

NOTE:—To get the full significance of this series you should read Part I —"The Gear with the Polished Teeth," which appeared in the previous issue. If you haven't a copy we shall be glad to mail you one.

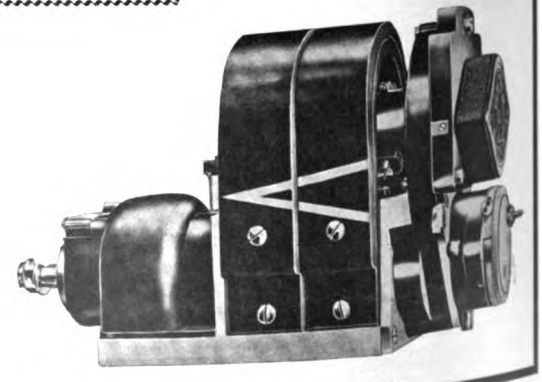
EISEMANN

100% Efficiency

OF the nineteen cars that made the trip from Indianapolis to the Pacific Coast in the recent Indiana-Pacific Tour eleven depended upon Eisemann Ignition. Here was a striking illustration of the faith American automobile manufacturers had in the dependability of Eisemann products before the tour. Each one of the eleven Eisemann Systems made the trip without missing a shot and sustained this extreme test of their efficiency with absolutely perfect scores.

Fording rivers, pushing through mud, dusting through clouds of alkali, one day on the level plains, the next climbing mountains, over all kinds of roads, meeting the varying conditions of atmosphere in extremely high altitudes and sea-level with the same characteristic efficiency as if working under normal conditions of uniform everyday use—this is the sort of ignition you want on your cars.



You have no requirements, whether you make pleasure cars or trucks, that an Eisemann System cannot fulfill better than any other. And we say this advisedly. Closer limits are common in truck practice than in the pleasure car field when it comes to economical working. Sixty-four or more manufacturers in America are now using Eisemann Ignition, thirty-nine of which are truck manufacturers.

What Eisemann Ignition is doing for thousands of others it will do for you—if you but give it a chance. Communicate direct with our nearest factory branch or through your dealer.

The Car You Can Sell Against Both High and Low-Priced Sixes

In the Havers 6-60, at $2485, with the most complete equipment ever put on any car, we offer you a car that occupies its own field.

And that field, you recognize, virtually removes the car from both high and low-priced competition.

On the other hand, the Havers is so high in quality, and makes such a complete offering of all the six-cylinder advantages, that it is bound to attract buyers from both classes.

The man who has paid more for his six has not had—and will not get—more than the Havers 6-60 brings him; a fact that will impress itself upon him when he sees the 6-60.

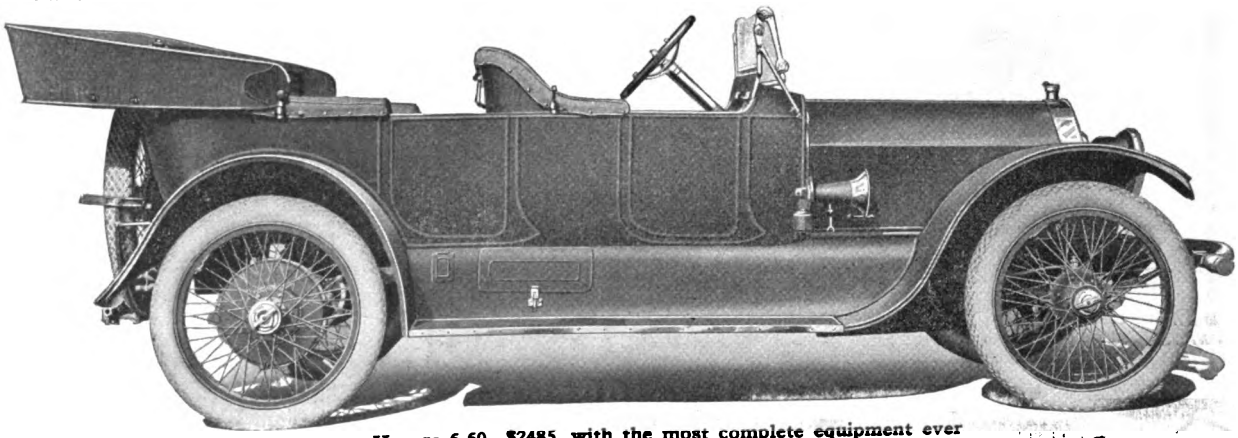
The man who has had one experience with the average six of low price now realizes that his car fell short in many respects.

So there are two great bodies of men who are potential Havers buyers.

Havers dealers took all of the 1913 product we could build. The close of the selling season found the factory floors and the dealers' floors clean of cars.

The 1914 production is now going into dealers' hands. New contracts are being closed. All our old dealers are holding the line; new ones are coming in, for we shall build more cars for 1914.

Every dealer who has investigated the Havers record in the past year, and the new car, sees for it sales even more readily closed.



Full-powered, high grade, built of standard units of known quality and highest repute, more completely equipped than any other car on the market—the Havers 6-60 offers all that any six can offer, and more than most.

If you have or can make a place in your business for such a car our advice is to waste no time in getting in touch with us.

1914 Features

Seven passenger body.
Seat covers.
Front bumper.
Rear double tire irons.
Klaxet horn.
Power tire inflator.
Rain vision windshield built as part of body.
Gasoline gauge.
Air pressure gauge.
8-day clock.
Ammeter.
Volt meter.
Large dial speedometer.
Two cowl-board lights.
Tonneau light.
Oil can holders.
Electric starter and lights.
10 gallon reserve gasoline tank at rear.
Foot scrapers on running board.

HAVERS MOTOR CAR COMPANY, Port Huron, Michigan

INVADER OIL

Why the Owner Should Use It

¶ It will lessen mechanical depreciation. It will lessen the expense of grinding valves. It will keep the whole interior of the cylinders cleaner—adding both compression and power. It will keep the motor cooler and make it run sweeter.

¶ Invader Oil is refined from Pure Pennsylvania Crude, is distilled and filtered, and has maintained only one Standard of quality ever since the automobile came to this country. It is the Pioneer Light Oil and is better than other oils for the very simple reason that it has a higher gravity, a higher fire test and a lower carbon test.

¶ If your dealer does not carry Invader Oil we can supply you direct, freight prepaid, in any quantity. Just write us.

I. O. C. GEAR OIL puts noisy gears to sleep. It reduces friction and absolutely eliminates noise. Write for prices and descriptive booklet.

INVADER OIL

Why the Dealer Should Carry It

¶ While it is not the cheapest, it is the highest grade oil made in this country today and every dealer has certain customers who will use the best oil even if they have to pay ten or fifteen cents more for it.

¶ It adds to the tone of any establishment to carry a stock of high grade goods, no matter what they are.

¶ The increased cost of Pennsylvania Crude has lessoned the supply of high gravity oils and flooded the market with low grade, low gravity oils, totally unfit for automobile lubrication.

¶ Invader Oil has a higher gravity than other oils, and it is a well known scientific fact that high gravity oils are freer from carbon than low gravity oils. Write us.

I. O. C. GEAR OIL is the only oil ever made especially and exclusively for automobile transmission gears. Write for prices and descriptive booklet.

H U P

The 1914 Hupmobile is in the hands of Hupmobile distributers.

We believe this new Hupmobile to be the **best** car of its class in the world.

By **best,** we mean best in internal essentials, especially. We mean best in those things which make for long life and continuous service at lowest cost.

But we believe you will also pronounce it the **most beautiful** car of its class in the world.

We believe we have put **more money into the chassis** than any car of its class in the world.

We base these beliefs on our conviction—

That the production of this new Hupmobile incorporates a greater tonnage of **high grade steel** than any car of its class in the world;

That this new Hupmobile is the **largest user of aluminum**—without regard to class or price—in the world;

That the frame used in the new Hupmobile **is the costliest piece of pressed steel construction used** by any car of its class in the world;

That the Hupmobile long-stroke motor will **outpull any engine** of its class in the world;

That the Hupmobile **pressed steel body** — designed by us and built by the builders of Pullman cars—is the costliest body used by any car of its class in the world;

That Hupmobile **springs** utilize a greater tonnage of **costly** steel — more than 2,000 tons — than any other car of its class in the world;

That Hupmobile bearings—Timken and Hyatt—are the best in the world; one whole Hyatt building being devoted to Hupmobile bearings.

We repeat—for readiness; for ruggedness; for smartness of style; for fineness of finish; for daily work on the road; for extremest economy—we believe this new Hupmobile to be the best car of its class in the world.

Details of The 1914 Hupmobile

Long-stroke, small-bore motor; cylinders cast en bloc, with enclosed valves; three bearing crankshaft, hollowed for circulation of oil; chain drive for magneto and cam shaft; unit power plant with multiple disc clutch; full floating rear axle; hood harmonized with body, without abrupt break at the dash; gasoline tank under the scuttle dash or cowl—

These are Hupmobile features which were new to the American market when the present type Hupmobile was introduced almost two years ago.

They are standard in the Hupmobile for 1914; many of them have been adopted by other American manufacturers; and a forecast of the 1914 European models published July 3 in "The Automobile"—the recognized authority—shows that nearly all of them are included in the latest Continental productions.

More than that, they remain Hupmobile standard because, in nearly two years of service, they have demonstrated their worth.

The body is unchanged, save for minor detailed improvements. The back of the front seat, in the touring car, is upholstered; the doors are upholstered, with pockets, and given a more substantial appearance.

A rain-vision, ventilating windshield, replaces the present type, though still hinged at its point of attachment to the car, so that it can be lowered forward if desired.

The capacity of the gasoline tank is increased approximately three gallons.

Oversize tires—33x4-inch—will be regular equipment for the $1200 car; also demountable rims, one extra rim and rear tire carrier, which clamps the rim without touching the rubber casing.

An electric horn, concealed under the hood, is included in the equipment. The horn button is at the center of the steering wheel.

Electrical starting and lighting are accomplished by the Westinghouse two unit system—separate generator and starting motor—with independent magneto ignition. Thus the ignition is not cut off in case accident should befall the generator, nor is the starting motor disabled for like cause, having the battery's store of electricity on which to operate—an advantage not found in systems where all electrical functions are centered in one machine.

The six-volt starting motor is practically built into the Hupmobile engine.

By means of a pedal convenient to the driver's left foot, a gear is shifted into engagement with a gear on the flywheel. The same motion of the operator's foot that engages the gears also closes the starting switch, and the starting motor is revolving slowly before the gears engage, thus greatly facilitating the operation.

The electric lighting equipment includes two headlights, with 16 c. p. bulbs adjustable for focus, and combination electric and oil side and tail lamps.

Current for the lamps is drawn direct from the generator, except at very low speed on high gear; so that the battery current is used only for the starting motor. The generator automatically keeps the battery up to full charge at all times.

$1395.00

GREATEST MOTOR CAR VALUE OF THE SEASON

Our second season of Motor Car building, but we have a quarter of a century of Manufacturing experience.

IMPORTANT SPECIFICATIONS

Electric Auto-Lite starting and lighting system (generator and electric motor in separate units, storage battery and all connections, switches, etc.)

Stream-line body.

Left side drive, center control.

Multiple disc clutch with Raybestos lining (dry or oil).

Wheelbase, 118 inches.

Motor cast en bloc, 4⅛ x 5.

Unit power plant—three point suspension.

Enclosed valves.

Warner Muncie selective type transmission with imported bearings throughout.

34 x 4 tires. Demountable rims.

Hess full floating rear axle with pressed steel housing and imported annular ball bearings.

Brake drums, 14 inches, all enclosed.

Gasoline tank in shroud dash.

Steering wheel 18 inches—irreversible gear.

Strictly No. 1 machine buffed leather used in upholstering.

Deep tilted cushions.

Ammeter.

Splitdorf magneto.

Battery and lighting switches and all dash equipment in auxiliary dash convenient for operator.

One-piece windshield built integral with body.

Genuine mohair top and boot.

Quickly adjusted inside curtains.

Electric horn.

Stewart revolving dial speedometer.

Heavy nickel trimming throughout.

Headlights, 12½ inches.

Bullet side lamps.

Foot rest rail. Nickel robe rail.

Tire irons, pump, jack, tools, tire repair kit, etc., complete.

We Make *Pneumatic* Tires Only And Therefore Make Them Well

THE SPECIALIST is a leader because he can produce in his particular line *better* than the man of general attainments. We are Specialists in the Manufacture of Pneumatic Tires. For fourteen years, since beginning business, we have made nothing else.

The outcome is what anyone would expect—SUPERIORITY—fairly reflecting such concentrated effort—an exclusive construction, known as Fisk Heavy Car Type, in which are embodied the lessons we have learned.

The *Quality* of our product is backed by integrity that has never been questioned, and an organization which, from the President down to each of the Branch Managers and assistants, is dominated by a spirit which places "the satisfaction of customers," whether dealers or consumers, above all other considerations.

We make Heavy Car Type Fisk Tires in all styles to fit all rims—Plain Tread or the famous Town Car (non-skid) Tread. Write Dept. 23 for Fisk Dealer Proposition.

At Last—A Plan

Dealers Can Sell CORREJA Cars on Time

No Disagreeable or Humiliating Methods Enter Into Plan; Nothing But a Clean-Cut, Business-Like Arrangement.

Thousands of people would own cars if they could buy them on time. It is true they can now, but in a most disagreeable way and with the humiliation of having a chattel mortgage attached. The Correja Plan is simply the adaptation of business methods in vogue in every-day commercial life to the purchase of an automobile.

THE PLAN

The Dealer is required to invest $1500. We provide a demonstrating car free, so that an established dealer or a prospective dealer can secure the Correja agency and suitable territory at a minimum outlay.

The Dealer receives commissions (in cash) for all cars sold, immediately upon acceptance of order by the factory.

The Dealer takes deposit with order.

The Factory takes purchaser's notes for balance of purchase price.

The Factory assumes all risks.

The Factory makes all collections.

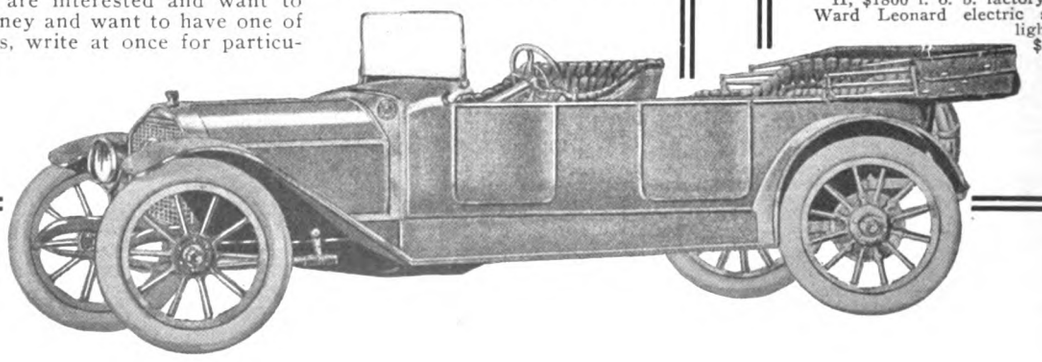
The Purchaser buys a car just as a merchant would buy a bill of goods on time, or as a manufacturer buys his machinery and equipment—on notes, payable as they mature.

The Purchaser pays no more than $1800 (list price) whether buying on installment plan or for cash.

The Purchaser receives unexcelled car value, service and courteous business treatment at all times.

Banking References: Bradstreets, Duns, or any New York Bank.

Not having spent a fortune in advertising in publications charging from two to five thousand dollars per insertion to get this car before the public, we are in position to offer it at a price ranging two-thirds less than the well known advertised cars, none of which can excel the Correja, the car which is "Built on Honor."



We want to show you how to get a Correja car for yourself absolutely free and to make a large revenue by becoming a Correja dealer.

If you are interested and want to make money and want to have one of these cars, write at once for particulars.

THE CAR

The illustration shows the Correja Six Cylinder, 50 H. P., 1914 Model H. CORREJA cars are "Built on Honor."

WHEELBASE—125 inches.
MOTOR—Six cylinder, T head, cast in pairs; silent chain driving timing gears. Bore 3½ in., stroke 5 in.
IGNITION—Magneto generator.
LUBRICATION—Force feed splash.
STEERING—Worm and gear type; 18 in. handwheel with mahogany rim.
CLUTCH—Correja cone type.
TRANSMISSION — Selective, three speeds forward and reverse, located on rear axle. Chrome nickel gears, nickel steel shaft, annular bearings throughout.
AXLES—Rear, full floating with bevel gear removable through axle housing from rear; annular bearings. Front, drop forged one piece I beam section. Yokes and steering knuckles, steel forgings.
WHEELS — Heavy artillery type, selected hickory.
TIRES—34 x 4, standard make.
SPRINGS—36 in. semi-elliptic front; 44 in. three-quarter elliptic rear.
BRAKES—Two pair, internal expanding in pressed steel drums.
BODY — Exceptionally strong and rigid. Sheet metal over hardwood frame. Upholstered in black leather over deep coil springs.
PAINTING—Beechnut brown standard.
EQUIPMENT — Extra demountable rim, headlights (2), dashlights (2), tail light (all electric), windshield, top with side curtains and boot. Tools and tire repair kit.
PRICE—60 H. P. Six Cylinder Model H, $1800 f. o. b. factory.
Ward Leonard electric starting and lighting system, $100 extra.

THOMAS HOWARD COMPANY, Inc., Sole Factory Representative

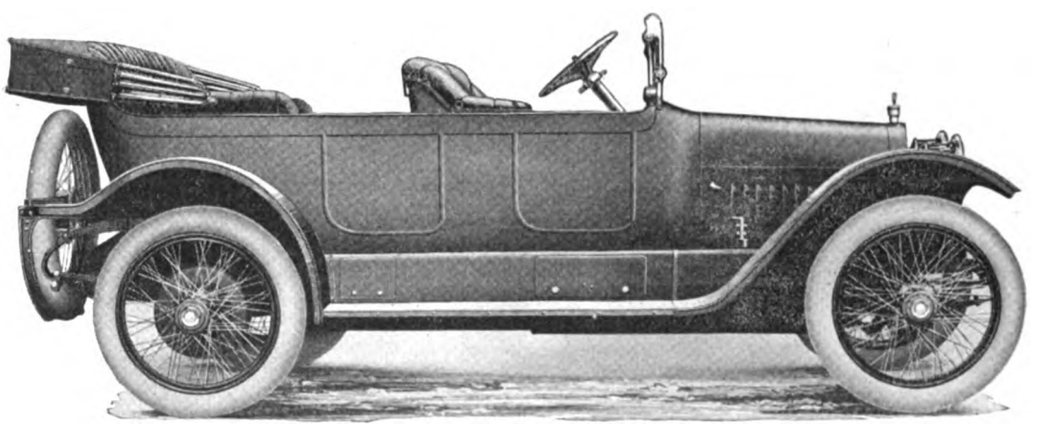
Wideawake Dealers are requested to write or wire for Sales Plan and Territory. Don't let the other man get ahead of you.

Digitized by Google

Consider what it would mean to YOU to sell the Stearns-Knight



—consider what it would mean to sell a car so simple in construction—so free from complications—that a minimum of attention is required after the sale.

Consider what it would mean to have the owner so well satisfied that he is constantly **working for you.**

And consider what it would mean to enjoy the prestige which goes with the name Stearns—to know that you are backed up by one of the oldest and strongest manufacturers in the industry.

These advantages weigh heavily with dealers who can see beyond the immediate sale. And they do not mean restricted contract conditions—on the contrary the Stearns contract is probably more liberal than that of any other high grade car manufacturer. There is still territory open for the right kind of dealers.

THE F. B. STEARNS COMPANY
Cleveland, Ohio

Stearns-Knight Four-Cylinder, Five-Passenger Touring Car (Wire Wheels Extra)

The new 1914 series of Stearns-Knight cars are the most noteworthy models ever produced. In addition to the wonderfully efficient power plant, the best ideas of late American and European practice have been incorporated in a remarkably wide range of models.

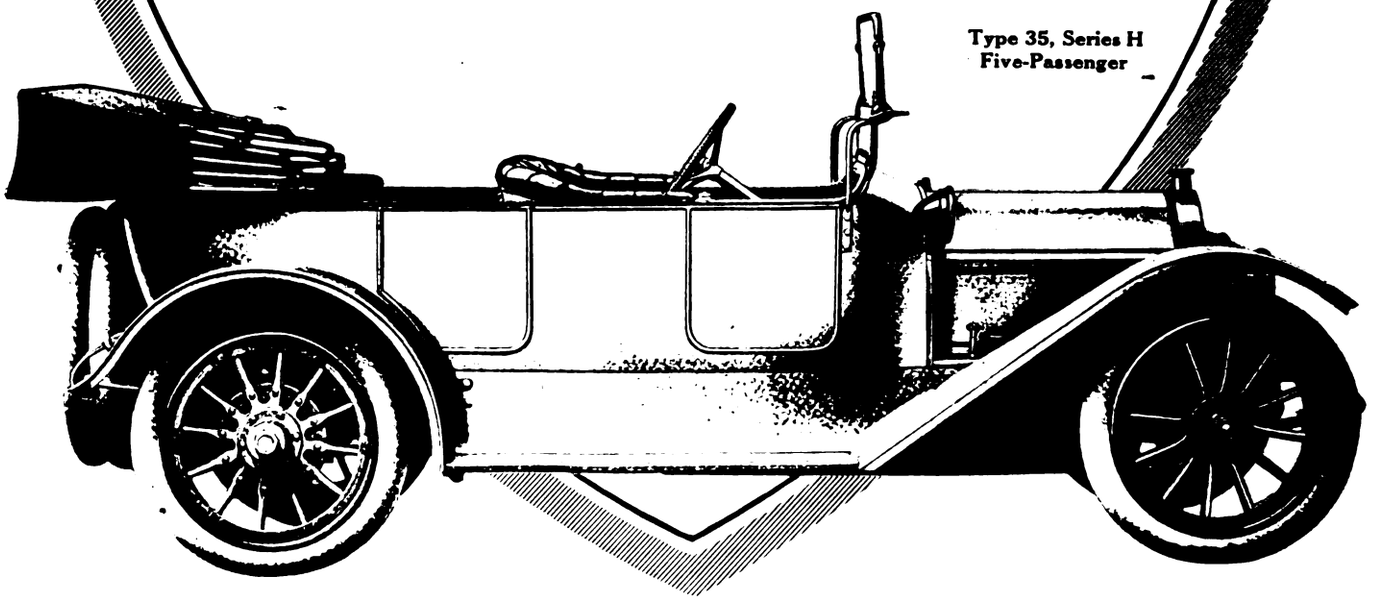
Digitized by Google

MERCER

A Constant Winner

A 300 CUBIC INCH MERCER driven by Ralph De Palma, won the 302-Mile Cobe Trophy Race at Elgin, Ill., Aug. 29, at an average speed of 66.8 miles per hour. This is the third consecutive year the Mercer has won the 300-inch division of the Elgin races.

The winning of one race, or even several races, does not necessarily indicate that any particular car possesses superior qualities from a speed and utility viewpoint, consistency, continued participation in racing, and the comparative merit of a car's performance is what proves its claim to championship honors.



The Mercer record for the past three years speaks volumes.

There is no greater asset for the dealer than the car's actual performance. Think what Mercer victories mean to Mercer dealers

Europe's Leading Car

Lancia

sells at AMERICAN PRICES

Town Coupe.
30 H.P.
Price $5500

The average would-be owner of a foreign car associates out-of-ordinary quality with prices beyond reason. He, in common with the majority of those who understand car value, wants such a car; but the prices of European products are prohibitive.

Lancia cars with all of the swing, dash and exclusive design, that only foreign designers and artizans can make possible, sell at American prices.

Lancia cars, made from steel that only Europe can turn out and with engineering features that America cannot touch, sell for American prices.

You, Mr. Dealer, have a market place for the Lancia, the car of durability, silence, flexibility, speed and rakish design. We will help you make your sales. Write and get our plan and proposition.

THE STURDY STUTZ
MADE GOOD IN A DAY

Get the New Stutz Series "E" Catalog—Now Ready

See the Sturdy Stutz Before You Decide

All we ask is, that before you select your next motor car, you compare the Stutz, part by part, with any car at any price—then you, too, will decide in favor of the Sturdy Stutz.

New Models Even Better Than Previous Stutz Cars

In the new Series "E" Stutz, no radical mechanical changes have been made—they were not necessary. Just a few details have been altered, insuring even greater service and power, with a few touches that add to the graceful beauty lines for which all Stutz Models have been famous.

The bodies of the Touring Cars are larger, roomier and even more comfortable than ever before. The upholstering is more generous, the springs are a little longer—the same perfection mechanically has been maintained.

The Electric Starting, Lighting and Ignition systems are **separate units**; simple, dependable and easy to operate.

So before you decide, write for our new illustrated Catalog No. A-15, Series "E." We will put you in touch with your nearest Stutz dealer.

We still have some desirable territory open and will make a satisfactory contract with responsible dealers—write us.

No Man Knows
Greater Tube Quality

No man—whether he be manufacturer, dealer or user—knows greater quality than we give in Marathon Tubes. No tube can have greater quality built into it. That is impossible. In Marathon Red Inner Tubes, we build in the most and the finest quality it is possible to put into a tube. We do it this way:

Finest Pure Gum

First of all we use nothing but the finest rubber. And we use it pure. It is not compounded. But this pure gum is given the utmost in life, toughness and strength by our special formula.

6 Fold Enforcement

To prevent the possibility of weakness or imperfections, we use 6 plies of rubber (9 plies in 4½ to 6 inch sizes). With that reinforcement slow leaks are out of the question. Marathons stay inflated.

Weighted and Measured

Each Marathon Tube is both weighed and measured before curing. It must conform precisely to our exacting standards. That double test insures accuracy and uniformity.

Note the Thickness

The picture is from an actual photo of a 34 x 4 stock tube in section. Note the great thickness. Think how this great tube overcomes all tube troubles.

Resists Heat

Our red coloring matter renders pure rubber highly heat resisting. The Marathon Red Tube positively will not stick to the casing.

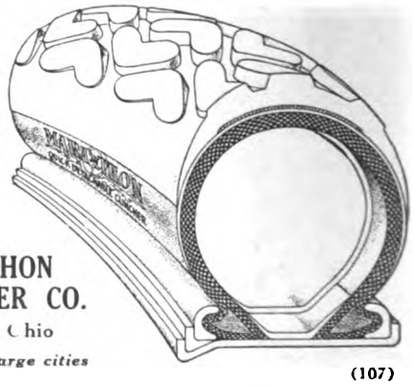
Men Want It

Motorists want this tube—it gives the quality they want.

Marathon costs a little more. But it gives twice as much—in quality and service.

The best dealers are selling Marathon tubes—(and tires). If your trade wants the BEST, YOU can sell them—they sell themselves.

WRITE FOR OUR EXCLUSIVE DISTRIBUTOR'S PROPOSITION.



MARATHON
SIDE-WIRE ENDURANCE

Exclusive Sale
Of Marathon 4,000 Mile Tires

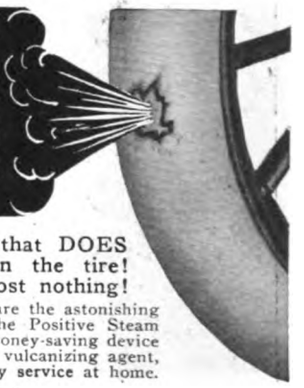
All Kinds of Cleaning Takes This Form



Nothing else cuts grease from the hands so quickly and completely; nothing else removes tarnished spots, stains and all foreign matter so **easily,** as Old Dutch Cleanser.

Around the shop, factory, garage, office and in the home—nothing takes hold with such power—gives the satisfaction—**saves time and labor**—like Old Dutch Cleanser.

Just as effective in cleaning soiled hands.

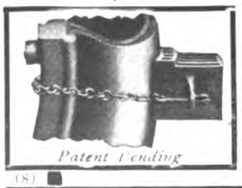
Many other uses and full directions on large sifter-can — 10c.

Let STEAM Do Mending In 20 Minutes!

At last! A handy vulcanizer that DOES vulcanize — that does NOT burn the tire! Shrinks tire up-keep cost to almost nothing!

There, crammed into a few words, are the astonishing advantages offered to motorists by the Positive Steam Tire Vulcanizer. A vastly improved money-saving device that utilizes steam—the only scientific vulcanizing agent, and at instant notice gives you factory service at home.

Positive Steam Tire Vulcanizer



In Single Season Saves Owner Ten Times Cost

All you do is to apply raw gum rubber, clap on the steam vulcanizer, put water in one section, gasoline in the other, and touch a match. In 20 minutes time the job is done. Done so well, mind you, that the union of raw rubber and casing is as solid as the casing itself. Done without risk of ruining your tire by burning it (one of the dangers of the common fire-heated vulcanizers)—AND—done at a SAVING that in one season pays ten times over for the Steam Vulcanizer.

Get More Mileage Out of Junked Tires

That's what you can do. You can mend holes either in tube or casing up to 2½ inches in diameter with one setting. Reset for larger holes. Tires scrapped, can thus be brought to life for hundreds of miles of added service. Price complete $5.00.

DEALERS! Here's a live proposition! Get in touch with us at once if you want to handle a sure money-maker!

Drop a Card Today

You can't afford to pay big prices for those inevitable tire repairs. Here's ready relief! Utilize it. Send card today for complete information.

THE FEDERATION OF TRADE PRESS ASSOCIATIONS IN THE UNITED STATES

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

Saved!

Weed Tire Chains enable you to safely make sharp turns and quick stops when a momentary loss of control means loss of life.

The above picture illustrates one of the numerous situations in which you may be placed during bad road weather — when suddenly someone appears directly in your path and in a fraction of a second you must make a sharp turn and apply the brakes. It is then you require a firm unfailing grip on the road which can only be obtained by equipping ***all*** tires with

Weed Anti-Skid Chains

The Only Device that Absolutely Prevents Skidding

The memory of one accident deters future enjoyment in the use of a car. Why run the risk of such accidents and why forfeit the pleasures of motoring ***forever after, when safety can surely be yours by equipping all four tires with WEED CHAINS?***

WEED CHAINS cannot injure tires because "they creep." Easily put on in a jiffy without the use of a jack or other tools. Directions packed with every pair.

Universally Used

WEED CHAINS are generally regarded as the most profitable accessory for the automobile Dealer — Extensively Advertised — Easily Handled — Quick Sellers — No Dead Stock — No Dull Seasons — Liberal Profits — Satisfaction Guaranteed.

Attractive, Decorative, Convincing Hangers regularly supplied to Dealers upon request

BUDD ALL STEEL BODIES

represent the last word in the art of truck body building. They stand for strength, stability, sturdiness and efficiency. Made entirely of steel, they will not rot or crack. They cannot warp or split. They will stand the maximum use or abuse and are practically indestructible. They eliminate fire risk. They are light in weight and easy on tires—pleasing in design and attractive. Summed up in a word, they give the highest degree of Service.

They are made in many styles—of any desired capacity. Estimates promptly furnished. Write us today for full information.

$1,785

Swinehart Non-Skid Tires

The one type that makes skidding impossible. Both the initial cost and the repair expense of chains and inevitable wear and tear on the fabric of the casing are avoided, representing more than 30% of total tire costs. Swinehart (Keaton) depression type has four times the wearing surface of any other non-skid, and its traction and non-skid properties last until the tire is worn out. Safe and economical.

The Swinehart Tire & Rubber Co.
AKRON, OHIO

Marmon "Thirty-Two"

Four-cylinder, 32-40 h. p., 120-inch wheel base, body types and equipment to meet every requirement. A rational, logical car for touring and city use. Years of satisfactory service have proved its economy in tires, fuel and upkeep—plus smooth, delightful operation and durability.

Price, $3,000.

NEW SOSS CONCEALED DOOR HINGE NO. 121

This new hinge requires a pillar only ⅝ inches wide. It is detached by removing two screws as indicated in illustration. The trouble avoided and time gained in hanging doors when using Soss Hinges are important factors.

Soss Concealed Hinges can be installed flush with the outside of the pillar, allowing the steel or aluminum panel to be turned over flush on to the face of the hinge, and fastened down securely in the rabbet provided on the edge of the face to receive it, thus allowing more than ordinary clearance.

The non-corrosive case attached to the pillar section of the hinge, prevents water from reaching the wood of the pillar through the hinge.

Description:

Face of hinge on pillar, ⅝ in. x 3⅛ in.
Face of hinge on door, ⅝ in. x 2⅞ in.
Water-proof case mortises into pillar, ⅝ in. x 1⅝ in. x 1¾ in. deep.
Clearance in opening, 11-16 inches.

The Wrapped Tread Method of Mending Blow-outs

Repair tires by the approved method that tire makers have adopted for **making** them. Instead of cutting away a lot of fabric and rubber from the **outside** of the tire, reinforce it from the **inside** with a few layers of canvas, seal the hole through the tire with a plug of raw rubber, and apply heat to the inside and outside at the same time. Thus you can make a repair that is actually stronger than the rest of the tire—one that cant' give way.

This method is economical, requiring only about half as much material as any other system. It is simple—anyone can do the work perfectly. Only one set of forms is required for handling all sizes of tires. By curing from both sides of the tire at once the time of curing is decreased 50 per cent. and all tendency toward overcuring the tire is eliminated.

SHALER

Steam and Electric VULCANIZERS

Wrapped tread repairing can be done best only with Shaler Vulcanizers because they have the exclusive feature of a temperature control that is automatic. This insures the maintenance of a uniform temperature from beginning to end of the cure and does away with constant watching by the operator. He can devote **all** of his time to preparing repairs while the vulcanizer is at work.

Write today for details of this moneymaking process

We have published a book of especial interest to garage men. In addition to other valuable information it contains description of Shaler tire repair outfits. White for free copy of "Common Sense About Tire Repairs."

C. A. SHALER CO., 426 4th St., Waupun, Wis.

INTERLOCKS

Stop Your Tire Trouble

Don't fail to write today for Interlock Booklet which tells all about Interlock Inner Tires, and gives many new tire pointers of the greatest value to every automobile owner.

The Interlock is an **extra inside tire** which is placed between the outer casing and the inner tube for the purpose of so strengthening the tire that it will be proof against blow-outs, rim cuts and punctures and therefore last twice as long.

When you know what Interlocks will do, you will want them. They give you practically **two tires on each wheel** with no change in the looks of the tire. With this combined strength you can run your car an entire season without delays, annoyance or tire trouble, and save about half your tire expense.

In writing for catalog, please give name of your local dealer, and if he cannot supply you with Interlocks, we will send you the name of a nearby dealer who can.

To Dealers: A good proof of the efficiency of Interlocks is that they are regularly stocked in all sizes by the largest jobbers who only handle quality goods, such as Beckley-Ralston Co., Chicago; Bi-Motor Equipment Co., and Iver Johnson, Boston; Fry & McGill Co., Denver; Motor & Machinist Co., Kansas City; Chanslor & Lyons, Los Angeles; Western Auto Specialty Co., Iowa City; Ia.; Gibson Automobile Co., Indianapolis and all leading automobile supply houses.

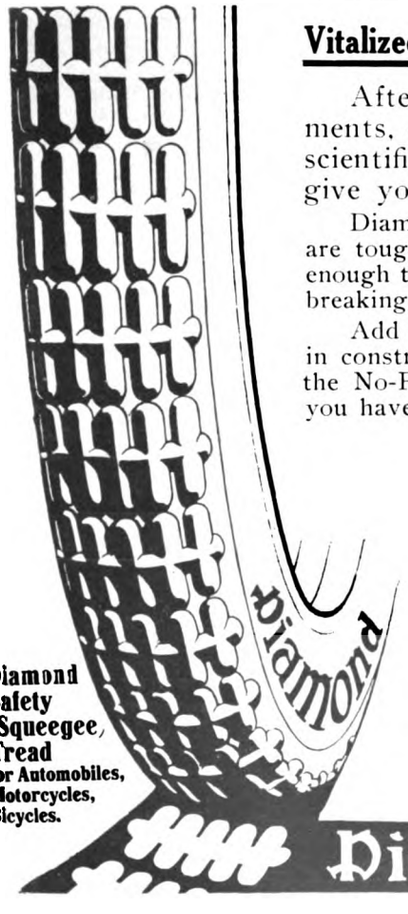
You get more air-room in Diamond (No-Clinch) Tires -and it's the extra air-room that does the work

THE more air-room — the more resiliency, which in turn means more comfort for you and your passengers — *more service from your tires.*



The secret of building a tire that lasts means building a tire that does the work easily—a tire that does not strain under road usage.

This extra air-room is gained for you without lessening the thickness of the tread or weakening the side walls in any way.

To stand the pull of the engine—to absorb the shocks of the road—to travel farthest on the smallest quantity of gasoline—to make inner tubes last longer, were scientific tire problems.

Our engineers have solved these problems for you and all other tire bills payers by building Diamond (No-Clinch) Tires with extra air-room—in a word—the ideal, perfectly constructed tire you have been demanding.

Diamond {No Clinch} Tires

Diamond Safety (Squeegee) Tread for Automobiles, Motorcycles, Bicycles.

Vitalized Rubber calls a halt on "Short Mileage"

After countless laboratory tests and experiments, our chemists have discovered a process to scientifically toughen pure rubber so that it will give you the mileage you pay for.

Diamond (No-Clinch) Tires made of Vitalized Rubber are tough and flint-like enough to fight the road, elastic enough to absorb shocks, thus preventing rim troubles and breaking above the bead.

Add to this high grade workmanship, nothing inferior in construction or fabric—Perfect 3-Point Rim Contact—the No-Pinch Safety Flap for inner tube protection—and you have the best tire money can buy.

Cross Section of Diamond Safety Tread Tire

Safety (Squeegee) Tread an additional Diamond advantage

Diamond Safety Tread Tires obey your will. No matter how slippery and treacherous the paving, they grip and hold. You drive with safety and you drive with pleasure with Diamond Safety (Squeegee) Tires on your cars.

And that's not all—there's real economy in Diamond Safety Tread Tires. The Safety Tread is added to the regular tread—the extra mileage makes the safety cost you nothing.

So this time buy Diamond Vitalized Rubber Tires—you can get them to fit your rims from

THE KLAXON is the one universally known warning signal. It is the only HIGH-GRADE signal — universally recognized as such. It is the STANDARD signal by which others are compared. Try to think of another one.

Car manufacturers who claim to make high-grade cars must of necessity equip with the Klaxon. They cannot afford to let the few dollars difference in the cost between the Klaxon, Klaxonet or Klaxet and signals of unknown make stand between them and their reputation.

They can't afford the explanation and argument necessary to justify the unknown signal. They can't afford to place their agents in the position where they have to supply the Klaxon at the agent's expense to satisfy the buyer's demand for it.

BOSS OF THE ROAD

"38" Packard "48"

PROWESS—From Chicago to Detroit, 284 miles, in seven hours and nine minutes is the record of the Packard "38"—an average of 40 miles an hour. This rough road performance has never been equalled. The Packard has more speed than you can use.

COMFORT—Packard road comfort is expressed in motion with no sense of exerted power. Added zest is given by the new, silent worm bevel gears. Ease and sureness of operation are the natural result of left drive, electric self starter and centralized control board.

SAFETY—The bridge builder's factor of safety is embodied in every detail of Packard construction. Each new model is pounded over dirt roads, alkali wastes and mountain trails for at least 30,000 miles. That is one reason why your family is safest in a Packard.

STAMINA—In a non-stop motor test of three hundred hours, the Packard more than doubled the best previous official record for continuous running. Durability far exceeding the requirement is the uncompromising standard to which every Packard is built.

BERRY BROTHERS' VARNISHES

Protect Metal Parts Against Rust by Using Berry Brothers "Lionoil"

To insure perfect finish on metal bodies, it is absolutely essential that the surface be free from rust. "Lionoil" is the world's best rust preventive.

Bodies coated with "Lionoil," when finished and in service, show no tendency to peel, check or flake off. These faults are almost always due to rust spots on the metal.

Springs, axles, frames, fenders, lamps and all sorts of metal stamping and forgings are insured against rust if coated with "Lionoil."

"Lionoil" is used by many manufacturers as the liquid ingredient for metal body primer. We can also furnish you "Lionoil" metal primer ready mixed.

"Lionoil" is inexpensive to buy, covers lots of surface, air-dries quickly. It pays for itself in labor saved and metal preserved.

Send for full information regarding "Lionoil."

We also make the Raven line of black Japans for lamps, hoods, top bows and other parts.
Let our Technical Department help you with your finishing problems. Write for booklet and full information.

Truffault-Hartford Shock Absorbers Would Have Prevented This—

"Chairman A. G. Batchelder, of the Executive Committee of the American Automobile Association had a painful experience during the run that he is not likely to forget for some time. As the car in which he was riding passed over an unusually abrupt obstruction in the road, he was propelled forward and his head struck the top of the car, rendering him unconscious."

Description of the American Automobile Association's Reliability Tour from Indianapolis to Glacier Park.

Erase Excess Tire Expense

THE monthly garage bill is a pretty good barometer of tire efficiency. Gasoline, lubricants and small adjustments are necessities. You can't expect to reduce them materially. But tires are different—you can economize in this direction and you should.

Firestone Non-Skid Tires are today erasing a big proportion of garage bills for experienced motorists everywhere. Charges for patching, vulcanising, and retreading are being reduced or eliminated entirely.

You motorists who have never tried Firestone Non-Skid Tires should ask for a copy of "What's What in Tires" by H. S. Firestone, a book by a tire authority written from the motorist's standpoint. Write for it.

Firestone pneumatic tires are guaranteed when filled with air at the recommended pressure and attached to rims bearing either one or both of these inspection stamps. When filled with any substitute for air or attached to any other rims than those specified our guarantee is withdrawn.

Hanging To A Test

¶ Any oil manufacturer can pick out one particular physical or chemical test that applies to his own oil and then hang his entire advertising story on the merits of the product because of its one feature.

¶ But we have always believed that a combination of all the best tests is really what is desired in an automobile oil and in

MONOGRAM OIL

one will find those features and tests which give real RESULTS and SERVICE and in the end these are the points which really count.

MOTOR WORLD

Vol. XXXVI New York, U. S. A., Thursday, September 18, 1913 No. 13

PETROLEUM SOCIETY FORMED TO LOOK INTO OIL INDUSTRY

Proposed to Eliminate Much Waste by Study of Production Methods —Officers Elected—Congress Two Years Hence.

Crowning the efforts of the past seven years to bring together the men interested in the petroleum industry, the American Petroleum Society at length has become a reality; it came formally into being last week at the Experiment Station of the United States Bureau of Mines at Pittsburgh, Pa., when the following officers were elected:

President, C. D. Chamberlain of the National Petroleum Association, Cleveland, O.; vice-president, R. Galbraith of the Independent Oil & Gas Producers' Association. Tulsa, Okla.; secretary, Dr. Irving C. Allen, U. S. Bureau of Mines, Pittsburgh, Pa.; treasurer, Warren C. Platt of the Independent Petroleum Marketers' Association, Cleveland, O.; acting past president, Frank B. Fretter of the Western Petroleum Refiners' Association, Coffeyville, Kan. In addition, the following members were elected to serve on the executive committee: Ralph Arnold, Los Angeles, Cal.; C. F. Clarkson, S. A. E., New York City; G. M. Swindell, Chamber of Mines and Oil, Los Angeles; Edmund O'Neill, University of California, Berkeley, Cal.; E. B. Rich, Gasolene Producers' Association, Parkersburg, W. Va.; George H. Taber, Gulf Refining Co., Pittsburgh, Pa.

It is the purpose of the society, as outlined at a preliminary meeting held August 1, at which some 18 national societies were represented, to study closely every phase of the natural gas and petroleum industry, including origin, statistics, conservation, drilling methods, production, transportation, storage, refining and specification for refined products, and it is hoped that as a result of such study it may be found possible to reduce some of the enormous waste which at present is going on for want of proper information.

It is anticipated that the first annual meeting will be held at some convenient place in the United States during the spring of 1914, and it is planned to hold the second annual meeting in connection with the Panama-Pacific Exposition in San Francisco in 1915. Invitations have been sent to the International Petroleum Commission, which meets in January, 1914, in Bucharest, Roumania, to hold its next meeting in conjunction with the 1915 meeting of the American society, and it is hoped to turn the two meetings into a great congress of petroleum technologists and scientists from all over the world.

Alco Plant Not Yet Disposed of.

Reports printed in Providence, to the effect that W. H. Draper and Michael W. Norton, of that city, are interested in a project to take over the automobile department of the American Locomotive Co., are authoritatively denied. All that Norton and Draper have done has been to purchase 26 Alco trucks. The Alco plant in Providence is still making up the stock on hand and when the work is completed the plant proper will be disposed of to best advantage. Those in position to know say that several "nibbles" already have been received but none of them has yet reached the dignity of being included in the term negotiations.

Swinehart Involved in Rubber Deal.

John Z. Lowe, Jr., William A. DeLong and Joseph W. Harriman, trustees in bankruptcy of the New York Commercial Co., a crude rubber dealer, have filed suit in the Supreme Court for New York county against the Swinehart Tire & Rubber Co., of Akron, Ohio, for $22,362.67 and this week were granted an attachment for that sum; the complaint states that rubber to this value was contracted for by the Cuyahoga Rubber Co. of Akron, and that the Swinehart company guaranteed the account.

GEORGE W. BENNETT DEAD; SUCCUMBS TO OPERATION

Appendicitis Carries Off Willys's Chief Lieutenant at Height of His Career — One of Strong Men of the Industry.

George W. Bennett, general manager of the Willys-Overland Co. and of John N. Willys's other interests, died at his home in Toledo yesterday (Wednesday) afternoon, as a result of an operation for appendicitis performed the previous Friday. He rallied from the operation fairly well, but Wednesday morning his condition took such an alarming turn that Dr. Crile, of Cleveland, one of the most eminent appendicitis specialists in the country, was summoned to Toledo, and made the journey by special train which averaged better than a mile a minute. He arrived too late to be of service, however, as Bennett expired soon after the specialist reached Toledo.

Bennett so long has been one of the conspicuous strong men of the industry, and as it was not generallly known that he had undergone the operation, the news of his death proved a profound and widespread shock. The sad news awaited John N. Willys when he arrived in New York yesterday, after several months stay in Europe. He was so deeply moved that he immediately retired to the Hotel Plaza in an effort to regain his composure.

Bennett's loss is no ordinary loss, and as Willys had vested him with almost complete power in the actual conduct of his business, his passing will be felt. He is survived by his widow and two boys, both of whom are in their teens.

Like so many of those engaged in the automobile business, Bennett was a graduate of the bicycle trade, which he entered in the late 80's as a traveling salesman for the Gormully & Jeffery Mfg. Co., of Chicago, which manufactured Rambler bicycles. Like Messrs. Gormully and Jeffery

Digitized by Google

themselves, Bennett was of British birth, but he had resided so long in this country as to appear almost to the manor born.

His first promotion was to the management of the Gormully & Jeffery branch in Washington, D. C., and when the Gormully & Jeffery property was taken over by the $80,000,000 American Bicycle Co.—the so-called "bicycle trust"—Bennett went with it and ultimately became one of the district managers of the big corporation. Before it failed, in 1900, Thomas B. Jeffery had acquired one of the trust's bicycle plants in Kenosha, Wis., which was the foundation of the present Rambler automobile plant, and Bennett rejoined the Jeffery retinue, becoming sales manager of the Jeffery company. He played a large part in building it up, but his business surroundings becoming unhappy, he resigned his position and became sales manager of the original Knox Automobile Co., in Springfield, Mass. He had been receiving a salary of five figures and it is no secret that Mr. Jeffery offered him an uncommonly handsome increase in order to retain his services, but, with that determination which was his characteristic, Bennett declined the offer, declaring that peace of mind was worth more than money, and accepted the Knox berth, which paid him $10,000 or $15,000 less. He also invested all of his savings in the Knox company and lost them when the company failed.

Leaving Knox in 1907, he became manager of the White Co.'s branch in New York, which office he held until June, 1910, when he attracted the notice of John N. Willys, one of his old friends in the bicycle trade. He quickly proved the sort of man that Willys desired and required. He was short of stature, but square jawed, square shouldered and powerfully built, his very appearance suggesting the power and positiveness which were two of his virtues, which for the first time he was permitted to exercise to the full and thus demonstrate his full value.

First serving chiefly as sales manager, Bennett's scope was gradually increased until, about a year ago, he became practically general manager of the Willys interests. He was elected vice-president of the Willys-Overland Co., and only two or three months since he was made general manager in name as well as in fact, Willys gradually devoting himself chiefly to his financial affairs, and absenting himself from the factory for months at a time, leaving in Bennett's hands practically the entire conduct and control of his automobile business. The marvelous growth of the business during the last three years is striking tribute to Bennett's energy, judgment and ability.

At the time of his death he was one of if not the most highly salaried men in the

(Continued on page 14.)

FRANKLIN LOWERS PRICE; WILL BUILD A "SIX" ONLY

"Little Six" Only Model Remaining in Line—Price of Touring Car $600 Less—Changes Include Left Drive and Center Control.

Although it became known some time ago, as was stated in Motor World, that the H. H. Franklin Mfg. Co., of Syracuse, N. Y., planned to discontinue "fours" and to concentrate on "sixes," the extent of the changes contemplated by the company did not become known until this week, when a new series of cars was brought out. Now it can be stated that not only is the company concentrating on "sixes" but on "a six," the Model M or the "little six" constituting the entire line, and prices have been generously pared insofar as it is possible to make comparisons with preceding models. Also, all cars have left drive and center control—a new construction.

The "little six" which now constitutes the line is much different from the car which occupied that position in previous production, and the only real comparison possible—that between the past and present five-passenger touring cars—shows the new "six" to be $600 less than the former model; the new price is $2,300, the old $2,900. Also, the weight has been cut; where it was 2,990 pounds it now is but 2,700 for this model.

For variety in style the single chassis mounts six different styles of body—five-passenger touring car, roadster, coupe, sedan, limousine and Berlin limousine. No seven-passenger car is included in the new line. The wheelbase of the new chassis is 120 inches, where that of the former "little six" was 116 inches.

The air cooling system which has marked every Franklin ever built is retained, but the mechanical changes are many; the car may be said to be "new from the ground up." The air jackets and flanges are now brightly nickled and all parts below the engine deck are black enameled, giving the motor an attractive appearance. The timing and magneto gears, formerly encased in the rear cheek piece, have been placed, with the silent chain of the Entz starter drive, in a cheek piece at the front where they are easily accessible by the removal of a plate.

Instead of a single I-beam support for the valves, extending across the tops of the cylinders but not attached to them, each pair of rocker arms works upon an individual support which is attached to the cylinder, making possible easier and more accurate timing. Ignition is now furnished by an Eisemann magneto in place of the equipment which had been used for a number of years. The bore remains 3⅝ inches and the stroke 4.

Throughout the mechanical part of the car numerous changes have been made for the attainment of simplicity and convenience. The switch box, formerly on the hood board, reposes between the front seats and the hot and cold air control of the carburetter has been moved from the engine to the dash. A Corbin-Brown speedometer is a difference in equipment. Headlight dimmers are included. The running board has been cleared of the tool box. Spare tires are not a problem for Franklin designers, since they are not carried.

An entirely new rear axle, of bevel drive as heretofore, has been incorporated, possessing a removable cover which affords easy access to the differential gears. The sloping hood has been refined in the direction of greater beauty and several of the models presented are new creations.

The roadster will carry three passengers in an emergency, but instead of a disappearing rumble seat the extra accommodation is found in a folding seat in front of the regular seat. The coupe is a new type and seats three on the regular seat with provision for one extra passenger. The sedan, a new type, will carry three on the rear seat; the driving seat is fixed and has beside it a movable Pullman seat. Entrance is by one door only. The limousine, with open compartment for the driver, had more or less of a counterpart in the preceding series but the Berlin model is new.

Treads are 56 inches; horsepower is 30. The full-elliptic springs, laminated wood sills and light-weight aluminum construction are retained. The prices are: Touring, $2,300; roadster, $2,300; coupe, $2,950; sedan, $3,200; limousine, $3,300; Berlin limousine, $3,400.

Georgia Sees Another Tire Plant Coming.

Despite the fact that for one reason or another tire manufacturing enterprises have not prospered in the South, Augusta, Ga., sees a tire plant coming its way. It will be operated under the style Southern Tire & Rubber Co., of which Weems A. Smith is president, H. S. Dunbar vice-president, and James P. Armstrong, secretary and treasurer. It is stated that "2,000 automobile owners have been secured as stockholders, all having agreed to purchase their supplies from the company."

To Make Bearings and Worms in Toledo.

For the purpose of making bearings and worm gears for automobiles, the Bock Bearing Co. has been organized in Toledo with W. E. Bock as its president. It has secured a factory site at Phillips avenue and Michigan Central Railroad, on which will be erected a one-story plant, 62 x 225 feet.

GOBY MOTOR NOT LUBRICATED WITH STANDARD OIL WEALTH

Horse Journal's Great "Scoop" Suffers Swift Denial—"John D." Not Interested in Company Bearing Name Rockefeller.

Standard Oil entered the automobile industry on Saturday last; on Sunday, it turned around and walked right out again.

Of course, the big corporation really did not do anything of the sort, but some one spoofed the New York Times into printing a long front page story which made it so appear. Twenty-four hours later it published a complete if less conspicuous denial, but meanwhile those who recognize "Standard Oil" stories when they see them already had made liberal use of the salt cellar.

The basis for the whole story is that the Rockefeller Motor Co., which was incorporated last week under the laws of Ohio, with an authorized capital of $10.000, has or is about to take over the Goby Engine Co., and, it is intimated, may take over or in some way be linked with two automobile enterprises, one of which, apparently, will be a cyclecar company, which, although it has no real factory and no real output, has been the subject of fulsome reports in print under Cleveland date lines.

The name Rockefeller naturally suggested that John D. himself, or some of his intimates, were interested in the project; indeed, the Times's story declared that four of the five incorporators were attorneys who represented the interests of Standard Oil and John D. Rockefeller. Immediately these reports were spread broadcast, denials arose in Cleveland, where, it is stated, that instead of representing John D. Rockefeller or other Standard Oil interests, the four lawyers were merely junior partners in a law firm which has offices in the Rockefeller Building. The first incorporator was none other than Thomas J. Fay, one-time president of the Society of Automobile Engineers, who, during recent months, has been engaged in developing the Goby piston valve engine in Cleveland.

Fay once was editor of a New York automobile journal, but the Rockefeller-Goby story did not escape through a publication of that sort; instead, a horse paper, with which one of Fay's former editorial associates is identified, "scooped the world," or would have "scooped" it, had not the horse editor permitted the Times to share the great story.

Some two months ago Fay attracted notice to the Goby engine by printing a full-page advertisement in a New York daily paper, in which Cicero, Caesar and other historic figures were coupled with Goby and placed in a frame formed by an address delivered before the S. A. E. by Henry M. Leland, general manager of the Cadillac Motor Car Co. As a result, rumors promptly arose that the Cadillac people were making ready to adopt the Goby engine, and they were put to considerable pains to counteract such reports, as Motor World stated at the time. For some reason or other, Fay took such violent objection to Motor World's statement to that effect that he made known his purpose to institute suit for libel if grounds therefor could be found. No suit, however, has yet been filed.

On Saturday, when the New York Times published the Standard Oil story, Fay was in New York, but it was gravely stated that he had "secluded" himself in Brooklyn "to obtain quiet for the maturing of his plans," to quote the remark attributed to him. Of course, he did not reveal the plans, but is credited with admitting that the Rockefeller company "had been formed to take over other companies engaged in the making of automobile motors."

Claim Coventry Broke Dealer's Contract.

Claiming that the Coventry Chain Co., Ltd., of England, violated the contract whereby the Sarco Engineering Co., of New York City, was to act as American distributer of Coventry chains from November 30, 1912, to December 31, 1916, the Sarco company has brought suit against the Coventry concern in the Supreme Court for New York county. It asks damages and an injunction restraining Herbert F. L. Funke from acting as the Coventry agent, the claim being that the English manufacturer switched its business from the Sarco company to Funke August 1 last.

Klaxon Sues Two More Dealers.

For handling Chandler cars equipped with Sparton horns, the Brady-Murray Motors Corporation, of New York City, has been made defendant in a suit instituted by the Lovell-McConnell Mfg. Co., of Newark, N. J., for infringement of the Klaxon patent. For handling Hudson cars equipped with the same horn, which is claimed to infringe the Lovell-McConnell patents, the Louis Geyler Co., of Chicago, has been made defendant in a similar action.

Tainter to Direct British Monogram.

Louis S. Tainter, for several years advertising manager of the New York Lubricating Co., maker of Monogram oils, sailed to London yesterday to assume charge of the company's British business, which is conducted under the style British Monogram Oil Co. Before joining the Monogram staff, Tainter had been identified with the Havoline and Wolverine oil companies.

APPERSON FOLLOWS TREND TOWARD LEFT HAND DRIVE

Brings Out Three New Models, Each of Which, Also, Has Controls in Center of the Car—"Sixes" Now a Stock Product.

While previous Appersons have been of the conventional right-hand drive and control, the maker, the Apperson Bros. Automobile Co., of Kokomo, Ind., has followed the plainly indicated trend of the times, and in the cars which are now coming through, has adopted left-hand drive and center control. Three new models have been added and the line as it now stands contains but one right-hand driven and controlled car.

The production of stock "sixes" is also an innovation with the Apperson company, for while it previously built "sixes" only on special order, and therefore sold them at a rather high price, the new line includes a "big six" listing at $2,350 and a "little six" at $2,200. The "sixes" are classed at "6-55" and "6-45." A new "4-45" has been added and it, too, locates the driver at the left.

The smaller of the two is made in three types—five- and seven-passenger touring cars and a roadster. The latter lists at $2,300, $100 more than the other two. The power plant is a block motor, whereas previous "sixes" utilized singly-cast cylinders, and the bore and stroke are respectively 3¾ and 5½ inches. Wheelbases are 128 inches for touring models and 120 inches for the roadster. The equipment includes a Gray & Davis starting and lighting system, and the car is left-driven and center-controlled. The larger car has a more nearly square motor, measuring 4¼ by 5 inches. Both are of the T-head type.

Last year's line of Apperson cars included a "4-45" which sold for $1,600 and for $1,800 with a lighting and starting system. The same car this year, equipped with the Gray & Davis electric system, sells for $1,600, in a way a reduction of $200. This model retains right-hand drive and control.

The new "4-45," has a 120-inch wheelbase, unit power plant, carries five passengers and is in many respects similar to the other "four." It, however, has left drive and center control. It is electrically lighted and started, and lists at $1,785.

Michelin Reduces Plain Tread Prices.

Following the downward tendency in tire prices which had its effect recently in several quarters of the trade, the Michelin Tire Co., of Milltown, N. J., although it still retains its position of "a bit higher than the others," has reduced its figures; the cuts amount approximately to 10 per cent. on

Digitized by Google

tubes and from 5 to 8 per cent. on casings. These reductions apply to plain treads only; the metric sizes and non-skid tires are largely made abroad and they are not affected by the reductions.

Illustrative of the changes which have been made, the 30 x 3-inch tube is now $4 where it was $4.50 and the corresponding tire has been reduced from $14.75 to $13.75. The 30 x 3½ tube is now $5, whereas it was $5.50, and the corresponding shoe is $20.50 instead of $21.50. In the 34 x 4 size the tubes are reduced from $8 to $7.25 and the tires from $33.25 to $30.75. Tubes in the 36 x 4½ size are $9.85 instead of $11, and for tires the price of $40 replaces $43.75.

Beebe Makes Partial Settlement.

John D. Beebe, former general manager of the bankrupt Midland Motor Co., of Moline, Ill., who was arrested in Chicago on a charge of embezzling the company's funds, and taken to Moline for trial, effected at least a temporary settlement and has been released.

It appears that last June the Merchants' and Mechanics' bank turned over to Beebe, for the Pope estate, four automobiles to be repaired and sold "to lessen the liabilities of the people most heavily affected by the bankruptcy," and advanced $1,000 with which to make the repairs. Later, it is said, Beebe shipped two of the cars to Minneapolis and two to Chicago.

After waiting a considerable time for a report in regard to the cars, an attorney was sent to Chicago to see Beebe, and it is said the latter refused to talk or to give up the bills of lading for the cars.

Beebe was not locked up, but he turned over the bills of lading for the cars and effected an incomplete settlement, paying all the costs and expenses, amounting, it is said, to about $9,000 in all.

Broker Selling Motor Wagon Assets.

A. C. Applebaum, a Detroit broker, is disposing of the assets of the bankrupt Motor Wagon Co. of Detroit, at private sale. When the property was put on the block by the receiver, the Union Trust Co., the best bid received was $3,250, but as the material on hand was appraised at $40,000, the court promptly rejected it. The receiver then disposed of $4,000 worth of the stock and, with the consent of the court, entered into an arrangement with Applebaum, whereby the latter agrees to dispose of the remaining assets of an commission basis. He will endeavor to realize as much more than $3,650 as is passible, and all over that sum will go to the creditors, less the broker's commission. Should he fail to receive more than $3,650 net, he must nevertheless pay that amount to the receiver and dispose of the property on his own account.

JACKSON PRICES LOWERED; MAKE NO RADICAL CHANGE

Reduces Figures by from $90 to $350 and Adds to Attractiveness of Cars —Double-Drop Frame and Crowned Fenders Adopted.

The products of the Jackson Automobile Co., of Jackson, Mich., which heretofore have hardly been within the popular-priced class, have moved nearer it in the line which is being introduced for the 1914 season, the prices having been reduced by from $90 to $350. Some changes, too, have been made, but none of them are what may be termed radical; all tend toward refinement and improvement of the appearance of the cars.

The line, as heretofore, consists of three models: The Olympic "40," the Majestic "45," and the Sultanic "6-65." On the Olympic the price is $340 less, having been reduced from $1,725 to $1,385; the Majestic is now $90 less—$1,885 instead of $1,975, and the Sultanic has been cut from $2,500 to $2,150, which is a decidedly substantial drop of $350.

In all models the addition of crowned fenders which drop more abruptly back of the front wheels has made possible an addition of 15 inches to the length of the running boards; the tool box, which heretofore has been attached to the under side of the running board, has been placed under the front seat and the whole car has been lowered two inches by means of a double-drop frame, an expedient which not only enhances the already good appearance of the machine, but also lowers the center of gravity.

The Olympic, which is a "four," now has its gasolene tank in the cowl instead of at the rear of the car, and the seat backs are two inches lower, which, with the two inches drop in the frame, makes the tops of the backs four inches nearer the ground than last year. The side lights have been eliminated and in their place is a double-bulb arrangement in the headlights, the two lamps being about 8 and 16 candlepower. The Autolyte lighting and starting system is retained with slight changes in all models. Tire irons on all models have been moved from the right side to the rear of the body.

In the Majestic, a "4-45," no changes have been made except those that apply to the whole line. The Sultanic "6-55" is made, as before, in a five-passenger car with 132-inch wheelbase and a seven-passenger car with 138-inch wheelbase. The added capacity costs $150, but the decrease in price is the same, from $2,650 to $2,300. The Majestic body is steel instead of wood. The Olympic body continues to be of wood construction and that of the Sultanic of aluminum.

Weed Acquires Lyon's Truck Non-Skid.

Supplementing its line of grips by a device for use on trucks exceeding one ton capacity, the Weed Chain Tire Grip Co. has taken over the Lyon Non-Skid Co., of Philadelphia, Pa., and will manufacture those grips on a royalty basis; the royalties will go to G. Albert Lyon, of Philadelphia, who invented the grip and manufactured it on a limited scale. It is designed essentially for heavy-duty vehicles and consists of four sections which join together by means of bolts and form a continuous metal side and cross-piece arrangement. The basic patent was issued June 15, 1909, under the number ———.

Lyon's Philadelphia plant, the equipment of which has been purchased by the Weed company, includes two furnaces, a drop forge, a press and bending machines, and is housed in a one-story structure, 100 x 70 feet. There is now on hand in this factory 50 tons of steel and as soon as this is manufactured the equipment will be removed to the new Weed plant in Bridgeport, Conn., where a duplicate of the Philadelphia equipment is being installed. After the removal, which will be in about 30 days, the capacity will be double that of Lyon's present factory.

Rubber Goods Increases Dividend.

The Rubber Goods Mfg. Co., which to all intents and purposes is the United States Tire Co., has declared a dividend of two per cent. on its common stock as against one per cent. at this time last year. This is the third dividend of the year, 6 per cent. having been declared in March and 1 per cent. in June, a total of 9 per cent. in nine months. For the entire 1912 year the dividends amounted to 9 per cent., and for 1911 8 per cent. It is stated that for the first eight months of this year, or up to September 1st, the Tire company's sales show an increase of approximately 30 per cent.

Crary to Market a Gasolene Saver.

The Crary Co. has been organized in Detroit and has located at 615 Woodward avenue for the purpose of marketing the Auto-Valve Gasolene Saver, which is substantially a dash-controlled air valve inserted in the intake manifold. The officers of the company are: Frederic B. Stevens, president; F. J. Alvin, of the Kingston Carburetter Co., vice-president; L. H. Kirby, secretary and treasurer; C. V. Burnett, formerly of the Michigan Motor Car Co., office and advertising manager.

The Week's Incorporations

HUPMOBILE REPRESENTATIVES GROUPED IN FRONT OF THE HUPP MOTOR CAR CO.'S FACTORY IN DETROIT DURING THE ANNUAL CONVENTION OF DEALERS

Philadelphia, Pa.—American Motor League, under Delaware laws; authorized capital, $100,000.

Los Angeles, Cal.—Pacific Motor Coach Co., under California laws; authorized capital, $500,000. Corporators—R. G. Munn, T. Y. Drake.

Los Angeles, Cal.—Los Angeles Cyclecar Co., under California laws; authorized capital, $10,000. Corporators—W. S. Bohannon and others.

Wilmington, Ohio—Wilmington Auto Co., under Ohio laws; authorized capital, $10,000; to deal in new and second-hand motor cars.

Los Angeles, Cal.—Safety Auto Signal Co., under California laws; authorized capital, $10,000. Corporators—J. C. Percival, Jr., and others.

Tullahoma, Tenn.—Killman Hydraulic Power & Transmission Co., under Tennessee laws; authorized capital, $100,000; to manufacture motor cars.

Detroit, Mich.—Service Tire & Repair Co., under Michigan laws; authorized capital, $2,000; to repair tires. Corporators—F. C. Farr, E. B. Taylor.

Statesville, N. C.—Carolina Motor Co., under North Carolina laws; authorized capital, $25,000. Corporators—S. B. Miller, G. L. McKnight, H. H. Yount.

Puyallup, Wash.—Herren Auto & Supply Co., under Washington laws; authorized capital, $10,000. Corporators—Hugh Herren, J. A. Menard and others.

Charlotte, N. C.—Harper's Motor Sales Co., under North Carolina laws; authorized capital, $25,000. Corporators—W. J. Crowell, J. A. Rose, C. H. Gorman.

Detroit, Mich.—Auto City Boat Co., under Michigan laws; authorized capital, $10,000; to manufacture automobile accessories. Corporators—H. C. Goodrich, E. O. Eck.

Chicago, Ill.—South Side Tire Co., under Illinois laws; authorized capital, $10,000; to repair automobile tires. Corporators—Lawrence A. Cohen, E. A. Linderholm, John W. Bissell.

San Antonio, Tex.—Auto Owners' Protective Association, under Texas laws; authorized capital, $10,000. Corporators—B. M. Jamison, Harry W. G. Jargo, J. T. Jamison and others.

Chicago, Ill.—Sixty-first Street Garage Co., under Illinois laws; authorized capital, $1,500; to deal in motor cars, etc. Corporators—A. C. Bender, Walter A. Beile, Channing L. Sentz.

Seattle, Wash.—Franklin-Wicks Co., under Washington laws; authorized capital, $10,000; to deal in motor cars, supplies, etc. Corporators—W. A. Wicks, John A. Nichols, Jr., and others.

Chicago, Ill.—Mark W. Heath Co., under Illinois laws; authorized capital, $2,500; to manufacture and sell automobile and mechanical specialties. Corporators—Katherine E. Heath and others.

Philadelphia, Pa.—E. Z. Ryde Shock Absorber Co., under Delaware laws; authorized capital, $10,000; to manufacture motor cars and accessories. Corporators—Frank R. Kessell and others.

Buffalo, N. Y.—Federal Auto-Supply Association, under New York laws; authorized capital, $6,000. Corporators—William H. Fitzpatrick, Augustus G. Striker, George Clinton, Jr., all of Buffalo.

Chicago, Ill.—Simplex Wire Wheel Co., under Illinois laws; authorized capital, $300,000; to deal in wire wheels for motor cars. Corporators—J. J. Cusick, A. G. Loveless, John R. Cochran.

Cincinnati, Ohio—Cincinnati Velie Motor Sales Co., under Ohio laws; authorized capital, $5,000; to deal in motor cars. Corporators—Walter S. Schmidt, Clendenning E. Groesbeck, John L. Fauth, Elmer Stategies, J. J. Grogan.

Hartford, Conn.—Donegan Auto Body & Specialty Co., under Connecticut laws; authorized capital, $21,000; to manufacture automobile bodies and accessories. Corporators—W. R. Donegan, J. J Walsh, Leon S. Risley.

Cleveland, Ohio—Rockefeller Motor Co., under Ohio laws; authorized capital, $10,000; to manufacture, buy, sell and deal in internal combustion engines. Corporators—Sterling Newell, Ellis R. Diehm, R. F. Dennison, Thomas J. Fay.

Camden, N. J.—Reeves Garage & Motor Co., under New Jersey laws; authorized capital, $100,000; to conduct a general motor vehicle business. Corporators—W. Lippincott, Haddon Heights; C. M. Reeves,

Digitized by Google

Camden; A. Moulton McNutt, Collingswood.

Caldwell, N. J.—Caldwell Garage & Machine Shop, under New Jersey laws; authorized capital, $25,000; to conduct a general motor vehicle business. Corporators—F. W. Klein and E. A. Rine, Caldwell; J. H. Harrison, Newark.

East Liverpool, Ohio—Chester Rubber Tire & Tool Co., under Ohio laws; authorized capital, $250,000; to manufacture motor cars, tires, etc. Corporators—John E. Newell, James C. Freshwater, George A. Hasson, George Arner.

New York, N. Y.—Auto Trip Co., under New York laws; authorized capital, $15,000; to publish automobile trips, etc. Corporators—Robert Wuerz, 26 Post avenue; Daniel F. Kenney and A. W. Le Bourveau, both of 501 West 182d street.

Columbiana, Ohio—Columbia Tire Association Co., under Ohio laws; authorized capital, $10,000; to deal in rubber goods. Corporators — E. L. Henderson, Thomas Mackierman, H. W. Mackiannan, R. E. Henderson, A. B. Albright.

Elm Grove, W. Va.—Elm Grove Motor Sales Co., under West Virginia laws; authorized capital, $5,000; to operate a garage. Corporators—G. W. Hand, D. L. Walter, John E. Shorts, H. V. Springer, Dr. R. M. Peddicord, all of Elm Grove.

Syracuse, N. Y.—Syracuse Buick Sales Co., under New York laws; authorized capital, $2,500; to deal in motor cars. Corporators—Edward A. Ross, 121 N. Seward avenue, Auburn; Fred Firth and Clara Firth, both of 29 Seymour street, Auburn.

New York, N. Y.—Columbia Tyres Import Co., under New York laws; authorized capital, $50,000; to import and deal in tires, rubber goods, etc. Corporators—Frank H. Twyeffort, 286 St. James place, Brooklyn; B. Ray Paige and A. D. Kahler, both of 1798 Broadway.

Crawfordsville, Ind.—American Motor Wheels Co., under Indiana laws; authorized capital, $600,000; to manufacture motor trucks, etc. Corporators—W. H. Owen, S. C. Rowland, John Vajen Wilson, E. G. Darnell, Gilbert Howell, Frank M. Boyd, Charles M. McCabe.

Glasgow, Ky.—Dickinson Bros. Motor Co., under Kentucky laws; authorized capital, $12,000. Corporators—Brents Dickinson, B. G. Dickinson, T. D. Dickinson.

Richmond, Ky.—Dathrage Airless Tire Co., under Kentucky laws; authorized capital, $14,000. Corporators—J. E. Collins, S. H. Dathrage, George W. Phelps.

Change in Capitalization.

Indianapolis, Ind.—Ray Harroun Co., from $50,000 to $600,000.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

Tom Jones, former advertising manager of the R. C. H. Corporation, of Detroit, has been added to the publicity staff of the J. I. Handley Co., of Indianapolis.

W. W. Beeson has been appointed manager of the Studebaker branch in Atlanta. Tributary to the branches are the States of Georgia, Alabama, Florida, South Caro-

Arthur K. Dawson, former manager of the Lozier branch in San Francisco, has been appointed assistant manager for Don Lee in that city. Lee handles Cadillacs on the coast.

C. G. Embleton, manager of the Packard Motor Car's branch in Hartford, Conn., has had the Springfield (Mass.) branch added to his dominion. He will divide his time between the two establishments.

H. H. Crawford has been appointed general manager of the Krit Motor Car Co., of Detroit, which, since the creditors signed the extension agreement, is going on as if there never had been even a flurry.

J. M. Van Harlingen, traffic engineering and analysis manager of the International Motor Co., has tendered his resignation to take effect on October 1. He will enter business on his own account as an expert truck and transportation adviser.

R. W. Hutchinson, Jr., former advertising manager of the International Motor Co., of New York, has become attached to the Packard Motor Car Co., of Detroit. He will be known as "publicity engineer" of the Packard commercial car division.

W. W. Calahan, who has been identified with the Goodyear sales department for six years, has been appointed manager of the Goodyear branch in Milwaukee. He succeeds Herbert P. Ziegler, who has been transferred to the Chicago branch.

A. H. McIntyre, who for five years has been engaged in the automobile accessory business, has been appointed New England sales manager for the J. I. Handley Co., of Indianapolis, and as such will direct the sales of Marion and American underslung cars in the New England States. He will have headquarters in Boston.

S. J. Green, for four years sales manager of the accessory department of the Gibson Automobile Co., of Indianapolis, has been appointed sales manager of the Emil Grossman Co., of New York. P. W. Warner, who recently was appointed office manager of the Grossman company, has been elected its secretary. Previously Warner was in the taxicab business in New York.

F. C. Carter has been appointed district manager for New England for the Herff-Brooks Corporation, of Indianapolis, which recently acquired the sole distribution of Marathon cars. Paul Morford, with headquarters at the office in Indianapolis, will have charge of the Atlantic Coast States, and F. E. Wilson, located at Dallas, will have charge of the Southern terrirtory.

Leo A. Piel, former sales manager of the Mitchell-Lewis Motor Co., of Racine, has returned to the Mitchell Automobile Co., of Chicago, Milwaukee and Racine, with which he was previously connected and which handles Mitchell cars in a considerable portion of the Middle West. As sales manager of the Mitchell-Lewis company, Piel was succeeded by Otto C. Friend, the company's former advertising manager.

Recent Losses by Fire.

Garrett, Ind.—Clarence Rogers; garage destroyed. Loss not stated.

Portsmouth, N. H.—Green Street Garage; destroyed. Loss not stated.

Asbury Park, N. J.—Zacharia's Garage, Main street; damaged. Loss, $10,000.

Pontiac, Mich.—Hess Spring & Axle Works, plant No. 2; damaged. Loss, $5,000.

Philadelphia, Pa.—Robert McAllister, 6813 Greenway avenue; garage destroyed. Loss, $5,000.

Long Island City, N. Y.—Prest-O-Lite Co., charging room damaged by explosion. Loss not stated.

Sacramento, Cal.—W. H. Bradley, 1011 11th street; garage and carriage repository destroyed. Loss, $60,000.

Georgetown, Ky.—Prather Bros., 132 West Main street; garage damaged and one car destroyed. Loss, $1,500.

Amesbury, Mass.—James N. Leitch Co., body builder, Cedar street; factory and stock damaged. Loss, $3,000.

Prest-O-Lite Long Island Plant Damaged.

One man was killed and three injured Thursday, 11th inst., when the heating of apparatus caused an explosion in the charging room in the Prest-O-Lite Co.'s plant in Long Island City, N. Y. The charging room, which is but a small part of the plant, is of steel and corrugated iron, and while it was badly damaged the remainder of the plant was unharmed. The cause of the accident is said to have been due to negligence in permitting the charging apparatus to reach too high a temperature during one of the manufacturing operations.

In the RETAIL WORLD

H. C. White, of West Bridgewater, Mass., is erecting a new garage.

Ralph Gibson, of Washington, Iowa, has sold his garage to Herbert Smith.

C. W. Henzler, of Bismark, N. D., has taken possession of a new garage.

The Emery Garage has been opened in Mazomanie, Wis. Empire cars are stocked.

J. R. Brandt has opened a garage in Los Angeles; it is located on Vermont avenue.

A. Horrell, of Phoenix, Ariz., is about to erect a new garage and salesrooms; he handles Cadillacs.

Elmer Uhl, of Logansport, Me., has opened a garage at 628 Congress street; he will stock Overlands.

Files & Riley, of De Kalb, Ill., have awarded the contract for a new garage; it will stand on 1st street.

J. A. Petty has taken over the East Street Garage in Mount Vernon, Iowa. H. M. Garetson was the owner.

W. M. Sitton and G. G. Martin, of San Miguel, Cal., have taken over the garage business of C. J. Metzler.

Meister & Marcles, of Hartford, Conn., will erect a new brick garage; it will be located at 258 Main street.

A new garage is to be built for the Fredericksburg (Va.) Motor Co.; the building will stand on Princess Anne street.

C. W. Brotherton, of Remsen, Iowa, has admitted F. J. Homan to partnership. They will handle Paige and Mitchell cars.

Bennett & Foremen, of Westfield, Ill., have opened a garage in Hume, in the same State; it is located on Center street.

J. Harold Johnson, of San Francisco, is to build a two-story garage on East 9th avenue; the estimated cost is $4,800.

The Halsey Automobile Co., of St. Louis, Mo., plans to erect new salesrooms at 2201-9 Locust street; the estimated cost is $48,000.

G. H. Hall, of Los Angeles, has bought the Santa Ana (Cal.) Garage of W. G. Milton; the latter handled Regal and Lozier cars.

James F. Pieper, of Sacramento, Cal., has purchased the garage of Casey & Furton; Pieper will continue to handle Detroit Electrics.

E. B. Murphy has taken over the Walker Garage in Riverside, Cal. Walker will be retained as head of the mechanical department.

John Thorpe, of New Bedford, Mass., has been granted authority to erect a concrete garage; it will stand at 191 Colotte street.

C. A. Reed and T. J. Bonney, of Bath, Me., are erecting a garage on North Lincoln street; it will be styled Reed-Bonney Garage.

R. F. Campbell, of 420 East 247th street, Chicago, plans to erect a garage on Cottage Grove avenue; the estimated cost is $15,000.

Charles Ebbinghausen, of Crookston, Minn., is to erect a new garage 60 x 130 feet; the entire first floor will be utilized as a salesroom.

The Germantown Garage & Storage Co., of Philadelphia, Pa., has secured plans for a new garage; it will be erected on Rittenhouse street.

The Modern Electric Garage, of San Francisco, has been granted permission to build a new garage; the site selected is on Van Ness avenue.

Ray S. Bridge, of the Cadillac Sales Co., of Pittsfield, Mass., has secured permission to erect a garage and salesrooms; the site is at 128 South street.

Murray & Allender, of Fairfield, Iowa, have sold their garage to R. T. and C. C. McClain; it was the first garage to be established in Fairfield.

Pexa & Kallauner have entered the trade in Tampa, Fla. They have taken over the Harris & Giddens garage at Lafayette street and Florida avenue.

Bickhart Bros., of 1901-3 4th avenue south, Minneapolis, Minn., have secured permission to erect a one-story concrete garage; it will cost $5,000.

A. M. Hartford, formerly of St. Louis, Mo., and Dallas, Tex., is about to enter the used car trade in Houston, Tex. He will open salesrooms at 915 Main street.

Harry Lightner, formerly with the Wood-Van de Berg Co. in Los Angeles, has branched out for himself; he has opened a repair-shop at 1362 South Flower street.

J. De Lauppe, of Sacramento, Cal., is erecting new salesrooms on K street; he is a Buick dealer. The Diamond-Goodrich Tire Co. will locate in the same building.

C. F. Briggs, of Newark, N. J., has formed the C. F. Briggs Co. and is located temporarily at 971 South Orange avenue; he has secured the Oakland and Lozier agencies.

Shell Adams has purchased E. G. Wheeler's garage in Lineville, Ia. Adams formerly was engaged in the truck and transfer business in Sewal, in the same State.

S. H. Mathews, of Birmingham, Ala., has sold the Mathews Auto Co. to L. J. Beyer; the name has been changed to Krit Motor Sales Co. to correspond with the line of cars handled.

A. W. Wiley and E. F. White have entered the trade in Los Angeles, Cal., under the style Wiley Rubber Co. They deal in tires and conduct a repairing business at 110 East Pico street.

The owners of the Auto Tire & Vulcanizing Co. and C. E. Graham, of Grand Rapids, Mich., have opened the Auto Shop at 11 Island street; the new company will conduct a repair business.

George Lewis and John Murphy have leased the Conley Garage in Herkimer, N. Y. The building, which stands at the rear of the Waverly House on North Main street, will be enlarged.

The Peterson-Keyes Co. has entered the trade in Indianapolis at 541 North Capitol avenue; P. H. Keyes is president and W. B. Peterson secretary and treasurer. The company handles Regals.

The Motor & Machinery Supply Co., of 1519 Grand avenue, Kansas City, Mo., is having new quarters erected; a six-story, steel and concrete building is being built on Grand avenue near 21st street.

The Haynes Motor Sales Co. has been formed in Baltimore, Md., and has located at 408-10 North Calvert street; it will handle Haynes and King cars. Charles A. Shaffer is a principal in the new concern.

L. F. Lipsey and T. C. Sinclair, both of whom have been connected with the trade in Baltimore, Md., for some time, have formed the Regal Motor Sales Co. They are located at 2312 Madison avenue and

Digitized by Google

will handle Regals in Maryland and part of West Virginia.

Underhill & Co. is the style of a new firm which has opened up in New York City at West 134th street and St. Nicholas avenue; besides dealing in supplies and accessories the concern maintains a vulcanizing department.

M. J. and W. M. Mitchell, of Victoria, B. C., have formed the Cartercar B. C. Co and have located at 723 View street; they have the entire province as their territory and will open a branch in Vancouver in the spring.

W. Ashley Gray, formerly with the Lindsay Motor Car Co. and the Dorris Motor Car Co., of St. Louis, Mo., has entered the Velie Motor Co. of Missouri; he has become vice-president and general manager of the latter.

Don P. McClure, of Oskaloosa, Ia., has sold the States Auto Supply Co. to H. F. Sheppard, who also takes over McClure's garage and automobile agency; McClure will continue in business as a territorial distributer of Oakland and Paige cars.

The Velvet Co., Inc., has entered the trade in New York City at West 74th street and Broadway; it has the metropolitan agency for Velvet shock absorbers. The officers are: President, H. O. Proctor; secretary, A. H. Miller; treasurer, W. D. Ramsburgh.

The George T. Gaston & Douglas C. Richardson Co. has been formed in Detroit by men of those names; Gaston is an ex-sheriff of Wayne county. The company has taken over the business and location of the branch formerly maintained in that city by the Abbott Motor Co.

A. J. Jackson, of Syracuse, N. Y., has taken possession of the garage at 571-77 South Clinton street, formerly occupied by the Cronin Coach & Transfer Co. He handles Federal and Republic trucks and will use the building as a sales and service station. His Republic territory consists of Onondaga, Madison, Oswego, Cayuga and Oneida counties.

Henry A. Brandtjen, who has been connected with the trade in St. Paul, Minn., for eight years, has purchased the St. Paul Motor Vehicle Co., of 50 East 4th street, and will change the name to Brandtjen Motor Car Co. The company handles Haynes, Lozier and Fiat cars. Felix Joswich, the former owner of the business, will devote his time to marketing a piston scavenging device he has invented.

Fred W. Linz and L. W. Sanborn, who constitute the United Motor San Francisco Co., of 1128 Van Ness avenue, have given up the Maxwell representation after eight years and may retire from the automobile trade; their plans are uncertain. Their territory embraced the entire Pacific Coast country as far east as Butte, Mont., and also included the Hawaiian Islands. They will, however, continue to handle Maxwells until a successor is secured. A new service station is in process of erection.

More Capital for Harroun's Carburetter.

Because the "business has grown out of their hands," to use their own expression, and for the purpose of erecting and owning their own plant, the Ray Harroun Co., of Indianapolis, has increased its capital stock from $50,000 to $600,000 and is offering a portion of the stock for sale at par, $100. With the added capital, it is proposed to erect a new plant in the suburbs of Indianapolis where, in addition to the Harroun kerosene carburetter, strainers, tanks, and similar things will be produced.

The increase of capital has served to disclose Harroun's associates in his kerosene carburetter enterprise. They are: L. D. Woods, president of the Pension Mutual Life Insurance Co., Pittsburgh; R. H. Allen, president of the Eastern Dispensing Co., Pittsburgh; H. B. Wilcox, president of the W. W. Wilcox Co., Chicago, and D. M. Bell, of the Ward-Bell Co., Chicago.

Weed Ends One of its Oldest Suits.

One of the first patent suits started by the Weed Chain Tire Grip Co. for alleged infringement of the Parsons patent, No. 723,299, was terminated this week after having been on the records of the United States District Court in Nashua, N. H., since 1908. It was against the Victor Tire Traction Co., which originally was the Victor Tire Grip Co. It, however, has been inoperative for three years, and when no one appeared for the defense when the case was called Wednesday, 17th inst., the Weed company's attorney asked that it be dismissed and brought to an end.

Dice Engine Acquires Anderson Business.

The Dice Engine Co., which recently was organized in Anderson, Ind., has taken over the business of the American Motor Co. and will continue the manufacture of engines, transmissions, differentials, etc. The officers of the new company are T. C. Werbe, president and treasurer; S. M. Hickman, vice-president, and E. F. Dice, secretary and manager.

January Dates Chosen for Importers' Show.

January 2nd to 10th have been chosen as the dates for the Importers' show which, as usual, will be held in the ballroom of Hotel Astor, New York. Also as usual, it will be managed by Stefan Kjeldsen, secretary of the Importers' Automobile Salon. The dates are the same on which the show has been held in former years, but for the first time they will run concurrently with those of the Automobile Chamber of Commerce's show in Grand Central Palace.

Mrs. Cohen Discontinues Her Horn Suit.

An action brought nearly a year ago by Mrs. Minnie Cohen, of New York City, to restrain the Salvini Electrical Horn Mfg. Co. from making the horn which now is being marketed under the name "Square Horn," was this week discontinued; Mrs. Cohen, who was one of the prospective investors, wished to hold up proceedings pending a patent search.

Takes Judgment Against Whichway.

Robert H. Lanyon this week took judgment in the Supreme Court for New York county against the Tobin Whichway Signal Co., which recently went into bankruptcy; his claim was for $1,010 and was confessed by John W. Tobin, the president. It was on money loaned July 8, 1913.

Breeland Gets Trojan Truck Output.

Walter H. Breeland, 805 Woodward avenue, Detroit, has acquired control of the output of the Trojan Motor Truck Co., which will produce about 100 trucks during the next twelvemonth. They are made in one-ton and three-ton models, listing at $1,800 and $2,500, respectively.

First Dividend for Streator Creditors.

The trustee in bankruptcy of the Streator Motor Car Co., of Streator, Ill., has declared a first dividend of 15 per cent. It is expected that when the affairs of the bankrupt are wound up the creditors will have received between 35 and 50 per cent. of their claims.

Texas Company Sues Watervleit Man.

The Texas Co. this week filed suit in the Supreme Court for New York county against John W. Cramer, of Watervleit, N. Y., for $144.03. It claims to have supplied him with oil to the value of $274.03 between December 2 and 22, 1912, on which Cramer paid but $130.

Fire Damages One Hess Axle Plant.

Fire which broke out early Sunday morning damaged the No. 2 plant of the Hess Spring & Axle Works, in Pontiac, Mich., to the extent of about $5,000. The loss is fully covered by insurance and the plant will be rebuilt immediately.

Continental Truck to Quit Colorado.

The Continental Motor Truck Co., which has built gas-electric trucks on a small scale in Denver, is seeking another location. Among the cities with which it is negotiating for a site is Waterloo, Iowa.

Cable Address, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York Post Office, November, 1900

NEW YORK, SEPTEMBER 18, 1913

MEANING OF THE LINCOLN HIGHWAY.

If patriotism fails to move them, self-interest should induce a large majority of those who have to do with automobiles to contribute at least the $5 for which the Lincoln Highway Association has issued an appeal. Now that nearly half of the necessary $10,000,000 has been pledged, and the route marked out, the mighty project may be said to have progressed far beyond the dream stage and it is evident that, to become an actuality, it requires but the financial support of at least a majority of those who will be benefited by its construction. Their support should be forthcoming.

By far the larger part of the sum within immediate reach has been pledged by a comparatively few of those engaged in the automobile industry, but so far and so well have plans now advanced that all those who are engaged in either the manufacture or the sale of automobiles or accessories, and all those who use them, should no longer remain but passively interested.

Every mile of good road means more business for those who make and those who sell automobiles, and more pleasure for those who use them. An unbroken stretch of more than 3,000 miles of such highway cannot fail to prove of corresponding benefit, the magnitude of which should be apparent to all. The benefits of such a great highway must be shared not merely by those who may incline to tour from New York to San Francisco, or vice versa, but the linking of so many great cities and so many small towns will permit the direct influence to be felt in thousands of retail stores and hundreds of thousands of homes.

Each should give according to his means, but certainly none who have to do with motor vehicles of any sort is too poor to contribute at least the $5 which the officials of the Lincoln Association are soliciting. It is a work to which dealers and clubs of right should lend themselves. The name of every club and every dealer should be on the subscription list, and every club and every dealer should constitute themselves a committee of one to swell the fund.

There are more than a million cars in use, and if but half of their owners will but contribute $5 each, more than $2,500,000 will be rendered available. Let every man do his part.

REMEMBER THE MOTOR BUGGY!

It begins to appear that the cyclecar is likely to prove more of a disturbing factor in the automobile industry than originally seemed possible. Although the little vehicles themselves are slow in actually making their appearance, the organization of cyclecar manufacturing companies is near to becoming epidemic, and if but a comparatively small portion of the promised outputs is produced it will be sufficient to justify serious reckoning.

Present indications are such that the display of the "Caution" signal is again advisable, for the daily press is giving space to all manner of gross exaggerations concerning the newcomer. Although the real extent of the demand is unknown and entirely problematical, stories which are going the printed rounds describe it as "already enormous." One story which carries this statement in big, black type would have it believed that one budding cyclecar manufacturer, who has not yet completed even his first machine, has orders for 53,000 of them, which, if even half true, conveys its own suggestion.

Motor World long ago stated its belief that the future of the cyclecar, or any other light, narrow gauge, belt-driven vehicle, is at best so uncertain as to make it an object for conservative investment only, and nothing has transpired to alter this view. The conservatism should extend not only to its manufacture but to the placing of orders by dealers.

Apparently it has escaped the notice or recollection of most of those who are now enamoured of the little vehicle that only about five years ago the so-called motor buggy occupied the peculiar niche into which it is now sought to force the cyclecar. The motor buggy was light, positively driven, economical in operation and popular priced, and, moreover, it was of standard tread; and while it never obtained the publicity which has fallen to the lot of the cyclecar, it, nevertheless, seemed to contain such promise that its production was embraced by several manufacturers of repute, and others who projected themselves into the field. But where is the motor buggy to-day? In considering the cyclecar, therefore, it is well that the fate of the motor buggy be not forgotten.

A. A. A. FORMALLY ENDORSES SINGLE REGISTRATION BILL

Executive Board, at Buffalo Meeting, Votes to Support Adamson Measure—To "Look Into" Matter of Grade Crossings.

Efforts to have enacted a Federal automobile registration law having proved unavailing, the executive board of the American Automobile Association formally endorsed at the monthly meeting held in Buffalo, N. Y., on Friday and Saturday, 12th and 13th inst., the bill introduced in the House of Representatives by William P. Adamson of Georgia, chairman of the committee on inter-state and foreign commerce. It is entitled "An Act to Regulate the Inter-State Use of Automobiles and all Self-Propelled Vehicles Which Use the Public Highways in Inter-State Commerce," and differs radically from the Federal registration originally advocated by the A. A. A., but is even more effective, as it seeks to put an end to the practice of taxing non-residents. It is short and to the point, as follows:

"No person who shall have qualified by complying with the laws and regulations of the State, territory or district of his residence to use and operate such vehicle or vehicles (self-propelled) shall be required in any other State or territory or district into which he may go for business or pleasure to make any additional registration or take out any additional license in order to use or operate any such machine."

Among other business of a routine nature transacted at the meeting, the first draft of the uniform traffic regulations prepared by Dr. H. M. Howe, chairman of a special committee that has the matter in hand, was presented, though the report is not yet complete. A committee, headed by Preston Belvin, of the Virginia State Automobile Association, was appointed to consider the subject of grade crossings with a view to suggesting means whereby they may be abolished. Upon invitation, Dr. E. Stagg Whitin, executive chairman of the National Committee on Prison Labor, was present and cooperation between the committee and the A. A. A. in the employment of convict labor on the roads is assured.

The dates for the next annual meeting, which is to be held in Richmond, Va., were set for December 1, 2 and 3.

Eleven World's Records Fall at Brooklands.

In an assault on both the 1,000-mile record and the 12-hour record, which still stand because of a delayed start due to heavy fog and a broken spring shackle, which stopped the progress of the car after 700 miles had been covered, A. J. Hancock, at the wheel of a Vauxhall car, shattered no less than 11 world's records on the Brooklands track in England, on Saturday, August 30th, to say nothing of setting up four new "class" records. The car which Hancock drove has four cylinders measuring 95 x 140 mm.—approximately 3¾ x 5½ inches—and is rated at 22.5 horsepower; his time for the 700 miles was 7:58:42.74, which figures out at 87.74 miles an hour. The eleven new records are as follows, the average speed being increased in nearly every instance by as much as 10 miles an hour:

Four hours, 366 miles 1,025 yds.; five hours, 456 miles 840 yds.; six hours, 541 miles 100 yds.; seven hours, 620 miles 320 yds.; eight hours, 720 miles 28 yds.; nine hours, 749 miles 1,348 yds.; 300 miles, 3:15:-24.72; 400 miles, 2:21:14.99; 500 miles, 5:34:-10.34; 600 miles, 6:46:57.27; 700 miles, 7:58:-42.74.

GEORGE W. BENNETT DEAD; SUCCUMBS TO OPERATION

(Continued from page 6.)

automobile indutry. In addition, Willys had several times testified in substantial fashion to the worth he placed on Bennett's services, only last year presenting his trusted lieutenant with a life insurance policy for $100,000 on his (Willys's) life.

Outside of the factories, Bennett also made his influence felt. For many years he was active in the affairs of the National Association of Automobile Manufacturers and was one of the strong forces which brought about the merger of that organization and the Automobile Board of Trade into what is known as the Automobile Chamber of Commerce.

In playing such parts, his directness, determination and strength of character never failed to show themselves. He despised cant and hypocrisy. It was his practice to take the shortest way across rather than the longest way around, and when he had anything to say he said it in a manner that left no room for misunderstanding.

Despite his sturdy frame and appearance of great strength, Bennett had been afflicted with more than one man's share of physical ills. For several years he suffered intermittent attacks of appendicitis, but he adopted the "cascade" treatment and declared himself cured, or, at any rate, felt fortified against danger. For years his throat also troubled him, each recurring attack apparently being more severe. Only last winter his vocal chords became partially paralyzed and for several weeks he was unable to speak. He went to Florida, where he recovered, and returning to Toledo he plunged into work with his old energy, and because of his faith that appendicitis would no longer trouble him, his friends scarcely expected that that malady would carry him off in the height of a career which had firmly established his reputation and which was fast leading him to fortune.

ASSOCIATION DIVULGES THE ROUTE OF LINCOLN HIGHWAY

Thirteen States to Be Traversed by Coast-to-Coast Boulevard—Individuals Solicited to Contribute in Five-Dollar Amounts.

The Lincoln Highway, that coast-to-coast boulevard which originated two years ago as a dream of Carl G. Fischer, of Indianapolis—the Prest-O-Lite man—made one of its biggest strides since its inception when the route which it is planned will be followed was made known early this week by the Lincoln Highway Association.

Thirteen States will be traversed by the highway; in order they are New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Iowa, Nebraska, Wyoming, Colorado, Utah, Nevada and California. The cities in the order in which they lie upon the proposed route are:

New York—New York City.

New Jersey—Jersey City, Newark, Trenton, Camden.

Pennsylvania — Philadelphia, Lancaster, York, Gettysburg, Chambersburg, Bedford, Ligonier, Greensburg, Pittsburgh, Beaver Falls.

Ohio—Canton, Mansfield, Marion, Kenton, Lima, Van Wert.

Indiana—Fort Wayne, Ligonier, Elkhart, South Bend, LaPorte, Valparaiso.

Illinois—Chicago Heights, Joliet, Geneva, DeKalb, Rochelle, Ashton, Dixon, Sterling, Morrison, Fulton.

Iowa—Clinton, Dewitt, Cedar Rapids, Tama, Marshalltown, State Center, Ames, Grand Junction, Jefferson, Dennison, Logan, Council Bluffs.

Nebraska—Omaha, Fremont, Columbus, Central City, Grand Island, Kearney, Lexington, Gothenberg, North Platte, Ogallalla, Big Spring, Chappell, Sidney, Kimball.

Colorado—Julesburg, Sterling, Fort Morgan, Denver, Longmont, Loveland, Fort Collins.

Wyoming—Pine Bluff, Cheyenne, Laramie, Rawlins, Wamsutter, Point of Rocks, Rock Springs, Green River, Granger, Fort Bridger, Evanston.

Utah—Echo, Parley's Canyon, Salt Lake City, Garfield, Grantsville, Timpie, Kanaka Ranch, Fish Springs, Kearney's Ranch, Ibapah.

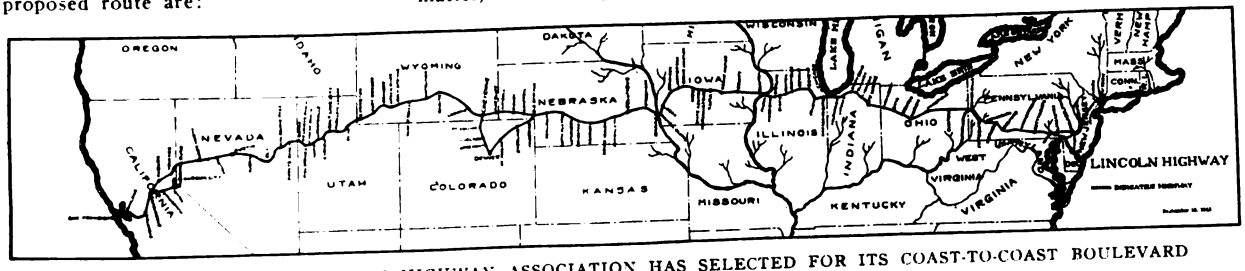
Nevada—Tippet's Ranch, Shelburne Pass, Ely, Eureka, Austin, Fallon, Wadsworth, Reno, Carson City.

California — Truckee, Auburn, Tallac, Placerville, Sacramento, Stockton, Oakland, San Francisco.

The directors of the association have endeavored to select a route of easy grades yet combining the scenic splendors of the country. Some of the points either on, adjacent to or to be connected by branch highways are Gettysburg, Washington, Canton (the resting place of McKinley), the Mammoth Cave of Kentucky, the home of Lincoln in Springfield, Ill., Lincoln's birthplace in Kentucky, the scenic splendors of Colorado, the Grand Canon of the Colorado, and the many and varied wonders of Utah, Nevada and California.

Of course, road building is generally recognized as essentially a State or county matter, and for the promoters of the scheme to go forward without considering public sentiment or existing conditions would be unwise, wherefore the association, in "proclamations" which on Sunday, 14th inst., were posted throughout the country, makes plain that it can hope to succeed only with the cooperation of the whole people along the projected route.

It states that its "proclamation" would be of no effect except it be wise and practicable and meet with the approval of the people for such a memorial, and to that end the association maintains that the route it has selected is the result of technical investigation and long deliberation, and that that portion lying west of Chicago long has been known as the Overland trail. It is held up as the most direct and practical route as to grades, curves and general topography and is that road which is to the greatest extent improved and marked throughout its length.



It will be constructed as a memorial to Abraham Lincoln and is to bear his name. The insignia which will be used to mark the way consists of a large letter L on a placard, the top of which is red and the bottom blue. Above the L is "Lincoln" and below "Highway." Wherever possible the road is to be of concrete and not a mere graded dirt track. It is planned to make possible a coast-to-coast trip over a course as pleasurable as a paved city street or boulevard.

So well has the preliminary work progressed that the promoters hope to have parts of the route ready for use by the time of the Panama-Pacific Exposition in San Francisco in 1915. Nearly half of the $10,000,000 required already has been pledged, chiefly by automobile manufacturers, but appeal is now being made for individual five-dollar subscriptions, although there need be no limit but the generosity of the giver.

However, each person who donates $5 to the association will receive an engraved certificate stating that he has financially allied himself with the other backers of the plan. He will also receive an automobile dash plate and a pocket card, each indicating that he is a contributor to the association.

The certificate states the object of the association to be "to immediately promote and procure the establishment of a continuous improved highway from the Atlantic to the Pacific, open to lawful traffic of all descriptions without toll charges, and to be of concrete wherever practicable. This highway is to be known, in memory of Abraham Lincoln, as 'The Lincoln Highway.'"

Those who are directing the work of the association are: President, Henry B. Joy, president of the Packard Motor Car Co., Detroit; vice-president, Carl G. Fisher, president of the Prest-O-Lite Co., Indianapolis; vice-president and secretary, A. R. Pardington, of New York; treasurer, Emory W. Clark, president of the First National Bank of Detroit; directors—Russell A. Alger, president of Alger, Smith & Co., Detroit; F. A. Seiberling, president of the Goodyear Tire & Rubber Co., Akron, O.; A. Y. Gowen, treasurer of the Cleveland Builders' Supply Co., Cleveland, O.; Paul H. Deming, of the George Worthington Co., Cleveland; Albert J. Beveridge, of Indiana; John N. Willys, president of the Willys-Overland Co., Toledo, O.; Roy D. Chapin, president of the Hudson Motor Car Co., Detroit. Henry E. Bodman is legal counsel and Frank H. Trego is the association's engineer.

ROUTE WHICH THE LINCOLN HIGHWAY ASSOCIATION HAS SELECTED FOR ITS COAST-TO-COAST BOULEVARD

DODDERING AND DODDERERS

Type of Man Who is Always Busy but Never Accomplishes Anything—Those in the Automobile Trade Whom the Definition Fits.

It does not appear whether or not there is such a word as dodderer. Nevertheless, that there are such beings is undeniable. Who are they? What do they do? Why are they entitled to fame? Do they deserve recognition at all? How may one know a dodderer when he sees him—and how may he know himself?

The dodderer is not a rare bird. Unfortunately, he is seen almost everywhere, in every business. He is not a quadruped. He is a biped—a two-legged human creature whose principal occupation is doddering. What is doddering? It's a long story. But it needs telling—and it is sure to be told. Sooner or later all truth must come to the light. And then the dodderer will be exposed. So, in the language of a national advertiser, "Eventually—why not now?"

Never Stays Long on Any One Task.

Hence this subject. The dodderer is a human flail who keeps everlastingly busy but accomplishes little. He spends his time delving into this and into that—but never staying long enough on any one thing to do any good. He is a salesman who has a long list of prospects on whom he calls without any real confident intention of getting an order—who nibbles here and there in the hope of finding an easy one. He does not have any systematic plan and he does not lay out his work thoroughly and carefully; he hears the last "noise like an order" and makes for the ground, getting there just a few minutes or a few days late. He is always busy, but never gets anywhere.

The dodderer is a general manager who is continually dipping into and sampling the soup of business—always demanding some new spice, some new flavor—always complaining that the soup is either too hot or too cold—but always making his complaints in the air and never intelligently analyzing and applying a remedy. He is busy—immersed in the soup—and never able to see clearly and act decisively. He just dodders and is as helpless as an automobile dealer who finds himself submerged in the details of his business, who has no time to see his business in its larger aspects and no time to plan for the big things. He is everlastingly busy, but his business does not keep apace; he does not attract the bright, energetic, hustling salesman; he gets "those that are left," because the dodderer has not the broader vision that perceives the wisdom of paying a high-salaried man who gets the business rather than a low-priced employe who is nothing of an inspiration and very little of a help.

What the Doddering Repairman is.

The dodderer is a repairman who skips from one job to the other without finishing any; whose help is disorganized because they never know what the boss wants or what he will do—whose customers are always grumbling because he does not keep his promises and never delivers on time.

That's what the dodderer is. He is a national institution and will probably continue from one generation to another. But it is to be hoped he will awake and, looking in the glass, see himself as others see him and apply prompt measures for a quiet but quick transformation into a clear-thinking, purposeful, business man who plans his work and works his plan.

CHANGING MENTAL ATTITUDE OF "WAITING" PURCHASERS

There are a number of persons in your locality who are going to buy cars some day. Most of them have the means and would buy now if the right sort of argument were given them. People of this sort are always "waiting" until the salesman with the irresistible "punch" comes along and then they suddenly become buyers. There is no consolation in saying to yourself "That man told me he wasn't going to buy till next year." You can mentally call him a liar, but it will avail you nothing. He told you the truth when you talked to him; it was then his mental attitude; but someone made him change his mind and that some one naturally derives the benefit.

SEATTLE "SERVICE MEETINGS" AND THE FRUITS THEY BEAR.

The Seattle branch of the Ford Motor Co. holds "service meetings" twice a month and finds them very profitable. The original idea was to school employes in the practical features that make for intelligent, satisfactory service. Gradually this plan has broadened to include suggestions and criticisms from employes that would in any way improve the service.

Ford owners in the vicinity heard of the meetings and their interest was so keen that now the programs are frequently made to include numerous topics of general interest covering the instruction, operation and repair of Ford cars, with such other points as may prove helpful to Ford owners and employes. It has been made apparent that these meetings have a distinct value in bringing Ford owners in closer touch with the organization, and one of the most satisfactory results has been the large number of prospects developed and the sales that have followed.

Meet Customers and Avoid "Knockitis."

Don't be afraid to meet your customers. Being afraid of them is a sure way to drive their trade to another dealer. Complaints are unpleasant, but if left unremedied they develop surely and easily into "knockitis." A satisfied customer is your best advertisement.

MAKING OLD CARS SELL NEW

Increasing Profits by Not Neglecting Buyer of Used Car—Methods Employed by One Dealer that Have Proved Worth While.

The sale of a used car ought to be simply the preliminary work for getting a new car of the line you sell into the hands of that customer. Sooner or later the man who bought the used car is going to detect the little noises and the slight shortcomings of the used car he bought and comparison with the swift, silent machines of the most recent vintage is going to make him long for a car that is brand new all the way through.

Every time the clutch slips, or the shifting fingers in the transmission fail to work smoothly, or the brakes slip and need relining or the axle gets noisy he is selling himself a new car. He does not know it, but just the ordinary little things that are liable to happen to any car, new or old, will gradually develop in his mind the fear that his used car is wearing out, and then is the logical time for the dealer to make a good deal on a new car.

Fear Used Car Buyer Will Ask Service.

Here is where a great many dealers fall down. When they sell a used car they bid it a fond farewell and devoutly hope they may never again see the man who purchased it. They are afraid that his next visit will mean a demand for free repairs or free service or other things they do not want to give. They promptly forget his address. He is not sent any announcements of the new models or any other literature that might remind him of the firm from whom he bought his car.

Not all follow this plan, however. One dealer who has sold a good many used cars at fair prices gets himself on a friendly footing with the customer when the sale is made and frankly tells him that a used car is always more or less of a gamble—that even with his experience in the business he could not always be sure of picking a winner. On the other hand, most of the cars of reliable make are good for a great many years' service and that it is more than likely he will get all the service he requires from the car he has chosen. He hopes the customer will keep in close touch with them, and so forth. The man goes away feeling that here is a square sort of a chap worth keeping in touch with.

Shows Superiority of "Newest" Model.

As time goes on this dealer develops his connection with the used car customer as circumstances permit, and after six or eight months begins a series of adroit attacks calculated to make the U. C. C. keen for a new car. He is sent all literature that is distributed and gets everything sent to a new car prospect except the letters. Every once in a while the dealer drops around to see him and take him or some member of his family out in a "latest model." Should some little trouble develop in the used car he seizes the opportunity to have the U. C. C. try one of the new models and drive it himself. After a few such occasions the U. C. C. invariably begins to talk new car himself. Then is the strategic moment, and for the first time the dealer really launches into a selling talk on the new car. And in most cases he sells the new car. Or, as he says, he makes the U. C. C. sell himself.

This is much better business than developing a customer for someone else. It takes courage, method and tact, but it delivers the goods.

MAKE USE OF ANNOUNCEMENTS THAT COME FROM FACTORIES

From many factories at this time come many handsome announcements giving details of the new cars. More than one dealer will paste these on his window; others will hang them up in the show-room; still others will look at them and do nothing until all the excitement is worn off. The time to use these announcements is while they are **new.** Place the one that comes to you in the window first shot. Don't hesitate and don't wait.

CLEAN WINDOWS AS MEANS OF DRAWING OR REPELLING TRADE

Show windows of the sort that command attention and invite a second look are not so hard to achieve as might seem at first blush. The principal elements in securing the hoped for results are light, cleanliness and location. The drawing power of cleanliness (meaning clean, brightly polished glass and clean interior) is so great that one instinctively pauses at a clean window. So many windows are allowed to remain dust covered and unwashed save for an occasional lick-and-a-promise treatment that a real clean window compels attention.

Not only this, but a clean window singles you out as a live one.

People may not remark on it, but they have that feeling about you, just the same—and when they get ready to buy you will not suffer any from having created that sentiment.

People like to do business with the live ones; they are almost certain of better treatment and as Americans we have been led by experience to expect better values from the dealer who is wide awake. We feel that he is likely to have the most up-to-date and reliable goods. So where there is no warm personal friendship to prejudice us we unfailingly bend our way toward the store that proclaims the interest and pride of the proprietor in his business.

Many places of business discount their architectural beauty by permitting dirt and disorder; on the other hand, others without architectural attractiveness draw like a magnet from sheer cleanliness. Every automobile dealer should make his place conspicuous for its freshness.

"My Best Sale and Why I Regard It as My Best"

How the Boasted Repair and Service Equipment of a Competitor Was Turned to Advantage by the Man Whose Establishment Was Small—Another "Best Sale" Which Came Only After Hold on Buyer Had Once Been Lost.

By ROBERT C. CROWTHERS, Cincinnati, Ohio.

OVERCOMING A DISPARAGING STATEMENT THAT WAS TRUTHFULLY MADE BY A COMPETITOR

My best sale was made away back in 1909 when I was selling lots of E——s. My customer had gone through the demonstration period, having taken numerous demonstrations in cars in which he was interested and in some that he was not; and by a sensible system of elimination, had thrown out all cars except the P—— and mine.

I had taken him and his wife home and was doing my best to get him to close, but all I could do was to get his promise to let me know his decision at 4 o'clock the next day. I knew that he would come in, for I was well acquainted with him, and at 4 o'clock I met him at my door. After considerable hem-hawing, as most people do when they have something unpleasant to impart, he managed to tell me that he had decided to buy the other car.

"I have just left their place," he said, "and they showed me through their entire establishment. Their building cost $125,000. They have $5,000 worth of tools and employ 35 skilled mechanics in their repair shop. When I asked them about you and your place they laughed and replied, 'Why, he has no repair-shop at all worthy of the name, and has really only one mechanic and two or three dubs in his place.' It was this that made me decide to buy their car. You can't blame me, can you?"

Two salesmen in the competition for stories of "My Best Sale" promoted by Motor World, narrate the part that "knocking" can play in the selling of a car.

In one story, the disparaging statements of a rival had taken a prospective buyer away from a salesman who regarded the sale as nearly made; but the boast of the rival was turned against him and the sale was saved.

In the other the salesman lost a sale by unwise statements but profited by the lesson and recouped his loss at a later date. Both required clever, spur-of-the-moment salesmanship, and in each case the necessity for instilling confidence in the purchaser is vividly illustrated.

I did not reply to him for a moment, but when I did I looked him straight in the eye and said: "They are the meanest competition I ever had, but for once they have told the absolute truth.

"It is true that I have not a large establishment, but it is equally true that my customers are as well satisfied as theirs. I have a standing offer at the automobile club where I eat lunch with many men who own all kinds of cars, that I will buy a suit of clothes for anyone who can find a dissatisfied E—— owner in ——, and up to this time no one has called me into his tailor's. However, let us follow my competitor's statement through to its logical conclusion," I continued. "If it takes 35 men and $5,000 worth of shop tools to take care of 250 P—— cars, while I, with only one mechanic and two or three dubs, with no repair-shop at all worth speaking of, can take care of 125 E——s, which is the better car for you to buy?"

He stood as though transfixed, but finally replied: "By Jove! They never thought of that. How soon can you get me a car?"

"I have anticipated this sale," I responded, "and have telephoned the factory to have a car tested out and ready for the road. If you will leave with me at 9.20 to-night, we can be in the E—— factory at 7.30 in the morning. We can look around for an hour and leave in the car at 8.30 and be at home to-morrow evening for dinner."

"You have sold me a car," he said.

We went to the factory together and he left his check for the full amount of the car and we drove away.

He has been a well pleased and contented customer ever since.

By ROBERT L. WHITCOMB, Detroit, Mich.

LESSONS THAT WERE LEARNED IN AN ATTEMPT TO "SHOW UP" DEFICIENCIES OF RIVAL CAR

It was to a lady who exercised the greater influence in the purchasing of a car by her husband that I made what I consider my best sale. She was on my list of prospects, and live ones, too, when I learned that she was about to purchase a car from a "cost salesman"—that is, one who gives all his commission in order to make the sale. This lured her on. I called on her and tried to point out the objectionable points in the car which I truthfully knew to be present in it. This was in reality "knocking" the car, and it is needless to say that the sale was lost. "Knocking" is misplaced advertising.

Later she frequented my place of business for service and took great pride in talking of her car. Disregarding the loss of the sale, she was treated like my best customer.

As all new owners generally are finally dissatisfied with their first car, she was no exception to the rule, and when she was ready to purchase a later model of the same make, it was the critical time. Her car had given good service and she had no reason to change; still I knew of the weak intermediate, drive shaft bearing, etc., which were holding up under the good care and skilful treatment of a careful driver. One day, after making a voluntary inspection of the car, I discovered that it was fast "going to pot." Pressing the conversation of selling the car, I succeeded in having her decide to sell it at once. How to place this car where she could see it "go down" was the next thing. By careful planning I gained my point, and the car was under her constant surveillance. The new owner was rough and the car went under in the weak places in a series of repairs. It was only then that I gained her confidence and could touch the question of a new car. I then had no time to lose on the faults of the old car; it was solely the merits of the new one that brought her order shortly afterward. There are a half-dozen good lessons in this sale.

SIDE LINES AND WHEN THEY OPERATE UNFAIRLY

Reilly Explains Wherein Attempts at Earning Extra Income Have Not in the End the Roseate Hue They First Possessed—Unjust to Man Who Pays the Salary and Harmful to Salary.

Reilly tramped up the stairs of the News building and, with a familiarity which indicated that he had been there before, turned through devious passages and finally emerged into the City Room, where the clatter of a telegraph instrument and the

REILLY WATCHED THE FLYING KEYS FOR AS MUCH AS THIRTY SECONDS

rattle of numerous typewriters marked the late afternoon industry of the half dozen busy men.

Over in one corner, through the bluish haze of cut plug, whang and regular tobacco which rose from anything from a corncob to a meerschaum, Reilly finally discerned Charley, who was automobile editor and several other things combined—mostly other things. The little dealer moved over to where Charley was playing his two-fingered tune and stopped beside this member of the Fourth Estate. He stood in waiting and watched the flying keys for as much as thirty seconds before Charley even so much as noticed him.

"Oh! Hello, Reilly! How'd you get in?"

"Strange things happen sometimes when you leave the door open," answered the dealer. "I brought the picture of his royal highness and that new runabout you wanted."

"Oh, fine! Looks just like you," exclaimed Charley, as he pulled from the envelope Reilly handed him an unmounted print of the dealer at the wheel of a new car.

"Ought to come out good, too."

Reilly bade adieu and turned to go.

"Wait a minute and I'll go with you. I'm almost through," and the dealer waited until Charley ripped the last sheet from his typewriter, threw the copy into the basket and picked up his hat.

"I'm going up your way," said Charley, as they reached the foot of the stairs.

"What's the story?" asked Reilly.

"No story, just a little private business."

"Ah, hah!" was the significant remark.

"No, I'm not going to call on a fairy; it's business, real business."

"That's what they all say," retorted Reilly.

"But honest, it is," insisted Charley. "I've hooked onto a little side line to boost my income."

"What now?"

"Magazine subscriptions."

"Making much out of it?"

"Not an awful lot," replied the newspaperman, "but I hope to. I get in a lick at it now and then. Every little helps, you know."

"Doesn't it interfere with your regular work?"

"I don't think so. Why?"

Side Lines Not Ultimately Satisfying.

"Nothing; only side lines generally do," replied Reilly. "I don't think much of them as a general rule, if you don't object to my giving my private opinion."

"Don't you think I ought to do it?"

"I'm not saying what you ought or ought not to do, but if I were in your place I don't think I would put in too much time at it."

"How so?"

"Well, I'll tell you, Charley," continued the dealer, "I never saw it work out very well. Side lines may exist in almost anything or in almost any line of endeavor, but they probably are more common, or more heard of among salesmen, and they have their undesirable features. You're not doing the best by yourself or the man you work for and in the end you are likely to see that you aren't as well satisfied as you thought you would be."

"Don't you carry side lines?" demanded Charley.

"What?"

"All those accessories and stuff."

What is and What is Not a Side Line.

"Those are not side lines; they're necessary adjuncts of the business. I've got to carry them to hold my trade. A side line is something apart from your regular business. If you send stuff to out-of-town papers, that would hardly come within the strict definition of a side line, for it's a part of the news business. That is the system by which the stuff is obtained; but when you dip into this magazine subscription stuff you are getting outside your regular work."

"May be."

"Not only 'may be' but 'is.'" continued

Digitized by Google

Reilly. "Salesmen are prone to fool with side lines in an endeavor to increase their incomes, but I don't think it's always a fair proposition. Here is Smith, a salesman for a tire company; he is paid a salary, and perhaps a commission, to push some manufacturer's line of tires, but Smith thinks he sees a chance to make a little extra money and decides that inasmuch as he is around among business men all the time he might be able to sell office supplies or stationery.

Deviation from "Now and Then" Idea.

"He takes on that as a side line, and whenever he calls on a customer or a prospective customer he makes it an opportunity to put in a whack for his side line. It is to be expected that he will make a little extra money out of it, but he isn't making a consistent increase financially. He isn't going to make the progress he ought to in his regular work, and that is what makes his side line possible. He may experience a temporary and sporadic boost in his income, but it is not consistent and permanent. His gain is a loss, only it may take some time for that fact to become apparent in its full reality."

"But what's the real harm? Here I'm running around all over town and meeting a lot of people; what's the harm in making a try for a magazine subscription now and then?"

"Therein, Charles, lies the fallacy of the whole thing—this 'now and then' idea. If a side line were given absolutely nothing but spare time, time that would go to waste if not applied to the side line, it wouldn't be so bad. But a side line, whether it's a side line of goods, a side line of work or a side line of pleasure, is pretty much like a bad habit in the insidious manner in which it works."

"Why?"

Assumes Quite Unexpected Proportions.

"Because. The first thing you know it has assumed proportions you never expected and has become so important as to overshadow dangerously your regular and legitimate work. Also, it is not difficult to see why this is true, especially if you have watched the thing in its workings for several years. A man starts out with a salary; that is something assured and certain—provided he holds his job. He picks up the side line as a means of extra money, and it is not difficult to see that the more attention he gives to the side line the greater will be his income from that direction; therefore, his natural inclination is to give the side line all the attention he can.

"The people for whom he is supposed to be working are paying him his salary and expenses and are getting some return from his efforts, but while they are also contributing to the expenses of pushing the side line—about which they may know nothing—they are getting no return from the time and energy the man expends in that direction. No matter which way you put it, the company that pays the salary and expenses gets the worst of it. I think you'll admit yourself that it doesn't seem to be exactly fair in all its phases."

"It does sound logical," admitted Charley. "But if a man does his work isn't the rest of his time his own?"

"Take your own particular case," continued Reilly. "You go to work and quit when?"

"Start at 2 o'clock and quit about midnight."

"Then the time between those hours belongs to the News, doesn't it?"

"Yes."

"Well, then, how do you figure that you are entitled to run up on the East Side at this time of day after magazine subscriptions?"

"I haven't anything else to do."

Showing the Newspaperman His Error.

"You haven't eh! You get assignments, I suppose, like all newspapermen, but you know yourself that some of the best stories that come in were not secured through assignments and that some of the best stories that ever happened never were printed because no one happened to run across them. Your beat probably includes hotels or some such general assignment as that, and don't you think it only fair that when you have nothing else to do you should be putting in time trying to get something around the hotels?"

"But I cover the hotels all right."

"But couldn't you cover them better if you put in more time on them? Are you covering them to the best of your ability as it is now?"

"Well," hesitatingly admitted Charley, "there may be something in that, at that."

"Quite right, there is, my boy," and Reilly gave him a fatherly slap on the back.

Not in Harmony with Concentration.

"The successes of to-day come through specialization and concentration," continued the dealer. "The men who climb are the men who make themselves good at one thing and keep at it; then when someone good is wanted in that particular field they go upward, because they understand it best and are the best fitted for the boost. I believe that when a man is engaged in any work or is holding down any one job he should do that work to the best of his ability, and no other.

"If he has something else on his mind it is bound to interfere more or less with his legitimate work. He can't think and plan and work out ideas that will show and help develop his efficiency in his regular work and he, therefore, is not as likely to rise in his regular work. He may dribble along all his life and successfully get away with a regular job and a side line, but he never will attain his greatest success and the greatest success of which he is capable until he throws everything else overboard and buckles down to one thing and makes good at it. By making good I don't mean an average 'make good'; I mean making good to the man's limit. Not only is the side line unfair to the man who pays the salary but it is unfair to the man who takes the salary."

"Do you ever get side lines shoved at you?"

Decides to Watch his One "Iron."

"Yes, lots of them," replied Reilly. "Some day, if my business gets big enough so I can hire other people to look after a good share of it and operate it successfully, I may see fit to invest in some other enterprise, but my belief is that it never will get big enough to be entrusted to others if I don't watch my one iron in the fire while the business is small. If I——"

"Rain!" exclaimed Charley, holding out his hand, palm upward.

"Guess I'll take a car the rest of the way," said Reilly, as he looked down the street to see if one were coming.

"And I guess I'll beat it to the office."

"And that your trip this far may not have been without profit I'll buy a cigar," and Reilly led his companion in through a door which was guarded by one of the few remaining wooden Indians of the city.

Ford's Manual Answers 142 Questions.

There is no doubt that a man who owns a car and does not know much about it can ask a great many questions; but it is safe to assert that any owner of a Ford car would find it a hard matter to ask a question pertinent to the care and operation of his machine that is not adequately answered in the "Ford Manual," a book of 115 pages which just has been issued for the benefit of Ford owners who want to know things. The information is given in the form of 142 questions and answers, covering the car from stem to stern and from top to tires. The questions and answers are divided into groups corresponding with the structural groups of the car itself, and the smallest details are brought into the light in the plainest, simplest way imaginable. Understandable English is employed; clear-cut illustrations help out the text; and, finally, an excellent index makes it a simple matter to locate any desired subject almost in an instant.

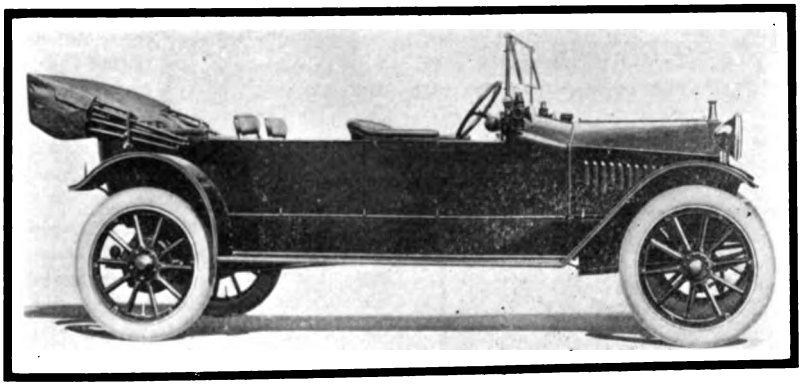
STARTER AND LIGHTS FOR LATEST HUPMOBILE "32"

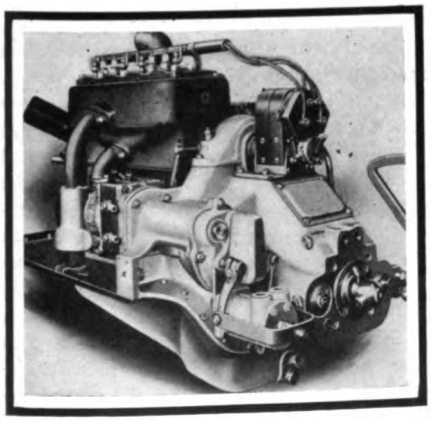
Westinghouse System Standard in One Model and Optional in Others—Safeguards Added, but Few Changes Made.

It seems to be the rule—though there are a few notable exceptions—that manufacturers who commence business by building small cars sooner or later work into the manufacture of larger machines, sometimes letting the "little fellows" slip into oblivion and sometimes continuing their manufacture, but adding bigger cars to the line. The Hupp Motor Car Co., of Detroit, achieved prominence in an amazingly short time through its diminutive runabout; but it was not long before the small machine was more or less overshadowed by a 32-horsepower car built as a four-passenger touring car and roadster and later as a six-passenger car and inside-driven coupe.



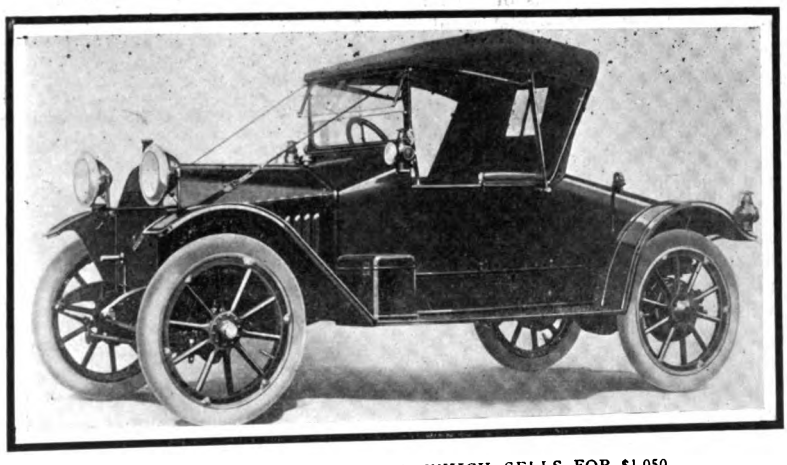
There has been but little change in the larger Hupmobile since it first made its appearance; the principal mechanical features that distinguished it still are abreast of the times in their effectiveness and efficiency, though they were incorporated in the car two years ago. Perhaps the most important addition that has been made to the car is the most recent. In the latest models, which just have been announced, provision has been made for the installation of the Westinghouse electric starting and lighting system, and this is furnished, when desired, at an additional cost on all models except the coupe, in which the electrical equipment is standard and not optional.

Four bodies are mounted on a single chassis—a two-passenger roadster, four- and six-passenger touring cars and a three-passenger inside-driven coupe. Besides the pleasure types, there is a delivery car of the enclosed type. While the price of the six-passenger touring car remains at $1,200, the four-passenger touring car and the roadster, which formerly were listed at $1,000 each, now cost $50 more, or $1,050. The price of the coupe is $1,300 and of the delivery car $1,075. The starting and lighting system adds $150 to the cost of the four-passenger touring car and the roadster, and $100 to the cost of the six-passenger car.



Much has been done to eliminate the little difficulties that sometimes mar the pleasure of automobiling. For instance, a rain shield has been placed on the magneto to protect that vital machine from the incursions of stray drops of water. The gasolene tank has been increased in size, and now holds 12 gallons of fuel—sufficient, it is stated, for about 200 miles of running. The tank is placed high up under the cowl, so that there is a good head of fuel to the carburetter regardless of grades. A reserve supply is made available by turning a two-way cock when the main tank is empty. The spare tire is carried on a rim which, in turn, is mounted in a carrier, so that there are no straps or other fastenings that might chafe the rubber.

The starting and lighting system is of the two-unit type—that is to say, there is a generator to produce the current which charges the 6-volt 100-ampere-hour storage battery, and a separate motor used only for starting the engine and idle at all other times. The generator is driven by "silent" chain at 1.4 times engine speed and at all ordinary car speeds furnishes current to lamps—when they are in use—and also to the battery. The starting motor drives through a pinion which meshes with teeth cut in a steel gear ring by pressure on a pedal, and the switch is connected to the pedal in such a way that the pinion begins revolving very slowly just before the teeth become engaged; the motor attains full power only when the teeth are fully meshed. The motor is on the left side of the engine and the generator on the right, and both, it goes without saying, are fully protected from dirt and water.



The Hupmobile unit power plant is of the same neat, compact design that has distinguished it in the past; the cylinders are cast in a single block and the valve mechanism is fully enclosed. A distinctive touch is given the unit by the mounting of the magneto on the top of the gearcase, the drive being through a "silent" chain which

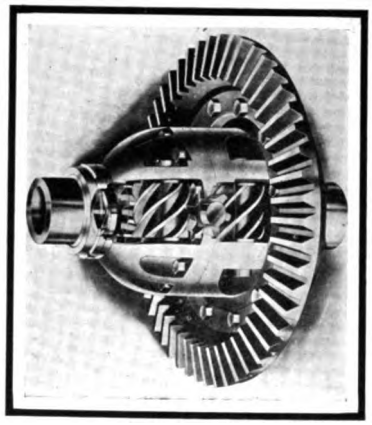
Digitized by Google

runs inside an extension of the crankcase. No little ingenuity has been displayed in the working out of the lubrication system, which, though of the constant circulation type, has no separate moving parts whatever. An oil well which forms the bottom of the crankcase and is sharply sloped backwards so that the oil is deepest at the rear end, extends far enough back to include the flywheel, which dips quite deeply into the oil.

When in motion the oil, of course, is taken up by the rim. Half way up the wheel there is a little oil deflector which skims most of the lubricant off the rim of the wheel and sends it shooting up a wide-mouthed pipe properly located to receive it. This pipe carries the oil to a large main passage in the upper part of the crankcase, whence it goes, through smaller ducts, to the main bearings and thence, through holes drilled in the cranks, to the connecting-rod bearings. Cylinders, camshaft bearings and cams are oiled by splash, though there is an auxiliary direct feed to the cylinders. The surplus oil drops into the well and is strained each time it passes through the system.

The change-speed gears, to which power is transmitted through an 8-plate disk clutch running in oil and fitted with a clutch brake, provides three speeds controlled by a centrally placed lever. The gearshafts are mounted on roller bearings and are short and stiff. Final drive is by propeller shaft, of course, and the rear axle is of the full-floating type, with the differential running on roller bearings. Both brakes operate on drums bolted to the rear wheels and are 12 inches in diameter by 2 inches face.

The standard Hupmobile finish is black with scarlet lake running gear and black-striped wheels; metal trimmings are black and nickel. The equipment consists of rain-vision ventilating windshield, silk mohair top with envelope, Jiffy curtains, cocoa mat in tonneau, rear shock absorber, electric horn and, when electric lighting is not specified, Prest-O-Lite gas tank and gas headlights and oil side and tail lights. Of course, the usual equipment of tools and so forth is provided.



Effect of Sun on Fresh Varnish.

Among the varied directions that have been given for the care of the varnish on a new car, little attention has been paid to the harm that may result if a newly finished body is left standing for any time in the sun. Fresh varnish is extremely sensitive to heat, and if a car is left in the direct rays of the sun the finish is likely to become dull in very short order. The only remedy in such a case is complete revarnishing, for there is nothing that will restore the luster that has been lost.

RADICAL CONSTRUCTION IN SPIRAL GEAR DIFFERENTIAL

Influence of Traction Eliminated in New Device which Acts as True Balance Gear — Construction and Operation.

It is singular, to say the least, that up to the present time, the ordinary differential mechanism, which long has been viewed by engineers and others as imperfect in action and as more or less of a makeshift arrangement, has survived, in its existing form, the general alteration that has further perfected in the change practically every other part of the motor vehicle; it is true that sporadic attempts have been made to overcome its shortcomings—several mechanisms calculated to replace it have appeared but few of them have lived up to the expectations of their sponsors—most prominent among which is made apparent by the adoption of differential locks by a number of prominent commercial vehicle makers.

MUEHL SPIRAL DIFFERENTIAL

Now, however, all the disadvantages of the ordinary type of spur gear differential bid fair to be subdued, for there soon is to be placed on the market a new type of differential which is radically different in construction and in action from the generally familiar type. It is the Muehl differential—named for its inventor, Wm. F. Muehl—and arrangements now are being made for its production both in America and abroad by the M. & S. Gear Co., whose offices are in the Dime Savings Bank Building, Detroit, Mich.

The Muehl differential differs from others of the orthodox type in that the differential gears are of the spiral type—this is made plain by the accompanying phantom view of its internal economy—and it is because of the form of these gears that the mechanism differs in action so completely from the action of the usual type of so-called equalizing gear. The action of the conventional differential is governed by both the traction of the wheels and the distance traveled by them, whereas the action of the Muehl is governed only by the distance.

In other words, the Muehl differential provides what is to all intents and purposes a solid axle as long as the two driving wheels rotate at the same speed; differential action is permitted, however, when one wheel rotates faster than the other, as when a car is rounding a curve, for instance, and owing to the action of the spiral gears the power from the engine is proportionately distributed between them both.

In construction, six of the spiral gears are anchored or journaled in the housing and have no rotative powers of their own. They are driven around with the housing, thus forming a complete mechanical lock and driving the two axle gears with equal speed when both wheels are required to travel the same distance. The two axle gears have rotative power through tractive distance of either wheel when the car is turning, or when one wheel is required to travel a greater distance than the other; the six anchored gears thus are caused to turn on their axes, permitting one wheel to advance in proportion as the other is retarded. As the gears always present the same pulling face when power is applied, through the master or ring gear which is of the usual bevel type, regardless of differentiation, the power is proportionately distributed between the two wheels.

The advantage of equalized tractive effort scarcely requires enlargement, for it means, briefly, that with one rear wheel on slippery pavement, the tractive effort then is applied through the other, which, with the usual differential would remain idle while the other merely spun around. The Muehl differential is neither larger nor heavier than the ordinary differential, for which it can be substituted, where the axles are full-floating, in less than one hour.

Although first examination would tend to give the idea that the cost of manufacturing the Muehl differential must be comparatively high, it is stated by the manufacturers that such is not the case, and in explanation of the statement the following facts are pointed out: The manufacture of the housing is exactly the same as that of the conventional type of differential; six of the spiral gears that are anchored in the housing are of standard size and are all exactly alike; the two axle gears also are alike, making only two settings of gears to cut; on the conventional type each gear must be cut separately; there are 54 teeth to cut on the Muehl and 72 in the conventional type for a 30-horsepower motor.

GIVING THE MOTOR CAR BUYER "PEACE OF MIND'

Salesroom in Which Salesmen Are Not Permitted to Ask Prospect's Name, Address or Telephone Number—Belief That Sale Is More Likely if Buyer's Life Is Not Made Miserable by Follow-Ups.

"Smith, I'm glad to see someone's waking up."

An automobile dealer who has been a part of the metropolitan "Automobile Row" for a considerable length of time walked into the salesroom of the Chevrolet Motor Co.'s branch at Broadway and West 51st street and addressed this blunt remark to Leslie F. Smith, the branch manager. Smith smiled and, with the visiting dealer, looked to the spot on the wall where hung this sign:

"Our salesmen are not permitted to ask the name, address or telephone number of any visitors to this store. If our product and presentation are not sufficiently impressive to justify the continued interest of the motor car buyer, we have failed of our purpose. Visitors are always welcome."

Those few words sum up a selling attitude that is, to say the least, different—in Broadway automobile selling tactics it makes a very close approach to being decidedly new. It is so different that the first question that comes up is "Does it pay?" The only answer Smith could make to the question was that the business pays; the branch is selling more cars than it can get. If a business is doing that, the owner is not likely to worry much about whether his methods are right or wrong.

The idea is the result of the collaboration of W. C. Durant, the head of the Chevrolet industry, and Smith; who was father of the thought is not material, but after discussion its wording was arrived at, Durant had the sign printed and framed, about 20 x 28 inches, and Smith hung it up.

Although the branch has been open only since the middle of the summer, it stands out as something different from the majority of other Broadway automobile selling establishments; it is on the northwest corner and has a glass window frontage that permits a man on Broadway to see entirely through the salesroom and out into 51st street. The salesroom is not large and there are only two cars in it, but there probably are more visitors there in a day than there are in some other salesrooms in a week. The number which enters daily ranges from 75 to 150. Some buy, some don't.

Smith stated that it would be difficult to cite concrete instances in support of the policy embodied in the sign on the wall, but the working out of the display and sales plan of the branch is interesting to an observer. There is nearly always a little knot of people looking in the windows. They are studying two motors which are set up side by side. One is an old-style motor, cast in pairs; the other is a Chevrolet motor, block cast, with enclosed valves and clean-cut. The latter weighs much less than the former and has many the fewer parts. Between the two is a small sign, "Why buy the old when you can buy the new?"

Exhibit in Window Initial Attraction.

This exhibit proves an interesting study. The newer motor is different from the other in appearance, and those who stop study the two with interest. Its neat and clean appearance is strikingly emphasized. Next they generally look around the salesroom; they see the two cars. If they see the cars they cannot fail to see the sign, for it is the only thing visible on a long stretch of wall and is easily read from the street.

Having seen the sign and absorbed its meaning, many of those who have looked from without step inside and ask questions. After having satisfied their curiosity they leave; some of them come back and buy and some do not, but every one of them goes away knowing more about the Chevrolet line than he did before. It is, at least, one seed sown for the harvest. The seed may not ripen for months or years—it may never ripen; but Smith believes the results will in the end justify the policy.

Partly Due to Desire to be "Different."

"It is partially due to a desire to be different from our competitors," explained Smith, "and also is an honest effort to sell cars in a way that we believe will prove popular with the general public. We do not believe any man likes to be hounded by a salesman, and there certainly is a lot of work along Broadway that comes close to that classification. The sign sums up our policy in the matter and explains it as fully as anything can.

"When a man comes in here we tell him anything he wishes to know about our cars, and if he is willing to listen we explain our proposition to him as fully and as interestingly as we can. In the course of the conversation we drop a remark to the effect that we have some interesting literature which we would be glad to send him, and if he responds at all to that remark and is willing to leave his name and address we take it, but in no case do we come out and bluntly ask a man for that information.

"Our salesmen are instructed to study those who come into the salesroom and to be very careful in their handling of them. If a man is sufficiently interested in our cars to leave his address for the sending of literature we make the way easy for the

Digitized by Google

leaving of his name, but we avoid all semblance of pressing him to do something he does not desire to do.

"Personally, I believe there has been too much of that kind of work in the selling of automobiles. This business is not so widely different from some others, and I cannot see why such tactics should be pursued here any more than they should in certain other lines. If you go into Tiffany's and ask to be shown jewelry the salesman will be as courteous as he can and will do his best to interest you in the goods he has to show. If you don't buy, very well. He may hand you his card and say he would like to see you again some day, but he doesn't maneuver for your name and address.

Follow-up not Found in Other Lines.

"If you go into Wanamaker's and look over their goods, even those which are high-priced, you will get every courtesy and an effort will be made to interest you in the merchandise, but a week from that day you are not followed up by a salesman who continues to try to interest you in something in which you, at the time you saw it in the store, did not have sufficient interest to buy it.

"I have speculated as to how the sign is taken by the motor car buyer. This afternoon two men came in and spoke of the sign in a sneering manner. They seemed to look upon it as an evidence of a lack of aggressiveness on our part, but they are the only ones who have so spoken of it. Furthermore, these two men did not appeal to me as being the class of men from which we expect to get our business.

Places Self in Position of Buyer.

"In the whole matter it is merely an effort on our part to place ourselves in the position of the man who is about to buy a car. If I were in the market for a car I would like to investigate the different makes and would like to feel free to go into a salesroom and ask a few questions without having a salesman put on my trail as soon as I left. Oftentimes when a man is out to buy a car and makes a stop at a salesroom, his name, if he doesn't care to give it, is secured through the license number on the car he is driving and, with four or five salesmen from as many different lines of cars after him, his life is made miserable and the salesmen become a veritable nuisance.

"On the other hand, several dealers from along Broadway have come in and have complimented us upon our attitude. One of them said, 'Smith, I'm glad to see someone's waking up.' He said it was time the dealers got away from their old 'prospect hunting' methods. We may discontinue this policy if the future should show it to be wrong, but it appeals to me as being satisfactory to the buyers of cars.

"The policy must be partially right somewhere, for we have on our waiting list some of the best known people in town; they have been in or have sent their chauffeurs to investigate, and as soon as we can get cars for them they will send us their checks. We tell our salesmen at all times to put themselves in the place of the prospect and to handle him as they would like to be handled themselves were they out to buy a car."

Being different—and successful—is the personal policy of Smith. He believes that progress is best made if a man is different from his competitors without being at the same time spectacular. Before going with the Chevrolet people he was Southern manager for the Oakland Motor Car Co., of Pontiac, Mich., and before that was manager of the Oakland branch in New York. His Southern terrirtory embraced ten States.

"Different" Methods in Publicity.

Illustrating his "difference" is an instance of how the Oakland car obtained many dollars' worth of publicity in Atlanta, Ga., at a cost of about $5. Smith had printed a few cards which bore a picture of an Oakland car and a few words, exactly what is not material. Five of these cards were given to prominent men, including the mayor of the city. The five men cheerfully agreed to enter into the plan.

The cards having been distributed, Smith and other salesmen went to the newsboys of the city and said, "We have had some cards printed like this one I am showing you and we have given them to certain men. Who the men are we are not going to tell you, but for every card you bring us we will pay you $1. To get the cards all you have to do is to ask a man if he owns an Oakland car. If he has a card he will take it out of his pocket and give it to you."

Newsboys Spread Car's Name Broadcast.

That afternoon Atlanta's army of newsboys went out into the streets and began asking of every man they met the question, "Say, mister! Do you own an Oakland car?" Only five men, outside the Oakland salesmen, knew what the lads were talking about, but they kept at it and if any man got by a newsboy that afternoon and evening without knowing that there is such a thing as an Oakland car he was a very elusive sort of individual or else deaf. The "kids" stormed the city with their Oakland query. If a man looked blankly at them and wanted to know what they were talking about they only repeated the question until sure the man had not a card in his pocket.

The first newsboy to get a card got it in the outskirts of the city. No more paper peddling for him! He started hot-foot for Peachtree street and burst into the Oakland salesrooms out of breath. No comment was necessary. He handed in the card, got his dollar and was out in a flash to wave the greenback and shout his success—also to hunt for another card. Every card was turned in that evening. The publicity, which, however, could be thus secured in the not too large cities, cost the Oakland people $5 and the few cents that the printing amounted to, but considering the number of business men who had "Oakland car" shouted at them the cost per shout was trivial.

Series and Parallel Lamp Diring.

When electric lights are connected up in series the current is bound to pass through all the lights in the circuit, giving each light an equal share of the current. When the connections are in parallel, however, each lamp takes what current it requires, and if one lamp burns out the others are not interfered with, as they are in series connection, where the burning out of one lamp interrupts the whole circuit. If a lamp of high resistance is inserted in a parallel circuit with lamps of low resistance it will not burn—or, at least, it will not burn as it should—because the lower resistance of the other lamps provides a much easier path for the current, which always goes the way of least resistance.

Remedy for "Force Cracks" in Bodies.

It is to be expected, of course, that the varnish on a car will show wear in time and will appear cracked in spots—"force cracks" they are styled by painters—though if a little care is used, in closing doors for instance, the surface can be preserved for a good deal longer time than usual. In many cases "force cracks" can be cured by gentle rubbing down and revarnishing, though if they have bitten in too deeply the only remedy lies in burning off the old finish and putting on new.

Sheet Aluminum for Vise Clamps.

While copper, brass and sometimes lead are the usual materials of which vise clamps are made for use in gripping things that the steel jaws would be likely to mar, sheet aluminum also is good for the purpose and, in fact, is preferred by some to the more commonly employed metals.

Gum Camphor to Prevent Tarnishing.

Polished metal parts that are wrapped up and stored while the car is out of commission may be kept from tarnishing by putting in the package a small piece of gum camphor.

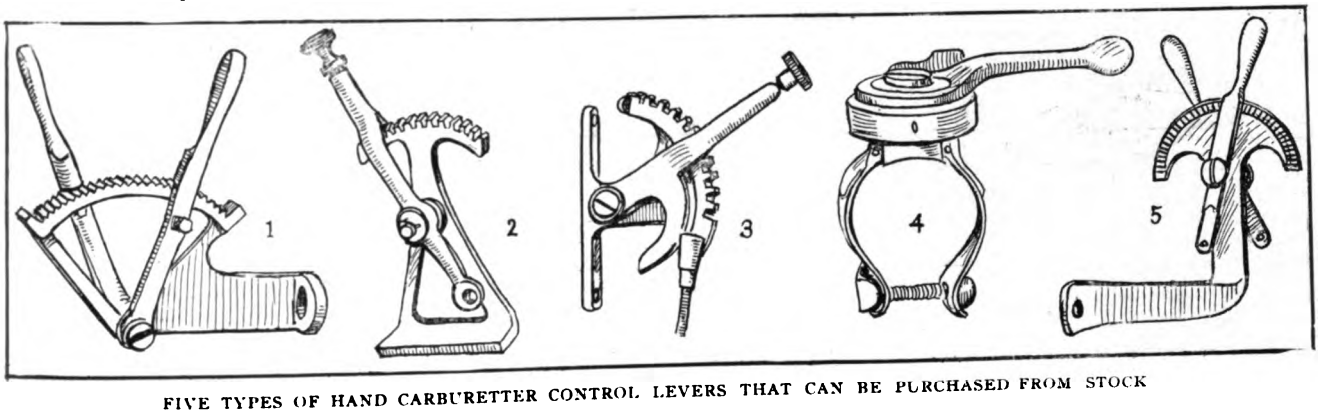
REDUCING FUEL EXPENSE BY MANUAL CONTROL

Advantages of Adjustments for Altering Gasolene and Air Supply From Driver's Seat—Action of the Auxiliary Air Supply and Some Simple Types Explained—Home Made Devices From Odds and Ends.



There is no gainsaying the maxim that much can be accomplished by determined effort; to let well enough alone when there is even the slightest change of making better that which already is good is to acknowledge defeat. Incidentally, there is always more than one way to kill a cat, and what cannot be done in one way often can be done in another way. Hence, as it is impossible to drag down the already high price of gasolene, it follows that some other means must be adopted to lighten the burden of fuel expense and it is here that much can be accomplished by determined effort.

Unfortunately for those who drive cars, the average automobile engine will run with nearly every evidence of health and vigor on mixtures that vary from perfect to mixtures that are not by any means perfect; they will run on rich mixtures when they should not be run on them—both because of the willful waste of fuel which must follow and because of the overheating and sooting that is likely to follow—and some of them will run on mixtures that are far too lean. Mixtures that vary on the lean side apparently favor the operator, though they may be cheating him in that they preclude the possibility of the generation of sufficient power to propel the car up grades that once could be "taken on high."

It is true that the average modern carburetter—which is miles ahead of its older prototype—is as automatic in its action as human ingenuity can make it. Manufacturers have striven to no small purpose to perfect devices which will furnish mixture of the proper quality over the whole, or nearly the whole, range of speeds of which the engine is capable. The fact remains, however, that a carburetter is an inanimate mechanism; it has no brain, and therefore it cannot proportion its mixture to the exact requirements of the motor in the manner that man can proportion his food to the needs of his body.

Supplementing Carburetter Action.

It is doubtful whether many really up-to-date carburetters could be improved insofar as their functioning is concerned; they have been designed automatically to vary quality and quantity of mixture according to the needs of the engine, and there is every reason to believe that they do so. But if their action cannot be improved it can at least be supplemented and the supplement is suggested by the construction that has been adopted by several makers who have provided means for manually controlling either the flow of gasolene through the needle valve, or the flow of air, or both.

FIVE TYPES OF HAND CARBURETTER CONTROL LEVERS THAT CAN BE PURCHASED FROM STOCK

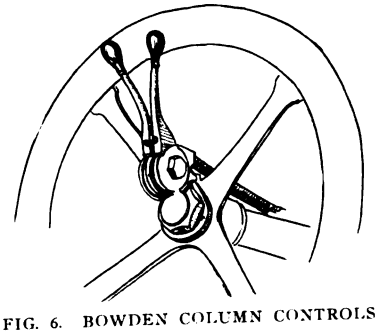


FIG. 6. BOWDEN COLUMN CONTROLS

That some such adjustment which will permit the normal action of even a good carburetter to be supplemented is required, or demanded, is indicated by the fact that manual control of either air or fuel will be a much more prominent feature of next year's cars than it is of this year's cars, or than it has been of any other crop of cars. And in the adoption of such construction there is apparent a well-defined effort to increase engine efficiency, which means, also, to reduce fuel consumption to the minimum consistent with proper operation. And that there is value in providing some means for manually varying the proportions of the mixture is indicated by the fact that at least one manufacturer who always has provided means for opening or closing the needle valve from the dash, has obtained fuel consumption figures far better than those of other makers who make no such provision. It is not necessary, with this particular carburetter, to vary the amount of fuel flowing through the needle valve, for it can be set so that the engine will run almost equally well at any speed. But by varying the amount of gasolene in the mixture, according to power requirements as indicated by road conditions and car speed, the engine can be induced to propel the car at times with considerably less gasolene than normally is required for average conditions.

Obviously, it requires effort and watchfulness to vary the mixture according to the requirements of the car, but in the long run the effort is exceedingly likely to be well worth while. It is not always possible with any degree of success to alter the needle valve adjustment with some carburettes and with some cars, but in a great many cases the air adjustment can be altered

Digitized by Google

manually, while the car is running, with considerable success, and little explanation is needed to make plain that where this adjustment is made between the carburetter and the cylinders the suction through the carburetter will be reduced and less mixture will be drawn from it.

Pros and Cons of Extra Air Inlets.

Much has been said for the manually controlled auxiliary air port and much has been said against it, though in any examination of pros and cons it would seem that the greatest drawback to its use is its added complication. Abroad, where greater attention is paid to fuel consumption than is the case in America—the comparatively high price of "petrol" is the reason—the extra air inlet is used to a considerable extent and is looked upon by a good proportion of the motoring fraternity as well-nigh indispensable. In the majority of cases, the purchasers of cars fit these devices themselves, either buying them complete from supply dealers, or using home-made ones, and there is no reason why any one so inclined cannot follow in their footsteps.

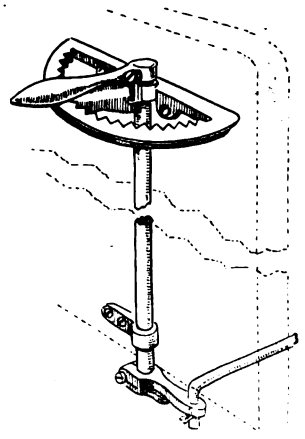

FIG. 8. SIMPLE DASH LEVER

Devices that Are Simple to Make.

It is neither difficult nor expensive to make and fit an extra air inlet which will permit the driver to vary his mixture at will; and as the intelligent use of a device of the kind is certain to reduce fuel consumption the adoption of such a device is a cheap expedient to the reduction of gasolene bills. In nine cases out of ten it will be found that the engine not only will accept a weakened mixture but will run considerably better on it than it will on the normal mixture. And even if the mixture cannot advantageously be varied, the auxiliary air port still has a valuable use in that it may be opened wide on down grades, when the engine is used as a brake, thus not only effectually stopping an expensive fuel waste but cooling the engine as well.

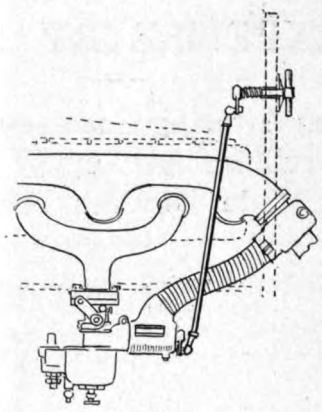

FIG. 7. HOLLEY MANUAL CONTROL

Although there are few manually controlled auxiliary air ports on the market in their complete form, it is quite possible to purchase in the open market very nearly, if not all, of the necessary parts. Miniature levers designed to be fixed either to the dash or to the steering column are carried in stock by Charles E. Miller and the American Auto Supply Co. (from whose catalogs a number of different types of levers illustrated herewith have been reproduced), and a number of others, including the New York & Brooklyn Auto Supply Co., Allied Motor Accessories Co., Auto Owners' Supply Depot, General Automobile Supply Co., and Geo. H. Roberton, all of New York City.

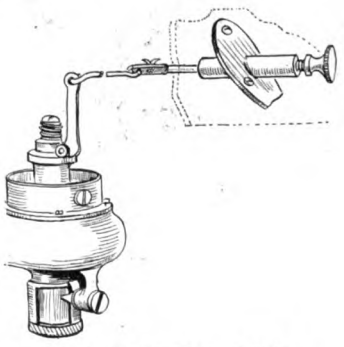

FIG. 9. TOE-BOARD LEVER

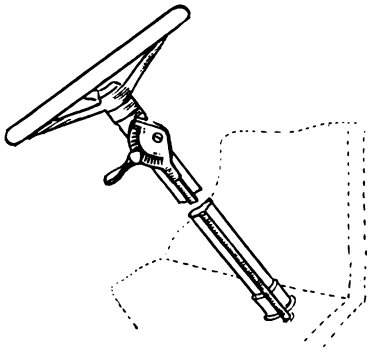

FIG. 11. STEERING COLUMN LEVER

Control Levers Stocked by Most Dealers.

In fact, there are few dealers in Automobile supplies, no matter how small the home city may be, that do not carry or that cannot get at short notice, devices of the kind. Other than a small lever of the kind, the only necessary adjuncts are a couple of lengths of thin brass or iron rod, which, with the necessary couplings, bell cranks, etc., can be purchased in any hardware store. With this material any one with even a small amount of mechanical ability ought to be able to rig up a thoroughly serviceable auxiliary air port or a needle valve adjuster.

In the accompanying plate there are shown several types of hand levers designed for attachment in various ways; all of them, with the exception of Fig. 4, are intended for attachment to the dash. Fig. 4 is a Bowden wire control, and as is shown by the sketch, is intended for attachment to the steering column. Just how simple the attachment of a control of the kind may be is shown by Fig. 8, in which the lever is mounted on the face of the dash with the rod running through a hole to the carburetter adjustment; the rod may connect with either the needle valve or an auxiliary air port, of course.

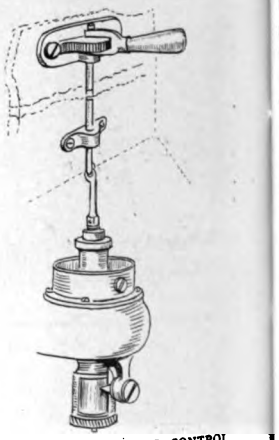

FIG. 10. AUXILIARY AIR CONTROL

Construction that May be Followed.

In Figs. 9, 10 and 11 there are shown three more simple types of auxiliary controls that are distributed by the American Auto Supply Co. of New York City, and in each case the drawing makes plain that no extended knowledge of mechanics is necessary to complete the fitting. In all three of these illustrations, the control lever connects directly with the existing carburetter

Digitized by Google

air inlet, though only slight alteration would be necessary to cause them to operate either the needle valve or a separate auxiliary air port.

Among the very few manually controlled extra air ports that can be purchased com-

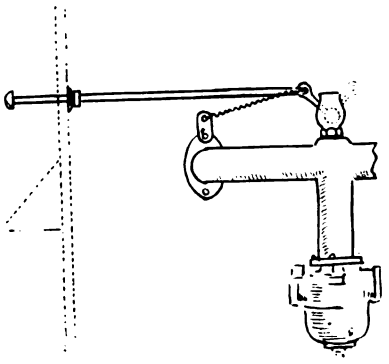

FIG. 12. SIMPLEST AUXILIARY PORT

plete, the Holley outfit, which is produced by the Holley Bros. Co., of Detroit, Mich., probably is the simplest. It is shown as it is attached to an engine by Fig. 7 and scarcely requires explanation. It consists essentially of a flexible tube with a clamp for attachment to the exhaust manifold and a sleeve shutter with which the amount of air admitted to the carburetter can be adjused.

East of Attachment Made Plain.

The Bowden auxiliary air inlet is one of the very few devices designed for attachment between the carburetter and the cylinders that can be purchased on the open market; it is stocked by the J. S. Bretz Co., of New York, sole representatives of the makers, Bowden Wire Ltd., London, and is shown completely by Fig. 13. The Bowden wire mechanism itself, as is fairly well known, consists of a stiff wire encased in a housing of spiral spring and its purpose is to obviate the necessity for bell cranks where there is a change in the direction of the movement it is desired to transmit. The wire may be led around any number of corners, or even tied in a couple of knots, without affecting the operation of the mechanism. Consequently, it is simple of attachment, for no special provisions are necessary. Fig. 6 shows one method of mounting two Bowden controls atop the steering column, where they are within easy reach of the driver's fingers.

The Bowden auxiliary inlet itself is cylindrical, pierced with a number of air holes, as shown in the drawing, and is shaped to fit the inlet pipe. Inside the body there is a plunger which normally closes the air holes. When more air is required this plunger is drawn away from the holes by means of the Bowden wire mechanism. To affix the device it is merely necessary to drill the intake pipe and insert the auxiliary port, drawing the nuts up tight against a washer provided for the purpose. The control, of course, can be placed anywhere that is most convenient, and in this respect it is pertinent to add that it should be placed where it is most convenient, for unless the use of the inlet is encouraged by the visibility of the control and the ease with which it can be manipulated, there is little use in fitting the device.

The simplest possible method of fitting a manually controlled auxiliary air port—it is also the cheapest, for the materials can be purchased for something under one dollar—is shown by Fig. 12. The method is applicable, of course, only where the shape of the intake manifold is as shown by the picture or where it is only slightly different. The only materials required are a large-size priming cup, which can be purchased at any supply store, a short length of spring and a rod long enough to reach from the dash to the intake manifold. The top of the manifold is drilled and the rod inserted and screwed tight. Then if the dash is drilled and the rod inserted through the hole and

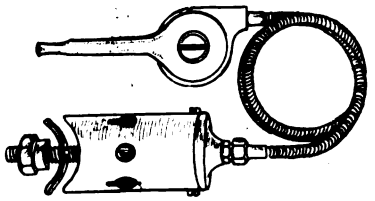

FIG. 13. BOWDEN EXTRA INLET

attached to the lever arm of the priming cup the device is complete. The spring is not necessary, though it will assist in preventing rattles. A home-made device of the kind has the advantages, too, that it affords a ready means for the introduction of kerosene into the cylinders to help remove carbon deposits.

Air Ports from Shop Odds and Ends.

The construction and application of any device of the kind will vary, of course, with the shape and accessibility of the intake manifold, another simple device that can be made out of shop odds and ends being shown by Fig. 14. In this case, the port consists of a short length of brass tubing threaded at one end and closed by a cap at the other end; the cap may be soldered in place. In the side of the pipe, which, needless to add, is screwed into the intake pipe above the carburetter, an oblong slot is cut with a hacksaw or a file. The device is completed by the addition of a sleeve which can be rotated to cover the slot cut in the pipe.

Where the carburetter is attached to a manifold in which several branches unite directly at the carburetter, thus leaving no place for the insertion of the extra inlet, it may be possible to insert a short length of pipe between the carburetter and the intake. If this can be done, it is comparatively simple to saw a hole in the pipe and to cover it with a sleeve connected with a lever on the dash or on the steering column.

In any case, the fitting of a manually controlled extra air port is not difficult, and there is little danger of causing irremedial damage in the attempt. If there is any doubt regarding the advisability of fitting one—whether it actually will cause the engine to run better, or at least to run as well on less fuel—it is easy enough to find this out by drilling the intake manifold and inserting an ordinary priming cup. If no better results can be obtained with the engine under this simple test, and it is deemed inadvisable to carry the test further by the adoption of a larger port, the hole very easily can be plugged, or, better still, the cup can be left in position, where it will serve for the introduction of kerosene.

Necessity for Intelligent Operation.

The addition of an extra air port is quite possible with almost any carburetter and any manifold construction, and the control the port affords probably is superior to that afforded by any attempt to vary the flow of gasolene through the needle valve, for, as already has been made plain, it is not always possible to change this adjustment to advantage. But whether the manual control is connected to the needle valve or to

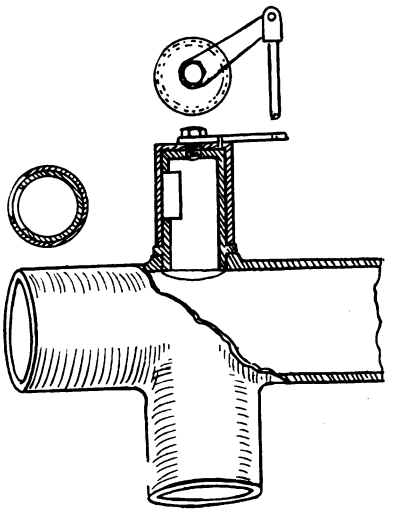

FIG. 14. HOME-MADE AIR PORT

an auxiliary air port, it must be remembered that no good can result, unless intelligent use is made of the adjustment. It other words, it will require patience and practice to ascertain just how much the air port can be opened for the best results when driving under different conditions.

WEIGHT LOW, POWER HIGH IN SIX-CYLINDER S & M

All Components Standard and Equipment Unusually Complete—Spare Wire Wheel Included in the Equipment.

The most conspicuous thing about the S & M car, the manufacture of which, as was stated in Motor World of September 4, has been undertaken by the S & M Motor Co., of Detroit, is that it is the latest exponent of the rapidly growing policy of building high-grade cars of parts produced by specialists in their respective fields. Supplementing the data already printed, the accompanying illustrations and more detailed description go far toward indicating that the machine, which is styled the "S & M six," will be worthy of the confidence reposed in it by its producers.

So far as the quality of the component parts is concerned, it is necessary only to state that the car has a Continental motor with Bosch dual ignition system, Rayfield carburetter, Jesco electric starting and lighting system, Brown-Lipe three-speed gearset selectively controlled, Spicer universal joints, Timken axles front and rear, the latter being of the full floating type, Parish & Bingham heat-treated pressed steel frame, Gemmer model K steering gear, Mayo radiator of the true cellular type and McCue wire wheels shod with 34 x 4½ inch Firestone tires.

To go more into detail, the six-cylinder motor, which has its cylinders cast in threes, has a bore and stroke of 3¼ inches and 5¼ inches, respectively, and its maximum rating is 58 horsepower at 2,000 revolutions per minute—a rating that gives one horsepower for every 57 pounds weight of the car. The change-speed gearing, which is linked to the motor through a multiple disk clutch, is calculated to carry the energy of an 80-horsepower motor; there should be no sign of weakness in this department of the car. Nickel steel is the material employed in the construction of the propeller shaft. The rear axle has pressed steel housing and the front axle is, of course, drop-forged. The frame has a depth of 4 5/16 inches and is of ample stiffness to carry the weight of the car which, incidentally, is moderate for a machine of its size, being 3,200 pounds. The wheelbase is 130 inches and the tread standard.

SIDE AND FRONT VIEWS OF THE WIRE-WHEELED S & M "SIX" TOURING MODEL SELLING FOR $2,485

The steering wheel has a generous diameter of 18 inches, and is placed on the left side of the car, from which it follows naturally that the control levers are centrally positioned. The dashboard has an open-sided cowl under which the instrument board is sheltered and upon which the windshield, which is of extremely substantial design, is built and stands firmly without the aid of stays or extra supports of any kind. The three-quarter elliptic rear springs are underslung, keeping the body low; the front springs are semi-elliptics.

S & M WHEEL AND CONTROLS

The equipment of the car is of the high grade necessary to complement the construction of the machine itself. The upholstering is done in genuine hand-buffed leather. The top is a Golde one-man affair. On the tonneau floor is a felt pad backed with pantasote and reversible. Hexagon robe and foot rails, an electric cigar lighter, a thermos bottle, plenty of convenient little storage pockets and other features indicate the care that has been taken to provide conveniences. With all equipment, including an extra wire wheel and electric horn carried under the engine hood, the price of the car is $2,485.

No Chains on Detroit Electrics

Owing to an unfortunate slip of the pen in the article "Shaft Drive Systems for Electric Cars" in the August 21 issue of Motor World, an illustration of a motor with chain drive to the shaft was given a caption indicating that it was the motor and drive of the Detroit electric, the product of the Anderson Electric Car Co., of Detroit, whereas it applied to another car. As a matter of fact, the Detroit drive is a direct shaft drive, with no chains and but one gear reduction—a fact that was brought out later in the same article by a description of the drive and a properly captioned illustration. The Detroit company was one of the first, if not the first, to adopt shaft drive, and has consistently advocated it as one of the leading features of its car

HOW CAN THE MANUFACTURER HELP THE DEALER?

Do Away With the Season Model, Suggests Col. K. C. Pardee, One of New York's Veteran Dealers—Shepherd Recommends the Building of Cars the Dealer Need Not Be Afraid to Stand Back Of.

If a fairy godmother should come to any automobile dealer and inform him that he could have one wish in answer to the question "What can the manufacturer do for the dealer?" the replies very likely would be numerous and varied, and it is not unlikely that a few dealers would have to cogitate considerably before selecting the one thing or condition upon which to base the wish.

Whether the manufacturer would grant the wish without the interference of the fairy godmother is an indefinite proposition, but if he should give full consideration to the suggestion of his dealer, it is indisputable that, even if he did not inaugurate the change, he would at least be more familiar with actual conditions in the trade than he would be if he continued to occupy his office chair at the factory; the value of a first-hand knowledge of conditions among dealers is indicated by the increasing number of manufacturers and manufacturers' representatives who make the "swing around the trade circle" and study conditions.

Pardee Favors No-Yearly-Model Plan.

When a Motor World man walked into Col. K. C. Pardee's salesrooms in New York City, at Broadway and West 61st street, and asked him what the manufacturer could do for the dealer, the colonel, who is or comes near to being the dean of New York's Automobile Row, asked if it wouldn't be rather presumptuous for him to set himself up as a critic of automobile manufacturers. When informed that a spirit of suggestion, and not of criticism, was intended, he looked back over his 15 years in the industry and immediately poined out the yearly model fallacy as one of the best things that could be eliminated.

The coloned had not hit upon something unheard of, and he remarked himself that it was rather an old subject, but there probably are few who will dispute the logic of the contention; some manufacturers have seen the light already, or profess to have seen it.

"The whole matter is more or less caused by the growth of the automobile business," said Col. Pardee. "In many respects conditions so far as dealers are concerned have changed and in some respects the attitude of manufacturers has not changed. Some have, some haven't and some won't. It is not unlikely that if I, a mere dealer, touch upon this subject the manufacturers will say, 'Who is he to be telling me how to run my business?'

"But one of the things which I think would benefit the dealer if altered is the yearly model plan of production. As manufacture is generally conducted to-day, a dealer sells a car for, say, $500. Along about this time of year, when the dealer still has cars in stock, the manufacturer brings out his 1914 models. The dealer generally has to cut $50 or so off the price of the 1913 cars to get them off his hands. He has lost money that he would not have been obliged to lose if the new models had not been pushed out into the market.

Series Plan Right if Carried Out.

"As to the series plan, it is all right if actually carried out. There has been considerable discussion of the series arrangement but, nevertheless, if you go up and down Automobile Row you will find that most of the dealers are pushing out their new year's cars. I may be wrong, but it appeals to me as not the best business system. Automobiles were changed and rightfully changed some years ago when they were being developed, and from those early days the yearly model has hung on. But making and selling cars ought to be just as much a continuous and standardized business as making shoes.

"In the shoe business a manufacturer doesn't come out once a year with an announcement of a new line and style of shoes and thereby cause preceding stock to depreciate artificially in value. A shoe that is put in stock in the spring is just as good a shoe in the fall and brings just as good a price. The season model doesn't prevail except with a few radical styles.

Disadvantages of Supplementary Model.

"Also, there is an amplification of the yearly model practice which serves to render the yearly model plan itself less desirable to the dealer and that is the changing of the line after the announcement for the supposed year has been made. Some manufacturers bring out a new line of cars in the summer or the fall and the dealer goes out to sell them only to find that about show time the manufacturer adds what may be called a supplementary model and which causes still another change of program."

"Build Cars Right," Advises Shepherd.

"If you should ask my brother he would very likely say, 'Build cars, C-A-R-S, cars,'" replied J. A. Shepherd, of the Shepherd Motor Car Co., of 318 West 48th street, New York City, when a Motor World man inquired of him what the manufacturer could do for the dealer. He and his brother, Irving R. Shepherd, are business partners and have been connected with the trade for a decade or more. Irving R. is the mechanical man and J. A. the salesman.

"This does not apply to all manufacturers and perhaps cannot be said to be of general application," continued Shepherd, "but there assuredly are instances where the manufacturer could greatly benefit the dealer by pursuing a different method of manufacture. What Dealers Larson and Drouet said in preceding issues of Motor World is true, every word of it, and the feature of the case to which I refer may lie back of Drouet's statement that manufacturers would do well to keep abreast of the times in manufacture.

Production Methods the Basic Fault.

"But the matter to which I refer is not so much keeping up to date in details as it is in making a car that the dealer can sell, a good-looking and dependable car. Many a manufacturer when he starts in to build a lot of cars takes his pencil in hand, sits down and figures that he will build a thousand cars. For this he must order a thousand motors, or, if he is to make the motors himself, must order the material for four thousand pistons—if it is a 'four'—must order a thousand bodies, and so on. The purchasing agent gets figures on what is needed and the manufacturer gets ready and begins to turn out the thousand cars.

"Maybe when the cars reach the dealer the body is such a looking affair that the dealer can't give it away, yet the factory people ordered a thousand of them in the belief that they were just what would sell and would prove popular with the trade. What is the result? The manufacturer keeps

Digitized by Google

on turning out the cars and pushing them out to the dealers and the dealers do their best to sell them, but it is mighty hard work. What could the manufacturer do? Well, that is something else. He might have done differently in the first place, and I have known instances where it would have paid him real money to have scrapped the bodies and bought new ones that were of some good.

"There was one manufacturer who designed a car that was a hummer. There was nothing whatever the matter with the design; it was good. But when the cars came to the dealer and he put them out to his customers things went wrong. The dealer investigated and found that the cars were improperly assembled. He took the matter up with the factory but the manufacturer had started in to build a certain number that way and there was nothing to it; he just had to build them that way—and he did so.

Dealer Compelled to Reassemble Cars.

"When the dealer saw that he would ruin his reputation if he continued to market such a car he decided that the only thing he could do was to rebuild the cars. He put them into his service department, and every car that came in was rebuilt and reassembled before it was placed in the hands of an owner. Some parts that were steel were replaced with bronze and a few such changes were made, but in no case was it necessary to alter the design of the car. The design was good, but the assembly and the material used in a few minor parts was bad.

"The dealer stuck it out to the end of his contract and quit. He maintained his reputation as a dealer and saved his business for the future, but it cost him several thousand dollars in service and rebuilding of the cars that should have come from the factory in shape to sell. This does not apply to all manufacturers, as anyone knows, but it is not an unheard-of story. Neither does it apply to the cars we are selling.

Building Down to a Price Not Best.

"Then, there is a tendency on the part of some car builders to build down to a price, despite the fact that it is easier to-day to raise the price than it is to lower it. The manufacturer who cuts down the quality or desirability of a body to shave $50 off the price of the car isn't necessarily making it easier for the dealer to sell the car. So far as dealers generally are concerned, I think they would rather see the manufacturer better the car and boost the price than cheapen the car and cut the price.

"It isn't necessarily the low price that sells a car to-day. It is what the car is. If a man builds a good car he need not be afraid to ask all it is worth, but when the cut price means less value in the car, the car doesn't sell any easier than it did before—nor so easy. Making a lower price for the same value by means of concentration or methods of manufacture is a different proposition.

"It may sound illogical to say it is easier to raise a price than lower it, but just look back over some of the high-priced cars of to-day and see what they used to build. One of them now is away up among the top-notchers and it used to be a $1,400 car. Also, the cars on which prices have been reduced successfully did not have the value cut out of them.

Should Take Advantage of Fall Season.

"One other thing which the manufacturer might do is to get his new cars out on schedule time. The ——— car owes its success to the fact that it always appears on time in the summer and gets full advantage of the late summer and the fall selling seasons. If the manufacturer would bring his old year's production to a close about the first of June and get his new year's cars on the market so the dealer could get the advantage of the following months it would mean a great deal to the retailer and also to the manufacturer.

"When cars don't come along until late in the season the dealer is wasting time on the old models. Other manufacturers, likely, have gotten their cars on the market and the dealer has to work with old stock while his competitors are pushing their new stuff. Maybe the dealer's new stuff isn't going to be any different from his old stuff, but if yearly models are to obtain they should be marketed at a time when they can be sold most easily.

No Credit to Dealer Not Fair Plan.

"Credit to the dealer? Well, that is something that I think will prevail more than it does now. We always had to pay practically cash for the cars we sold, and if we couldn't get cash for them we had to finance the sales ourselves. But I don't see any reason why an automobile dealer shouldn't get credit to a certain extent, the same as a dealer in other merchandise receives.

"Under the cash payment system the manufacturer often had the money as soon as or before he had delivered the car and, believe me, that tided more than one factory over a bit of hard going. If it hadn't been for that practice there wouldn't be as many factories as there are to-day. Credit to the dealer is more prevalent now than it was once and personally I think it is a rather good thing. I may be wrong, but that is my own opinion.

"The most important thing, however, to my mind is building cars that the dealer is not afraid to stand back of; and if some of the cars that are sent out do not seem to be giving satisfaction, do something to lighten the dealer's load in straightening out matters and in seeing that everyone connected with the transaction gets a fair deal."

Kansas City Puts Ban on Joy-Riders.

If the young men of Kansas City, Mo. who are under 21 years of age, want to take a girl out riding in a motor car after dark they will have three choices, according to an ordinance which has been introduced in the City Council—Take "daddy" or "aunty" along as a chaperon, take your sister as the companion in the ride, or pay a fine.

The councilmen are hitting at joy-riding's possibly pernicious effects on the younger element of the city and propose to forbid nocturnal escapades on the part of boys and girls; the ordinance provides that persons of the opposite sex, less than 21 years of age, shall not be allowed to ride in a motor car after dark unless accompanied by an adult or their parents or unless they are brother and sister. A fine of from $100 to $500 is provided for violation of the ordinance.

"It is time the city took some action to protect young girls from young men who use the motor car as a persuasion to go wrong," said Alderman W. F. Fleming, who introduced the measure. "Every night I see motor cars filled with young boys and girls of high school age riding late at night when they should be at home with their parents. Sometimes they are under the influence of liquor. It is no wonder so many cases of the downfall of girls are brought before our eyes. Think of the number we know nothing about."

Trouble from Control Connections.

Abnormal motor action after an overhauling frequently is caused by failure to connect up the throttle and ignition levers and connections exactly as they were before the work was done. A slight lengthening or shortening of a rod, the reversing of a bell crank with arms of unequal length and other simple mistakes may easily cause the motor to handle queerly and lead to the impression that something more serious has happened.

Replacing the Spark Plug Nut.

To render easier the replacement of the tiny nuts that hold ignition cables to spark plugs, it is a good plan to remove the top three or four threads with a file; if this is done, the nuts can be put on, even with gloves, merely by dropping them in place and giving them a twirl.

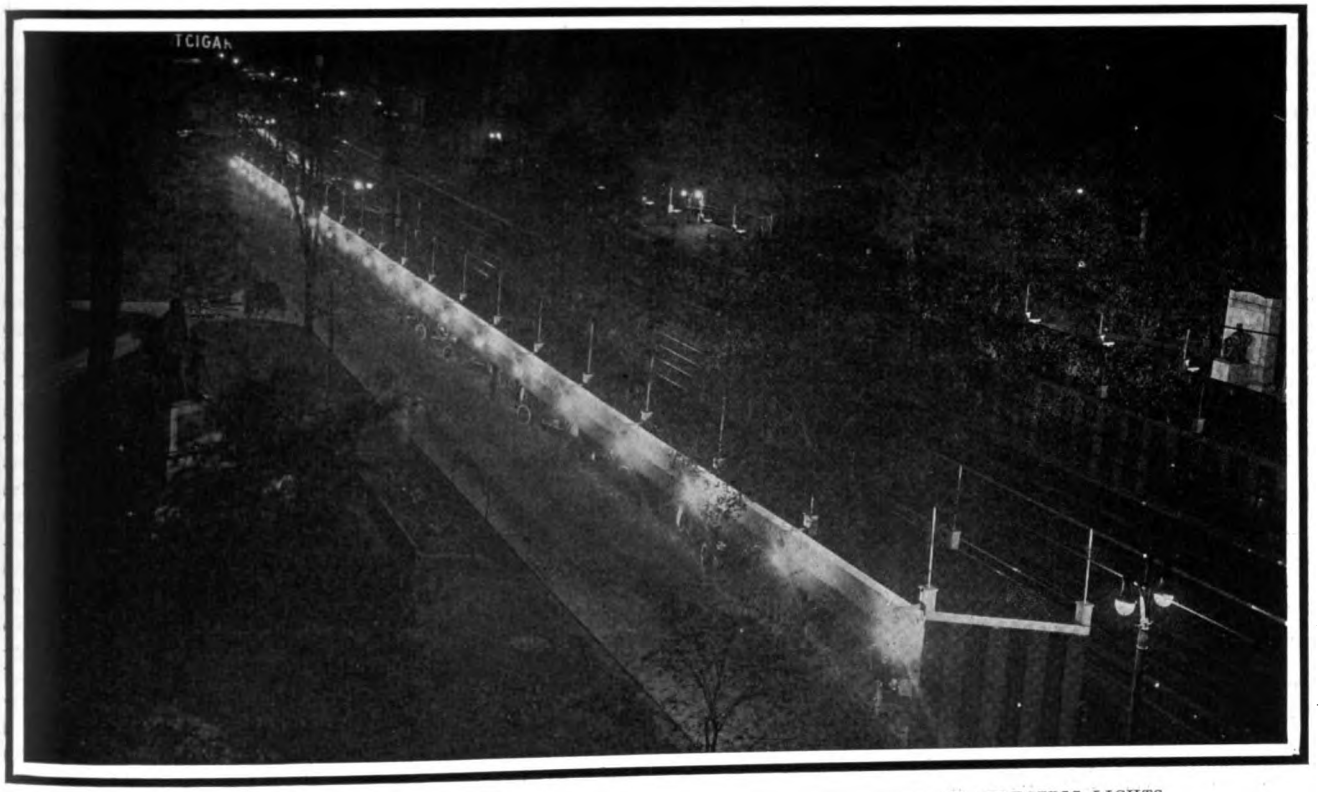
"MADE-IN-DETROIT" WEEK REVEALS MANY NEW MODELS



Fifty Exhibits Housed in Booths Erected on the Street Draw Crowds Night and Day—The Exhibitors.

Detroit got its first formal view of the new models that are being produced in its myriad of automobile factories last week during the "Made-in-Detroit" exposition that served to bring to more prominent notice the varied products that come from the automobile hub. And just because it is the automobile hub it is quite natural that a by no means small part of the widespread exhibition centered about automobiles and automobile parts. Altogether, 16 brands of cars were on view continuously from Monday, 8th inst., until the following Saturday, when the exhibition was brought to a close, and the automobile exhibits were supplemented by the displays of 34 accessory makers.

The automobile exhibits were housed in special booths erected for the purpose on Woodward avenue, at Grand Circus Park, and that the exhibition was a popular one is made plain by the fact that night and day the display street was thronged with spectators. During the evening hours, the booths were brilliantly lighted by electricity and were scarcely less attractive than during the day. The complete list of car and accessory makers who displayed their products is as follows:

Automobiles—Century Electric Car Co.; Abbott Motor Co.; Briggs-Detroiter Co.; Cadillac Motor Car Co.; Chalmers Motor Co.; Detroit Tractor Co.; Federal Motor Truck Co.; Ford Motor Co.; Hudson Motor Car Co.; Lozier Motor Co.; Packard Motor Car Co.; Paige-Detroit Motor Car Co., Standard Truck Co.; Regal Motor Car Co.; Studebaker Corp.; and Universal Motor Truck Co.

Accessories—Auto Crankshaft Co.; Crary Co. (Crary gas saver); Metal Products Co. (axles); Bundy-Goebel Mfg. Co. (gasolene gauges); Michigan Top Co.; Williams Auto Top Co.; Gemmer Mfg. Co.; J. B. Carburetter Co.; Trio Mfg. Co. (cone clutches); American Pattern Works; Advance Machine Co. (parts); Standard Tool & Mfg. Co. (stampings); Detroit Forging Co.; Disco Co.; Detroit Gear & Machine Co. (parts); Bower Roller Bearing Co.; Muzzy-Lyon Co.; The Gasolock Co.; Long Mfg. Co. (radiators); Sewell Cushion Wheel Co.; Detroit Wood Pulley Co. (top bows and wood split pulleys); Emil Grossman Co.; Stocker Mfg. Co. (pumps and hood locks); U. S. Tire Co.; Hayes Mfg. Co. (sheet metal parts); Miller Tire Remover Co.; Edmunds & Jones; Jos. N. Smith Co. (body hardware and windshields); Lewis Spring & Axle Co.; Jeffery-Dewitt Co.; Gray-Hawley Co. (muffler cut-out valves, pedal locks and exhaust horns); Timken-Detroit Axle Co.; Rudd Auto Top Co. (tops, trimmings and Jiffy side curtains).

DETROIT'S OUTDOOR AUTOMOBILE SHOW AS IT APPEARED AT NIGHT UNDER THE ELECTRIC LIGHTS

Now a Subway Garage for Detroit.

Following the suggestion made in Chicago to meet the parking congestion in the downtown streets, Park Commissioner Dust, of Detroit, suggests that a subway garage be constructed under Cadillac square for the accommodation of owners who desire to leave their cars downtown during business hours; the structure he considers and has proposed would house 2,000 cars.

New Plant for Master Carburetter.

The Master Carburetter Co., of Los Angeles, of which W. M. Jenkins is general manager, has taken possession of a new plant in that city on Los Angeles street. The Master carburetter itself is the invention of Harry A. Miller, who designed the Miller carburetter. It is intended chiefly to operate on the heavier oils.

Edison Adding to Battery Plant.

To care for a material increase in business, the Edison Storage Battery Co., of Orange, N. J., is practically tripling the capacity of its existing plants.

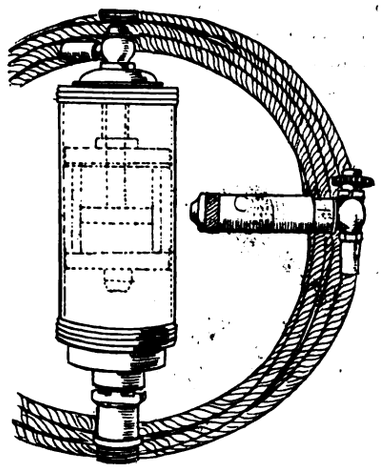
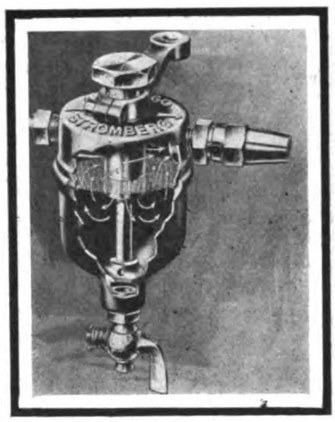
RECENT DEVELOPMENTS in ACCESSORIES



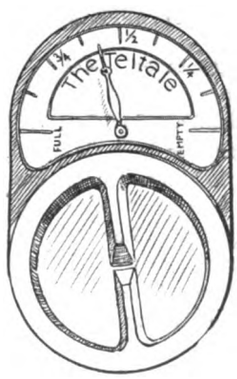
Spark Plug Pump With Double Piston.

Adding one more to the comparatively short list of spark plug type tire inflators now on the market, the Hill Pump Valve Co., of Chicago, Ill., just has brought out a device of this kind which is quite different from anything else of the kind and which has a number of interesting and distinctive features. In the first place, the pump is made wholly of brass and bronze; there is not a bit of iron or steel in it, and it is beautifully finished all over in lacquer. It is furnished complete in a strong, lock-corner varnished box that is small enough to fit into the usual tool box.



It is in the internal construction of the pump that it differs from others. The outer shell is heavy, seamless brass and contains a substantial bronze piston which is in reality a piston and a cylinder combined. This piston slides up and down under the alternate push and pull caused by the movement of the engine piston in its cylinder. The inside of the piston is a carefully finished cylinder housing a piston all its own which is attached to the outer casing at the top and therefore remains stationary. Hence, when the movable piston is forced upward by the compression in the engine cylinder, air is compressed in the inside cylinder and forced along the flexible tube to the tire. The tube, by the way, is quite as much out of the ordinary as is the pump itself. Instead of being mere rubber hose, reinforced, it is strongly covered with woven material which not only reinforces it but beautifies it as well. So that there may be no danger of inflating tires beyond the recommended pressure of the maker, an ingenious blow-off valve, styled a "pneumeter," is furnished with the pump. By merely turning the outer shell of the "pneumeter" it is possible to set it for any desired pressure and the instant that pressure is reached no more air will be pumped into the tire. The pump can be screwed into place with the hands and two spark plug adapters—one metric and one standard thread—are supplied with it.

Stromberg Offers Gasolene Strainer.



No matter how carefully gasolene is strained when poured into the tank, it is possible for trouble to occur through the clogging of the carburetter by dirt in the tank, or by water condensed from the air in the tank or present in small quantities in the fuel itself. Realizing this, the Stromberg Motor Devices Co., of Chicago, which obviously is in a position to know what is good for a carburetter, has devised an effective gasolene strainer the internal economy of which is well shown in the accompanying illustration. The strainer may be inserted at any convenient point in the gasolene line and is supported by an arm on top which is bolted to anything that offers an opportunity. The fuel flows in through the connection at the left, which may or may not be provided with a shut-off cock, passes down through the central tube to the bottom of the bowl and rises through the strainer—nearly three square inches of the finest wire gauze—to the outlet on the right. As the quantity of gasolene in the bowl is large in comparison to the rate of flow, there is very little movement in the bowl, and sediment and water are precipitated to the bottom, and are drained off from time to time through the cock. The Stromberg separator is supplied with or without the arm and shut-off cock.

UTILITY "BOUGIE" TYPE PUMP

STROMBERG GASOLENE STRAINER

TELL-TALE GASOLENE GAUGE

Gasolene Gauge That's Filler, Too.

By a clever adaptation of the float-and-spiral principle and by the use of an offset body into which a filler cap is screwed, the Bundy-Goebel Mfg. Co., of Detroit, Mich., has evolved a gasolene gauge that has several advantageous features all of its own. Perhaps the most appealing point is that though the gauge is screwed into the regular filler hole of the tank, so that the cutting of a special opening is unnecessary, the gauge does not have to be removed for filling the tank because the offset construction, which is shown plainly in the accompanying illustration, permits the pouring in of fuel through an opening in the gauge body itself. Once applied, the instrument is a permanent fitting, and no tools are needed for making the application. A neat constructional feature consists in making the spiral and the needle in a single piece of metal, so that there never can be any doubt as to whether the operating and the indicating members are fast to each other. Models are practically ready for Ford, Buick and Studebaker cars, and gauges for other machines will follow.

Printing Plant for Klaxon Makers.

The better to care for its needs in the literary field, the Lovell-McConnell Mfg. Co., of Newark, N. J., has completed the installation of its own printing plant, which, quite appropriately has been christened "The Klaxon Press." The equipment of the plant is thoroughly up-to-date, and a new type face styled Klaxon, which has been designed especially, will be used exclusively.

THREE "GAS" FIRE ENGINES MAKE LONG UNBROKEN RUNS

Eight Others Stopped for Minor Causes During 12-Hour Pumping Test—Results and Conditions of the Demonstration.

Official compilation of the results of the demonstration of gasolene fire apparatus, which finished up the 41st annual convention of the International Association of Fire Engineers that was held in New York City during the week of September 1-6, reveal that the test through which the 11 engines were put was very far removed from being an easy one and that not all of the 11 engines survived the 12-hour full capacity run. The test was held during the last day of the convention, the engines being lined up for the purpose on a pier at the foot of West 54th street and the Hudson River, and all day long they pumped the murky waters of the river through lengths of hose.

The full capacity tests were commenced at 6 o'clock in the morning and, the approximate capacities of the vehicles entered having been ascertained earlier in the week, each was required to operate at full capacity for six hours at not less than 120 pounds pressure, pumping through three lines of hose siamesed into one nozzle; at not less than half capacity and 200 pounds pressure for three hours, pumping through one line of hose and nozzle; and at not less than 250 pounds net pressure for three hours through one line of hose and nozzle. During the tests, stops were permitted only when necessary for changing hose and nozzles and, where possible, engines were expected to be kept running.

Only one suction line was allowed each engine and the average lift from the river to the pier was 10 feet. Engines rated at less than 700 gallons a minute were restricted to a suction line of 4½ inches inside diameter; 750 to 800 gallons, 5-inch suction; and 900 gallons and over, 6-inch suction. Not more than two men were allowed to operate each engine and the amounts of gasolene and lubricating oil were carefully measured and checked.

As may be seen by reference to the accompanying table, only three of the engines —Seagreave, Ahrens-Fox and Waterous— completed the 12 hours test without stops, though to none of them belongs the credit for pumping the greatest amount of water. Although it lost an hour and eight minutes partly because of a cracked pump air dome and partly because of a broken valve spring, the giant American La France engine, rated at 1,400 gallons a minute, pumped some 200,000 gallons more than its nearest competitor, the Seagreave, which ran the whole 12 hours and pumped 542,940 gallons.

Of the four engines that were withdrawn, the Luitweiler and one of the Notts were taken out in the ninth hour, the former because of hot bearings and the latter because of a defective cylinder gasket which permitted water to get into one of the cylinders. In many cases trouble with fire pumps, leaky suction lines and broken fire pump connections caused loss of time that otherwise might have been avoided; the big American La France lost 15 minutes with a broken pump plunger sleeve; the Nott engine lost considerable time with heated pump bearings; the larger of the two Robinsons had trouble with its plunger packing, which leaked a little; and the smaller of the La France engines lost time because of a broken fire pump bearing.

There was not a great deal of engine trouble and not much time was lost for this cause. During the first hour the Luitweiler evidenced ignition trouble which was cured by switching to the battery; the smaller Nott developed a loosened valve rocker arm pin which, however, did not effect its operation much; the larger Nott experienced the same trouble. In the next hour the Luitweiler commenced to steam because of faulty carburetter adjustment, which was corrected; the smaller of the two Robinsons was shut down 43 minutes because of a tight bearing; the larger Nott broke an inlet valve spring and lost 30 minutes; and the other Robinson had its fan belt removed because the draft blew water against the plugs and affected the ignition.

From the fifth to the seventh hours all of the engines ran smoothly until the larger Robinson was shut down temporarily with two broken valve springs; in the next hour another broke and was replaced; the large Nott also had valve spring trouble about this time, the springs on two cylinders giving out at the same time. In the tenth hour, the giant American La France lost 23 minutes because of a broken valve spring. During the 11th and 12th hours nothing occurred to stop any of the engines.

TABULATED RESULTS OF THE FULL CAPACITY PUMPING TESTS.

Name.	Capacity, Gallons per Min.	No. Cyl.	Bore.	Stroke.	Gallons Gasolene Used.	In Operation. Hrs.	Min.	Total Discharge Gallons.

Automobile Electricity Elucidated.

"An electrical book written for the man who is not an electrician." Thus the opening statement of a little bok that just has been published by the Packard Electric Co., of Warren, O., describes the purpose of that concise collection of electrtical information accurately and satisfactorily. The information covers the ground indicated by the title, "Electrical Installations on Automobiles and Motor Boats," thoroughly and simply; ignition, starting and lighting systems are explained clear through from principle to practice, and excellent illustrations help to make things plain. The book is written by G. L. Chandler for the Packard company, which, by the way, is not interested in the manufacture of electrical apparatus except insofar as the use of conducting cables, which the company makes, is concerned.

German Professor to Discuss Bearings.

Prof. A. Riebe, director of the Riebe Kugellager & Werkzeug Fabrik, of Berlin, Germany, is due to arrive in New York today and is booked to lecture before the Metropolitan Section of the Society of Automobile Engineers on September 25th. Prof. Riebe, who, in conjunction with Prof. Striebeck, claims to be responsible for "the ball bearing in its present form," will speak to the subject, "A Review of the Inception of the Ball Bearing and Roller Bearing and Their Application in the Automobile Industry."

Importers' Salon Reelects Officers.

The Importers' Automobile Salon has chosen officers for the ensuing year, as follows: E. Lascaris, president; Thomas Adams, vice-president; F. Sewell, treasurer; Stefan Kjeldsen, secretary. At the annual meeting at which these officers were reelected a gold watch, suitably engraved, was presented to Secretary Kjeldsen, who has managed the salon since it was instituted.

"VILLAGE BOOSTERS" HAVE PLAYDAY ON WAGNER'S FARM

New York Tradesmen Prove They Can Be Boys Again—"Young" Wetmore Spurts to Victory on Bicycle, but Spurns Prize.

When Fred J. Wagner is not starting automobile races or selling Ajax tires, he is "raising things" on a farm at Smithtown, L. I. One of the "things" he raises each year is the semi-annual outing of the Big Village Boosters, that organization of New York automobile tradesmen which exists chiefly for having good times on Wagner's farm.

They had the best time of their existence on Tuesday last, when one of the "semi-annuals" occurred. More than 200 "Boosters" and their guests were in attendance, most of them having covered the 40 miles of road in something more than 40 minutes. One of the guests was Mitchell May, secretary of New York State, who proved himself a "good sport" by throwing dignity to the dogs so far as to participate in the wheelbarrow race.

In addition to food and drink and sport, there was music—two kinds of it, one provided by a hurdy gurdy; the other by a full band of Scotch Highlanders.

Both breakfast and dinner were served on the farm, but there was lots of eating between times, the crowning "function," however, being a clambake spread on the lawn in the evening. It was disposed of beneath the electric light, and between swallows the prizes for the day's sports were presented, and a clock presented to Alfred Reeves, one of the big, big "Boosters," who happened to be born on Tuesday, September 16, 1849.

John C. Wetmore, who, although born in 1839, is still as young as the next fellow, spurned the prize which he won in the bicycle race open to those who had engaged in cycle racing before the war—the Spanish war. This was easily the event of the day. It was run in three heats, won, respectively, by Charles S. Wells, C. G. Sinsabaugh and Fred J. Titus, who beat out such "whirlwinds" as Frank M. Dampman, A. G. Bachelder, Wallie Owen, Al Reeves and W. B. Young, all of them names to conjure with in the heyday of cycling.

WETMORE WINS! THE REST NOWHERE!

Wetmore drew a bye, which made it unnecessary for him to compete in a heat. He was, therefore, much fresher than the winded "crackerjacks" and confided to a few personal friends that as he had turkey-trotted all summer his muscles were in such fine shape that a surprise was due; and the surprise was promptly forthcoming. Wetmore won the race puffing but "sitting up." The other three contenders were scarcely in sight; they were backpedaling in order that Victory might perch on the Wetmore shoulders. When the "thirty-niner" realized the truth, he took it as befits his merry nature and insisted that the cup—they had cups for nearly every winner—should be awarded to Wells, who finished second. It is now understood that Batchelder, Wetmore and Reeves will be declared professionals and that all of the "racers" will be suspended for life for participating in an unsanctioned contest.

They had a baseball game, which was won by R. H. Johnston's "White Hopes," and a tennis match, which was captured by David McLaughlin Beecroft and T. Clothier Lay. They also had an alleged fat men's race, which was won by Dan C. Swander, the Firestone manager, and a sack race, won by E. R. Waterman, of the Hartford Suspension Co.; also a tire rolling contest, which went to A. Griener, the Gaulois tire man, whose prize, incidentally, was a G & J tire; and they had potato races, three-legged races and pretty nearly everything else which comes under the head of sport or fun. In fact, the whole affair proved a big boost for the Big Boosters.

TIRE ROLLING NOT AS EASY AS IT SOUNDS

STRUGGLE OF FAT MEN AND THE ALMOST-FATS

HON. MITCHELL MAY AS A "SPORT"

RICKENBACHER WINS MAIN EVENT IN LATONIA RACEMEET

Accounts for Century Grind in a Mason and also Captures Shorter Race — Bad Spill Stops a Local Pilot.

Edward Rickenbacher was easily the bright particular star of the racemeet that was staged on the Latonia (Ky.) mile track by the Cincinnati (O.) Automobile Club on Saturday last, for he won both the feature event on the program, which went for 100 miles, and also accounted for a 10-mile race; as usual, he drove a Mason car. Rainey and Radina won the other two events that made up the card.

Despite the fact that the track was in excellent condition, recent rain serving to harden the surface, one serious accident occurred in the 100-mile race and several minor skids and slides served to add interest to the other events, none of which proved particularly exciting from a racing point of view. Nick Nickles, at the wheel of a Fiat, crashed through the fence when he had half completed the century race, wrecking his car and sustaining injuries that are likely to keep him in the hospital for some time to come. Cotton Shuster, his mechanician, also was badly cut and bruised.

Nickles's accident, and another that put Max Selzer, Mercer Pilot, out of the running—it was caused by a burst tire and no one was hurt—furnished about the only thrills in the 100-mile race, for once Rickenbacker got the lead, and he got it early, he never was headed and finished six minutes ahead of Lutrell. The summary:

One hundred miles—Won by Ed. Rickenbacher, Mason; second, G. W. Luttrell, Mercer; third, Wm. Chandler, Mason, fourth, Fred Radina, Cino. Time, 1:42:00.

Twenty-five miles—Won by Radina, Cino; second, Chandler, Mason; third, Luttrell. Time, 25:57.

Ten miles—Won by Rickenbacher, Mason; second, Horace Heisey, Buick; third, F. Smith, Buick. Time, 10:49.

Five Miles—Won by John Raimey, Cino; second, Radina, Cino; third, M. S. Britt, Schacht. Time, 4:55.

Oldfield's Rejected Record Now Accepted.

Reversing its own decision rejecting Barney Oldfield's claim to the world's record for one mile on a one-mile circular dirt track, the Contest Board of the American Automobile Association, at a special meeting held last week, has allowed the record, which stands at 46⅗ seconds and was made with the old Christie front-drive car at Bakersfield, Cal., on April 22 last. Originally the record was rejected because it was deemed that the Pendleton timing device that was used was insufficient evidence because the starting and stopping times of the car were not printed on a paper tape, instead, the passage of the car over the timing wire established electrical connections which caused a trigger to stop three watches.

Lacks Hands but Drives a Car.

Many a novice taking his first driving lesson becomes convinced, for the time being, that he has only about half enough arms and legs to take care of the levers and pedals which, to his eye, are put in wherever there is room. But while a little experience serves to dispel first impressions,

ZIBBELL'S CONTROL APPARATUS

even an experienced driver would be "stumped" to handle a car were he to be deprived of the use of both hands, one arm and one leg, as was W. Zibbell, of Fresno, Cal., who came out of a railroad accident with his left arm, right hand and left leg missing. By the use of ingenious control devices, however, Zibbell manages to drive his Paige "36" as well as many a man who has a complete anatomy; he is of an ingenious turn of mind, and has worked out his own schemes.

Disbrow Drives Fast on Half-Mile Track.

Louis Disbrow, who, as nearly every one knows, has been driving Case cars—and driving them fast—nearly all over the United States, gave the natives of Toledo, O., a couple of genuine thrills on Saturday last, when he whirled twice around the half-mile Lucas County Fair Grounds track in 1:06⅗. Needless to add, he was promptly credited with a "world's record," despite the fact that the A. A. A. takes no notice of marks set up on half-mile tracks.

ANOTHER "NEAR RECORD" ESTABLISHED BY BURMAN

Drives Fast at Milwaukee But Not Fast Enough to Lower His Own Mark—Takes Four of Five Events, as Usual.

Ernie Moross and his following of racing drivers invaded Milwaukee on Saturday last and might have set up another new "world's record" except for the fact that they did not. Burman, Moross's star performer, drove his big Benz around the mile Fair Grounds track in the lightning fast time of 48 seconds in a time trial, and the officials were considerate enough of home pride to announce it as a record despite the fact that Burman has a record of having driven a mile on the Brighton Beach track in 47.85. The announcement of the "record" probably caused more excitement than did anything else, for none of the races, only one of which escaped Burman, by the way, were calculated to make one's blood boil. The summary:

One mile time trials—Won by Burman, Benz (48 sec.); Benedict, Mercedes (57 sec.); Steel, Mercer (1:07).

Three miles, free-for-all—Won by Burman, Benz; second, Goetz, Endicott special. Time, 3:08½.

Three miles—Won by Burman, Benz; second, Goetz, Endicott special. Time, 3:26.

Three miles, free-for-all, open—Won by Burman, Benz; second, Goetz, Endicott special. Time, 3:08½.

Three miles, free-for-all, handicap—Won by Benedict, Mercedes; second, Burman, Mercedes. Time, 3:09¾.

Law Looks Askance at Spare Tires.

Something in the way of a rearrangement of the spare tires on cars that carry those appurtenances on the rear of the body in such a way as to obstruct the view of the license tag will be necessary if New Jersey users of automobiles are going to keep out of reach of the long arm of the law, for Job H. Lippincott, State Commissioner of Motor Vehicles, has ordered his inspectors to stop all cars in which the spare tires—or, for that matter, anything else that is carried—prevent the limbs of the law from taking observations of numbers or interferes with the proper placing of the tail lights. The commissioner is acting upon the authority of the motor vehicle law of 1906, and is very much in earnest. Police activity also is to be increased in preventing speeding on Saturdays and Sundays, inspectors having been detailed to assist the municipal police in the enforcement of the law.

1,054,118. Resilient Wheel. Stephen Hipkins, Martins Ferry, Ohio. Filed Aug. 30, 1911. Serial No. 646,869. (Disk wheel with short radial springs and equalizing levers.) 3 claims.

1,054,171. Tire-Holder. Henry Buermann, Newark, N. J. Filed May 6, 1912. Serial No. 695,356. (Sheet metal spare tire holder.) 3 claims.

1,054,205. Internal-Combustion Engine. Louis Illmer, Jr., Reading, Pa., and Edward J. Kunze, East Lansing, Mich., assignors to Illmer Gas Engine Co., a corporation of Delaware. Original application filed Feb. 4, 1904, Serial No. 191,968. Renewed April 12, 1912, Serial No. 690,314. Divided and this application filed Aug. 29, 1912. Serial No. 717,703. (Scavenging motor.) 7 claims.

1,054,219. Electrical-Circuit Controller. Joseph H. Lehman, New York, N. Y. Filed April 23, 1908. Serial No. 428,871. (Eccentric timer with ball bearing contact ring.) 2 claims.

1,054,262. Wrist-Pin and Fastener for Pistons. Geo. E. Wilson, Stillwater, Minn., assignor to M. Rumely Co., Laporte, Ind., a corporation of Indiana. Filed Oct. 13, 1911. Serial No. 654,497. (Piston pin with expanding ends.) 5 claims.

1,054,303. Engine-Starter for Automobiles. Frank Grove McKlveen and Leslie Wilfred Naylor, Denver, Col., said Naylor assignor to said McKlveen. Filed Jan. 12, 1912. Serial No. 670,953. (Lever, chain and sprocket starting device.) 6 claims.

1,054,312. Sectional Pneumatic Tire. Morton Peabody Prince, Cambridge, and Clement M. Bernheimer, Newburyport, Mass. Filed Jan. 15, 1912. Serial No. 671,381. (Pneumatic tire with sectional casing and removable sectional tubes.) 5 claims.

1,054,314. Motor Truck. Howard S. Riddle, Columbus, Ohio, assignor, by mesne assignments, to The Jeffrey Mfg. Co., a corporation of Ohio. Filed April 14, 1906. Serial No. 311,627. (Power and driving system for rail vehicles.) 8 claims.

1,054,346. Automatic Change-Speed Gearing. Chalmers G. Hall, Fort Leavenworth, Kans. Filed Jan. 13, 1912. Serial No. 671,000. (Sliding gears controlled by springs.) 5 claims.

1,054,398. Apparatus for Recording Speeds of Vehicles. August Ernst Carl Deckert, Dresden, Germany. Filed Aug. 8, 1912. Serial No. 714,111. (Automatic printing speed recorder.) 3 claims.

1,054,444. Resilient Tire for Wheels. Etienne Louis Auguste Olivier, Paris, France. Filed Jan. 3, 1907. Serial No. 350,660. (Cushion tire with internal springs.) 1 claim.

1,054,501. Spring-Wheel. Silenus D. Brooks, Oneonta, N. Y., assignor of one-half to Charles N. Murdock, Oneonta, N. Y. Filed Aug. 19, 1912. Serial No. 715,887. (Spokes cushioned by helical springs.) 2 claims.

1,054,504. Means for Tire Inflation. Louis Burgraff, Jr., Mason City, Iowa. Filed Sept. 7, 1911. Serial No. 648,090. (Air carried to tire through wheel hub.) 1 claim.

1,054,510. Automobile-Fender. William A. Crawford-Frost, Baltimore, Md. Filed Dec. 6, 1911. Serial No. 664,246. (Fender with double set of helical springs.) 1 claim.

1,054,533. Gasolene-Tank Outlet. George J. Greiner, Detroit, Mich. Filed Aug. 28, 1912. Serial No. 717,594. (Reserve supply control valve.) 1 claim.

1,054,587. Spring-Wheel. Oliver P. McKee, Waukesha, Wis. Filed Nov. 7, 1912. Serial No. 730,062. (Springs between inner and outer rims.) 1 claim.

1,054,590. Elastic Suspension for the Driving-Wheels of Motor Cars. Daniel Mesure, Var, France. Original application filed Feb. 14, 1912, Serial No. 677,607. Divided and this application filed Aug. 28, 1912. Serial No. 717,475. (Suspension by coil springs working in guides.) 1 claim.

1,054,592. Engine-Hood Cover. Clinton D. Miller, Washington, D. C. Filed Oct. 10, 1912. Serial No. 724,958. (Hood with movable flaps for front opening.) 2 claims.

1,054,609. Cultivator. William Jerome Perry, Castlegar, British Columbia, Canada, assignor of one-fourth to William Scheffer, Castlegar, British Columbia, Canada. Filed Dec. 13, 1911. Serial No. 665,580. (Depth regulator for motor plow.) 1 claim.

1,054,640. Automatic Braking Device for Automobiles. Joel Ellis Fisher, Jr., New Haven, Conn. Filed March 31, 1911. Serial No. 618,057. (Automatic brake applied by racing of driving wheels.) 11 claims.

1,054,641. Combustion-Engine of the Injection Type. Ludwig Gentzen, Mulheim-on-the-Rhine, Germany. Filed Jan. 10, 1911. Serial No. 601,843. (Fuel injection valve.) 1 claim.

1,054,649. Automobile-Tractor. Frederic Edouard Edmond Leferver, Rouen, France. Filed May 16, 1911. Serial No. 627,537. (Caterpillar type tractor with link-track device.) 5 claims.

1,054,679. Demountable Rim for Resilient Wheels. Sydney Allen Currin, Bristol, England. Filed April 14, 1911. Serial No. 621,146. (Demountable rim and fastenings for wire wheels.) 1 claim.

1,054,692. Automobile-Wheel. George A. Imhoff, Carrington, N. D. Filed Jan. 10, 1912. Serial No. 670,455. (Resilient wheel with two concentric parts and coil springs between.) 1 claim.

1,054,703. Gearing. Thomas Alexander Maxwell, Whigham, Ga. Filed March 14, 1912. Serial No. 683,777. (Friction drive system for cultivator.) 2 claims.

1,054,714. Valve-Gear for Explosion-Motors. Louis Renault, Billancourt, France. Filed July 10, 1911. Serial No. 673,754. (Reciprocating sleeve valve.) 3 claims.

1,054,729. Rotary Explosive-Engine. James Whittinghill and Elijah W. Richmond, Advance, Mo. Filed July 3, 1912. Serial No. 707,594. (Rotary motor with cylinders and pistons for supplying charges.) 1 claim.

1,054,746. Lamp-Socket. Walter E. Christian, Kenosha, Wis., assignor to the Badger Brass Mfg. Co., Kenosha, Wis., a corporation of Wisconsin. Filed May 27, 1912. Serial No. 699,903. (Electric lamp with means for adjusting position of bulb.) 5 claims.

1,054,747. Lamp. Walter E. Christian, Kenosha, Wis., assignor to the Badger Brass Mfg. Co., Kenosha, Wis., a corporation of Wisconsin. Filed June 17, 1912. Serial No. 704,046. (Electric lamp with reflector detachably attached to door.) 8 claims.

1,054,755. Automobile-Seat. Arthur F. Draper, Berkeley, Cal. Filed Feb. 16, 1910. Serial No. 544,217. (Rear seat for cars of the runabout type.) 12 claims.

1,054,762. Automobile-Pump. Richard Anton Goeth, Robert B. Rodgers, and John Albert Dittmar, San Antonio, Tex. Filed April 26, 1912. Serial No. 693,410. (Air pump operated by rear wheel of car.) 7 claims.

1,054,808. Hydrocarbon Motor. Sidney D. Waldon, Detroit, Mich., assignor to Packard Motor Car Co., Detroit, Mich., a corporation of Michigan. Filed March 23, 1912. Serial No. 685,874. (Automatic governor for lubricating oil pump.) 12 claims.

1,054,820. Tire with Detachable Tread. Junius A. Bowden, Los Angeles, Cal. Filed March 9, 1910. Serial No. 548,313. (Detchable tread with wire fastenings.) 8 claims.

1,054,831. Draft Appliance for Automobiles. Gay Victor De Peel, Crocker, S. D. Filed March 18, 1912. Serial No. 684,429. (Windlass on rear wheel and cable guide at front of car.) 2 claims.

1,054,903. Taximeter. Wilhelm Gustav Bruhn, Berlin, Germany. Filed Sept. 27, 1910. Serial No. 584,087. (Taximeter with sliding device for disconnecting gears.) 5 claims.

1,054,909. Spark-Plug Tester. Adolfo de Clairmont, Toledo, Ohio. Filed Oct. 3, 1911. Serial No. 652,614. (Spark gap device.) 7 claims.

1,054,942. Means for Retaining the Wristpins of Pistons. Foster C. Rhoads and Hugh A. Leis, Dayton, Ohio. Filed June 5, 1912. Serial No. 701,803. (Spring-pressed ball catch for piston pins.) 1 claim.

1,054,975. Auxiliary Steering-Gear for Vehicles. John D. Maxfield, Hemet, Cal. Filed March 13, 1911. Serial No. 614,558. (Emergency steering device.) 4 claims.

1,054,980. Tire Attachment. Ralph L. Morgan, Worcester, Mass. Filed April 3, 1912. Serial No. 688,341. (Coil spring fastening for dual tires.) 3 claims.

1,054,996. Magnetic Speedometer. John K. Stewart, Chicago, Ill., assignor to Stewart-Warner Speedometer Corporation, of the State of Virginia. Filed Aug. 18, 1911. Serial No. 644,732. (Magnetic adjustment for magnetic speedometer.) 6 claims.

1,054,997. Magnetic Speedometer. John K. Stewart, Chicago, Ill., assignor to Stewart-Warner Speedometer Corporation, of the State of Virginia. Filed June 4, 1912. Serial No. 701,695. (Magnetic adjustment for magnetic speedometer.) 4 claims.

1,055,010. Traction Vehicle. Robert E. Zager Hardy, Cal. Filed Jan. 12, 1912. Serial No. 670,808. (Four-wheel drive system.) 2 claims.

1,055,017. Lubricating System for Automobile Transmission Mechanism. Alanson P. Brush, Flint, Mich. Filed May 8, 1911. Serial No. 625,868. (Partition system for lubrication of transmission gears in unit power plant.) 3 claims.

1,055,026. Spring-Hub Wheel for Automobiles. Geo. K. Ewing and Colby R. Farley, Ewington, Ohio. Filed June 26, 1912. Serial No. 705,994. (Resilient hub with helical springs.) 2 claims.

1,055,042. Carburetter. William H. C. Higgins, Jr., Laporte, Ind., assignor to M. Rumely Co., Laporte, Ind., a corporation of Indiana. Filed Aug. 20, 1910. Serial No. 578,172. (Heavy oil carburetter with iris fuel valve.) 1 claim.

1,055,057. Automobile Fender. George E. Legendre, Chicago, Ill. Filed Jan. 19, 1912. Serial No. 672,161. (Buffer with spring backing.) 1 claim.

1,055,069. Gasolene-Engine. Daniel H. Muir, Lincoln, Neb. Filed June 20, 1911. Serial No. 634,351. (Two concentric cylinders with piston in space between them.) 6 claims.

1,055,071. Means for Controlling and Regulating the Operation of Clutches. Clark W. Parker, Springfield, Mass., assignor to Parker Transmission & Appliance Co., Springfield, Mass., a corporation of Massachusetts. Filed Dec. 28, 1910. Serial No. 599,690. (Dashpot control of clutch movement.) 4 claims.

1,055,084. Carburetter. Edward A. Rumely, Laporte, Ind., assignor to M. Rumely Co., Laporte, Ind., a corporation of Indiana. Filed Jan. 10, 1910. Serial No. 537,202. (Regulating port for air admission.) 6 claims.

1,055,085. Tractor. Edward A. Rumely, Laporte, Ind., assignor to M. Rumely Co., Laporte, Ind., a corporation of Indiana. Filed April 11, 1912. Serial No. 690,164. (Means for equalizing slip of driving wheels of tractors.) 7 claims.

1,055,101. Shield for Driving-Gear of Motor Vehicles. John W. Thompson, Brent, Ala. Filed April 12, 1912. Serial No. 690,282. (Casing for gears of combined driving and steering wheels.) 1 claim.

1,055,120. Explosive-Engine. Joseph H. Daniel Beaucage, Pittsfield, Mass. Filed Dec. 14, 1911. Serial No. 665,598. (Rotary valve motor.) 6 claims.

1,055,164. Shock-Absorber. Fulton A. Green, Kittanning, Pa. Filed Sept. 13, 1911. Serial No. 649,095. (Hydraulic shock absorber.) 1 claim.

1,055,225. Dirigible Automobile Light-Support. Julius Marion Raiky, Coffeeville, Miss., assignor of one-half to C. K. Bailey, Coffeeville, Miss. Filed Oct. 14, 1912. Serial No. 725,573. (Headlights movable by steering gear.) 1 claim.

1,055,313. Steering Mechanism. James E. Briggs, Waterloo, Iowa. Filed April 17, 1911. Serial No. 621,699. (Pinion-and-sector steering mechanism.) 1 claim.

1,055,314. Spring Suspension for Vehicles. Ettore Bugatti, Molsheim, Germany. Filed Dec. 29, 1911. Serial No. 668,498. (System of single armed springs.) 3 claims.

1,055,333. Resilient Wheel. Emil J. Kreis, Mendota, Ill. Filed April 12, 1911. Serial No. 620,544. Renewed Sept. 12, 1912. Serial No. 720,089. (Tire backed by helical springs.) 5 claims.

Holds World's Stock Championship

National

Holds World's Record for Fastest 500 Miles in Competition

Once a National dealer, always a National dealer

Electric started and lighted; not only left side drive but *access* to both front doors

New series V-3—five models, $2750 to $3400

Motors 1640 miles, from Indianapolis to San Antonio, Texas, to convince one customer

National Motor Vehicle Co.,
Indianapolis, Ind.

Gentlemen:

We arrived in San Antonio, Saturday night.

The *National* is all you claim it to be and *then some.* I do not think there is another car made that could come over the same road and make the same number of miles we did, with as much ease.

We encountered sand, mud, rocks, stumps, rain and everything else it takes to make a bad road. The car was never in distress and never *missed a stroke the whole time.*

We drove 1640 miles from your factory at Indianapolis to San Antonio, *averaging 200 miles per day*, from start to finish, which I think was very good considering the condition of the roads.

Col. Tinnin is highly pleased with the car and claims it is the only car that could have made the trip without help.

I have always *believed* the *National* to be the best car make and now I *know* it.

Very truly yours,
R. M. Yantis.

The accompaning letter is from our *National* dealer in San Antonio, Texas, who brought a customer to our factory at Indianapolis. The customer, Col. Tinnin, bought the car after seeing our modern factory and improved processes of manufacturing. They then decided to drive the *National* home, with the results as stated.

Dealers' opportunity—New Series V-3 now ready—write us

The *National* is the dealer's best car because it will satisfy your customers. Let us prove this—write today for full information regarding our New Series V-3—we can make *immediate delivery.* Don't tie up with anyone till you get our Special Offer to Live Dealers.

***National*—the car that maintains its leadership**

National Motor Vehicle Co., Dept. 90, Indianapolis, Ind.

Unexcelled American Genius
Unexcelled American Skill
Unexcelled American Manufacturing Processes

have produced the Unexcelled, American-made, New Departure ball bearing — the bearing that has proved its superiority by actual service in 80 per cent. of American-made motor cars.

Three Types:

Double Row — A two-purpose bearing of maximum capacity for both radial and thrust loads.

Single Row — For radial loads only. An improved separator is an advantageous feature.

Radax — High grade cup-and-cone type bearing for sustaining radial loads and one-direction thrusts.

Descriptive catalog will be sent on request.

Engineering consultation service at your command. Send us your blueprints, speed and load data and we will tell you what size and type of bearing will best do your work with greatest efficiency and least friction and wear.

"Elimination of Friction" brochure, now in third edition, discusses the relative merits of balls and rollers in bearing work. A copy will be sent you free on request.

The New Departure Mfg. Co.
Bristol, Conn.
WESTERN BRANCH: 1016-17 Ford Bldg, Detroit, Mich.

"New Departure Ball Bearing Manual" full of information for the garage man and dealer, just off the press. The only book of its kind. Ask us for it.

Special data sheets on New Departure Self Aligning Shaft Hangings and use of New Departure Ball Bearings in machine tools sent free on request. Address New Departure Mfg. Co., Hartford Division, Hartford, Conn. for them.

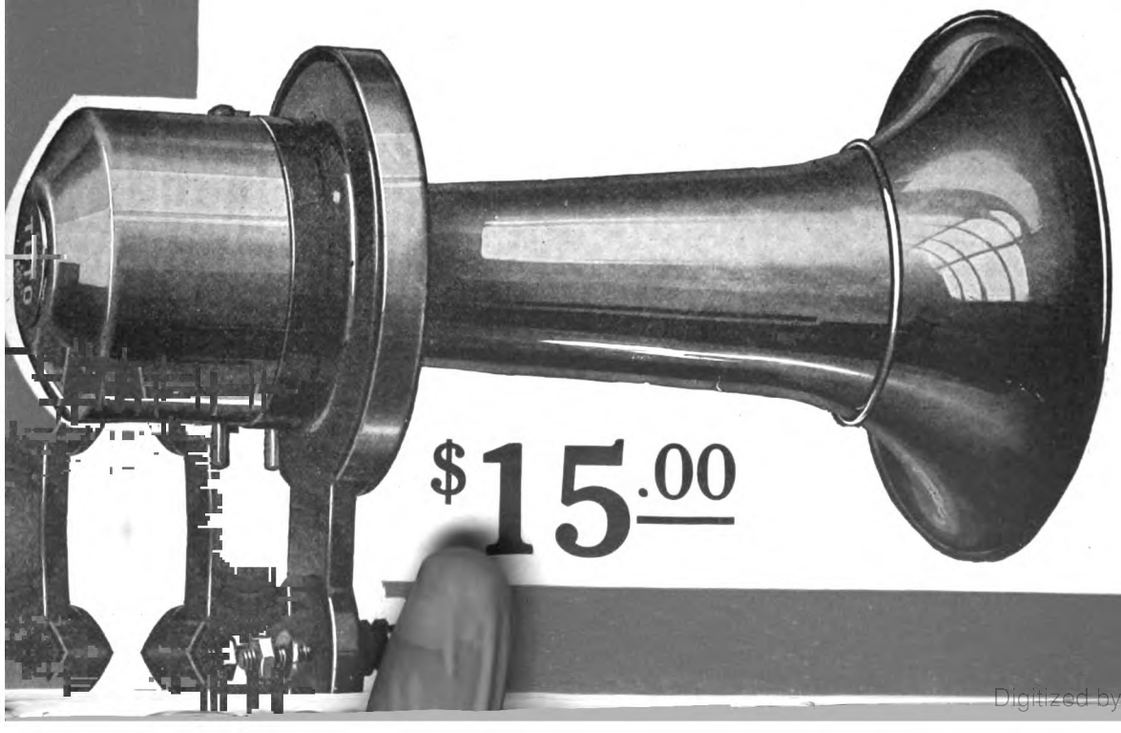
WHERE QUALITY'S SEEN



DEALERS!

In the sale of accessories it is well to place your independence on a STANDARDIZED article, one of known merit. An accessory so universally indorsed that the car owner will show no hesitancy when the name is before him.

In the Sale of Warning Signals – ELYRIA-DEAN Is Standardized

The name alone is a guarantee of faithful performance. The product is known, it is accepted by the OWNERS and INDUSTRY alike as a superior warning signal.

When car owners ask for a warning signal by name the ELYRIA-DEAN WARNING SIGNALS—TUTO HORN and REXO HORN—are not difficult to remember. They are backed by a general publicity campaign that must make them the first thought when one thinks of Warning Signals.

An Invitation to Manufacturers of Electric Lighting Systems

Certain manufacturers of electric lighting systems have endeavored to overcome the showing of the Speedway Tests by preparing mysterious charts of engineering curves and making plenty of lead pencil figures.

Anyone can test the proposition of "miles per gallon" with a lead pencil. But it can be done more accurately with an automobile.

We cordially invite any manufacturer of electric lighting equipment who wants to prove its power consumption on these Speedway curves to bring a car with his equipment to the Speedway and give it a practical test.

We shall be glad to furnish the gasoline and all necessary mechanical help. We also have two electrical engineers and a few electricians whom we have found handy in case of electrical troubles on cars being tested.

The only recompense we ask is a copy of the report of the test, certified by the manufacturer of the electric equipment.

Here is a splendid opportunity for any electric lighting equipment manufacturer to show whether his lead pencil theory will hold together on the brick speedway.

"What is the BEST Light for My Car?"

Here is an accurate analysis of automobile lighting systems.

It tells **facts**—

Not theoretical "curves" or technical "figures" but—

Real tests of cars in service—indisputable information about the best light for your car.

It tells why electric equipment cripples an engine—

Why electric light costs more than Prest-O-Lite—

What expert electricians say about electric lights on automobiles.

It proves why Prest-O-Lite is more reliable, just as convenient and gives a better quality of light than any electric system.

It shows why some automobile manufacturers use electric equipment.

It gives inside facts about self-starters.

It recounts real results of the experience of owners with electric lights.

These FACTS Save You Time, Money, Trouble.

If you own a car or buy one you will benefit by every page.

Here is the evidence.

You are the jury.

Before you give your verdict—read these facts.

The coupon or a post card brings them to you.

The Prest-O-Lite Co., Inc.

287 Speedway
INDIANAPOLIS, IND.

The new Prest-O-Lite factory, which multiplied our capacity 4 times, is running to the limit endeavoring to keep up with the demand for Prest-O-Lite.

The Prest-O-Lite Co., Inc.,
287 Speedway, Indianapolis, Indiana.

Please send facts on lighting systems and reports of tests to—

The AXLE WITH your CHOICE of the FINEST BEARINGS

For years Sheldon Truck axles have been the undisputed leaders in the field. But we realized that to attain supremacy is one thing; to maintain it is another.

Every Sheldon Axle which leaves our factory is of unvarying perfection.

We are continually striving to improve and perfect wherever it is possible to do so.

In line with this policy we offer to you the choice of the following leading bearings—the best and finest produced in the world:

Standard Taper Roller Bearings,
Bower Straight Roller Bearings,
New Departure,
Rhineland,
Hess-Bright,
F & S,
S. K. F.,
Fafnir,
S. R. O.,
R. B. F.,
Schafer,
Norma Roller,
R. I. V.

Or single row in any type desired.

We leave the manufacture of bearings to the specialist and make the axles as well as infinite care and unlimited experience can make them.

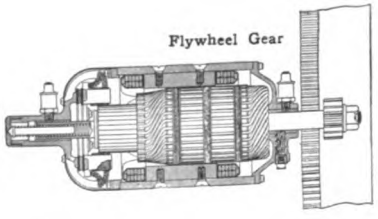
The Starter For Women Drivers

No Gears to Shift



When a woman purchases a self-starting car from you for her own use, are you glad or sorry?

It depends a good deal on the starter, doesn't it?

The **sale** may depend only on how prettily the starter works while it is nice and new. But the **profits** of that sale will depend entirely on what the starter takes a notion to do six months or a year later! Unless it will come up smiling under the same sort of casual treatment that her carpet sweeper or vacuum cleaner receives, it might better not be on the car.

If the commutator is going to burn up, or if the clutch is going to slip, the ratchet drive to stick, or the intermediate gears to wear out, **you will have to make good** even if it costs the profits of several sales to do it. And your real happiness will not begin before She is satisfied.

The RUSHMORE STARTER

gears directly to the flywheel, eliminating all the usual intermediate gearing, friction clutches and ratchet drives. It engages the flywheel gear **automatically** when the foot button is pressed, and disengages **automatically** the instant the engine starts. Its compactness, small weight, great power and freedom from trappy wearing parts make it the ideal solution of the starter problem.

The Rushmore Dynamo is as simple, scientific and dependable as the Starter.

Rushmore Dynamo Works, Plainfield, N. J.

PROFITS ? PROFITS

COX CARBON OXYGEN CLEANER

There are hundreds of lines of goods on the market, all more or less useful and desired by the motorist—some of which net the dealer and garageman a good profit—others a small margin by reason of their being little used.

Every motorist knows the desirability, the necessity even, of having the carbon cleaned from his motor every once-in-so-often. The demand for this service is constant—it is increasing. It is increasing because of the poor grade of commercial gasolene—because motorists know they can lengthen the life of their motors by keeping them free from carbon deposits.

Does this kind of work pay? If done by the antiquated method of scraping the cylinders, probably not. At least, the results, unless the job is very, very carefully done—at the expense of a lot of time and patience—are not always satisfactory.

At any rate, the time tickets show. Note the time ticket showing what an exorbitant charge must be made to yield you a narrow margin of profit.

Workman removes spark plug, turns on oxygen — regulates its flow by gauge and valve — inserts nozzle in spark plug opening and ignites gas with piece of burning paper. By feeding the flame about the walls and valve ports of a cylinder every vestige of carbon is consumed, leaving no sediment. Guaranteed to cause not the slightest harm to motor.

REPAIR TICKET

Remove carbon from cylinders — scrape — 4 cyl. motor

Mechanic A. Smith

DATE	STARTED	FINISHED	HRS
10/1	8:00 A.M.	5:00 P.M.	8
Total Hrs.			8

THE OLD WAY

Figuring labor as low as $15 a week, you can't make money and do a first class job, at $1 per cylinder.

Then consider the new way—far more satisfactory to your customer—because it doesn't necessitate holding up his car more than an hour or so—because the charge of $1 per cylinder is reasonable enough and because the job is always perfectly satisfactory—when the carbon is burned away by a Cox Oxygen Carbon Cleaner.

The picture shows how burning oxygen gas is fed into a cylinder through the spark plug opening by a nozzle. One tank contains enough gas to clean from 35 to 40 cylinders perfectly. The burning oxygen is guaranteed not to cause the slightest harm to a motor. A tank of oxygen costs $2—the tank itself is loaned to you.

Then note the time ticket when a Cox Oxygen Carbon Cleaner is used. It tells the story.

Write or wire for further particulars—don't delay.

REPAIR TICKET

Remove carbon from cylinders - Use Cox Oxygen Carbon Cleaner - 4 Cyl.

Mechanic Jimmy

DATE	STARTED	FINISHED	HRS
10/15	8:00 A.M.	8:45 A.M.	3/4
Total Hrs.			3/4

THE NEW WAY

From 6 to 10 minutes per cylinder is all the time required. All jobs uniform and guaranteed 1000% better than by scraping.

Stewart Speedometer
MAGNETIC PRINCIPLE

A Tip From England

Writing about an American speedometer of the centrifugal type, a correspondent of an English paper, "The Autocar," says:

"I found it telling some very black lies. It was generally fairly consistent, being slow below 25 m. p. h. and fast (exceedingly so at high speeds) above this figure. At 50 m. p. h. it would read 60 m. p. h., but the hand was rarely steady."

The above shows that they are realizing in England, as they have *already* realized in this country---the practical superiority of the MAGNETIC speedometer. Witness the fact that the magnetic Stewart Speedometer is outselling all other makes at the ratio of 4 to 1. The majority of motorists want to know *exactly*, and the Stewart is telling them.

It will pay you to have a Stewart on your car.

NORTHWAY'S LATEST AND GREATEST ACHIEVEMENT

Crowning glory of his greatest of great successes.
Standard of the world.

After years of experience, exhaustive tests and expensive experiments, the greatest of all designers and inventors, Mr. R. E. Northway, the founder of the Northway Motor Company, and original designer of that now famous motor, acknowledged by the best engineers and motor experts to be the greatest motor in the world, now brings out his very latest and greatest of all motors, to be used exclusively by the Crescent Motor Company, of Cincinnati, Ohio.

Ohio Model, 4¼ x 4¾, with 116-inch wheelbase, 34 x 4 tires, equipped with everything, including electric starter, lights and horn, at $1275.00.

"Model Royal," six cylinder, 4 x 6, with 132-inch wheel base, full floating axle, fully equipped with everything, inclusive of electric starter, lights and horn, at $1985.00.

Ohio "4-35," Five Passenger
Price $1275

Motor—4¼ x 4¾.
Axles—Full floating on annular bearings.
Transmission—Three speeds and reverse.
Clutch—Multiple disc.
Inside control; right hand drive.
Speedometer—Stewart.
Rims—Demountable.
Tires—34 x 4.
Wheel Base—116 inches.

"Model Royal," Five Passenger,
"6-60," Price $1985

Motor—4 x 6.
Axles—Full floating on annular bearings.
Transmission—Four speeds and reverse, direct on fourth.
Clutch—Multiple disc.
Center control; left hand drive.
Speedometer—Warner, flush type.
Rims—Firestone demountable.
Tires—35 x 4½.
Wheel Base—132 inches.

Almost too good to be true. Nevertheless it is true, for here it is, and we are now ready to contract with good, live, wide-awake dealers. See us at once and make your arrangements before territory is all taken. This is absolutely the best proposition ever offered.

Let it alone

A man buys an automobile from you, a good car, one with standard parts and one which the makers equipped with what they considered the best carburetor made; still the man has carburetor trouble. Is the carburetor to blame for all the "Carburetor Trouble"? Can it be possible that inventors and engineers have been able to develop motors, ignition, self-cranking devices, clutches, in fact, almost every other element in an automobile's make-up to a high state of perfection, and have not been able to develop a perfect carburetor?

There is a world of wisdom in our message —"Let the Carburetor Alone; it's all right as it is. Look to your fuel, for there lies the source of so-called "Carburetor Trouble."

Almost any carburetor will vaporize gasolene properly and efficiently—and will go on doing so until some foreign substances such as particles of paraffine, dirt, grit and water—always present in commercial gasolene—interfere to clog or choke the carburetor. The ELLIS GASOLENE PURIFIER is a final remedy for carburetor trouble. It taps on the fuel pipe between the carburetor and the gas tank, the nearer the carburetor the better, and by a series of screens and filters takes out of the fuel every bit of foreign substance that finds its way into commercial gasolene and lets nothing get to the carburetor besides purified and filtered gasolene. The Ellis takes advantage of the greater specific gravity of water to eliminate that omnipresent and troublesome element from the fuel. In fact, fuel passing through an ELLIS GASOLENE PURIFIER goes to the carburetor in such a state that even a makeshift carburetor will give good results.

Every particle of sediment, however fine, is removed, leaving nothing but pure gasolene to feed on to the carburetor.

Every dealer should know the advantages of equipping cars with the ELLIS GASOLENE PURIFIER. It provides the true way of stopping carburetor trouble because it goes right to the source of such trouble and insures against it. The insurance against carburetor trouble is a benefit worth many times the cost of the Ellis and a benefit you should urge upon your customers. Send for an Ellis to try on your demonstrator. It is made of brass or aluminum and is very light. Requires no attention outside of draining at regular intervals. When ordering give diameter of fuel lead pipe so unions of proper size may be provided.

Booklet upon request.

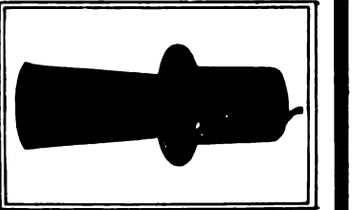
IN THE SALE OF ACCESSORIES YOU WILL FIND IN THE "SPARTON" LINE THE CORRECT ANSWER TO EVERY WARNING SIGNAL REQUIREMENT

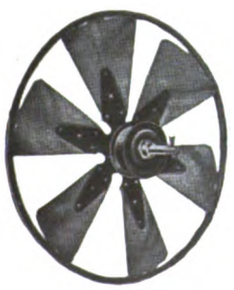


FOUR MODELS. ALL MOTOR DRIVEN BY BIG MOTORS

A dash or underhood style for both big and little cars.

Finished in standard gun metal or with gun metal and brass or nickel bell.

Each "SPARTON" carries the unconditional guarantee of the Sparks-Withington Company. We publish no price list on parts. Every "SPARTON" dealer is instructed to MAKE GOOD and return damaged parts to us collect.



Our selling arrangement protects you in every way. We do not insist on exclusive representation and guarantee you delivery on all the "SPARTONS" you want—when you want them. One price to all DEALERS, no sliding scale—no favorites.

MODEL D "SPARTON" Dash Type - $15.00
MODEL U "SPARTON" Underhood Type 14.00
MODEL J "SPARTON" Underhood Type 10.00
MODEL B "SPARTON" Dash Type - 10.00

The new "SPARTON" catalogue is ready for mailing

WE SPECIALIZE ON THE PRODUCTION OF BETTER FANS
Sparks-Withington famous One Piece Blade Radiator Fans are selected by the better Car Manufacturers as standard equipment.
More Sparks-Withington Automobile Fans are in use than all other makes combined.
The cooling efficiency of each fan is exactly determined in our laboratory. This information is tabulated and gladly furnished to those interested. Our new catalogue treats on Motor Cooling in an intelligent manner and will be mailed on request.

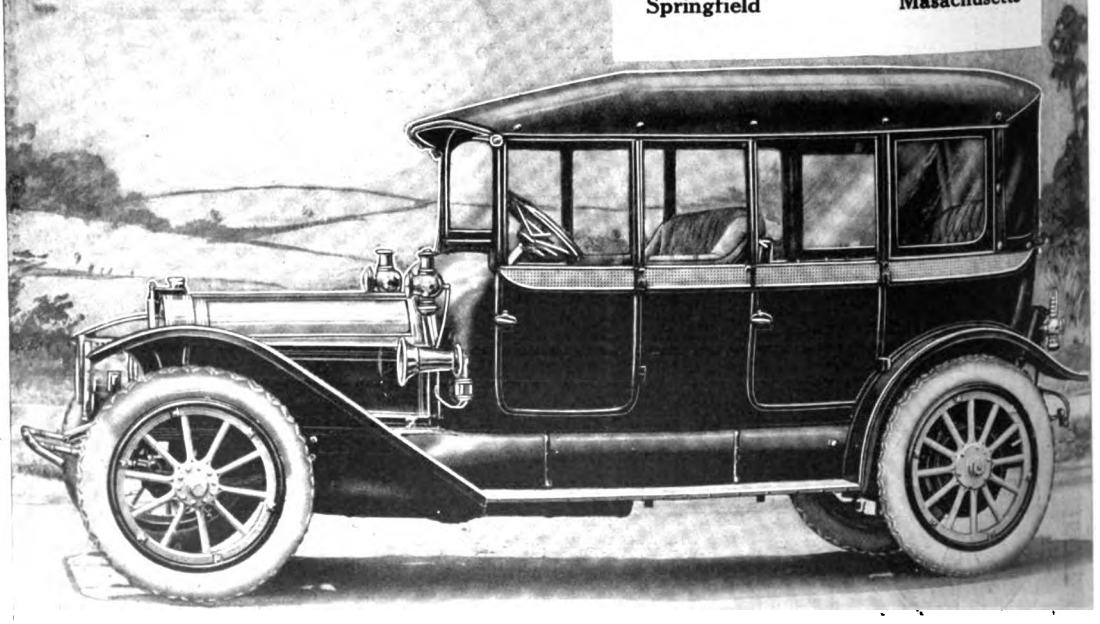
SPRINGFIELD CONVERTIBLE BODIES

With a Springfield Convertible Body, a few minutes work will turn the open touring car into a handsome luxurious closed car.

This radical departure from the unsightly, uncomfortable, ordinary top, is the final result of three years' development and it is today the ***only*** practical all-year-round body on the market.

When open, there are no signs calling attention to the fact that the body can be entirely enclosed in glass—just an ordinary closed top is visible.

When in position, the Springfield Convertible Body gives a beautiful glass enclosed, weather proof car with wide doors free from obstructions—in every way equal to the permanently closed car in appearance and comfort.



The transformation can be worked in remarkably short time through the simple operation of raising the top and adjusting the glass windows which are contained in a box back of the front seat when the car is open.

The Convertible Top feature is exclusive on Springfield Metal Bodies. It will not fit any other body, but we are prepared to make prompt deliveries on all designs from the little runabout to the largest limousine or landaulet.

Further information is at your command. Write for it.

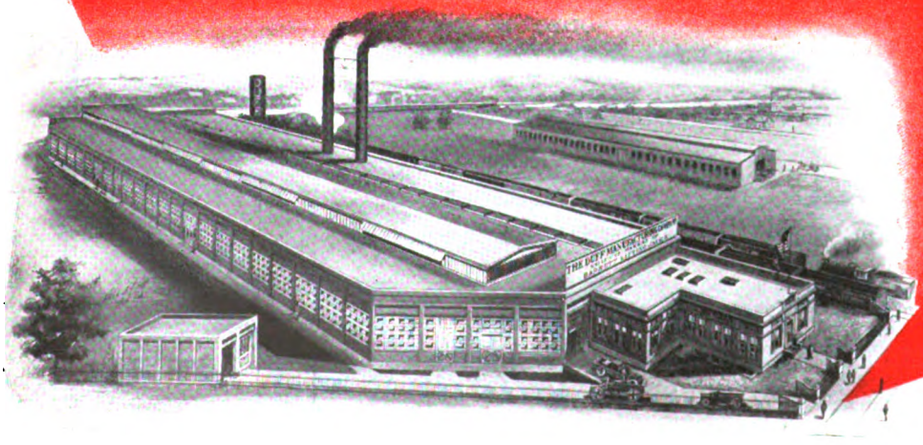
The Ten "Specialists" in Motor Car Lifting

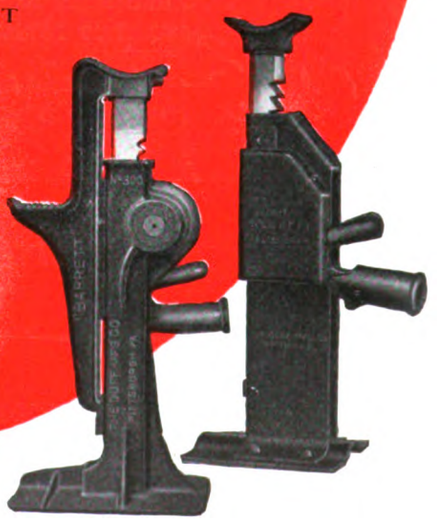
This line of jacks represents a complete study and mastery of every lifting requirement that can be encountered with every make and model of pleasure car or power truck.

The development of this line as it now stands makes stronger than ever the long-recognized exclusive standard of

GENUINE DUFF-BUILT

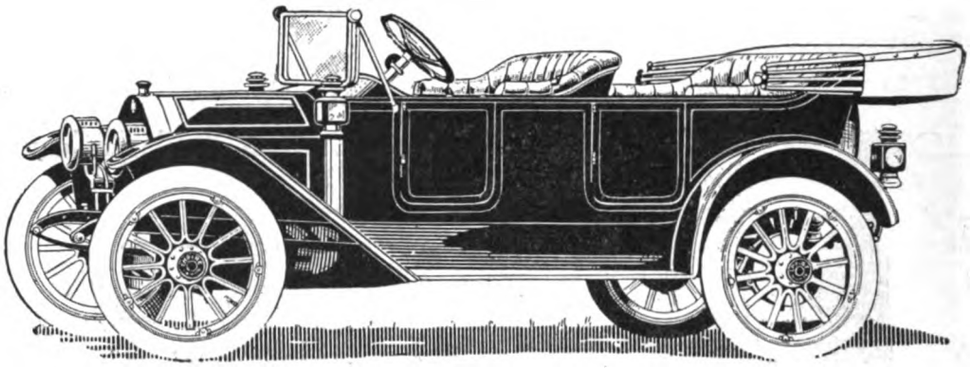


BARRETT AUTOMOBILE JACKS



The manufacturer in selecting his jack equipment and the dealer in selling jacks at retail, can do the motorist no better service than to see that he gets the special Barrett best suited to his car. The expense can be but *slightly* greater—the added safety, efficiency and durability being out of all proportion thereto.

A noteworthy feature of this Company's activities has always been the high standard of its manufacturing organization, plant and equipment. Its present plant, new this year, is not only the largest jack manufactory in the world, but is one that cannot be excelled for ideal equipment and working conditions in any industry.



Prompt service on all estimates, orders and correspondence from manufacturers or dealers.

EMPIRE

"The Little Aristocrat"

The Empire "31" had proved itself a masterpiece of engineering skill and the most solidly constructed car of moderate price.

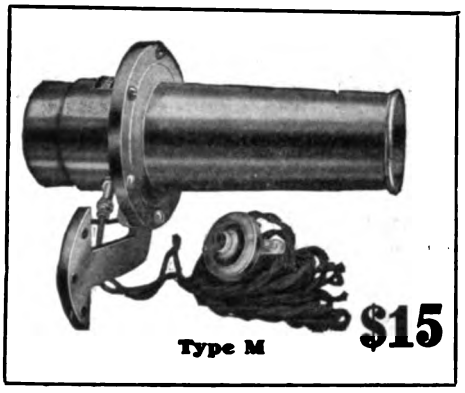
Its marvelous run in the Indiana-Pacific Tour from Indianapolis to the finish at Los Angeles in perfect condition is a record never before achieved by a car of its size and power.

Empire dealers and owners all over the country are enthusiastic over the service given by this car and are coming back for more Empires.

When we launched this model we went out for the progressive dealers who knew cars and the public's demand. In two months we were swamped with orders which left hundreds of dealers without Empire contracts.

We immediately began to plan for increased 1914 production. Now, after months of preparation, we are turning out four times as many cars, and we are consequently in a position to allot territory which we could not supply last season.

In every important territory where we have distributors we have had, in the last few months, solicitous notes from other dealers who realized too late the popular success of the Empire.



There is still some open territory but it won't last long. Tomorrow may be too late to secure territory now open.

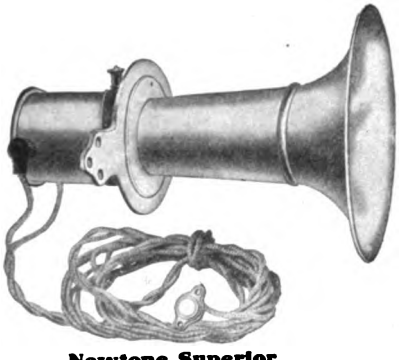
Type M $15

Torpedo Type $15

Prices Reduced On Newtone Horns

Quantity production and most advanced manufacturing methods enables us to lower cost 25%.

TO TAKE EFFECT OCTOBER 1st, 1913 { **Type M, $15** **"Torpedo," $15** **Type N, $15**



During the last three years the demand and production of Newtone Horns has increased nearly 800 per cent.

Average Weekly Production

In 1911 we produced an average of 350 Newtones per week. In 1912, 900 and in 1913---so far---an average of 2,765 per week.

To meet the tremendous demand for these horns we have added new floors, new machinery and a greatly increased force of skilled mechanics, so that we have doubled our present capacity, thereby insuring absolute satisfaction and prompt delivery on future orders.

We invite criticism and challenge competition.

Newtone Superior

NEWTONE Superior

$10 As Heretofore

The Most "Talked Of" Motor Driven Horn

The Newest Newtone is in every essential the Greatest Newtone we have ever produced.

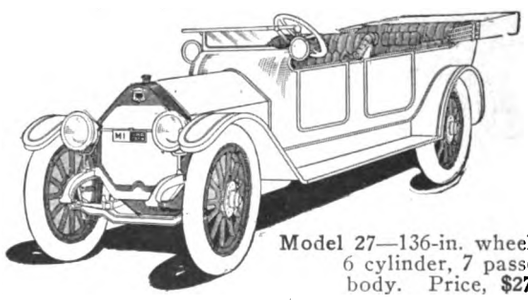
The Haynes Automobile Company not only makes a good car but keeps in close touch with its dealers—

Helps them sell cars with the greatest possible profit



To this end, Elwood Haynes, the President of our Company (creator of America's First Car), and Robert Crawford, our Advertising and Publicity Manager, have been touring from Indiana to the Coast, visiting the dealers in every town and learning first-hand their problems.

The reason why many dealers aren't making enough money has been discovered. This discovery may mean a great deal to you. The reason is that there are

Too many mediocre cars on the market

—too many cars that are "*pretty good*" cars, so far as their mechanical construction is concerned. It is hard to find glaring flaws to pick in them—the trouble is that they are just mediocre in name, reputation and in a selling way. They aren't sufficiently popular cars. They aren't the cars people are interested in. They have no strong individuality, no powerful prestige, no strong advertising back of them to help out the dealer.

Such cars are sold only by the dint of hardest kind of selling effort on the part of the dealer. The dealer has to dig up all his own prospects, keep on their trail day in and day out, and put over the sales by sheer force of his own personality and hard work.

Model 27—136-in. wheelbase, 6 cylinder, 7 passenger body. Price, **$2785**

How many more cars a dealer can sell—how very much larger his profit must be—if he has a strong car of reputation to handle.

Digitized by Google

The

HAYNES

America's First Car

Help sell themselves

They are distinctive and desirable in every way. Their prestige as America's first car is a strong selling help—their reputation, built uninterruptedly through twenty years of automobile history, makes them well known. In handling the Haynes, you have the assistance of an alert selling and advertising organization and thousands of dollars spent in publicity—you have in the car itself noteworthy beauty of design, power, durability, coupled with absolutely everything in the way of comforts and conveniences, even down to the little details that often make such a difference—and lastly you have

The greatest feature of this season and of all seasons—

The Vulcan Electric Gear Shift

to help you sell the Haynes. This wonderful feature is sending prospective buyers of automobiles to our dealers by the thousands—and is sending them half sold. Think what a saving this is in time and the expense of salesmanship. How different from having to search out prospects for a car in which people are utterly uninterested, and getting their orders only after long drawn out and arduous efforts.

The Haynes Automobile Company, 1 Main St., Kokomo, Ind.

An outline of the features which make the Haynes sell easily:

Motor—Bore 4¼ in., Stroke 5½ in. L-head Haynes. Cylinders cast in pairs. Model 26, A. L. A. M., 43.35 H. P., Dynamometer 65 H. P. Model 27, A. L. A. M., 43.35 H. P., Dynamometer 65 H. P. Model 28, A. L. A. M., 29.9 H. P., Dynamometer 48 H. P.
Weight—Model 26, 3800 lbs.; Model 27, 4000 lbs.; Model 28, 3400 lbs.
Cooling—Centrifugal pump and pressed steel fan.
Wheel Base—Model 26, 130. Model 27, 136. Model 28, 118.
Ignition—American Simms Magneto.
Carburetor—Stromberg.
Lubrication—Splash and gravity feed.
Control—Left hand. Vulcan Electric Gear Shift.
Transmission—Selective Type, three speeds forward, one reverse.
Steering Column—Worm and worm gear type.
Clutch—Haynes contracting steel band.
Rear Axle—Full Floating Timken on Models 26 and 27; McCue, Model 28, Gurney Bearings.
Front Axle—I-Beam. O. H. steel heat treated.
Wheels—Artillery type. Funk demountable rims.
Tires—Models 26 and 27, 36 x 4½. Model 28, 34 x 4.
Springs—Front Semi-elliptic 39⅛ x 2, rear 48 x 2.
Brakes—15¼ external and 15 internal Models 26 and 27. 12 and 16 internal on Model 28.
Finish—Indiana dark blue body. Pacific Tour gray, optional.
Gasoline Feed—Pressure. Automatic feed.
Upholstery—Buffed leather—deep cushions.
Starting and Lighting—Leece-Neville electrical system.
Cowl-board Equipment—Electric lights, sight oil feed, automatic cut-out for generator, dash light, auxiliary air pressure pump, air gauge, speedometer. Models 26-27 have rim wind clock.
Other Standard Equipment—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind-shield, Vulcan electric gear shift, two large electric headlights, electric side lights, electric tail light, electric starter, generator, 12 volt, 80 ampere hour storage battery, speedometer, horn, coat and foot rails, tire irons, full tool equipment, one extra demountable rim and Collins curtains. Models 26 and 27 have shock absorbers.

Hand lever shift optional, all models, at $200 reduction.

Let us send you full particulars about the latest Haynes models and their noteworthy new features

Lippard-Stewart Model "F"

Chassis Price $2300, f. o. b. Buffalo

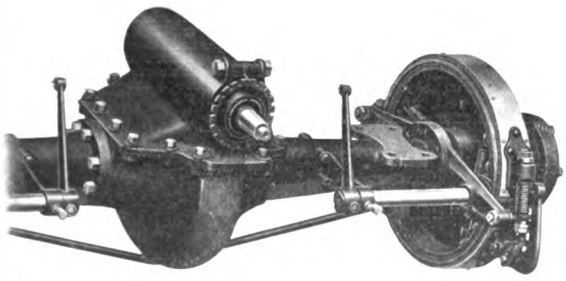
Backed by Reputation

A worthy running mate of the widely successful Lippard-Stewart 1500 pound delivery car is this new truck of popular type. Just as far advanced in its field as the car which has established the name of Lippard-Stewart as the embodiment of all that's high quality in commercial cars. The first truck of its capacity to be strictly up-to-date in its construction, and at a price that stamps it the foremost truck value of today. The Lippard-Stewart line, with this new 1½-2 Ton Worm Drive Truck added, will meet the requirements of the great proportion of truck users. For the dealer, the line offers opportunities for sales unequalled in the trade.

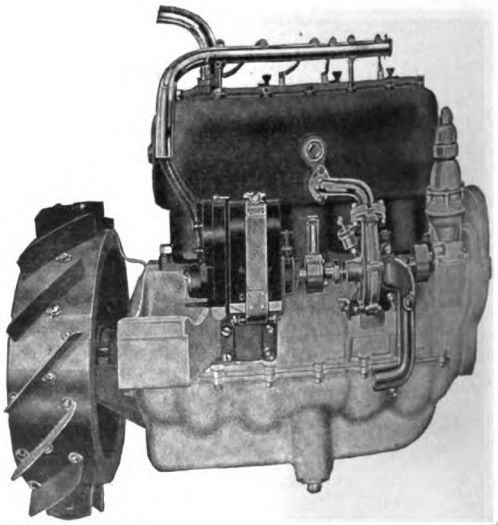
The New Truck's Features

35 H. P. Continental motor; Eisemann Magneto; built-up tubular radiator; cone clutch; Brown-Lipe transmission; worm and gear steering device—left drive, right hand control; straight line shaft drive; Spicer Universal Joints; Timken axles, worm drive rear; two sets big brakes on rear wheels; semi-elliptic springs; wheelbase 145 in. or 158 in.; tires solid, 36 x 3½ in. front, 36 x 3 in. dual rear.

After you read about this truck, think how many qualities it possesses that you know are heavy scorers—how many points have a direct appeal to the well posted purchaser of today! The advanced design of the Lippard-Stewart means that it is a leader—far ahead of any truck that claims to be in the same class. Dealers, hitch your wagon to a live wire!



Worm Drive



Worm drive is one feature which in itself stamps the Lippard-Stewart as thoroughly modern. For trucks of Model F's capacity, other types of final drive are back numbers. English engineers have for a long time used the worm and gear on big London omnibuses with marked success. We ourselves have tested it for many months in connection with the shipping department of a big factory. The first Lippard-Stewart 1½-2 ton truck was tried out in Pennsylvania mountains and the heavy clay and sand roads of Ohio. Such grueling work—days of it without a halt—established under every condition the make-good qualities of worm drive.

The Lippard-Stewart rear axle is built through the combined efforts of the Timken-Detroit Axle Company and David Brown Sons Company, the latter firm widely known English experts on worm gearing. It permits more power to be delivered to the rear wheels than through any other drive system. It reduces friction loss. It does not lose its efficiency after wear commences. It retains its original working condition no matter how long it is in service. It is quiet in operation and applies power smoothly.

Wealth of Power

Then again—Lippard-Stewart Model F has a wealth of power—more than just enough for ordinary requirements. The big Continental motor develops 35 H. P. at normal speed, which, acting through a 7¾ to 1 gear ratio, gives that assurance of ability to meet any emergency which so few trucks nowadays possess. But a driver cannot force the car—an automatic governor keeps down the speed to 15 miles an hour. The motor is built as nearly fool-proof as possible.

Digitized by Google

1½-2 Ton Capacity; Worm Drive

Bodies for Various Purposes

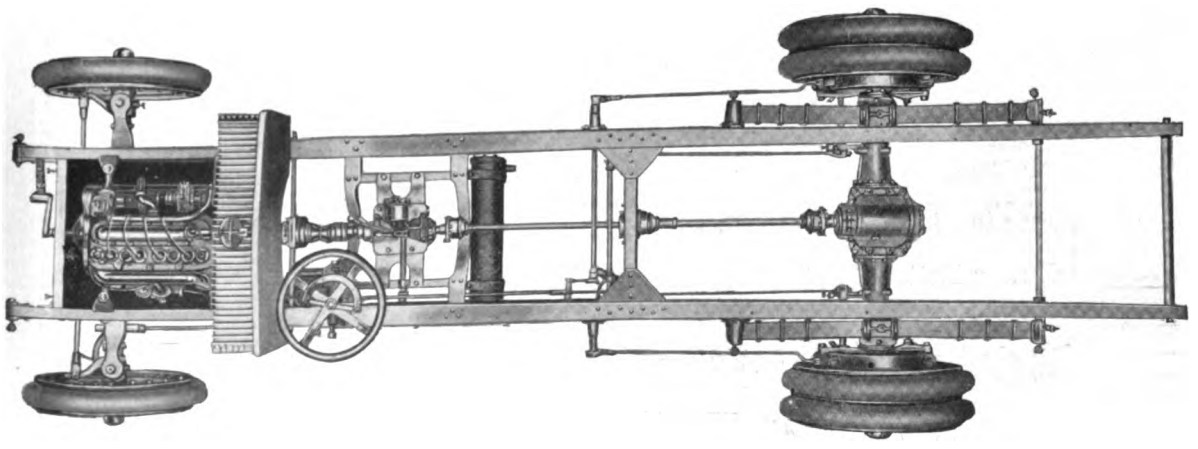
Once more—there are no bugaboos about overheating of Model F. Lippard-Stewart engineers know the distinction between touring car practice in design and truck practice. As the service is harder, so must greater cooling facilities be provided in a truck; so must ease of repair and protection from damage be dominating features. By mounting at the dash on coil springs a vertical tubular radiator of the built-up type, having large cast aluminum tanks, the Lippard-Stewart meets the necessary requirements to the last detail. Liberal water capacity and cooling area make overheating practically impossible.

Reserve Strength

What do we mean by reserve strength? We mean that Model F's construction will stand up under the unexpected. In the worst pinches it will pull through. The mechanism won't go wrong when the truck's work is hardest. This is the reason why we make the clutch and transmission of even greater capacity than the motor rating—why we make the frame 4¼ in. wide and 6 1-16 in. deep, where the greatest strain comes, in order to make sagging an impossibility—why we make spring carriers and pivot bolts extra large—why we use a steering gear of a size which makes safety an absolute surety.

Straight line shaft drive supported at its center by a self-adjusting ball bearing, a load distribution that provides easy steering and sufficient traction, accessibility and simplicity—here we find the completion of a truck that is unquestionably suited to its work like no other. And back of it is the truck wisdom and the quality stamp of Lippard-Stewart.

Now, Mr. Dealer



you see what great value this truck offers. You know how extensive is the demand for such a thoroughly good truck, and how it will grow. You know what other makers are offering. Your judgment of trucks will tell you how Lippard-Stewart Model F at $2300.00 excels in a way that forestalls competition in its class. If you are one of the wise dealers who have the ability to spot a good thing, you want our proposition. Write for it and ask for literature on the complete Lippard-Stewart line. It is a winner in a winning business. Get all the facts before you now.

"BOWER SAVES POWER"

Gnarding the Ronte of Power

You know the horsepower of a certain automobile—but do you know how much of that power is transmitted into MOTIVE power or traction power? On its way from the engine the power of an automobile is assailed at SEVENTEEN bearing points by its greatest enemy—Friction.

There are seventeen such places in a car where more or less power is lost—seventeen places where power may be "spilled" in transmission.

It is the business of Bower Roller Bearings to guard the route of power at these danger points. Compare the efficiency of a single Bower bearing with that of any other bearing; multiply that difference by seventeen—and you will see how vital is the value of Bower Roller Bearings to the effective power of an automobile.

Friction is the thief of Power.

Bower Roller Bearings are Power's Guardian.

"American" Axles

Bring Out the Full Effectiveness of the Lanchester-Daimler Worm Drive

Not until the Lanchester-Daimler Worm Drive was placed in a full floating "American" Axle, did it become part of a unit that is flawless in every factor.

Acknowledged the most efficient Worm Drive ever created, we have given it a mounting correspondingly perfect in design, material and workmanship; bringing to this important problem precisely the same high quality of engineering skill that won first place for our Bevel Gear Axle.

We have, therefore, increased for users in America the prestige of that Worm Drive which has for years ranked highest abroad, and whose adoption for both gasoline and electric pleasure cars marks the most notable recent advance in motor car building.

The adjusting and full floating features of "American" Axles are fully covered by our own patents and by shop rights from other patentees.

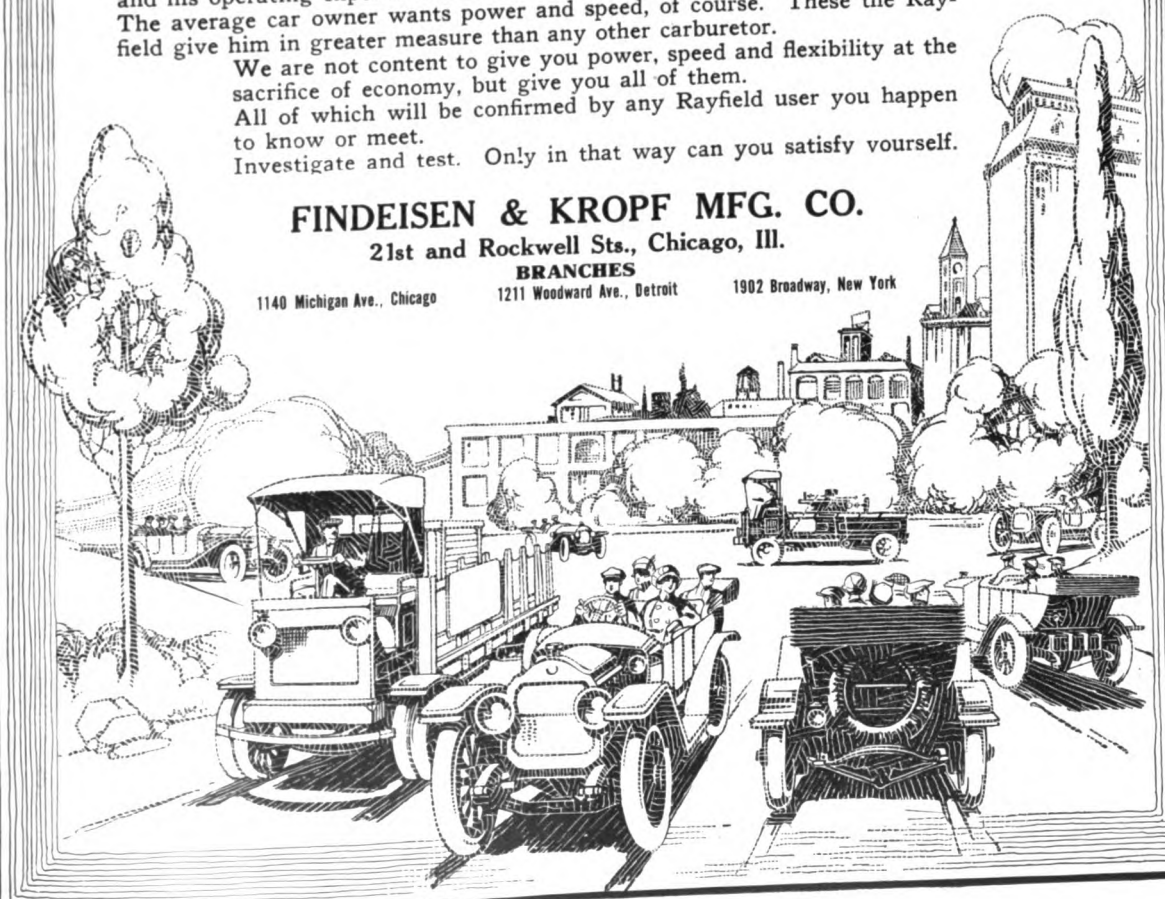
RAYFIELD CARBURETORS



are Most Economical

in All Kinds of Weather
With All Makes of Cars
Using All Grades of Gasoline

Every Rayfield user knows that economy is one of the cardinal features of Rayfield carburetion, whether touring, hill climbing, racing or driving on the boulevard.
This carburetor, in the most recent economy tests for heavy, high-powered six-cylinder cars, established the world's record.
Many an owner of a car that was eating up gasoline and returning six, seven or at most eight miles per gallon, has installed a Rayfield and found his mileage increased and his operating expense reduced.
The average car owner wants power and speed, of course. These the Rayfield give him in greater measure than any other carburetor.
We are not content to give you power, speed and flexibility at the sacrifice of economy, but give you all of them.
All of which will be confirmed by any Rayfield user you happen to know or meet.
Investigate and test. Only in that way can you satisfy yourself.

How the ten-thousand car producer can INCREASE his costs by $20,000 to $30,000.

The SPRING LOCK WASHER, as a detail of automobile construction, will remain a general standard only so long as it provides automobile users with such security of bolted-up parts that the continuous maintenance of same may be disregarded.

And if the LOCK WASHER fails to provide such security, the manufacturers of automobiles will be compelled by public demand to return to the castellated nut and cotter with an increased cost in manufacture OF OVER ONE CENT PER BOLT.

The average number of SPRING LOCK WASHERS in use per car is between 200 and 300—and the expense of procuring the device adapted to proper efficiency is but a trifle as compared with the expense of returning to a construction which will increase cost from $2 to $3 per car.

There are three points to a nut lock—proper size, proper analysis, proper treatment. Are you sure of all three on your car?

Monarch

ANNOUNCEMENT

Full five-passenger touring car, long stroke motor, 25 horse power, 110 inch wheel base, gasoline in dash, selective sliding gears, bell backed body, quick detachable rims, 32 x 3½ inch tires, complete equipment, wire wheels, electric self-starter and lights.

$1050

F. O. B. DETROIT

With All the Qualities of a Leader

The new Monarch will be ready for delivery in September. Look at the car and note the specifications. Was there ever an automobile more appropriately named? Big, beautiful—it has no contenders to the place of leadership in its field. It possesses the attributes of distinction. Feature upon feature, found only in the higher priced cars, will surprise and delight the man who is looking for a car around $1000.

Nothing in the low price field approaches the beauty of Monarch design. The stream line body with its original method of using the Renault hood gives it lines of grace and beauty unexcelled by the elite of motordom.

FULL FIVE PASSENGER BODY

Exceptional roominess both in the fore seat and in the tonneau, deep upholstery and full elliptic springs provide the utmost comfort under all conditions. It's a full five-passenger car with so much leg room in the tonneau that a foot rail is necessary.

ECONOMICAL OF FUEL

The motor is designed to give plenty of power for rough road or steep hill travel, yet to keep the gasoline consumption down to the minimum. A small bore, long stroke motor of the twin cylinder type assures great power and absolute reliability.

CONVENIENT DRIVING

No feature for convenient driving is omitted. A foot throttle and foot brake are on the toe board. There are also a hand brake within easy reach, a hand lever throttle and spark control both on the steering wheel. An efficient electric system operated from the seat starts the motor and supplies electricity for five lights.

DEALERS—HAVE YOU ITS EQUAL?

Can you offer the buying public so much real automobile value as shown by the Monarch? No—This sets a new standard of value—a value that will arouse the enthusiasm of every person who sees the car.

What about your car when it's three or four years old?

What about it when it is stuck in the mud and the engine has real work to do?

You know well enough that any good modern motor will pull a brand new car over a boulevard "just as nice as pie". But when your motor has thirty, forty or a hundred thousand miles to its credit, or when it goes against real work—that's the time you'll be glad if you insisted on having a car with a

BUDA MOTOR

"the part that sells the car"

The difference between a motor and a ***BUDA*** Motor does not all appear to the casual glance, because the car or truck motor of today is a standard article in its general features.

But when you have a BUDA Motor, which is good enough to cause many car manufacturers to give up their motor departments in its favor—when your BUDA Motor is old enough to have a *record—then you know* what it means to sit behind the product of our great organization of *Motor Specialists*, who make motors of superlative excellence because they concentrate their whole activity on motors, and motors only. The result is the admitted "world's best motor". You'd rather have that than just "our regular motor". Remember that an automobile is only a motor with trimmings.

CAPACITY
GURNEY
ENDURANCE

Radio-Thrust Bearings in the Differential

¶ We show above several Radio-Thrust substitutions as applied about the differential.

¶ An R-T Bearing (wide type) in place of a radial and a thrust bearing back of the large bevel gear, and a narrow type R-T opposed thereto in the place of an ordinary annular on the other side of the differential.

¶ An R-T Bearing (wide type) in place of a double row annular back of the pinion with another R-T opposed thereto supporting the other end of the pinion shaft.

¶ The simplicity of this construction needs no comment. Each bearing is subject to both radial and thrust loads, and each has the needed capacity thrust as well as radial to safely and easily take care of any stresses that any emergency may impose upon it. The distinctive point in these bearings is that the particular sort of loads that the several bearings are subject to are in each case merely normal loads, just what the bearings are designed to carry. In other words we think it is the logical and rational thing to adapt the bearings to the character of the service. Hence the Radio-Thrust Bearing. It makes Gurney capacity and endurance available in every bearing of the car.

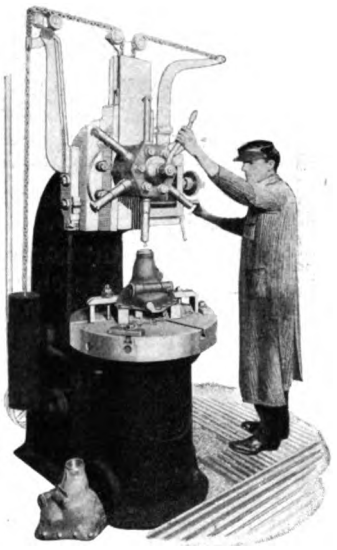
The Teeth that Always Fit

Part III The Story of Four Holes



OUT in the factory is a machine on which is mounted the differential-carrier of a rear axle. The carrier stands upright on its smaller end while sharp cutting tools plane off the surface that is to fit against the axle housing.

The same machine also reams out and threads the opening for the sleeve that holds the pinion bearing.

On the accuracy of that machine depends the perfect meshing of gears, quiet running, long wear—satisfaction to the owner of a Timken-Detroit Axle.

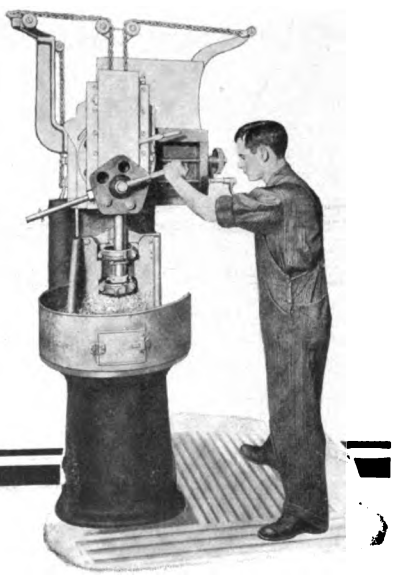
It took years of engineering experience, days of careful labor in the toolroom, to design and make the jig that holds the differential-carrier on that machine.

But it's worth while, for only thus can we *know* that those three operations will be done right *every time*. The jig is automatic, it is not subject to human error.

TIMKEN-DETROIT AXLES

Getting the Pinion-Shaft in Line

At the front of the pinion-shaft is another bearing. The opening for it, too, must be exactly determined.



And so the carrier goes to a second jig and is held firm while that second hole is reamed true.

Now we know that when the carrier is bolted to the axle-housing the pinion-shaft will be exactly at right angles to the drive shaft.

Still Another Jig is Needed

The openings for the differential bearings remain. They too, must be right, or the teeth of the gears will never fit.

So jig No. 3 takes its turn, and makes us sure that the drive gear will turn in a plane parallel to the two wheels, and with its center exactly the right distance from the pinion.

Even This Does Not Satisfy Timken Ideals

We have found the way to do the thing right, but that is not enough. We must prove it right beyond any shadow of doubt.

So once more we turn to the humble jig.

But that's another story, and will follow in Part Four, in the next issue of this magazine.

NOTE:—The first two articles in this series on "The Teeth that Always Fit" appeared in the two preceeding issues of this magazine. We shall be glad to send you copies of the articles free on request.

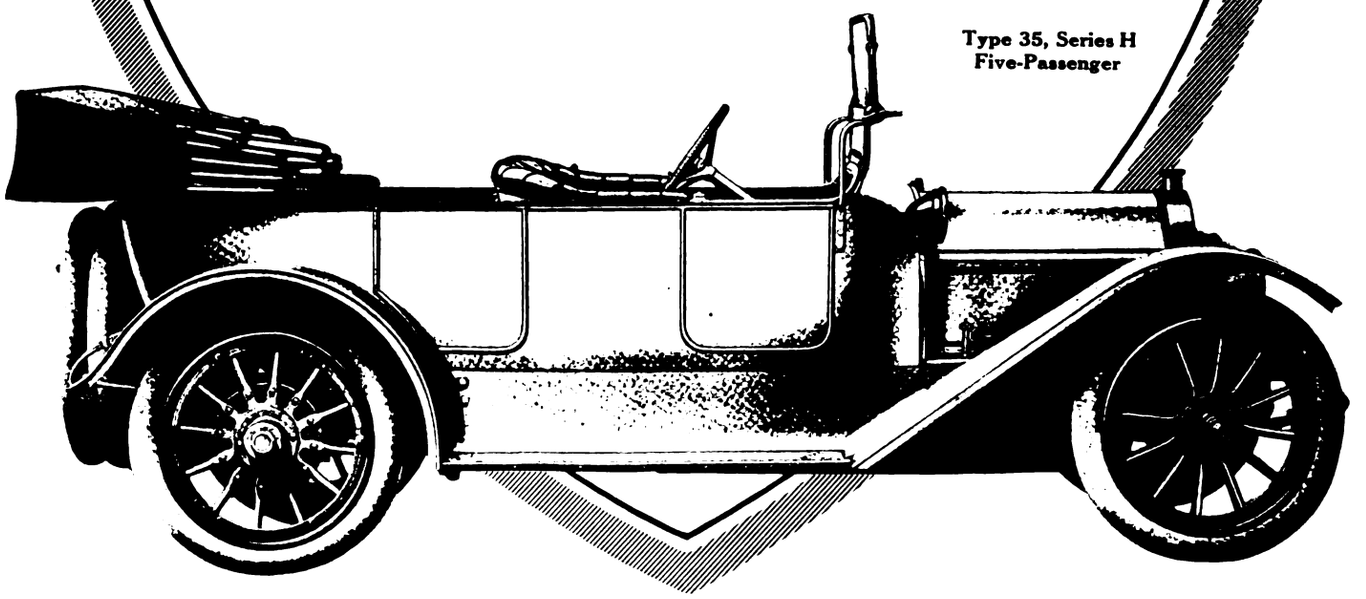
MERCER

A Consistent Winner

A 300 CUBIC INCH MERCER driven by Ralph De Palma, won the 302-Mile Cobe Trophy Race at Elgin, Ill., Aug. 29, at an average speed of 66.8 miles per hour. This is the third consecutive year the Mercer has won the 300-inch division of the Elgin races.

The winning of one race, or even several races, does not necessarily indicate that any particular car possesses superior qualities from a speed and utility viewpoint, consistency, continued participation in racing, and the comparative merit of a car's performance is what proves its claim to championship honors.



The Mercer record for the past three years speaks volumes.

There is no greater asset for the dealer than the car's actual performance. Think what Mercer victories mean to Mercer dealers

"I have sold more than one_____car in competition with others of much higher price, because it was equipped with an Auto-Lite Electric Generator."

"Current to Burn"

AUTO-LITE ELECTRIC STARTING and LIGHTING SYSTEM

The new Model "G" Auto-Lite Generator is built with magneto dimensions—can be placed on the bracket provided on the engine for the magneto and driven directly by the magneto shaft, or it can be connected direct to pump shaft—no additional transmission, such as gears, chains or belts being required.

Reaches its maximum output at a car speed of 17½ miles per hour. Begins to produce current at a speed of about 6 miles per hour.

Water and dustproof—gives you high current production at low car speeds.

THE star salesmen of one of the well known automobile concerns made this statement last week in our office. He went on to say—

"The Auto-Lite Electric Generator has given such satisfactory service on_____cars, that I have actually marveled at its ability to keep running day and night without any more attention than I have given the radiator or tires.

I have driven a demonstrator equipped with an Auto-Lite System all over the country, through rain storms, over the roughest kind of roads, and I have yet to find the first fault with it.

The lights are always bright—ready when I want them.

The control is perfect, which is something you can't say about the others.

The Auto-Lite is unquestionably the best electric lighting system on the market today."

These statements were made by a man with long experience in the motor car business.

He travels continuously, is personally acquainted with all of the well-known automobile agents east of the Mississippi River.

Therefore, he is thoroughly posted and knows whereof he speaks.

"THE PIONEER 6 VOLT ELECTRIC SYSTEM"

GET THIS BOOK

Send for our "Handbook on the Care and Operation of Automobile Electric Systems," a book so full of interesting information on all modern electric systems that no automobile owner can afford to be without it.

Explains in detail, functions of the various parts—how to locate and remedy troubles of all kinds—embraces all electrical automobile systems.

The large operation chart which it contains is alone worth the price.

Regular price 50 cents.

Will be sent to you for 10 cents in stamps if you use this coupon.

70 to 140 Miles Every Day

That's the steady record of the one-ton Kelly Trucks running on the Malvern Hill-Richmond Bus Line.

Each truck makes at least four trips a day between the Virginia capital and historic Malvern Hill. The distance is 18 miles and the average is 1 hour and 30 minutes.

Hundreds of Kelly Trucks are equaling or bettering this performance every day under all sorts of conditions.

Would it help your business if your wagons were able to average more than 70 miles a day? A kelly can do it.

DEALERS!

There is still some desirable Kelly territory open. Write for our agency proposition.

A New Detaching-Tool for Continental and Standard Universal No. 3 Rims

THIS new tool will enable you to change a casing or tube in much less time than you can do it now and with considerable less effort.

Tool in operation — unlocking rim

EVERY OWNER OF CONTINENTAL OR STANDARD UNIVERSAL NO. 3 RIMS SHOULD OWN ONE OF THESE TOOLS

Tool in operation — locking rim

This tool provides a much greater leverage than the old tool.

It is easily applied to the rim.

It is easy to operate.

It is made of drop-forgings and is very strong.

The tool is made in two sizes — one size for 36" x 4½" rims — one size for all other rims.

It costs only one dollar plus delivery charges.

Send us the dollar in any way convenient to you. Enclose with your order postage sufficient to pay for parcel-post delivery. The tool weighs one pound.

We'll ship it by return mail.

THE ATTERBURY LINE

It is a shrewd move on the part of a dealer who makes sure, before he signs up to handle a certain line of trucks, that he can get prompt deliveries on both chassis and bodies.

This feature of the business is watched with jealous care at the Atterbury shops. Shop practice is carried on so as to insure against delays. We do so much of the work of building our trucks, and depend so little upon outside help that we govern our deliveries to the last degree.

We cannot urge too strongly the wisdom of investigating the Atterbury Line, the value of knowing what ten years of actual truck building has taught and the satisfaction of handling a line of trucks which are sold right, on which the maker realizes a fair margin of profit, and on which the dealer builds a paying business.

Confidential to Automobile Manufacturers

Getting right down to "brass tacks" and talking man to man isn't it true that the CLUTCH is the one point of contact between the driver and your car?

That being so, isn't the continued good behavior of the CLUTCH a matter of prime importance? You want the CLUTCH right in the first place and you want it to stay right.

You are naturally anxious that the CLUTCH should say good things to those who drive your cars; what are you doing to make sure of it?

We respectfully suggest that the services of CLUTCH SPECIALISTS would be extremely worth while. KONIGSLOW-CLEVELAND will gladly have you make use of their experience and facilities.

Don't wait till you're ready to place orders—write today.

Notice to Customers Who Desire to Use "Whitney" Chains of the Silent Type

Copy of Circular Issued May 14, 1913

Since we commenced to market chains of the Silent type, we have made special effort to impress upon our customers the necessity for providing proper conditions for both chains and sprockets. We have pointed out that sprocket blanks must be turned to the right shape and that the teeth must be correctly cut. Sprockets should not have less than 15 teeth, should be larger if possible, and should be kept accurately in line. We have also urged on our csutomers the importance of selecting chains wide enough and large enough for their purpose and we have asked that in all cases customers make a thorough and exhaustive test before ordering in quantities to make sure that all conditions have been properly provided for. As a means to this end we have requested that the sprocket teeth be cut either by the customer or by The Whitney Mfg. Co. and not by some third party. In spite of these warnings we now find cases where our chains may fail to give complete satisfaction because some customers are already using them on improper sprockets, or have adopted chains too small in pitch or too narrow for their conditions.

We therefore desire to state that customers who do not follow our suggestion, but on the contrary secure sprockets wherever they please and possibly where they can secure the lowest price, are liable to obtain incorrect sprockets, so that at any moment we may feel compelled in such cases to discontinue shipments of chain, or insist that sprockets be sent to us for inspection at the customers' expense, before furnishing chain.

We will endeavor to force customers to use our chains on correct sprockets and to use chains of a sufficient size for the purpose even if we get certain customers into temporary difficulty. The ultimate result, however, we believe will be beneficial to all.

If a customer will explain the conditions for which our Silent chain is desired, we will be pleased to recommend a size of chain for trial, but, as stated above, we advise that chains shall not be purchased in quantity until a severe test has been made and the results found satisfactory.

In the early days of the Bicycle industry and when Roller chains were first used for the main drive on automobiles, certain customers used our chains on incorrect sprockets and we shielded them in every way possible, letting the chain take the blame for unsatisfactory results. With the Silent chain we will positively not follow this plan, and if customers adopt chains without making proper tests, and use them on poor sprockets, or under unfavorable conditions, they must take the consequences, for we certainly shall accept no responsibility in the matter, though such customers would, of course, have our sympathy and we would do our best to render assistance.

We must positively maintain our position, as outlined above, as we do not intend that our chains shall be unjustly condemned if we can help it.

THE WHITNEY MANUFACTURING COMPANY, Hartford, Conn.

SPLITDORF

"Always There"

Look before you leap

and study well the "make-up" of plugs before making another solitary purchase.

We invite the closest possible study, investigation and trial of SPLITDORF COMMON SENSE PLUGS—the "stand-by" of plugdom.

You will always find the insulation of SPLITDORF PLUGS is high quality mica and designed and manufactured to absolutely withstand the breaking down effects of high tension current.

The design of the SPLITDORF central electrode is proof against all expansion and contraction.

The construction of the SPLITDORF shell allows small space for gas and its shape prevents all trouble due to pre-ignition on account of red-hot metal parts.

The SPLITDORF PLUG is less liable to short-circuit from carbon deposits than any other form of plug ever put out by any manufacturer.

SPLITDORF PLUGS will stand every test and scrutiny—TRY THEM NOW AND ALWAYS.

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

Full information may be obtained from

75% of all tire trouble is due to under inflation

THERE is no method yet discovered of ascertaining the pressure in the inside of a tire, except by the use of a pressure gauge. A casing containing 40 pounds of air looks and feels exactly like a casing containing 80 pounds. If your tires require 80 pounds and you only give them 40, they're on the quick road to the scrap-heap.

Get Weed Tire Chains at Once!

"I know you are a careful driver, but it is best to adopt every device to ***prevent*** accidents.

"I can't afford to take ***any chances.*** We have all foolishly depended on rubber alone long enough. It's time to awake to our responsibility. So go at once and buy a complete equipment of ***Weed Chains*** and never start out without them when the roads or pavements are slippery or greasy."

Weed Anti-Skid Chains

Insure Against Anxious Moments

Probably no other device has done so much to raise the factor of automobile safety as WEED CHAINS. They are the proverbial "ounce of prevention" against skidding, the cause of over ninety per cent of all automobile accidents—***Life Insurance*** and ***Accident Insurance Companies*** strongly endorse them and recommend their use. ***Taxicab Companies,*** for their own protection, ***insist*** that their drivers put them on when the streets are wet or slippery.

Increasing Demand

for WEED CHAINS makes them the ***most profitable*** Automobile Accessory handled by Dealers—Quick and Steady Sales—No Dull Seasons—No Dead Stock—Easily Handled—Liberal Profits—Universal Satisfaction.

Attractive, convincing, decorative, lithographed hangers supplied to dealers upon request.

DEALERS: A million motorists will have tire trouble in 1913. There is a demand for a **reliable,** inexpensive vulcanizer that can be used by anyone, anywhere—a vulcanizer that will mend tube punctures as perfectly as the most elaborate plant.

VUL CANIZER REPAIR KIT $2

The only inexpensive vulcanizer that actually **vulcanizes** a repair clear through because it is the only one in which the vulcanizing temperature is maintained long enough to cure the raw rubber. Its ever-present fuel, gasoline, is converted into a gas by the patent generator which distributes the flame over the vulcanizing surface at just the right intensity.

Other exclusive Shaler features are a handle that is cool enough to permit moving the vulcanizer the moment the repair is finished, asbestos plate inlaid in tube shelf to retain heat and prevent pinching tube, and universal clamp insuring even pressure to all parts of a repair.

A Real SHALER Vulcanizer

Not an experiment, but the product of the largest exclusive vulcanizer manufacturers in the world. Sold under the Shaler guarantee which has made the Shaler line of vulcanizers for motorists and repairmen the standard throughout the auto industry.

Get our trade proposition

Write today and get full details and trade prices on this indispensable accessory. Sooner or later every motorist will get a VUL-KIT from someone.

The KisselKar advertisement in the Saturday Evening Post of September 6th contains the following:

> —The Golde patent "one man" top, Warner speedometer, Klaxon horn, and many other earmarks of the highest priced cars are all manifest in the equipment of the KisselKar 60 "Six."

This is an apt expression of what we have been trying to drive home for months; The Klaxon is an earmark of the highest-priced cars.

It is found in the equipment of every high-priced car made.

And of every moderate priced car whose makers realize that known, advertised, STANDARD accessories are sufficiently important as talking points, as unmistakable indications of the car's quality, to warrant the additional cost.

THERE are comparatively few business houses in the United States that can point to an uninterrupted business career of more than half a century.

—and, in addition, possess unlimited financial resources, and a world-wide reputation for integrity and the "square deal."

Stability, financial responsibility, integrity—are but a few of the reasons that make automobile dealers anxious to sell Studebaker cars. They have confidence in Studebaker and in Studebaker Service.

The confidence is felt by car purchasers as well as by the men who sell cars. That is why Studebaker cars are easy to sell. And—having sold a car—Dealer and Purchaser know that every aid and co-operation will be given by Studebaker to keep both Dealer and Purchaser satisfied.
